Preface

Over the years, students appearing for the Joint Entrance Examination (JEE) have banked on conventional methods and shortcuts provided by books to crack the examination. However, the paper-setting patterns during the recent years have made it clear that only conventional techniques arc not enough as most of the questions are based on concepts rather than on just formulae.

It is necessary for students appearing for JEE to gain a thorough knowledge and understanding of the concepts, and this book helps students in acquiring the same. This book uses a right mix of fundamental principles and concepts, illustrations which highlight the application of these concepts, and exercises for practice. It is designed to help students to get an all-round grasp of the subject so as to be able to make its useful application in all its contexts.

The objective of the book is to help students develop their problem-solving skills/accuracy, the ability to reach the crux of the matter, and the speed to get answers in limited time.

It is imperative to note that this book would be as profound and useful as you want it to be. Therefore, in order to get maximum benefit from this book, we recommend the following study plan for each chapter:

Step 1: Go through the entire opening discussion about the fundamentals and concepts.

Step 2: After learning the theory/concept, follow the illustrative examples to get an understanding of the theory/concept.

Step 3: Attempt in-text concept application exercises. This will ensure your understanding and implementation of concepts and formulae.

Step 4: Move to the section that lists solved problems. This will help better your understanding of the chapter theory.

Step 5: Finally, there are many exercises/problems to try your hands on. These problems warrant the recall of all the formulae and concepts involved. Archives is a collection of solved problems from previous years' examinations, which will help students understand the trend(s) behind JEE.

The purpose of this book is to help you actually understand what you are doing, rather than blindly applying memorized techniques. It is recommended that you solve the problems given in the book by yourself, without the help of the solution at the end of the section. The idea is that if you discover something on your own, you will remember it better than if you had simply seen the a nswer. So, refer to the solution only if you fail to solve a problem after several attempts or when you have already found a solution a nd want to check your approach.

Although this book h as been written on the basis of the syllabus prescribed for JEE, it will prove useful also to the student s preparing for other entrance examinations since the content of *physics* remains almost the same for all examinations.

We hope this book helps you immensely in acquiring the kind of acumen that is vital for students appearing for JEE. Since we believe that there is always scope for improvement, any suggestions are welcome.

You have taken the first step. A bright future beckons you. We wish you success in this endeavour and in life.

B.M. Shanna

Chapter 1

Units, Dimensions and Measurement

PHYSICAL QUANTITY

A physical quantity is represented completely by its magnitude and unit. For example, 10 m means a length which is 10 times the unit of length. Here 10 represents the numerical value of the given quantity and meter represents the unit of quantity under consideration. Thus, in expressing a physical quantity, we choose a unit and then find that how many times that unit is contained in the given physical quantity, i.e.,

Physical quantity (Q) = Magnitude × Unit = $n \times u$

where n represents the numerical value and u represents the unit. Thus, while expressing a definite amount of physical quantity, it is clear that as the unit u changes, the magnitude (n) will also change but product nu will remain same.

i.e. $\quad n\,u = \text{constant}$

or $\quad n_1u_1 = n_2u_2 = \text{constant} \Rightarrow n \propto \dfrac{1}{u}$

i.e., the magnitude of a physical quantity and units are inversely proportional to each other. Larger the unit, smaller will be the magnitude.

FUNDAMENTAL AND DERIVED QUANTITIES

Fundamental quantities Out of a large number of physical quantities which exist in nature, there are only few quantities which are independent of all other quantities and do not require the help of any other physical quantity for their definition. Therefore, these are called absolute quantities. These quantities are also called fundamental or base quantities, as all other quantities are based upon and can be expressed in terms of these quantities.

Derived quantities All other physical quantities can be derived by suitable multiplication or division of different powers of fundamental quantities. These are, therefore, called derived quantities.

For example, if length is defined as a fundamental quantity, then area and volume are derived from length and are expressed in term of length with power 2 and 3 over the term of length.

Table 1.1: Fundamental quantities in SI system and their units

S. No.	Physical quantity	Name of unit	Symbol of unit
1.	Mass	Kilogram	kg
2.	Length	Meter	m
3.	Time	Second	s
4.	Temperature	Kelvin	K
5.	Luminous Intensity	Candela	Cd
6.	Electric Current	Ampere	A
7.	Amount of Substance	Mole	mol

Table 1.2: Supplementary quantities in SI system and their units

S. No.	Physical quantity	Name of unit	Symbol of unit
1.	Plane angle	Radian	rad
2.	Solid angle	Steradian	sr

FUNDAMENTAL AND DERIVED UNITS

Normally each physical quantity requires a unit or standard for its specification so it appears that there must be as many units as there are physical quantities. However, it is not so. It has been found that if in mechanics we arbitrarily choose units of any three physical quantities we can express the units of all other physical quantities in mechanics in terms of these. Arbitrarily, the physical quantities *mass, length,* and *time* are choosen for this purpose. So any unit of mass, length, and time in mechanics is called a *fundamental, absolute, or base unit*. Other units which can be expressed in terms of fundamental units are called derived units. For example, light year or km is a fundamental units as it is a unit of length while s^{-1}, m^2, or $kg\,m^{-1}$ are derived units as these are derived from units of time, mass, and length, respectively.

System of units A complete set of units, both fundamental and derived, for all kinds of physical quantities is called system of units. The common systems are given in Table 1.3.

Table 1.3: Fundamental quantities in SI system and their units

	MKS System	CGS System	FPS System	SI units
Length	m (meter)	cm (centimeter)	ft (foot)	It is an extended form of MKS system. It includes four more fundamental units (in addition to three basic units) which represent fundamental quantities in electricity, magnetism, heat, and light.
Mass	kg (kilogram)	g (gram)	lb (pound)	
Time	s (second)	s (second)	s (second)	

DIMENSIONS OF A PHYSICAL QUANTITY

When a derived quantity is expressed in terms of fundamental quantities, it is written as a product of different powers of the fundamental quantities. The powers to which fundamental quantities must be raised in order to express the given physical quantity are called its dimensions.

To make it more clear, consider the physical quantity force:

Force = Mass × Acceleration

$$= \frac{\text{Mass} \times \text{Velocity}}{\text{Time}} = \frac{\text{Mass} \times \text{Length/Time}}{\text{Time}}$$

$$= \text{Mass} \times \text{Length} \times (\text{Time})^{-2} \quad \text{(i)}$$

Thus, the dimensions of force are 1 in mass, 1 in length and –2 in time. Here the physical quantity that is expressed in terms of the base quantities is enclosed in square brackets to indicate that the equation is among dimensions and not among magnitudes.Thus, (i) can be written as [force] = $[MLT^{-2}]$. Such an expression for a physical quantity in terms of the fundamental quantities is called the dimensional equation. If we consider only the RHS of the equation, the expression is termed as dimensional formula. Thus, the dimensional formula for force is $[MLT^{-2}]$.

APPLICATIONS OF DIMENSIONAL ANALYSIS

To find the unit of a physical quantity in a given system of units:

By writing the definition or formula for the physical quantity, we find its dimensions. Now in the dimensional formula replacing M, L, and T by the fundamental units of the required system, we get the unit of physical quantity. However, sometimes to this unit, we further assign a specific name, e.g.,

Work = Force × Displacement

So $[W] = [MLT^{-2}] \times [L] = [ML^2T^{-2}]$

So, its units in CGS system will be g cm^2 s^{-2} which is called erg while in MKS system will be kg m^2 s^{-2} which is called joule.

To convert a physical quantity from one system to the other:

The measure of a physical quantity is nu = constant.

If a physical quantity X has dimensional formula $[M^aL^bT^c]$ and if the derived units of that physical quantity in two systems are $[M_1^aL_1^bT_1^c]$ and $[M_2^aL_2^bT_2^c]$ and n_1 and n_2 be the numerical values in the two systems, respectively, then

$$n_1[u_1] = n_2[u_2]$$

$$\Rightarrow \quad n_1[M_1^aL_1^bT_1^c] = n_2[M_2^aL_2^bT_2^c]$$

$$\Rightarrow \quad n_2 = n_1\left[\frac{M_1}{M_2}\right]^a\left[\frac{L_1}{L_2}\right]^b\left[\frac{T_1}{T_2}\right]^c$$

where M_1, L_1, and T_1 are the fundamental units of mass, length, and time in the first (known) system and M_2, L_2, and T_2 are the fundamental units of mass, length, and time in the second (unknown) system, respectively. Thus, knowing the values of fundamental units in two systems and the numerical value in one system, the numerical value in the other system may be evaluated.

ILLUSTRATION 1.1 Convert 1 joule to ergs.

Solution. Joule: SI system, erg: CGS system

Work = Force × Distance = Mass × Acceleration × Length

$$= \text{Mass} \times \frac{\text{Length}}{(\text{Time})^2} \times \text{Length}$$

Dimensions of work = $[W] = [M^1L^2T^{-2}]$

$\therefore \quad a = 1, b = 2, c = -2.$

Now

SI system	CGS system
$M_1 = 1$ kg	$M_2 = 1$ g
$L_1 = 1$ m	$L_2 = 1$ cm
$T_1 = 1$ s	$T_2 = 1$ s

Here $N_1 = 1, N_2 = ?$

$$\therefore \quad \text{Using } N_2 = N_1\left[\frac{M_1}{M_2}\right]^a\left[\frac{L_1}{L_2}\right]^b\left[\frac{T_1}{T_2}\right]^c$$

$$= 1\left[\frac{1\text{kg}}{1\text{ g}}\right]^1\left[\frac{1\text{ m}}{1\text{ cm}}\right]^2\left[\frac{1\text{ s}}{1\text{ s}}\right]^{-2}$$

$$= 1\left[\frac{1000\text{ g}}{1\text{ g}}\right]^1\left[\frac{100\text{ cm}}{1\text{cm}}\right]^2 = 10^7$$

$\therefore \quad N_2 = 10^7$

So $\quad 1\text{ J} = 10^7$ erg

ILLUSTRATION 1.2 In CGS system, the magnitude of the force is 100 dynes. In another system where the fundamental physical quantities are kilogram, meter, and minute, find the magnitude of the force.

Solution. We have $n_1 = 100$, $M_1 = 1$ g, $L_1 = 1$ cm, $T_1 = 1$ s and $M_2 = 1$ kg, $L_2 = 1$ m, $T_2 = 1$ min, the dimensional formula of forces is $[M^1L^1T^{-2}]$, where $a = 1, b = 1, c = -2$.

By substituting these values in the following conversion formula, we have

$$n_2 = n_1\left[\frac{M_1}{M_2}\right]^a\left[\frac{L_1}{L_2}\right]^b\left[\frac{T_1}{T_2}\right]^c$$

$$= 100\left[\frac{1\text{ g}}{1\text{ kg}}\right]^1\left[\frac{1\text{ cm}}{1\text{ m}}\right]^1\left[\frac{1\text{ s}}{1\text{ min}}\right]^{-2}$$

$$= 100\left[\frac{1\text{ g}}{10^3\text{g}}\right]^1\left[\frac{1\text{ cm}}{10^2\text{cm}}\right]^1\left[\frac{1\text{ s}}{60\text{ s}}\right]^{-2} = 3.6$$

To check the dimensional correctness of a given physical relation: This is based on the *principle of homogeneity*. According to this principle, the dimensions of each term on both sides of an equation must be the same.

If $X = A \pm (BC)^2 \pm \sqrt{DEF}$,

then according to the principle of homogeneity, we have

$$[X] = [A] = [(BC)^2] = [\sqrt{DEF}].$$

If the dimensions of each term on both sides are same, the equation is dimensionally correct, otherwise not. A dimensionally correct equation may or may not be physically correct.

ILLUSTRATION 1.3 Find out the unit and dimensions of the constants a and b in the van der Waals equation $\left(P + \frac{a}{V^2}\right)(V - b) = RT$, where P is pressure, V is volume, R is gas constant, and T is temperature.

Solution. We can add and subtract only like quantities.

$\Rightarrow$ Dimensions of P = Dimensions of $\frac{a}{V^2}$ (i)

and Dimensions of V = Dimensions of b (ii)

From (i),

Dimensions of a = Dimensions of $P \times$ Dimensions of V^2

$$[a] = [M^1L^{-1}T^{-2}] \times [L^3]^2 = [M^1L^5T^{-2}]$$

Unit of a = Unit of $P \times$ Unit of $V^2 = \frac{\text{N}}{\text{m}^2} \times \text{m}^6 = \text{N m}^4$

From (ii), $[b] = [V] = [M^0L^3T^0]$

So unit of b = Unit of $V = \text{m}^3$

ILLUSTRATION 1.4 A famous relation in physics relates the moving mass m to the rest mass m_0 of a particle in terms of its speed v and the speed of light c. (This relation first arose as a consequence of the special theory of relativity due to Albert Einstein). A boy recalls the relation almost correctly but forgets where to put the constant c. He writes $m = \frac{m_0}{(1 - v^2)^{1/2}}$. Guess where to put the missing c.

Solution. According to the principle of homogeneity of dimensions, powers of M, L, T on either side of the formula must be equal. For this, on RHS, the denominator $(1 - v^2)^{1/2}$ should be dimensionless. Therefore, instead of $(1 - v^2)^{1/2}$, we should write $(1 - v^2/c^2)^{1/2}$. Hence, the correct formula would be

$$m = \frac{m_0}{(1 - v^2/c^2)^{1/2}}$$

As a research tool to derive new relations: If one knows the dependency of a physical quantity on other quantities and if the dependency is of the product type, then using the method of dimensional analysis, a relation between the quantities can be derived. Let us understand this point through following examples:

Time period of a simple pendulum: Let the time period of a simple pendulum be a function of the mass of the bob (m), effective length (l), and acceleration due to gravity (g), then assuming the function to be the product of power function of m, l, and g, i.e., $T = Km^x l^y g^z$, where K = dimensionless constant.

If the above relation is dimensionally correct, then by substituting the dimensions of quantities,

$$[T] = [M]^x [L]^y [LT^{-2}]^z$$

or $$[M^0L^0T^1] = [M^xL^{y+z}T^{-2z}]$$

Equating the exponents of similar quantities, we get $x = 0$, $y = 1/2$, and $z = -1/2$.

So, the required physical relation becomes $T = K\sqrt{\frac{l}{g}}$.

The value of dimensionless constant is found (2π) through experiments, so $T = 2\pi\sqrt{\frac{l}{g}}$.

Stoke's law: When a small sphere moves at low speed through a fluid, the viscous force F, opposing the motion, is found experimentally to depend on the radius r, the velocity of the sphere v, and the viscosity η of the fluid.

So $F = f(\eta, r, v)$

If the function is the product of power functions of η, r, and v, $F = K\eta^x r^y v^z$, where K is the dimensionless constant.

If the above relation is dimensionally correct,

$$[MLT^{-2}] = [ML^{-1}T^{-1}]^x [L]^y [LT^{-1}]^z$$

or $$[MLT^{-2}] = [M^xL^{-x+y+z}T^{-x-z}]$$

Equating the exponents of similar quantities $x = 1$; $-x + y + z = 1$; and $-x - z = -2$.

Solving these for x, y, and z, we get $x = y = z = 1$.

So it becomes $F = K\eta rv$

On experimental grounds, $K = 6\pi$; so $F = 6\pi\eta rv$

This is the famous Stoke's law.

ILLUSTRATION 1.5 If velocity (V), force (F), and time (T) are chosen as fundamental quantities, express (a) mass and (b) energy in terms of V, F, and T.

Solution. Let M = (Some number)$(V)^a(F)^b(T)^c$

Equating dimensions of both the sides, we get

$$M^1L^0T^0 = (1)\,[L^1T^{-1}]^a\,[M^1L^1T^{-2}]^b\,[T^1]^c$$

$$= M^b L^{a+b} T^{-a-2b+c}$$

Get $a = -1, b = 1, c = 1$.

M = (Some number) $(V^{-1} F^1 T^1)$ or $[M] = [V^{-1} F^1 T^1]$

Similarly, we can also express energy in terms of V, F, and T.

Let $[E]$ = [Some number] $[V]^a [F]^b [T]^c$

$\Rightarrow$ $[ML^2T^{-2}] = [M^0L^0T^0] [LT^{-1}]^a [MLT^{-2}]^b [T]^c$

$\Rightarrow$ $[M^1L^2T^{-2}] = [M^b L^{a+b+c} T^{-a-2b+c}]$

$\Rightarrow$ $1 = b; 2 = a + b + c; -2 = -a - 2b + c$

Get $a = 1; b = 1; c = 1$.

$\Rightarrow$ E = (Some number) $V^1F^1T^1$ or $[E] = [V^1][F^1][T^1]$.

LIMITATIONS OF DIMENSIONAL ANALYSIS

Although dimensional analysis is very useful, it cannot lead us too far due to the following reasons:

1. If dimensions are given, physical quantity may not be unique as many physical quantities have same dimensions. For example, if the dimensional formula of a physical quantity is $[ML^2T^{-2}]$, it may be work or energy or torque.
2. Numerical constant having no dimensions $[K]$ such as (1/2), 1, 2π, etc., cannot be deduced by the methods of dimensions.
3. The method of dimensions cannot be used to derive relations other than the product of power functions. For example, $s = ut + (1/2)\,at^2$ or $y = a \sin \omega t$ cannot be derived by using this theory (try if you can). However, the dimensional correctness of these can be checked.
4. The method of dimensions cannot be applied to derive formula if in mechanics a physical quantity depends on more than three physical quantities as then there will be less number (= 3) of equations than the unknowns (>3). However, still, we can check the correctness of the given equation dimensionally. For example, $T = 2\pi\sqrt{I/mgl}$ cannot be derived by theory of dimensions but its dimensional correctness can be checked.
5. Even if a physical quantity depends on three physical quantities, out of which two have same dimensions, the formula cannot be derived by the theory of dimensions, e.g., formula for the frequency of a tuning fork $f = (d/L^2)\,v$ cannot be derived by the theory of dimensions but can be checked.

CONCEPT APPLICATION EXERCISE 1.1

1. The number of particles is given by $n = -D\dfrac{n_2 - n_1}{x_2 - x_1}$ crossing a unit area perpendicular to X-axis in unit time, where n_1 and n_2 are the number of particles per unit volume for the value of x meant to x_2 and x_1. Find the dimensions of D called diffusion constant.
2. The potential energy of a particle varies with distance x from a fixed origin as $U = \dfrac{A\sqrt{x}}{x^2 + B}$, where A and B are dimensional constants, then find the dimensional formula for AB.
3. Convert 1 MW power on a new system having basic units of mass, length, and time as 10 kg, 1 dm, and 1 min, respectively.
4. If the present units of length, time, and mass (m, s, kg) are changed to 100 m, 100 s, and 1/10 kg, then how will the new unit of force change?
5. Suppose we employ a system in which the unit of mass equals 100 kg, the unit of length equals 1 km and the unit of time 100 s and call the unit of energy *eluoj* (*joule* written in reverse order), then what is the relation between *eluoj* and *joule*?
6. If velocity (V), force (F), and energy (E) are taken as fundamental units, then find the dimensional formula for mass.

SIGNIFICANT FIGURES

Significant figures in the measured value of a physical quantity tell the number of digits in which we have confidence. Larger the number of significant figures obtained in a measurement, greater is the accuracy of the measurement. The reverse is also true.

The following rules are observed in counting the number of significant figures in a given measured quantity:

All non-zero digits are significant.

Example: 42.3 has three significant figures.
243.4 has four significant figures.
24.123 has five significant figures.

A zero becomes a significant figure if it appears between two non-zero digits.

Example: 5.03 has three significant figures.
5.604 has four significant figures.
4.004 has four significant figures.

Leading zeros or the zeros placed to the left of the number are never significant.

Example: 0.543 has three significant figures.
0.045 has two significant figures.
0.006 has one significant figure.

Trailing zeros or the zeros placed to the right of the number are significant.

Example: 4.330 has four significant figures.
433.00 has five significant figures.
343.000 has six significant figures.

In exponential notation, the numerical portion gives the number of significant figures.

Example: 1.32×10^{-2} has three significant figures.
1.32×10^4 has three significant figures.

Rounding Off

While rounding off measurements, we use the following rules by convention:

If the digit to be dropped is less than 5, then the preceding digit is left unchanged.

Example: $x = 7.82$ is rounded off to 7.8, again $x = 3.94$ is rounded off to 3.9.

If the digit to be dropped is more than 5, then the preceding digit is raised by 1.

Example: $x = 6.87$ is rounded off to 6.9, again $x = 12.78$ is rounded off to 12.8.

If the digit to be dropped is 5 followed by digits other than zero, then the preceding digit is raised by 1.

Example: $x = 16.351$ is rounded off to 16.4, again $x = 6.758$ is rounded off to 6.8.

If the digit to be dropped is 5 or 5 followed by zeros, then the preceding digit is left unchanged, if it is even.

Example: $x = 3.250$ becomes 3.2 on rounding off, again $x = 12.650$ becomes 12.6 on rounding off.

If the digit to be dropped is 5 or 5 followed by zeros, then the preceding digit is raised by 1, if it is odd.

Example: $x = 3.750$ is rounded off to 3.8, again $x = 16.150$ is rounded off to 16.2.

Significant Figures in Calculation

In most of the experiments, the observations of various measurements are to be combined mathematically, i.e., added, subtracted, multiplied, or divided as to achieve the final result. Since all the observations in measurements do not have the same precision, it is natural that the final result cannot be more precise than the least precise measurement. The following two rules should be followed to obtain the proper number of significant figures in any calculation.

1. The result of an addition or subtraction in the number having different precisions should be rounded off the same number of decimal places as are present in the number having the least number of decimal places. The rule is illustrated by the following examples:

(a) 33.3 ← (has only one decimal place)
3.11
+ 0.313
36.723 ← (answer should be rounded off one decimal place)

Answer = 36.7

(b) 3.1421
0.241
+ 0.09 ← (has 2 decimal places)
3.4731 ← (answer should be rounded off 2 decimal places)

Answer = 3.47

(c) 62.831 ← (has 3 decimal places)
−24.5492
38.2818 ← (answer should be rounded off 3 decimal places)

Answer = 38.282

2. The answer to a multiplication or division is rounded off to the same number of significant figures as is possessed by the least precise term used in the calculation. The rule is illustrated by the following examples:

(a) 142.06
× 0.23 ← (two significant figures)
32.6738 ← (answer should have two significant figures)

Answer = 33

(b) 51.028
× 1.31 ← (three significant figures)
66.84668

Answer = 66.8

(c) $\frac{0.90}{4.26} = 0.2112676$

Answer = 0.21

CONCEPT APPLICATION EXERCISE 1.2

1. The length, breadth, and thickness of a block are measured as 125.5 cm, 5.0 cm, and 0.32 cm, respectively. Which one of the measurement is most accurate?
2. The length of a rectangular sheet is 1.5 cm and the breadth is 1.203 cm. Find the area of the face of a rectangular sheet to the correct number of significant figures
3. Each side of a cube is measured to be 5.402 cm. Find the total surface area and the volume of the cube in appropriate significant figures.
4. Taking into account the significant figures, what is the value of 9.99 m + 0.0099 m?
5. Find the value of the multiplication 3.124×4.576 correct to three significant figures.
6. If the value of resistance is 10.845 Ω and the value of current is 3.23 A, the potential difference is 35.02935 V. Find its value in significant number.

ERRORS OF MEASUREMENT

The measuring process is essentially a process of comparison. Inspite of our best efforts, the measured value of a quantity is always somewhat different from its actual value, or true value. This difference in the true value of a quantity is called error of measurement.

Absolute error Absolute error in the measurement of a physical quantity is the magnitude of the difference between the true value and the measured value of the quantity.

Let a physical quantity be measured n times. Let the measured value be $a_1, a_2, a_3, \ldots, a_n$. The arithmetic mean of these values is $a_m = \frac{a_1 + a_2 + \ldots + a_n}{n}$.

Usually, a_m is taken as the true value of the quantity, if the same is unknown otherwise.

By definition, absolute errors in the measured values of the quantity are

$$\Delta a_1 = a_m - a_1$$
$$\Delta a_2 = a_m - a_2$$
$$\cdots$$
$$\Delta a_n = a_m - a_n$$

The absolute errors may be positive in certain cases and negative in certain other cases.

Mean absolute error It is the arithmetic mean of the magnitudes of absolute errors in all the measurements of the quantity. It is represented by $\overline{\Delta a}$. Thus,

$$\overline{\Delta a} = \frac{|\Delta a_1| + |\Delta a_2| + \cdots + |\Delta a_n|}{n}$$

Hence, the final result of measurement may be written as

$$a = a_m \pm \overline{\Delta a}$$

This implies that any measurement of the quantity is likely to lie between $(a_m + \overline{\Delta a})$ and $(a_m - \overline{\Delta a})$.

Relative error or fractional error The relative error or fractional error of measurement is defined as the ratio of mean absolute error to the mean value of the quantity measured. Thus, relative error or fractional error

$$= \frac{\text{Mean absolute error}}{\text{Mean value}} = \frac{\overline{\Delta a}}{a_m}$$

Percentage error When the relative/fractional error is expressed in percentage, we call it percentage error.

Thus, percentage error $= \dfrac{\overline{\Delta a}}{a_m} \times 100\%$

Propagation of Errors

Error in sum of the quantities Suppose $x = a + b$

Let Δa = absolute error in measurement of a

Δb = absolute error in measurement of b

Δx = absolute error in calculation of x, i.e., sum of a and b.

The maximum absolute error in x is $\Delta x = \pm(\Delta a + \Delta b)$.

Percentage error in the value of $x = \dfrac{(\Delta a + \Delta b)}{a + b} \times 100\%$

Error in difference of the quantities Suppose $x = a - b$.

Let Δa = absolute error in measurement of a

Δb = absolute error in measurement of b

Δx = absolute error in calculation of x, i.e., difference of a and b.

The maximum absolute error in x is $\Delta x = \pm(\Delta a + \Delta b)$

Percentage error in the value of $x = \dfrac{(\Delta a + \Delta b)}{a - b} \times 100\%$

Error in product of quantities Suppose $x = a \times b$.

Let Δa = absolute error in measurement of a

Δb = absolute error in measurement of b

Δx = absolute error in calculation of x, i.e., product of a and b.

The maximum fractional error in x is $\dfrac{\Delta x}{x} = \pm\left(\dfrac{\Delta a}{a} + \dfrac{\Delta b}{b}\right)$

Percentage error in the value of x = (Percentage error in value of a) + (Percentage error in value of b)

Error in division of quantities Suppose $x = \dfrac{a}{b}$.

Let Δa = absolute error in measurement of a

Δb = absolute error in measurement of b

Δx = absolute error in calculation of x, i.e., division of a and b.

The maximum fractional error in x is $\dfrac{\Delta x}{x} = \pm\left(\dfrac{\Delta a}{a} + \dfrac{\Delta b}{b}\right)$

Percentage error in the value of x = (Percentage error in value of a) + (Percentage error in value of b)

Error in quantity raised to some power Suppose $x = \dfrac{a^n}{b^m}$.

Let Δa = absolute error in measurement of a

Δb = absolute error in measurement of b

Δx = absolute error in calculation of x

The maximum fractional error in x is $\dfrac{\Delta x}{x} = \pm\left(n\dfrac{\Delta a}{a} + m\dfrac{\Delta b}{b}\right)$

Percentage error in the value of $x = n$(Percentage error in value of a) + m(Percentage error in value of b)

- The quantity which have maximum power must be measured carefully because it's contribution to error is maximum.

ILLUSTRATION 1.6 The length and breadth of a rectangle are (5.7 ± 0.1) cm and (3.4 ± 0.2) cm, respectively Calculate the area of rectangle with error limits.

Solution. Here, $l = (5.7 \pm 0.1)$ cm, $b = (3.4 \pm 0.2)$ cm.

Area, $A = l \times b = 5.7 \times 3.4 = 19.38\ \text{cm}^2 = 19.0\ \text{cm}^2$ (rounding off to two significant figures)

$$\therefore \quad \frac{\Delta A}{A} = \pm\left(\frac{\Delta l}{l} + \frac{\Delta b}{b}\right)$$
$$= \pm\left(\frac{0.1}{5.7} + \frac{0.2}{3.4}\right) = \pm\left(\frac{0.34 + 1.14}{5.7 \times 3.4}\right) = \pm\frac{1.48}{19.38}$$
$$\Rightarrow \quad \Delta A = \pm\frac{1.48}{19.38} \times A = \pm\frac{1.48}{19.38} \times 19.38 = \pm 1.48$$

$\Delta A = \pm 1.5$ (rounding off to two significant figures);

Area $= (19.0 \pm 1.5)\ \text{cm}^2$.

ILLUSTRATION 1.7 A physical quantity x is calculated from the relation $x = \dfrac{a^2 b^3}{c\sqrt{d}}$. If the percentage error in a, b, c, and d are 2%, 1%, 3%, and 4%, respectively, what is the percentage error in x?

Solution. As $x = \dfrac{a^2 b^3}{c\sqrt{d}}$,

$$\therefore \quad \frac{\Delta x}{x} = \pm\left[2\frac{\Delta a}{a} + 3\frac{\Delta b}{b} + \frac{\Delta c}{c} + \frac{1}{2}\frac{\Delta d}{d}\right] \times 100$$

$$= \pm\left[2 \times 2\% + 3 \times 1\% + 3\% + \frac{1}{2} \times 4\%\right]$$

$$= \pm[4\% + 3\% + 3\% + 2\%] = \pm 12\%$$

ILLUSTRATION 1.8 The length and breadth of a field are measured as: $l = (120 \pm 2)$ m and $b = (100 \pm 5)$ m, respectively. What is the area of the field?

Solution. Now $\dfrac{\Delta A}{A} = \dfrac{\Delta l}{l} + \dfrac{\Delta b}{b} = \left(\dfrac{2}{120} + \dfrac{5}{100}\right) = 0.0667$;

$$\Delta A = 0.0667 \times A$$

Now $A = l \cdot b = 120 \times 100 = 12000\ \text{m}^2$

$\Rightarrow \quad \Delta A = 0.0667 \times 12000 = 800.4\ \text{m}^2$

Area of the field $= A \pm \Delta A$

$$= 12000 \pm 800.4 = (1.2 \pm 0.08) \times 10^4\ \text{m}^2$$

Concept Application Exercise 1.3

1. A research worker takes 100 observations in an experiment. If he repeats the same experiment by taking 500 observations, how is the probable error affected?
2. A body travels uniformly a distance of (13.8 ± 0.2) m in a time (4.0 ± 0.3) s. Find the velocity of the body within error limits and the percentage error.
3. The error in the measurement of the radius of a sphere is 1%. Find the error in the measurement of volume.
4. Given $R_1 = 5.0 \pm 0.2\ \Omega$, and $R_2 = 10.0 \pm 0.1\ \Omega$. What is the total resistance in parallel with possible % error?
5. The value of resistance is 10.845 Ω and the current is 3.23 A. On multiplying them, we get the potential difference = 35.02935 V. What is the value of potential difference in terms of significant figures?
6. The length of one rod is 2.53 cm and that of the other is 1.27 cm. The least count of the measuring instrument is 0.01 cm. If the two rods are put together end to end, find the combined length.
7. The pressure on a square plate is measured by measuring the force on the plate and the length of the sides of the plate. If the maximum error in the measurement of force and length are, respectively, 4% and 2%, Find the maximum errors in the measurement of pressure.
8. A physical quantity P is given by $P = \dfrac{A^3 B^{1/2}}{C^{-4} D^{3/2}}$. Which quantity among A, B, C, and D brings in the maximum percentage error in P?

Solved Examples

1. From the equation $\tan\theta = \dfrac{rg}{v^2}$, one can obtain the angle of banking θ for a cyclist taking a curve (the symbols have their usual meanings). Then, say, it is
   (a) Both dimensionally and numerically correct
   (b) Neither numerically nor dimensionally correct
   (c) Dimensionally correct only
   (d) Numerically correct only

Sol. (c) Given equation is dimensionally correct because both sides are dimensionless but numerically wrong because the correct equation is $\tan\theta = v^2/rg$.

2. From the dimensional consideration, which of the following equation is correct?
   (a) $T = 2\pi\sqrt{\dfrac{R^3}{GM}}$ (b) $T = 2\pi\sqrt{\dfrac{GM}{R^3}}$
   (c) $T = 2\pi\sqrt{\dfrac{GM}{R^2}}$ (d) $T = 2\pi\sqrt{\dfrac{R^2}{GM}}$

Sol. (a) By substituting the dimensions in $T = 2\pi\sqrt{\dfrac{R^3}{GM}}$, we get $\sqrt{\dfrac{L^3}{M^{-1}L^3T^{-2} \times M}} = T$

3. The equation of the state of some gases can be expressed as $\left(P + \dfrac{a}{V^2}\right) = \dfrac{R\theta}{V}$, where P is the pressure, V the volume, θ the absolute temperature, and a and b are constants. The dimensional formula of a is
   (a) $[ML^5T^{-2}]$ (b) $[M^{-1}L^5T^{-2}]$
   (c) $[ML^{-1}T^{-2}]$ (d) $[ML^{-5}T^{-2}]$

Sol. (a) By the principle of dimensional homogenity,

$$[P] = \left[\frac{a}{V^2}\right]$$

$$\Rightarrow [a] = [P] \times [V^2] = [ML^{-1}T^{-2}][L^6] = [ML^5T^{-2}]$$

4. The dimension of $\dfrac{a}{b}$ in the equation $P = \dfrac{a - t^2}{bx}$, where P is pressure, x is distance and t is time, is
   (a) MT^{-2} (b) M^2LT^{-3}
   (c) ML^3T^{-1} (d) LT^{-3}

Sol. (a) $[a] = [T^2]$ and $[b] = \dfrac{[a - t^2]}{[P][x]} = \dfrac{T^2}{[ML^{-1}T^{-2}][L]}$

$\Rightarrow \quad [b] = [M^{-1}T^4]$

So $\quad \left[\dfrac{a}{b}\right] = \dfrac{[T^2]}{[M^{-1}T^4]} = [MT^{-2}]$

5. The dimension of $e^2/4\pi\varepsilon_0 hc$, where e, ε_0, h and c are electronic charge, electric permittivity, Planck's constant and velocity of light in vacuum, respectively, is
   (a) $[M^0L^0T^0]$ (b) $[M^1L^0T^0]$
   (c) $[M^0L^1T^0]$ (d) $[M^0L^0T^1]$

Sol. (a) $[e] = [AT]$, $\varepsilon_0 = [M^{-1}L^{-3}T^4A^2]$ $[h] = [ML^2T^{-1}]$

and $[c] = [LT^{-1}]$

$$\left[\frac{e^2}{4\pi\varepsilon_0 hc}\right] = \left[\frac{A^2T^2}{M^{-1}L^{-3}T^4A^2 \times ML^2T^{-1} \times LT^{-1}}\right] = [M^0L^0T^0]$$

6. If the acceleration due to gravity is 10 ms^{-2} and the units of length and time are changed in kilometer and hour respectively, the numerical value of the acceleration is
   (a) 360000 (b) 72000
   (c) 36000 (d) 129600

Sol. (d) $n_2 = n_1\left[\frac{L_1}{L_2}\right]^1\left[\frac{T_1}{T_2}\right]^{-2} = 10\left[\frac{\text{meter}}{\text{km}}\right]^1\left[\frac{\text{sec}}{\text{hr}}\right]^{-2}$

$$n_2 = 10\left[\frac{\text{m}}{10^3\text{m}}\right]^1\left[\frac{\text{sec}}{3600\,\text{sec}}\right]^{-2} = 129600$$

7. With the usual notations, the following equation $S_t = u + \frac{1}{2}a(2t-1)$ is
   (a) Only numerically correct
   (b) Only dimensionally correct
   (c) Both numerically and dimensionally correct
   (d) Neither numerically nor dimensionally correct

Sol. (c) We can derive this equation from equations of motion. So it is numerically correct.

$$S_t = \text{Distance travelled in } t^{\text{th}} \text{ second} = \frac{\text{Distance}}{\text{Time}} = [LT^{-1}]$$

$$u = \text{Velocity} = [LT^{-1}] \text{ and } \frac{1}{2}a(2t-1) = [LT^{-1}]$$

As dimensions of each term in the given equation are same, hence equation is dimensionally correct also.

8. The speed of light (c), gravitational constant (G) and Planck's constant (h) are taken as the fundamental units in a system. The dimension of time in this new system should be
   (a) $G^{1/2}h^{1/2}c^{-5/2}$ (b) $G^{-1/2}h^{1/2}c^{1/2}$
   (c) $G^{1/2}h^{1/2}c^{-3/2}$ (d) $G^{1/2}h^{1/2}c^{1/2}$

Sol. (a) Time $\propto c^xG^yh^z \Rightarrow T = kc^xG^yh^z$

Putting the dimensions in the above relation

$\Rightarrow$ $[M^0L^0T^1] = [LT^{-1}]^x[M^{-1}L^3T^{-2}]^y[ML^2T^{-1}]^z$

$\Rightarrow$ $[M^0L^0T^1] = [M^{-y+z}L^{x+3y+2z}T^{-x-2y-z}]$

Comparing the powers of M, L and T

$-y + z = 0$ ...(i)

$x + 3y + 2z = 0$ ...(ii)

$-x - 2y - z = 1$ ...(iii)

On solving equations (i) and (ii) and (iii)

$$x = \frac{-5}{2}, y = z = \frac{1}{2}$$

Hence dimension of time are $[G^{1/2}h^{1/2}c^{-5/2}]$

9. In the relation $P = \frac{\alpha}{\beta}e^{-\frac{\alpha Z}{k\theta}}$ P is pressure, Z is the distance, k is Boltzmann constant and θ is the temperature. The dimensional formula of β will be
   (a) $[M^0L^2T^0]$ (b) $[M^1L^2T^1]$
   (c) $[M^1L^0T^{-1}]$ (d) $[M^0L^2T^{-1}]$

Sol. (a) In given equation, $\frac{\alpha z}{k\theta}$ should be dimensionless

$$\therefore \quad \alpha = \frac{k\theta}{z} \Rightarrow [\alpha] = \frac{[ML^2T^{-2}K^{-1} \times K]}{[L]} = [MLT^{-2}]$$

and $P = \frac{\alpha}{\beta} \Rightarrow [\beta] = \left[\frac{\alpha}{p}\right] = \frac{[MLT^{-2}]}{[ML^{-1}T^{-2}]} = [M^0L^2T^0]$.

10. The frequency of vibration of string is given by $\nu = \frac{p}{2l}\left[\frac{F}{m}\right]^{1/2}$. Here p is number of segments in the string, l is the length and F is the tension in the string. The dimensional formula for m will be
   (a) $[M^0LT^{-1}]$ (b) $[ML^0T^{-1}]$
   (c) $[ML^{-1}T^0]$ (d) $[M^0L^0T^0]$

Sol. (c) $\nu = \frac{P}{2l}\left[\frac{F}{m}\right]^{1/2} \Rightarrow \nu^2 = \frac{P^2}{4l^2}\left[\frac{F}{m}\right] \therefore m \propto \frac{F}{l^2\nu^2}$

$$\Rightarrow \quad [m] = \left[\frac{MLT^{-2}}{L^2T^{-2}}\right] = [ML^{-1}T^0]$$

11. A wire has a mass 0.3 ± 0.003 g, radius 0.5 ± 0.005 mm and length 6 ± 0.006 cm. The maximum percentage error in the measurement of its density is
   (a) 1 (b) 2
   (c) 3 (d) 4

Sol. (d) $\because$ Density, $\rho = \frac{M}{V} = \frac{M}{\pi r^2 L}$

$$\Rightarrow \quad \frac{\Delta\rho}{\rho} = \frac{\Delta M}{M} + 2\frac{\Delta r}{r} + \frac{\Delta L}{L}$$

$$= \frac{0.003}{0.3} + 2 \times \frac{0.005}{0.5} + \frac{0.06}{6}$$

$$= 0.01 + 0.02 + 0.01 = 0.04$$

$$\therefore \quad \text{Percentage error} = \frac{\Delta\rho}{\rho} \times 100 = 0.04 \times 100 = 4\%$$

12. A physical parameter a can be determined by measuring the parameters b, c, d and e using the relation $a = b^\alpha c^\beta / d^\gamma e^\delta$. If the maximum errors in the measurement of b, c, d and e are $b_1\%$, $c_1\%$, $d_1\%$ and $e^1\%$, then the maximum error in the value of a determined by the experiment is

(a) $(b_1 + c_1 + d_1 + e_1)\%$
(b) $(b_1 + c_1 - d_1 - e_1)\%$
(c) $(\alpha b_1 + \beta c_1 - \gamma d_1 - \delta e_1)\%$
(d) $(\alpha b_1 + \beta c_1 + \gamma d_1 + \delta e_1)\%$

Sol. (d) $a = b^\alpha c^\beta / d^\gamma e^\delta$

So, maximum error in a is given by

$$\left(\frac{\Delta a}{a}\times 100\right)_{\max} = \alpha\cdot\frac{\Delta b}{b}\times 100 + \beta\cdot\frac{\Delta c}{c}\times 100 + \gamma\cdot\frac{\Delta d}{d}\times 100 + \delta\cdot\frac{\Delta e}{e}\times 100$$

$$= (\alpha b_1 + \beta c_1 + \gamma d_1 + \delta e_1)\%$$

13. The relative density of material of a body is found by weighing it first in air and then in water. If the weight in air is (5.00 ± 0.05) Newton and weight in water is (4.00 ± 0.05) Newton. Then the relative density along with the maximum permissible percentage error is

(a) $5.0 \pm 11\%$ (b) $5.0 \pm 1\%$
(c) $5.0 \pm 6\%$ (d) $1.25 \pm 5\%$

Sol. (a) Weight in air $= (5.00 \pm 0.05)$N

Weight in water $= (4.00 \pm 0.05)$N

Loss of weight in water $= (1.00 \pm 0.1)$N

Now relative density $= \dfrac{\text{weight in air}}{\text{weight loss in water}}$

$$R.D = \frac{5.00 \pm 0.05}{1.00 \pm 0.1}$$

Now relative density with max permissible error

$$= \frac{5.00}{1.00} \pm \left(\frac{0.05}{5.00} + \frac{0.1}{1.00}\right)\times 100 = 5.0 \pm 11\%$$

14. The length of a cylinder is measured with a meter rod having least count 0.1 cm. Its diameter is measured with venier calipers having least count 0.01 cm. Given that length is 5.0 cm. and radius is 2.0 cm. The percentage error in the calculated value of the volume will be

(a) 1% (b) 2%
(c) 3% (d) 4%

Sol. (c) Volume of cylinder $V = \pi r^2 l$

Percentage error in volume

$$\frac{\Delta V}{V}\times 100 = \frac{2\Delta r}{r}\times 100 + \frac{\Delta l}{l}\times 100$$

$$= \left(2\times\frac{0.01}{2.0}\times 100 + \frac{0.1}{5.0}\times 100\right) = (1+2)\% = 3\%$$

15. In an experiment, the following observation's were recorded: $L = 2.820$ m, $M = 3.00$ kg, $l = 0.087$ cm, Diameter $D = 0.041$ cm. Taking $g = 9.81$ m/s^2, using the formula, $Y = \dfrac{4Mg}{\pi D^2 l}$, the maximum permissible error in Y is

(a) 7.96% (b) 4.56%
(c) 6.50% (d) 8.42%

Sol. (c) $Y = \dfrac{4MgL}{\pi D^2 l}$ so maximum permissible error in

$$Y = \frac{\Delta Y}{Y}\times 100 = \left(\frac{\Delta M}{M} + \frac{\Delta g}{g} + \frac{\Delta L}{L} + \frac{2\Delta D}{D} + \frac{\Delta l}{l}\right)\times 100$$

$$= \left(\frac{1}{300} + \frac{1}{9.81} + \frac{1}{9820} + 2\times\frac{1}{41} + \frac{1}{87}\right)\times 100$$

$$= 0.065 \times 100 = 6.5\%$$

EXERCISES

Basic Concept of Units

1. If the unit of length and force be increased four times, then the unit of energy is

(a) Increased 4 times (b) Increased 8 times
(c) Increased 16 times (d) Decreased 16 times

2. If u_1 and u_2 are the units selected in two systems of measurement and n_1 and n_2 their numerical values, then

(a) $n_1u_1 = n_2u_2$ (b) $n_1u_1 + n_2u_2 = 0$
(c) $n_1n_2 = u_1u_2$ (d) $(n_1 + u_1) = (n_2 + u_2)$

3. To determine the Young's modulus of a wire, the formula is $Y = \dfrac{F}{A}\times\dfrac{L}{\Delta L}$; where L = length, A = area of cross-section of the wire, ΔL = change in length of the wire when stretched with a force F. The conversion factor to change it from CGS to MKS system is

(a) 1 (b) 10 (c) 0.1 (d) 0.01

4. In C.G.S. system the magnitude of the force is 100 dynes. In another system where the fundamental physical quantities are kilogram, metre and minute, the magnitude of the force is

(a) 0.036 (b) 0.36 (c) 3.6 (d) 36

5. A physical quantity is measured and its value is found to be nu where n = numerical value and u = unit. Then which of the following relations is true

(a) $n \propto u^2$ (b) $n \propto u$ (c) $n \propto \sqrt{u}$ (d) $n \propto \dfrac{1}{u}$

6. If $x = at + bt^2$, where x is the distance travelled by the body in kilometres while t is the time in seconds, then the unit of b is

(a) km/s (b) km-s (c) km/s^2 (d) km-s^2

7. If $S = a + bt + ct^2$. S is measured in metres and t in *seconds*. The unit of c is

(a) None (b) m (c) ms^{-1} (d) ms^{-2}

8. A watt is

(a) kg m/s^2 (b) kg m^2/s^3 (c) kg m/s (d) kg m^2/s^2

9. Experiment shows that two perfectly neutral parallel metal plates separated by a small distance d attract each other

via a very weak force, known as the Casimir force. The force per unit area of the plates, F, depends only on the Planck constant h, on the speed of light c, and on d. Which of the following has the best chance of being correct for F?

(a) $F = \dfrac{hc}{d^2}$ (b) $F = \dfrac{hc}{d^4}$

(c) $F = \dfrac{hd^2}{c}$ (d) $F = \dfrac{d^4}{hc}$

Dimensional Analysis

10. Suppose refractive index μ is given as

$$\mu = A + \frac{B}{\lambda^2}$$

where A and B are constants and λ is wavelength, then dimensions of B are same as that of

(a) Wavelength (b) Volume
(c) Pressure (d) Area

11. A physical quantity x depends on quantities y and z as follows: $x = Ay + B\tan(Cz)$, where A, B, and C are constants. Which of the followings do not have the same dimensions?

(a) x and B (b) C and z^{-1}
(c) y and B/A (d) x and A

12. If L and R denote inductance and resistance, respectively, then the dimensions of L/R are

(a) $M^1L^0T^0Q^{-1}$ (b) $M^0L^0TQ^0$
(c) $M^0L^1T^{-1}Q^0$ (d) $M^{-1}LT^0Q^{-1}$

13. Force F is given in terms of time t and distance x by $F = A\sin Ct + B\cos Dx$. Then the dimensions of A/B and C/D are

(a) $[M^0L^0T^0]$, $[M^0L^0T^{-1}]$
(b) $[MLT^{-2}]$, $[M^0L^{-1}T^0]$
(c) $[M^0L^0T^0]$, $[M^0LT^{-1}]$
(d) $[M^0L^1T^{-1}]$, $[M^0L^0T^0]$

14. The frequency (n) of vibration of a string is given as $n = \dfrac{1}{2l}\sqrt{\dfrac{T}{m}}$, where T is tension and l is the length of vibrating string, then the dimensional formula is

(a) $[M^0L^1T^1]$ (b) $[M^0L^0T^0]$
(c) $[M^1L^{-1}T^0]$ (d) $[M^1L^0T^0]$

15. In the relation $y = r\sin(\omega t - kx)$, the dimensions of ω/k are

(a) $[M^0L^0T^0]$ (b) $[M^0L^1T^{-1}]$
(c) $[M^0L^0T^1]$ (d) $[M^0L^1T^0]$

16. The dimensions of $\varepsilon_0\mu_0$ are

(a) $[LT^{-1}]$ (b) $[LT^{-2}]$ (c) $[L^2T^{-2}]$ (d) $[L^{-2}T^2]$

17. If frequency F, velocity V, and density D are considered fundamental units, the dimensional formula for momentum will be

(a) DVF^2 (b) DV^2F^{-1}
(c) $D^2V^2F^2$ (d) DV^4F^{-3}

18. If force F, acceleration a, and time T are taken as the fundamental physical quantities, the dimensions of length on this system of units are

(a) FAT^2 (b) FAT (c) FT (d) AT^2

19. The frequency f of vibrations of a mass m suspended from a spring of spring constant k is given by $f = Cm^xk^y$, where C is a dimensionless constant. The values of x and y are, respectively.

(a) $\frac{1}{2}, \frac{1}{2}$ (b) $-\frac{1}{2}, -\frac{1}{2}$

(c) $\frac{1}{2}, -\frac{1}{2}$ (d) $-\frac{1}{2}, \frac{1}{2}$

20. If C (the velocity of light) g, (the acceleration due to gravity), and P (the atmospheric pressure) are the fundamental quantities in MKS system, then the dimensions of length will be same as that of

(a) C/g (b) C/P (c) PCg (d) C^2/g

21. The quantities A and B are related by the relation $A/B = m$, where m is the linear mass density and A is the force, the dimensions of B will be

(a) Same as that of pressure
(b) Same as that of work
(c) That of momentum
(d) Same as that of latent heat

22. Write the dimensions of $a \times b$ in the relation $E = \dfrac{b - x^2}{at}$, where E is the energy, x is the displacement, and t is the time.

(a) ML^2T (b) $M^{-1}L^2T^1$ (c) ML^2T^{-2} (d) MLT^{-2}

23. If the velocity of light C, the universal gravitational constant G, and Planck's constant h are chosen as fundamental units, the dimensions of mass in this system are

(a) $h^{1/2}C^{1/2}G^{-1/2}$ (b) $h^{-1}C^{-1}G$
(c) hCG^{-1} (d) hCG

24. In the relation $V = \dfrac{\pi}{8}\dfrac{Pr^4}{\eta l}$, where the letters have their usual meanings, the dimensions of V are

(a) $M^0L^3T^0$ (b) $M^0L^3T^{-1}$
(c) $M^0L^{-3}T^{-1}$ (d) $M^1L^3T^0$

25. If the velocity (V), acceleration (A), and force (F) are taken as fundamental quantities instead of mass (M), length

(L), and time (T), the dimensions of Young's modulus (Y) would be

(a) FA^2V^{-4} (b) FA^2V^{-5} (c) FA^2V^{-3} (d) FA^2V^{-2}

26. Which of the following product of e, h, μ, G (where μ is the permeability) be taken so that the dimensions of the product are same as that of the speed of light?

(a) $he^{-2}\mu^{-1}G^0$ (b) $h^2eG^0\mu$

(c) $h^0e^2G^{-1}\mu$ (d) $hGe^{-2}\mu^0$

27. The mass of the liquid flowing per second per unit area of cross section of the tube is proportional to P^x and v^y, where P is the pressure difference and v is the velocity, then the relation between x and y is

(a) $x = y$ (b) $x = -y$ (c) $y^2 = x$ (d) $y = -x^2$

28. The potential energy of a particle varies with distance x as $U = \dfrac{Ax^{1/2}}{x^2 + B}$, where A and B are constants. The dimensional formula for $A \times B$ is

(a) $M^1L^{7/2}T^{-2}$ (b) $M^1L^{11/2}T^{-2}$

(c) $M^1L^{5/2}T^{-2}$ (d) $M^1L^{9/2}T^{-2}$

29. Using mass (M), length (L), time (T), and electric current (A) as fundamental quantities, the dimensions of permittivity will be

(a) $[MLT^{-1}A^{-1}]$ (b) $[MLT^{-2}A^{-2}]$

(c) $[M^{-1}L^{-3}T^4A^2]$ (d) $[M^2L^{-2}T^{-2}A]$

30. Assuming that the mass m of the largest stone that can be moved by a flowing river depends upon the velocity v of the water, its density ρ, and the acceleration due to gravity g. Then m is directly proportional to

(a) v^3 (b) v^4 (c) v^5 (d) v^6

Errors in Measurement

31. The best method to reduce random error is

(a) To change the instrument used for measurement
(b) To take help of experienced observer
(c) To repeat the experiment many times and to take the average results
(d) None of the above

32. A length is measured as 7.60 m. This is the same as

(a) 7600 mm (b) 0.0076 mm
(c) 760 cm (d) 0.76 dm

33. If the percentage errors of A, B, and C are a, b, and c, respectively, then the total percentage error in the product ABC is

(a) abc (b) $a + b + c$

(c) $\dfrac{1}{a} + \dfrac{1}{b} + \dfrac{1}{c}$ (d) $ab + bc + ca$

34. Which of the following numbers has least number of significant figures?

(a) 0.80760 (b) 0.80200
(c) 0.08076 (d) 80.267

35. If $X = a + b$, the maximum percentage error in the measurement of X will be

(a) $\left(\dfrac{\Delta a}{a} + \dfrac{\Delta b}{b}\right) \times 100\%$

(b) $\left(\dfrac{\Delta a}{a+b} - \dfrac{\Delta b}{a+b}\right) \times 100\%$

(c) $\left(\dfrac{\Delta a}{a+b} + \dfrac{\Delta b}{a+b}\right) \times 100\%$

(d) $\left(\dfrac{\Delta a}{a} \times \dfrac{\Delta b}{b}\right) \times 100\%$

36. A physical quantity X is represented by $X = (M^xL^{-y}T^{-z})$. The maximum percentage errors in the measurement of M, L, and T, respectively, are $a\%$, $b\%$ and $c\%$. The maximum percentage error in the measurement of X will be

(a) $(ax + by - cz)\%$ (b) $(ax - by - cz)\%$
(c) $(ax + by + cz)\%$ (d) $(ax - by + cz)\%$

37. The length l, breadth b, and thickness t of a block of wood were measured with the help of a measuring scale. The results with permissible errors (in cm) are

$l = 15.12 \pm 0.01$, $b = 10.15 \pm 0.01$, and $t = 5.28 \pm 0.01$.

The percentage error in volume up to proper significant figures is

(a) 0.28% (b) 0.35% (c) 0.48% (d) 0.64%

38. The relative density of a material of a body is found by weighing it first in air and then in water. If the weight of the body in air is $W_1 = 8.00 \pm 0.05$ N and the weight in water is $W_2 = 6.00 \pm 0.05$ N, then the relative density $\rho_r = W_1/(W_1 - W_2)$ with the maximum permissible error is

(a) $4.00 \pm 0.62\%$ (b) $4.00 \pm 0.82\%$
(c) $4.00 \pm 3.2\%$ (d) $4.00 \pm 5.62\%$

39. The percentage errors in the measurement of mass and speed are 2% and 3%, respectively. How much will be the maximum error in the estimation of KE obtained by measuring mass and speed?

(a) 5% (b) 1% (c) 8% (d) 11%

40. An experiment measures quantities a, b, and c, and then X is calculated from $X = \dfrac{a^{1/2}b^2}{c^3}$. If the percentage errors in a, b, and c are $\pm1\%$, $\pm3\%$, and $\pm2\%$, respectively, then the percentage error in X can be

(a) $\pm12.5\%$ (b) $\pm7\%$ (c) $\pm1\%$ (d) $\pm4\%$

41. The resistance of a metal is given by $R = V/I$, where V is potential difference and I is the current. In a circuit, the potential difference across resistance is $V = (8 \pm 0.5)$ V and current in resistance, $I = (4 \pm 0.2)$ A. What is the value of resistance with its percentage error?

(a) $(2 \pm 5.6\%)\,\Omega$ (b) $(2 \pm 0.7\%)\,\Omega$
(c) $(2 \pm 35\%)\,\Omega$ (d) $(2 \pm 11.25\%)\,\Omega$

42. The specific resistance ρ of a circular wire of radius r, resistance R, and length l is given by $\rho = \pi r^2 R/l$. Given: $r = 0.24 \pm 0.02$ cm, $R = 30 \pm 1\ \Omega$, and $l = 4.80 \pm 0.01$ cm. The percentage error in ρ is nearly
(a) 7% (b) 9% (c) 13% (d) 20%

43. The mass of a body is 20.000 g and its volume is 10.00 cm^3. If the measured values are expressed to the correct significant figures, the maximum error in the value of density is
(a) 0.001 g cm^{-3} (b) 0.010 g cm^{-3}
(c) 0.100 g cm^{-3} (d) None of these

44. While measuring the acceleration due to gravity by a simple pendulum, a student makes a positive error of 1% in the length of the pendulum and a negative error of 3% in the value of time period. His percentage error in the measurement of g by the relation $g = 4\pi^2(l/T^2)$ will be
(a) 2% (b) 4% (c) 7% (d) 10%

45. While measuring acceleration due to gravity by a simple pendulum, a student makes a positive error of 2% in the length of the pendulum and a positive error of 1% in the value of time period. His actual percentage error in the measurement of the value of g will be
(a) 3% (b) 0% (c) 4% (d) 5%

46. The relative density of a material is found by weighing the body first in air and then in water. If the weight in air is (10.0 ± 0.1) gf and the weight in water is (5.0 ± 0.1) gf, then the maximum permissible percentage error in relative density is
(a) 1 (b) 2 (c) 3 (d) 5

47. The dimensional formula for a physical quantity x is $[M^{-1}L^3T^{-2}]$. The errors in measuring the quantities M, L, and T, respectively, are 2%, 3%, and 4%. The maximum percentage of error that occurs in measuring the quantity x is
(a) 9 (b) 10 (c) 14 (d) 19

48. The heat generated in a circuit is given by $Q = I^2Rt$, where I is current, R is resistance, and t is time. If the percentage errors in measuring I, R, and t are 2%, 1%, and 1%, respectively, then the maximum error in measuring heat will be
(a) 2% (b) 3% (c) 4% (d) 6%

Problems Based on Mixed Concepts

49. The wavelength associated with a moving particle depends upon p^{th} power of its mass m, q^{th} power of its velocity v and r^{th} power of Planck's constant h. Then the correct set of values of p, q and r is
(a) $p = 1, q = -1, r = 1$
(b) $p = 1, q = 1, r = 1$
(c) $p = -1, q = -1, r = -1$
(d) $p = -1, q = -1, r = 1$

50. A gas bubble from an expression under water, oscillates with a period T proportional to $p^a d^b E^c$, where p is the static pressure, d is the density of water and E is the total energy of explosion. Find the value of a.
(a) $\frac{1}{2}$ (b) $\frac{1}{3}$ (c) $-\frac{1}{4}$ (d) $-\frac{5}{6}$

51. In the relation $P = \frac{\alpha}{\beta} e^{-\alpha Z/k\theta}$, P is the pressure, Z is the distance, k is the Boltzmann constant and θ is the temperature. The dimensional formula of β will be
(a) $[M^0L^2T^0]$ (b) $[M^1L^2T^1]$
(c) $[M^1L^0T^{-1}]$ (d) $[M^0L^2T^{-1}]$

52. In a direct impact, loss in kinetic energy is given by
$$\Delta K = \frac{M_1M_2}{2(M_1+M_2)}\cdot(V_1-V_2)^2(1-k^2)$$
with usual notations (except k). The quantity k will have dimensional formula
(a) $[M^0L^2T^{-2}]$ (b) $[MLT^{-1}]$
(c) $[M^0L^0T^0]$ (d) $[M^0LT^{-1}]$

53. If area (A) velocity (v) and density (ρ) are base units, then the dimensional formula of force can be represented as
(a) $Av\rho$ (b) $Av^2\rho$ (c) $Av\rho^2$ (d) $A^2v\rho$

54. A bus travels distance x_1 when accelerates from rest at constant rate a_2 for some time and after that travels a distance x_2 when decelerates at a constant rate a_2 to come to rest. A student established a relation $x_1 + x_2 = \frac{a_1a_2t^2}{2(a_1+a_2)}$.
Choose the correct option(s).
(a) The relation is dimensionally correct
(b) The relation is dimensionally incorrect
(c) The relation may be dimensionally correct
(d) None of the above

55. If energy E, length L and time T are taken as fundamental quantities. The dimensional formula of gravitational constant is
(a) $[FL^6E^{-2}]$ (b) $[FL^5T^{-1}]$
(c) $[E^2FL^6T^3]$ (d) $[E^3F^{-1}L^6T^5]$

56. A wire has a mass 0.4 ± 0.004 g and length 8 ± 0.08 (cm). The maximum percentage error in the measurement of its density is 4%. The radius of the wire is $r \pm \Delta r$, find Δr.
(a) $0.02r$ (b) $0.01r$ (c) $0.03r$ (d) $0.1r$

57. In the formula $X = 3YZ^2$, X and Z have dimensions of capacitance and magnetic induction respectively. What are the dimensions of Y in MKSQ system?

(a) $[M^{-2}L^{-2}T^{3}Q^{4}]$ (b) $[M^{-1}L^{-2}T^{4}Q^{4}]$
(c) $[M^{-2}L^{-2}T^{4}Q^{4}]$ (d) $[M^{-1}L^{-1}T^{3}Q^{4}]$

58. The error in measurement of unknown resistance of X is minimum in a meter bridge when $l = 70$ cm, where l is the distance of null point from one end. If $X = \left[\frac{l}{(A-l)}\right]R$, find the value of A, where R is known resistance.
(a) 35 cm (b) 105 cm (c) 140 cm (d) 210 cm

59. A body travels uniformly a distance of $(S + \Delta S)$ in a time $(t \pm \Delta t)$. What may be the condition so that body within the error limits move with a velocity $\left(\frac{S}{t} \pm \frac{\Delta S}{\Delta t}\right)$?

(a) $\frac{\Delta t}{t} + \frac{S(\Delta t)^2}{(\Delta S)t^2} = \pm 1$ (b) $\frac{\Delta t}{t} + \frac{S\,\Delta t}{\Delta S\, t} = \pm 1$

(c) $\frac{\Delta t}{t} + \frac{(\Delta S)t}{S(\Delta t)} = \pm 1$ (d) $\frac{\Delta t}{t} + \frac{S^2\Delta t}{(\Delta S)^2 t} = \pm 1$

60. If an unknown quantity, $\phi = \frac{ma}{\alpha}\log\left(1 + \frac{\alpha l}{ma}\right)$, where m = mass, a = acceleration and l = length.

(a) $[MLT^{-2}]$ (b) $[MT^{-2}]$
(c) $[M^0LT^0]$ (d) $[ML^{-3}]$

61. If $F = \frac{v}{C\ln(xb)}$, then
(a) F and v denote force and velocity, the dimensions of C are $[MT]$
(b) x denotes distance, the dimensions of b are $[L^{-1}]$
(c) the dimension of $\frac{v}{C}$ never be same as F
(d) the dimensions of x must be same as $\frac{v}{cb}$

62. If m, e, ε_0, h and c denote mass electron, charge of electron, Planck's constant and speed of light, respectively. The dimensions of $\frac{me^4}{\varepsilon_0^2 h^3 c}$ are

(a) $[M^0L^0T^{-1}]$ (b) $[M^0L^{-1}T^{-1}]$
(c) $[M^2LT^{-3}]$ (d) $[M^2L^{-1}T^0]$

63. $\int \frac{dt}{\sqrt{2at - t^2}} = a^x \sin^{-1}\left[\frac{t}{a} - 1\right]$. The value of x is
(a) 1 (b) −1 (c) 0 (d) 2

64. A physical quantity P is given by $P = \frac{A^3B^{1/2}}{C^{-4}D^{3/2}}$. The quantity which brings in the maximum percentage error in P is
(a) A (b) B (c) C (d) D

65. Number of particles is given by $n = -D\frac{n_2 - n_1}{x_2 - x_1}$ crossing a unit area perpendicular to X-axis in unit time, where n_1 and n_2 are number of particles per unit volume for the value of x meant to x_2 and x_1. Find dimensions of D called as diffusion constant
(a) M^0LT^2 (b) $M^0L^2T^{-4}$ (c) M^0LT^{-3} (d) $M^0L^2T^{-1}$

66. The position of a particle at time t is given by the relation $x(t) = \left(\frac{v_0}{\alpha}\right)(1 - e^{-\alpha t})$, where v_0 is a constant and $\alpha > 0$. The dimensions of v_0 and α are respectively
(a) $M^0L^1T^{-1}$ and T^{-1} (b) $M^0L^1T^0$ and T^{-1}
(c) $M^0L^1T^{-1}$ and LT^{-2} (d) $M^0L^1T^{-1}$ and T

ARCHIVES

1. Identify the pair whose dimensions are equal.
(a) torque and work (b) stress and energy

   (d) the energy delivered by radiation to a target.
   (AIEEE 2006)

10. The dimensions of magnetic field in M, L, T, and C (coulomb) is given as
    (a) $[MLT^{-1}C^{-1}]$ (b) $[MT^2C^{-2}]$
    (c) $[MT^{-1}C^{-1}]$ (d) $[MT^{-2}C^{-1}]$
    (AIEEE 2008)

11. The respective number of significant figures for the numbers 23.023, 0.0003, and 2.1×10^{-3} are
    (a) 5, 1, 2 (b) 5, 1, 5 (c) 5, 5, 2 (d) 4, 4, 2
    (AIEEE 2009)

12. Resistance of a given wire is obtained by measuring the current flowing in it and the voltage difference applied across it. If the percentage errors in the measurements of the current and the voltage difference are 3% each, then error in the value of resistance of the wire is:
    (a) 6% (b) zero (c) 1% (d) 3%
    (AIEEE 2012)

13. Let $[\varepsilon_0]$ denote the dimensional formula of the permittivity of vacuum. If M = mass, L = length, T = time and A = electric current, then:
    (a) $[\varepsilon_0]=[M^{-1}L^{-3}T^4A^2]$ (b) $[\varepsilon_0]=[M^{-1}L^2T^1A^{-2}]$
    (c) $[\varepsilon_0]=[M^{-1}L^2T^1A]$ (d) $[\varepsilon_0]=[M^{-1}L^{-3}T^2A]$
    (JEE Main 2013)

14. A student measures the time period of 100 oscillations of a simple pendulum four times. The data set is 90 s, 91 s, 95 s and 92 s. If the minimum division in the measuring clock is 1 s, then the reported mean time should be:
    (a) 92 ± 2 s (b) 92 ± 5.0 s
    (c) 92 ± 1.8 s (d) 92 ± 3 s
    (JEE Main 2016)

15. A screw gauge with a pitch of 0.5 mm and a circular scale with 50 divisions is used to measure the thickness of a thin sheet of Aluminium. Before starting the measurement, it is found that when the two jaws of the screw gauge are brought in contact, the 45th division coincides with the main scale line and that the zero of the main scale is barely visible. What is the thickness of the sheet if the main scale reading is 0.5 mm and the 25th division coincides the main scale line?
    (a) 0.75 mm (b) 0.80 mm
    (c) 0.70 mm (d) 0.50 mm
    (JEE Main 2016)

16. The density of a material in the shape of a cube is determined by measuring three sides of the cube and its mass. If the relative errors in measuring the mass and length are respectively 1.5 % and 1 %, the maximum error in determining the density is
    (a) 6% (b) 2.5% (c) 3.5% (d) 4.5%
    (JEE Main 2018)

Chapter 2

Vectors

VECTORS AND SCALARS

Certain physical quantities are completely described by a numerical value alone (with units specified) and are added according to the ordinary rules of algebra. Such quantities are called *scalars*.

If a physical quantity is a vector, it has a direction, but the converse may or may not be true, i.e., if a physical quantity has a direction, it may or may not be a vector, e.g., pressure, surface tension, current, etc., have directions but are not vectors because they do not obey parallelogram law of addition.

The magnitude of a vector ($\vec{A}$) is the absolute value of a vector and is indicated by $|\vec{A}|$.

Example of vector quantity: displacement, velocity, acceleration, force, etc.

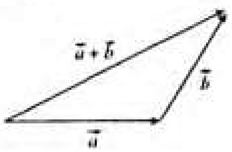
REPRESENTATION OF VECTOR

A vector is represented by a straight arrow. The tail is the staring point, the head is the ending point and the line measures the direction. The length of the line gives the value or magnitude of the vector. To express them mathematically, we need to draw the origin and the coordinate systems.

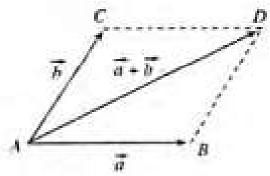
Mathematically, vector is represented by $\vec{A}$. Sometimes, it is represented by bold letter *A*.

ADDITION OF VECTORS

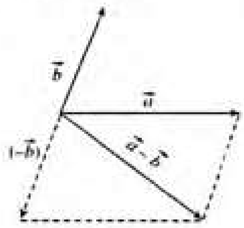
Triangle law of addition of vectors: If $\vec{a}$ and $\vec{b}$ are two vectors to be added, a diagram is drawn in which the tail of $\vec{b}$ coincides with the head of $\vec{a}$ (see figure). The vector joining the tail of $\vec{a}$ with the head of $\vec{b}$ is the vector sum of $\vec{a}$ and $\vec{b}$. Figure shows the construction.



Parallelogram law of addition of vectors: The same rule may be stated in a slightly different way. We draw the vectors and $\vec{b}$ with both the tails coinciding (see figure). Taking these two as the adjacent sides we complete the parallelogram. The diagonal through the common tails gives the sum of the two vectors. Thus, in the figure, $\overline{AB}+\overline{CD}=\overline{AD}$

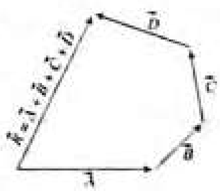


Subtraction of vectors: Let $\vec{a}$ and $\vec{b}$ be two vectors. We define $\vec{a}-\vec{b}$ as the sum of the vector $\vec{a}$ and the vector $(-\vec{b})$. To subtract $\vec{b}$ from $\vec{a}$, invert the direction of $\vec{b}$ and add to $\vec{a}$. The figure shows the process.

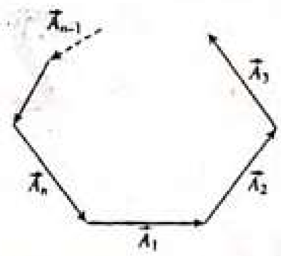


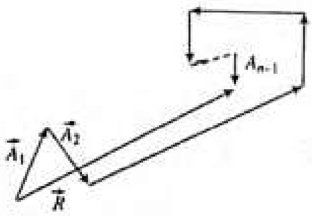
Polygon Law of Addition of Vectors

A geometric construction can also be used to add more than two vectors as shown in figure for the case of four vectors. The resultant vector $\vec{R}=\vec{A}+\vec{B}+\vec{C}+\vec{D}$ is the vector that completes the polygon. In other words, $\vec{R}$ is the vector drawn from the tail of the first vector to the tip of the last vector. This technique for adding vectors is often called the "head to tail method."



If *n* vectors are represented by the sides of a polygon of *n* sides in cyclic manner, the resultant of these vectors is a zero vector. Triangle and rectangle are the polygons of sides three and four, respectively. The non-coplanar vectors can be represented by a polygon of sides which cannot lie in a single plane. Sometimes, for coplanar vectors represented by a polygon, the resultant (closing side of the polygon) may cross the component vectors (other sides of the polygon) as shown in the figure.



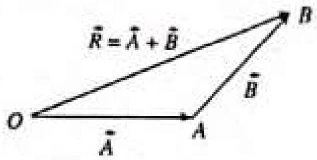


- Resultant of two unequal vectors cannot be zero.
- Resultant of three co-planar vectors may or may not be zero.
- Resultant of three non-co-planar vectors cannot be zero.

Vector Addition by Analytical Method

Triangle Law of Vector Addition of Two Vectors

If two non-zero vectors are represented by two sides of a triangle taken in the same order, then the resultant is given by the closing side of triangle in opposite order, i.e., $\vec{R} = \vec{A} + \vec{B}$



$\because \quad \overline{OB} = \overline{OA} + \overline{AB}$

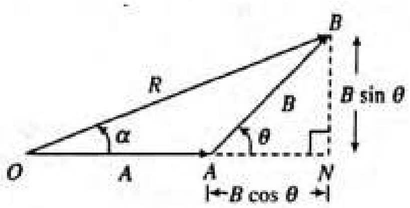
Magnitude of resultant vector: In ΔABN

$$\cos\theta = \frac{AN}{B}$$

$\therefore \quad AN = B\cos\theta$

$$\sin\theta = \frac{BN}{B}$$

$\therefore \quad BN = B\sin\theta$



In ΔOBN, we have $OB^2 = ON^2 + BN^2$

$$\Rightarrow \quad R^2 = (A + B\cos\theta)^2 + (B\sin\theta)^2$$

$$= A^2 + B^2\cos^2\theta + 2AB\cos\theta + B^2\sin^2\theta$$

$$= A^2 + B^2(\cos^2\theta + \sin^2\theta) + 2AB\cos\theta$$

$$= A^2 + B^2 + 2AB\cos\theta$$

$$R = \sqrt{A^2 + B^2 + 2AB\cos\theta}$$

Direction of resultant vectors: If θ is the angle between $\vec{A}$ and $\vec{B}$, then

$$|\vec{A} + \vec{B}| = \sqrt{A^2 + B^2 + 2AB\cos\theta}$$

If $\vec{R}$ makes an angle α with $\vec{A}$, then in ΔOBN,

$$\tan\alpha = \frac{BN}{ON} = \frac{BN}{OA + AN} = \frac{B\sin\theta}{A + B\cos\theta}$$

Special Cases

Case 1: When the given vectors act in the same direction $(\theta = 0°)$.

So $\quad R = \sqrt{A^2 + B^2 + 2AB\cos 0°}$

$$= \sqrt{A^2 + B^2 + 2AB}$$

$$= \sqrt{(A+B)^2} = A + B \qquad [\therefore \cos 0° = 1]$$

or $\quad |\vec{R}| = |\vec{A}| + |\vec{B}|$ which represents the magnitude of the resultant.

Case 2: When the given vectors act in opposite directions $(\theta = 180°)$.

So $\quad R = \sqrt{A^2 + B^2 + 2AB\cos 180°}$

$$= \sqrt{A^2 + B^2 - 2AB}$$

$$= \sqrt{(A-B)^2} \qquad [\because \cos 180° = -1]$$

$$= \pm(A - B) = A - B \text{ or } B - A$$

or $\quad |\vec{R}| = \left||\vec{A}| - |\vec{B}|\right|$ which represents the magnitude of the resultant.

Case 3: When the given vectors $\vec{A}$ and $\vec{B}$ act at right angle to each other $(\theta = 90°)$.

$\therefore \quad R = \sqrt{A^2 + B^2 + 2AB\cos 90°}$

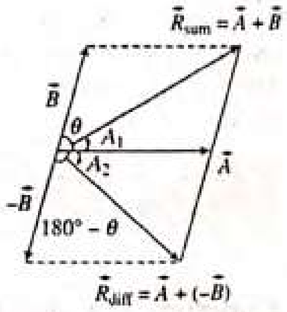
$$= \sqrt{A^2 + B^2} \qquad [\because \cos 90° = 0]$$

or $\quad |\vec{R}| = \sqrt{|\vec{A}|^2 + |\vec{B}|^2}$

and $\quad \tan\beta = \dfrac{B\sin 90°}{A + B\cos 90°}$ or $\tan\beta = \dfrac{B}{A}$ $[\because \sin = 90° = 1]$

Subtraction of Vectors

Two vectors $\vec{A}$ and $\vec{B}$ are inclined at as angle θ (see figure). The summation of both vectors is represented by the bigger diagonal of parallelogram and difference of vectors is represented by the smaller diagonal of parallelogram.



Since, $\vec{A} - \vec{B} = \vec{A} + (-\vec{B})$

and $\quad |\vec{A} + \vec{B}| = \sqrt{A^2 + B^2 + 2AB\cos\theta}$

$$\Rightarrow \quad |\vec{A} - \vec{B}| = \sqrt{A^2 + B^2 + 2AB\cos(180° - \theta)}$$

Since, $\cos(180° - \theta) = -\cos\theta$

$$\Rightarrow \quad |\vec{A} - \vec{B}| = \sqrt{A^2 + B^2 - 2AB\cos\theta}$$

$$\tan\alpha_1 = \frac{B\sin\theta}{A + B\cos\theta}$$

and $\quad \tan\alpha_2 = \dfrac{B\sin(180° - \theta)}{A + B\cos(180° - \theta)}$

But $\sin(180° - \theta) = \sin\theta$

and $\cos(180° - \theta) = -\cos\theta$

$$\Rightarrow \quad \tan\alpha_2 = \frac{B\sin\theta}{A - B\cos\theta}$$

Illustration 2.1 The greatest and least resultant of two forces acting at a point is 10 N and 6 N, respectively. If each force is increased by 3 N, find the resultant of new forces when acting at a point at an angle of 90° with each other.

Solution. Let A and B be the two forces.

Greatest resultant $= A + B = 10$ ... (i)

Least resultant $= A - B = 6$ ... (ii)

Solving (i) and (ii), we get, $A = 8$ N and $B = 2$ N.

When each force is increased by 3 N then

$A' = A + 3 = 8 + 3 = 11$ N, then

$B' = B + 3 = 2 + 3 = 5$ N

As the new forces are acting at an angle of 90° (i.e., $\theta = 90°$)

So $R' = \sqrt{A'^2 + B'^2} = \sqrt{(11)^2 + (5)^2} = \sqrt{146}$ N

Illustration 2.2 Two equal forces have their resultant equal to either. At what angle are they inclined?

Solution. Here $A = F$; $B = F$; $R = F$; $\theta = ?$

Now $R = \sqrt{A^2 + B^2 + 2AB\cos\theta}$

$$F = \sqrt{F^2 + F^2 + 2F.F.\cos\theta}$$

$$= F\sqrt{2(1+\cos\theta)}$$

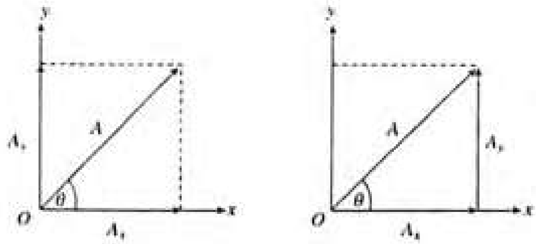
$\Rightarrow \quad 1 = 2(1 + \cos\theta)$

$$\cos\theta = -\frac{1}{2} = \cos 120° \Rightarrow \theta = 120°$$

COMPONENTS OF A VECTOR

The graphical method of adding vectors is not recommended whenever high accuracy is required or in three-dimensional problems. In this section, we describe a method of adding vectors that makes use of the projection of vectors along coordinate axes. These projections are called components of the vector. Any vector can be completely described by its components.

Consider a vector A lying in the xy plane and making an arbitrary angle θ with the positive x-axis, as shown in Fig. (a). This vector can be expressed as the sum of two other vectors A_x and A_y. From Fig. (b), we see that the three vectors form a right triangle and that $A = A_x + A_y$. We shall often refer to the "components of a vector A," written A_x and A_y (without the boldface notation). Component A_x represents the projection of A along the x-axis and component A_y represents the projection of A along the y-axis. These components can be positive or negative. The component A_x is positive if A_x points in the positive x direction and is negative if A_x points in the negative x direction. The same is true for the component A_y.



(a) (b)

From Fig. (b) and the definition of sine and cosine, we see that $\cos\theta = A_x/A$ and that $\sin\theta = A_y/A$. Hence, the components of A are

$A_x = A\cos\theta$ ...(i)

$A_y = A\sin\theta$ ...(ii)

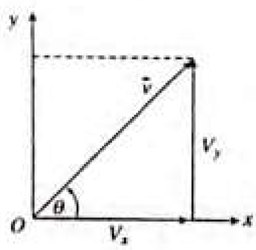
These components form two sides of a right triangle with a hypotenuse of length. Thus, it follows that the magnitude and direction of A are related to its components through the expressions

$$A = \sqrt{A_x^2 + A_y^2} \qquad \text{...(iii)}$$

$$\theta = \tan^{-1}\left(\frac{A_y}{A_x}\right) \qquad \text{...(iv)}$$

Illustration 2.3 A particle is moving with velocity $v = 100$ m s^{-1}. If one of the rectangular components of a velocity is 50 m s^{-1}. Find the other component of velocity and its angle with the given component of velocity.

Solution. Here we are given net velocity $v = 100$ m s^{-1}.



Let $v_x = 50$ m s^{-1} $\Rightarrow v_x = v\cos\theta$

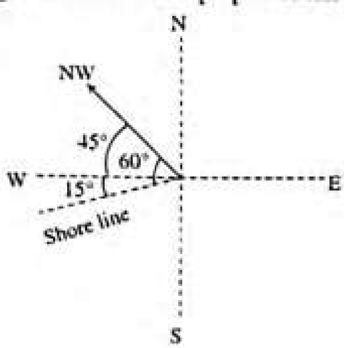
$\Rightarrow \quad 50 = 100\cos\theta$

$\Rightarrow \quad \cos\theta = \frac{1}{2}$ or $\theta = 60°$

$\therefore \quad v_y = v\sin\theta = 100\sin 60°$

$$= 100 \times \frac{\sqrt{3}}{2} = 50\sqrt{3} \text{ m s}^{-1}$$

Illustration 2.4 A man rows a boat with a speed of 18 km h^{-1} in the north-west direction (see figure). The shoreline makes an angle of 15° south of west. Obtain the components of the velocity of the boat along the shoreline and perpendicular to the shoreline.



Solution. The north-west direction of the boat makes an angle of 60° with the shoreline.

Component of the velocity of boat along the shoreline

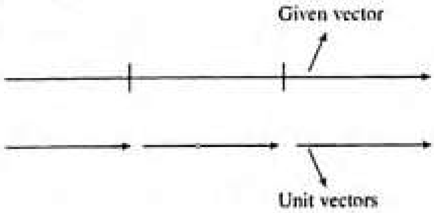
$$= 18\cos 60^\circ \text{ km h}^{-1} = 9 \text{ km h}^{-1}$$

Component of the boat velocity along a line normal to the shoreline

$$= 18\sin 60^\circ \text{km h}^{-1} = 18 \times \frac{\sqrt{3}}{2} \text{ km h}^{-1} = 9\sqrt{3} \text{ km h}^{-1}$$

UNIT VECTORS

When we divide an arrow which represents a vector of magnitude 3 units into three equal parts, each arrow represents a magnitude of one unit (see figure).



In general, when we divide any vector $\vec{A}$ by its magnitude $|\vec{A}|$, it gives us a unit vector of that vector denoted by the symbol $\hat{a} = \vec{A}/|\vec{A}|$. Hence, any vector $\vec{A}$ can be given as its magnitude times its unit vector, $\vec{A} = |\vec{A}|\hat{a}$. Hence, $\vec{A} \parallel \hat{a}$. The unit vectors have no dimensions and no units. A unit vector shows the orientation of the corresponding vector in space.

Suppose a force of magnitude 10 N acts in direction of $\hat{A}$ vector, this force $\vec{F}$ can be expressed as $\vec{F} = (10\hat{A})$ N.

Illustration 2.5 Find the unit vector of $\vec{A} = 2\hat{i} + 3\hat{j} + 2\hat{k}$.

Solution. $\vec{A} = 2\hat{i} + 3\hat{j} + 2\hat{k}$

We know that $\hat{A} = \dfrac{\vec{A}}{|\vec{A}|}$

where $|\vec{A}| = \sqrt{A_x^2 + A_y^2 + A_z^2}$

$$= \sqrt{2^2 + 3^2 + 2^2} = \sqrt{4+9+4} = \sqrt{17}$$

$$\hat{A} = \frac{\vec{A}}{|\vec{A}|} = \frac{2\hat{i} + 3\hat{j} + 2\hat{k}}{\sqrt{17}}$$

Illustration 2.6 Determine that vector which when added to the resultant of $\vec{A} = 3\hat{i} - 5\hat{j} + 7\hat{k}$ and $\vec{B} = 2\hat{i} + 4\hat{j} - 3\hat{k}$ gives unit vector along y-direction.

Solution. Here $\vec{A} = 3\hat{i} - 5\hat{j} + 7\hat{k}$ and $\vec{B} = 2\hat{i} + 4\hat{j} - 3\hat{k}$

Resultant $\vec{R} = \vec{A} + \vec{B}$

$$= (3\hat{i} - 5\hat{j} + 7\hat{k}) + (2\hat{i} + 4\hat{j} - 3\hat{k}) = 5\hat{i} - \hat{j} + 4\hat{k}$$

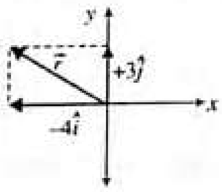
Let the vector to be added is $\vec{X}$. As the unit vector along y direction is $\hat{j}$

$$\therefore \quad \hat{j} = 5\hat{i} - \hat{j} + 4\hat{k} + \vec{X}$$

So, required vector, $\vec{X} = \hat{j} - (5\hat{i} - \hat{j} + 4\hat{k}) = -5\hat{i} + 2\hat{j} - 4\hat{k}$

Illustration 2.7 A car is moving in direction $\vec{r} = -4\hat{i} + 3\hat{j}$ with a speed of 10 m s^{-1}. Write the velocity vector of car in unit vector notation.

Solution. The direction of the motion of car is along the unit vector $\hat{r}$.



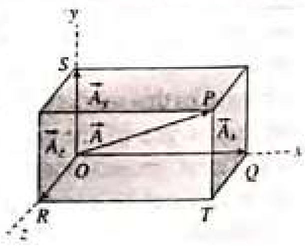
$$\therefore \quad \hat{r} = \frac{-4\hat{i} + 3\hat{j}}{\sqrt{4^2 + 3^2}} = -\frac{4}{5}\hat{i} + \frac{3}{5}\hat{j}$$

Thus, velocity vector of car equal to

$$\vec{v} = |\vec{v}|\hat{r} = (10 \text{ m s}^{-1})\left(-\frac{4}{5}\hat{i} + \frac{3}{5}\hat{j}\right) = (-8\hat{i} + 6\hat{j}) \text{ m s}^{-1}$$

RECTANGULAR COMPONENTS OF A VECTOR IN THREE DIMENSIONS

When a vector is split into mutually perpendicular directions in 3-D space, the component vectors obtained are called rectangular components of the given vector in 3-D space.



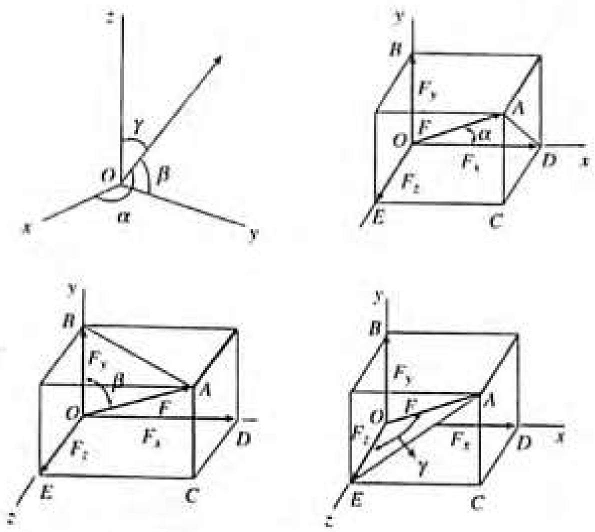
The figure shows vector $\vec{A}$ represented by $\overline{OP}$.

Here $\vec{A} = \vec{A}_x + \vec{A}_y + \vec{A}_z = A_x\hat{i} + A_y\hat{j} + A_z\hat{k}$

The magnitude of $\vec{A}$ is given by $A = \sqrt{A_x^2 + A_y^2 + A_z^2}$

Direction Cosines

Let A be a point in space whose coordinates are (x, y, z). Then its position vector w.r.t. the origin of coordinate system is given by: $\vec{r} = \overline{OA} = x\hat{i} + y\hat{j} + z\hat{k}$.



and $r = OA = \sqrt{x^2 + y^2 + z^2}$

Angles with x-, y-, and z-axes, respectively, are given by:

$$\cos\alpha = \frac{x}{r} = l, \cos\beta = \frac{y}{r} = m, \cos\gamma = \frac{z}{r} = n$$

The direction cosines l, m, and n of a vector are the cosines of the angles α, β, and γ, which a given vector makes with x-axis, y-axis, and z-axis, respectively.

Now squaring and adding l, m, and n,

$$\cos^2\alpha + \cos^2\beta + \cos^2\gamma = \frac{x^2 + y^2 + z^2}{r^2}$$

or $\quad l^2 + m^2 + n^2 = \frac{r^2}{r^2} = 1$

It means the sum of the squares of the direction cosines of a vector is always unity.

Illustration 2.8 A bird moves with velocity 20 ms^{-1} in a direction making an angle of 60° with the eastern line and 60° with vertical upward. Represent the velocity vector in rectangular form.

Solution. Let the eastern line be taken as x-axis, northern as y-axis, and vertical upward as z-axis. Let the velocity v makes angles α, β, and γ with x-, y-, and z-axes, respectively. Then $\alpha = 60°$ and $\gamma = 60°$.

$$\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$$

We have $\cos^2 60° + \cos^2\beta + \cos^2 60° = 1$

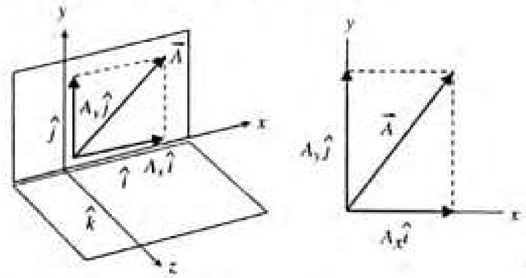
or $\quad \cos\beta = \frac{1}{\sqrt{2}}$

$$\vec{v} = v\cos\alpha\,\hat{i} + v\cos\beta\,\hat{j} + v\cos\gamma\,\hat{k}$$

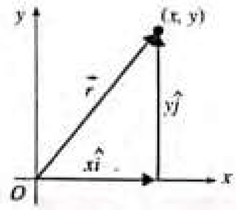
$$= 20\left[\frac{1}{2}\hat{i} + \frac{1}{\sqrt{2}}\hat{j} + \frac{1}{2}\hat{k}\right] = 10\hat{i} + 10\sqrt{2}\,\hat{j} + 10\hat{k}$$

POSITION VECTOR

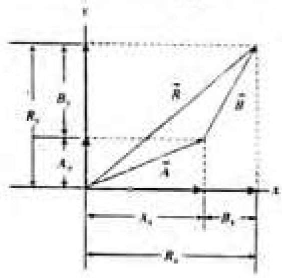
Consider a vector $\vec{A}$ lying in the xy plane as shown in the figure. The product of the component A_x and the unit vector $\hat{i}$ is the component vector $\vec{A}_x = A_x\hat{i}$, which lies on the x-axis and has magnitude $|A_x|$. Likewise, $\vec{A}_y = A_y\hat{j}$ is the component vector of magnitude $|A_y|$ lying on the y-axis. Therefore, the unit vector notation for the vector $\vec{A}$ is $\vec{A} = A_x\hat{i} + A_y\hat{j}$.



For example, consider a point lying in the xy plane and having Cartesian coordinates (x, y) as in the figure. The point can be specified by the position vector $\vec{r}$, which in unit vector form is given by $\vec{r} = x\hat{i} + y\hat{j}$. This notation tells us that the components of $\vec{r}$ are the coordinates x and y.



Now let us see how to use components to add vectors when the graphical method is not sufficiently accurate. Suppose we wish to add vector $\vec{B}$ to vector $\vec{A}$ as shown in the figure, where vector $\vec{B}$ has components B_x and B_y. Because of the book-keeping convenience of the unit vectors, all we do is add the x and y components separately. The resultant vector $\vec{R} = \vec{A} + \vec{B}$ is



$$\vec{R} = (A_x\hat{i} + A_y\hat{j}) + (B_x\hat{i} + B_y\hat{j})$$

$$= (A_x + B_x)\hat{i} + (A_y + B_y)\hat{j}$$

Because $\vec{R} = R_x\hat{i} + R_y\hat{j}$, we see that the components of the resultant vector are $R_x = A_x + B_x$ and $R_y = A_y + B_y$.

Therefore, we see that in the component method of adding vectors, we add all x components together to find the x component of the resultant vector and use the same process for y components. We can check this addition by components with a geometric construction as shown in the figure.

The magnitude of $\vec{R}$ and the angle it makes with the x-axis are obtained from its components using the relationships

$$R = \sqrt{R_x^2 + R_y^2} = \sqrt{(A_x + B_x)^2 + (A_y + B_y)^2}$$

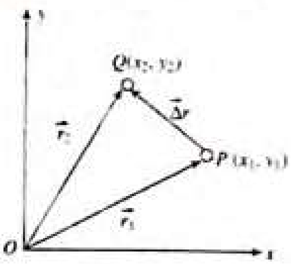
$$\tan\theta = \frac{R_y}{R_x} = \frac{A_y + B_y}{A_x + B_x}$$

DISPLACEMENT VECTOR

Displacement vector is a vector which gives the position of a point with reference to a point other than the origin of the co-ordinate system.

It gives the position with reference to a point other than the origin.

Applying the triangle law of vectors, we get



$$\vec{r}_1 + \overrightarrow{\Delta r} = \vec{r}_2 \quad \text{or} \quad \overrightarrow{\Delta r} = \vec{r}_2 - \vec{r}_1$$

Thus, displacement vector is merely the difference of two position vectors.

If (x_1, y_1) and (x_2, y_2) are the co-ordinates of P and Q, respectively, then $\vec{r}_1 = x_1\hat{i} + y_1\hat{j}$ and $\vec{r}_2 = x_2\hat{i} + y_2\hat{j}$.

$$\therefore \quad \overrightarrow{\Delta r} = (x_2 - x_1)\hat{i} + (y_2 - y_1)\hat{j}$$

$$|\overrightarrow{\Delta r}| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$$

Generalizing this result for three dimensions, we get

$$|\overrightarrow{\Delta r}| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$

Illustration 2.9 A particle is initially at point $A(2, 4, 6)$ m moves finally to the point $B(3, 2, -3)$ m. Write the initial position vector, final position vector, and displacement vector of the particle.

Solution. Initial position vector: $\vec{r}_1 = 2\hat{i} + 4\hat{j} + 6\hat{k}$

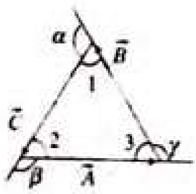
Final position vector: $\vec{r}_2 = 3\hat{i} + 2\hat{j} - 3\hat{k}$

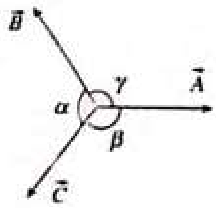
Displacement: $\vec{d} = \vec{r}_2 - \vec{r}_1 = (3-2)\hat{i} + (2-4)\hat{j} + (-3-6)\hat{k}$

$$= \hat{i} - 2\hat{j} - 9\hat{k}$$

Lami's Theorem

It states that if the resultant of three vectors is zero, then the magnitude of a vector is directly proportional to the sine of angle between other two vectors (see figure). Or it can be stated as if the resultant of three vectors is zero, then the ratio of magnitude of a vector to the sine of angle between other two vectors is constant, i.e.,

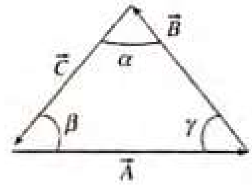




$$\frac{A}{\sin\alpha} = \frac{B}{\sin\beta} = \frac{C}{\sin\gamma}$$

Illustration 2.10 Given that $\vec{A} + \vec{B} + \vec{C} = \vec{0}$. Out of three vectors, two are equal in magnitude and the magnitude of the third vector is $\sqrt{2}$ times that of either of the two having equal magnitude. Find the angles between the vectors.

Solution. Given



$$A = B,\ C = \sqrt{2}A = \sqrt{2}B.$$

From the figure, $\alpha = \beta$ and $\alpha + \beta + \gamma = 180°$

$\Rightarrow \quad \gamma = 180° - 2\alpha$

Apply Lami's theorem: $\dfrac{A}{\sin\alpha} = \dfrac{C}{\sin\gamma}$

$$\Rightarrow \quad \frac{A}{\sin\alpha} = \frac{\sqrt{2}A}{\sin(180 - 2\alpha)}$$

$$\Rightarrow \quad \frac{1}{\sin\alpha} = \frac{\sqrt{2}}{\sin 2\alpha}$$

$$\frac{1}{\sin\alpha} = \frac{\sqrt{2}}{2\sin\alpha\cos\alpha} \Rightarrow \cos\alpha = \frac{1}{\sqrt{2}} \Rightarrow \alpha = 45°$$

$\Rightarrow \quad \beta = 45° \quad$ and $\quad \gamma = 180° - 2\alpha = 90°$

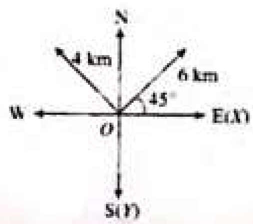
Angle between $\vec{A}$ and $\vec{B}$ = $180° - \gamma = 90°$.

Angle between $\vec{B}$ and $\vec{C}$ = $180 - \alpha = 135°$.

Angle between $\vec{C}$ and $\vec{A}$ = $180° - \beta = 135°$.

CONCEPT APPLICATION EXERCISE 2.1

1. A car travels 6 km towards north at an angle of 45° to the east and then travels distance of 4 km towards north at an angle of 135° to the east (see figure). How far is the point from the starting point? What angle does the straight line joining its initial and final position makes with the east?



2. There are two force vectors, one of 5 N and other of 12 N. At what angle should the two vectors be added

to get the resultant vector of 17 N, 7 N, and 13 N respectively?

3. If $\vec{A} = 4\hat{i} - 3\hat{j}$ and $\vec{B} = 6\hat{i} + 8\hat{j}$, then find the magnitude and direction of $\vec{A} + \vec{B}$.
4. A truck travelling due north at 20 m s^{-1} turns west and travels at the same speed. Find the change in its velocity.
5. If the sum of two unit vectors is a unit vector, then find the magnitude of difference.
6. The sum of the magnitudes of two forces acting at a point is 18 and the magnitude of their resultant is 12. If the resultant is at 90° with the force of smaller magnitude, what are the magnitudes of forces?
7. Two forces $F_1 = 1$ N and $F_2 = 2$ N act along the lines $x = 0$ and $y = 0$, respectively. Then find the resultant of forces.
8. Let $\vec{A} = 2\hat{i} + \hat{j}$, $B = 3\hat{j} - \hat{k}$ and $\vec{C} = 6\hat{i} - 2\hat{k}$. Find the value of $\vec{A} - 2\vec{B} + 3\vec{C}$.

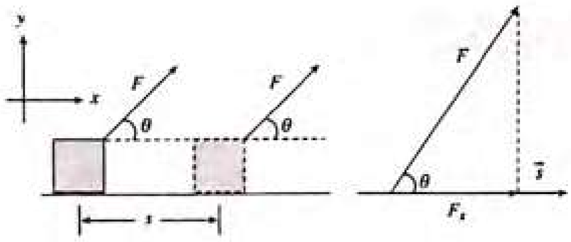
PRODUCT OF TWO VECTORS

Scalar Product of Two Vectors

If we multiply a vector by a scalar produces another vector. The scalar product is different from this multiplication. The scalar product is a way to multiply two vectors to yield a scalar result.

In physics, we defined some scalar quantities such as work, power, flux, etc., as the product of two vectors. For example, work done W by a force $\vec{F}$ is defined as the product of the displacement of a point at which the force is acting and the component of the force along the displacement (direction of motion of the point).

Symbolically, $W = |\vec{F}_x||\vec{s}|$, where $|\vec{F}|$ $|\vec{F}|\cos$.



This gives $W = |\vec{F}||\vec{s}|\cos\theta$. Since the scalar quantity W is defined as a product of two vectors $\vec{F}$ and $\vec{s}$, we can call this product "scalar product."

In short, substituting cos θ by a dot (.), we write $W = \vec{F}\cdot\vec{s}$. Hence the scalar product can also be termed as a "dot product."

There are many instants in physics where we need to express some scalar quantities such as flux, pressure, power as products of two vectors. For this, we need to develop the idea of scalar (dot) product of two vectors.

Note: If, in general, a scalar quantity C is defined as the scalar (or dot) product of any two vectors and $\vec{B}$, C is given as $C = |\vec{A}||\vec{B}|\cos\theta = \vec{A}\cdot\vec{B}$, where θ is the smaller angle between the vectors $\vec{A}$ and $\vec{B}$.

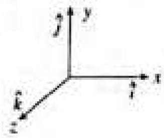
Special Cases

1. If $\theta = 0°$, $\vec{A}\cdot\vec{B} = AB$ (maximum value) [$\because \cos 0° = 1$]
2. If $\theta = 180°$, $\vec{A}\cdot\vec{B} = -AB$ (negative maximum value) [$\because \cos 180° = -1$]
3. If $\theta = 90°$, $\vec{A}\cdot\vec{B} = 0$ (minimum value) [$\because \cos 90° = 0$] So if two vectors are perpendicular, then their dot product is zero.
4. If θ is acute then, $\vec{A}\cdot\vec{B}$ is +ve. [$\because$ cos θ is +ve when θ is acute.]
5. If θ is obtuse, then $\vec{A}\cdot\vec{B}$ is –ve. [$\because$ cos θ is –ve when θ is obtuse.]

NOTE: The dot product of two vectors is always a scalar quantity.

Dot Product of Unit Vectors

The dot product of a unit vector with itself is unity and with other perpendicular unit vector is zero.



$$\hat{i}.\hat{i} = \hat{j}.\hat{j} = \hat{k}.\hat{k} = 1 \text{ and}$$

$$\hat{i}.\hat{j} = \hat{j}.\hat{i} = \hat{j}.\hat{k} = \hat{k}.\hat{j} = \hat{k}.\hat{i} = \hat{i}.\hat{k} = 0$$

In component form, the product is expressed as:

Let $\vec{A} = A_x\hat{i} + A_y\hat{j} + A_z\hat{k}, \vec{B} = B_x\hat{i} + B_y\hat{j} + B_z\hat{k}$

Then $\vec{A}\cdot\vec{B} = (A_x\hat{i} + A_y\hat{j} + A_z\hat{k})\cdot(B_x\hat{i} + B_y\hat{j} + B_z\hat{k})$

$$= A_x\hat{i}(B_x\hat{i} + B_y\hat{j} + B_z\hat{k}) + A_y\hat{j}(B_x\hat{i} + B_y\hat{j} + B_z\hat{k}) + A_z\hat{k}(B_x\hat{i} + B_y\hat{j} + B_z\hat{k}).$$

So $\vec{A}\cdot\vec{B} = A_xB_x(\hat{i}.\hat{i}) + A_xB_y(\hat{i}.\hat{j}) + A_xB_z(\hat{i}.\hat{k})$

$$+ A_yB_x(\hat{j}.\hat{i}) + A_yB_y(\hat{j}.\hat{j}) + A_yB_z(\hat{j}.\hat{k})$$

$$+ A_zB_x(\hat{k}.\hat{i}) + A_zB_y(\hat{k}.\hat{j}) + A_yB_z(\hat{k}.\hat{k})$$

$$= A_xB_x + A_yB_y + A_zB_z$$

Properties of Dot Product

Dot product is commutative: $\vec{A}\cdot\vec{B} = \vec{B}\cdot\vec{A}$

Applying the commutative property to unit vectors, we get

$$\hat{i}\cdot\hat{j} = \hat{j}\cdot\hat{i}, \hat{j}\cdot\hat{k} = \hat{k}\cdot\hat{j}, \hat{k}\cdot\hat{i} = \hat{i}\cdot\hat{k}$$

Dot product is distributive: $\vec{A}(\vec{B}+\vec{C}) = \vec{A}\cdot\vec{B} + \vec{A}\cdot\vec{C}$

This may be extended to any number of vectors.

$$\vec{A}\cdot(\vec{B}+\vec{C}+\vec{D}+\cdots)=\vec{A}\cdot\vec{B}+\vec{A}.\vec{C}+\vec{A}\cdot\vec{D}+\cdots$$

Dot product of perpendicular vectors is zero

Proof. If $\vec{A}$ is perpendicular to $\vec{B}$, then $\theta = 90°$.

$$\vec{A}\cdot\vec{B} = AB\cos 90° = 0$$

This leads us to the following condition of perpendicularity of two vectors.

"Two given non-zero vectors will be perpendicular to each other if and only if their dot product is zero."

Applying the result to unit vectors, we get

$$\hat{i}\cdot\hat{j}=0,\ \hat{j}\cdot\hat{k}=0, \text{ and } \hat{k}\cdot\hat{i}=0.$$

Dot product of a vector with itself: A vector is parallel to itself. So, angle of a vector with itself is zero.

$\therefore$ $\quad \vec{A}\cdot\vec{A} = A\,A\cos 0° = A^2 \qquad [\because \cos 0° = 1]$

Hence, the dot product of a vector with itself is the square of its magnitude.

We can also write: $\vec{A}\cdot\vec{A}=|\vec{A}|^2 \Rightarrow |\vec{A}|=\sqrt{\vec{A}\cdot\vec{A}}$

For example: $|\vec{P}+\vec{Q}|=\sqrt{(\vec{P}+\vec{Q})\cdot(\vec{P}+\vec{Q})}$

(taking $\vec{A}=\vec{P}+\vec{Q}$)

$$\Rightarrow\quad |\vec{P}+\vec{Q}|^2=(\vec{P}+\vec{Q})\cdot(\vec{P}+\vec{Q})$$

$$= P^2+Q^2+2\vec{P}\cdot\vec{Q} = P^2+Q^2+2PQ\cos\theta$$

Similarly, $|\vec{P}-\vec{Q}|^2 = P^2+Q^2-2\vec{P}\cdot\vec{Q}$

$$= P^2+Q^2-2PQ\cos\theta$$

Important Results

1. Angle between two vectors can be calculated from:

$$\cos\theta=\frac{\vec{A}\cdot\vec{B}}{AB}=\frac{a_1b_1+a_2b_2+a_3b_3}{\sqrt{a_1^2+a_2^2+a_3^2}\sqrt{b_1^2+b_2^2+b_3^2}}$$

2. If $|\vec{A}+\vec{B}|=|\vec{A}-\vec{B}|$, then angle between $\vec{A}$ and $\vec{B}$ is 90°

Proof: Given $|\vec{A}+\vec{B}|=|\vec{A}-\vec{B}|$

Squaring both sides, we get $|\vec{A}+\vec{B}|^2=|\vec{A}-\vec{B}|^2$

$$\Rightarrow\quad A^2+B^2+2\vec{A}\cdot\vec{B}=A^2+B^2-2\vec{A}\cdot\vec{B}\Rightarrow 4\vec{A}\cdot\vec{B}=0$$

$$\Rightarrow\quad \vec{A}\cdot\vec{B}=0$$

Hence, $\vec{A}$ is perpendicular to $\vec{B}$.

3. If $(\vec{A}+\vec{B})\cdot(\vec{A}-\vec{B})=0$, then $\vec{A}$ and $\vec{B}$ are equal in magnitude, i.e., $A = B$.

Proof: Given $(\vec{A}+\vec{B})\cdot(\vec{A}-\vec{B})=0$

$$\Rightarrow\quad \vec{A}\cdot\vec{A}-\vec{A}\cdot\vec{B}+\vec{B}\cdot\vec{A}-\vec{B}\cdot\vec{B}=0$$

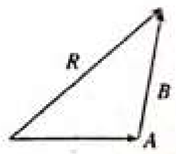
$$\Rightarrow\quad A^2-B^2=0$$

$$\Rightarrow\quad A^2=B^2$$

$\Rightarrow\quad A=B \qquad$ (Hence proved)

4. We can find the addition of two vectors using dot product.

In the figure, $\vec{R}=\vec{A}+\vec{B}$



$$\Rightarrow\quad |\vec{R}|=|\vec{A}+\vec{B}|$$

or $\quad |\vec{R}|^2=|\vec{A}+\vec{B}|^2$

or $\quad R^2=(\vec{A}+\vec{B})\cdot(\vec{A}+\vec{B}) = A^2+B^2+2\vec{A}\cdot\vec{B}$

or $\quad R=\sqrt{A^2+B^2+2\vec{A}\cdot\vec{B}}=\sqrt{A^2+B^2+2AB\cos\theta}$

Similarly, we can find subtraction of two vectors also.

Illustration 2.11 Find the value of m so that the vector $3\hat{i}-2\hat{j}+\hat{k}$ may be perpendicular to the vector $2\hat{i}+6\hat{j}+m\hat{k}$.

Solution. The given vectors will be perpendicular if their dot product is zero.

$$(3\hat{i}-2\hat{j}+\hat{k})\cdot(2\hat{i}+6\hat{j}+m\hat{k})=0$$

$$6(\hat{i}\cdot\hat{i})-12(\hat{j}\cdot\hat{j})+m(\hat{k}\cdot\hat{k})=0$$

or $\quad 6-12+m=0$

or $\quad m-6=0$ or $m=6$

Illustration 2.12 What is the angle between the following pair of vectors ?

$$\vec{A}=\hat{i}+\hat{j}+\hat{k} \text{ and } \vec{B}=-2\hat{i}-2\hat{j}-2\hat{k}.$$

Solution. $\vec{A}\cdot\vec{B}=AB\cos\theta$ or $\cos\theta=\dfrac{\vec{A}.\vec{B}}{AB}$ ...(i)

But, $\quad \vec{A}\cdot\vec{B}=(\hat{i}+\hat{j}+\hat{k})\cdot(-2\hat{i}-2\hat{j}-2\hat{k})$

$$\vec{A}\cdot\vec{B}=-2-2-2=-6$$

Again $A=|\vec{A}|=\sqrt{(1)^2+(1)^2+(1)^2}=\sqrt{3}$;

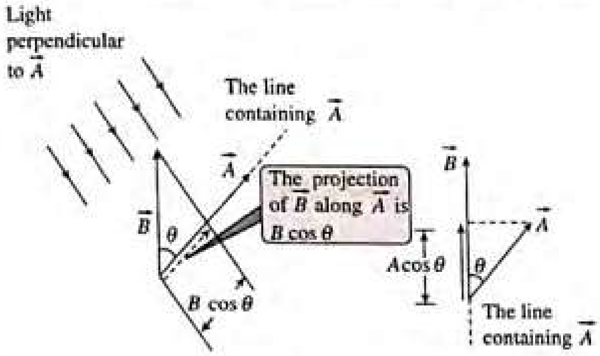
$$B=|\vec{B}|=\sqrt{(-2)^2+(-2)^2+(-2)^2}=\sqrt{12}=2\sqrt{3}$$

Now, $\cos\theta=\dfrac{-6}{\sqrt{3}\times 2\sqrt{3}}=-1$

$$\Rightarrow\quad \theta=180°$$

Geometric Interpretation of Dot Product

In order to geometrically interpret the scalar product, we draw $\vec{A}$ and $\vec{B}$ drawn with their tails together, we drop a perpendicular from the tip of $\vec{B}$ to line containing $\vec{A}$ (see figure). The quantity $B\cos\theta$ is called projection of $\vec{B}$ or component of $\vec{B}$ on the line containing $\vec{A}$. Imagine light shinning perpendicular to $\vec{A}$ then the shadow of vector $\vec{B}$ on the line containing $\vec{A}$, has length equal to the projection of $\vec{B}$ or component of $\vec{B}$ on line of $\vec{A}$.



We can also take projection the other way around.

$$\vec{A}\cdot\vec{B} = A(B\cos\theta) = (A\cos\theta)B$$

$$\vec{A}\cdot\vec{B} = \vec{B}\cdot\vec{A}$$

Illustration 2.13 $\hat{i}$ and $\hat{j}$ are unit vectors along x- and y-axes respectively. What is the magnitude and direction of the vectors $\hat{i}+\hat{j}$ and $\hat{i}-\hat{j}$? What are the components of a vector $\vec{A}=2\hat{i}+3\hat{j}$ along the direction $\hat{i}+\hat{j}$ and $\hat{i}-\hat{j}$?

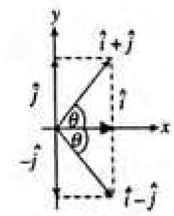
Solution.

(a) $|\hat{i}+\hat{j}| = \sqrt{1^2+1^2+2\times1\times1\times\cos 90^\circ}$

$= \sqrt{2} = 1.414$ units

$\tan\theta = \frac{1}{1} = 1$

$\therefore\ \theta = 45^\circ$



So, the vector $\hat{i}+\hat{j}$ makes an angle of -45° with x-axis.

(b) $|\hat{i}-\hat{j}| = |\hat{i}+(-\hat{j})|$

$= \sqrt{1^2+(-1)^2+2(1)(-1)\cos 90^\circ} = \sqrt{2}$

$\tan\theta = \frac{1}{-1} = -1 \quad \therefore\ \theta = -45^\circ$

The vector $(\hat{i}-\hat{j})$ makes an angle of -45° with x-axis.

Let us now determine the component of $\vec{A} = 2\hat{i}+3\hat{j}$ in the direction of $\hat{i}+\hat{j}$.

Then, $\vec{B} = \hat{i}+\hat{j}$

$\vec{A}.\vec{B} = AB\cos\theta = (A\cos\theta)B$

So component of $\vec{A}$ in the direction of $\vec{B}$.

$$= \frac{\vec{A}.\vec{B}}{B} = \frac{(2\hat{i}+3\hat{j}).(\hat{i}+\hat{j})}{\sqrt{1^2+1^2}} = \frac{2.1+3.1}{\sqrt{2}} = \frac{5}{\sqrt{2}} \text{ units}$$

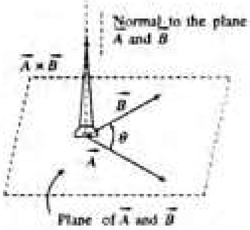
Component of $\vec{A}$ in the direction of $\hat{i}-\hat{j}$

$$= \frac{(2\hat{i}+3\hat{j}).(\hat{i}-\hat{j})}{\sqrt{2}} = -\frac{1}{\sqrt{2}} \text{ units}$$

Here, PM is the component of $\vec{A}$ in the direction of $\vec{B}$. So, dot product of two vectors $\vec{A}$ and $\vec{B}$ may be defined as the product of the magnitude of $\vec{B}$ and the component of $\vec{A}$ in the direction of $\vec{B}$.

Vector Product of Two Vectors

The cross product of two vectors $\vec{A}$ and $\vec{B}$ is equal to the product of the magnitude of $\vec{A}$ and $\vec{B}$ and sine of the shortest angle between them, i.e., $\vec{A}\times\vec{B} = AB\sin\theta\ \hat{n}$, where $\hat{n}$ is the unit vector which represents the direction of $\vec{A}\times\vec{B}$ and it is perpendicular to the plane containing $\vec{A}$ and $\vec{B}$. It is given by right-handed screw rule depicted in the figure. Note that $\hat{n}$ is perpendicular to both $\vec{A}$ and $\vec{B}$.



Magnitude of $\vec{A}\times\vec{B}$: $|\vec{A}\times\vec{B}| = AB\sin\theta$

From here, we can write: $\vec{A}\times\vec{B} = |\vec{A}\times\vec{B}|\hat{n}$

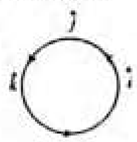
$$\Rightarrow \quad \hat{n} = \frac{\vec{A}\times\vec{B}}{|\vec{A}\times\vec{B}|}$$

Unit Vectors and their Cross Product

$\hat{i}$, $\hat{j}$, and $\hat{k}$ are unit vectors along x, y, and z axis, respectively. The magnitude of each vector is 1 and the angle between any of two unit vectors is 90°.

So $\hat{i}\times\hat{j} = (1)(1)\sin 90^\circ\ \hat{n} = \hat{n}$, where $\hat{n}$ is a unit vector perpendicular to the plane containing vector, $\hat{i}$ and $\hat{j}$.

To find out the resultant of any unit vector in cross product, use the following rule (see figure).



1. Multiplication of any two unit vectors in anticlockwise direction gives the third unit vector with positive sign.
2. Multiplication of any two unit vectors in clockwise direction gives the third unit vector with negative sign.

From these rules, we obtain the following results:

From Rule 1

1. $\hat{i} \times \hat{j} = \hat{k}$ 2. $\hat{j} \times \hat{k} = \hat{i}$
3. $\hat{k} \times \hat{i} = \hat{j}$

From Rule 2

1. $\hat{j} \times \hat{i} = -\hat{k}$ 2. $\hat{k} \times \hat{j} = -\hat{i}$
3. $\hat{i} \times \hat{k} = -\hat{j}$

Cross product

$$\vec{A} \times \vec{B} = (A_x \hat{i} + A_y \hat{j} + A_z \hat{k}) \times (B_x \hat{i} + B_y \hat{j} + B_z \hat{k})$$

$$= A_xB_x(\hat{i}\times\hat{i}) + A_yB_x(\hat{j}\times\hat{i}) + A_zB_x(\hat{k}\times\hat{i})$$

$$+A_xB_y(\hat{i}\times\hat{j}) + A_yB_y(\hat{j}\times\hat{j}) + A_zB_y(\hat{k}\times\hat{j})$$

$$+A_xB_z(\hat{i}\times\hat{k}) + A_yB_z(\hat{j}\times\hat{k}) + A_zB_z(\hat{k}\times\hat{k})$$

[As $\hat{i}\times\hat{i} = 0,\ \hat{j}\times\hat{j} = 0,\ \hat{k}\times\hat{k} = 0$ and $\hat{i}\times\hat{j} = \hat{k}$,

$\hat{j}\times\hat{i} = -\hat{k}, \hat{k}\times\hat{i} = \hat{j}, \hat{i}\times\hat{k} = -\hat{j}, \hat{j}\times\hat{k} = \hat{i}\ \hat{k}\times\hat{j} = -\hat{i}$]

So, we have $\vec{A} \times \vec{B}$

$$= A_yB_x(-\hat{k}) + A_zB_x\hat{j} + A_xB_y\hat{k}$$

$$+ A_zB_y(-\hat{i}) + A_xB_z(-\hat{j}) + A_yB_z(\hat{i})$$

$$= (A_yB_z - A_zB_y)\hat{i} - (A_xB_z - A_zB_x)\hat{j} + (A_xB_y - A_yB_x)\hat{k}$$

Properties of Vector Cross Product

Anti commutative property: The vector product of two vectors is anti commutative

$$\vec{A} \times \vec{B} = AB \sin\theta\, \hat{n} \text{ and } \vec{B} \times \vec{A} = BA \sin\theta(-\hat{n})$$

$$= -AB \sin\theta\, \hat{n} = -(\vec{A} \times \vec{B})$$

So $\vec{B} \times \vec{A} = -(\vec{A} \times \vec{B})$

It means $\vec{B} \times \vec{A} \neq \vec{A} \times \vec{B}$

Distributive property: Vector product is distributive, i.e.,

$$\vec{A} \times (\vec{B} + \vec{C}) = \vec{A} \times \vec{B} + \vec{A} \times \vec{C}$$

Associative Property:

$$(\vec{A} + \vec{B}) \times (\vec{C} + \vec{D}) = \vec{A} \times \vec{C} + \vec{A} \times \vec{D} + \vec{B} \times \vec{C} + \vec{B} \times \vec{D}$$

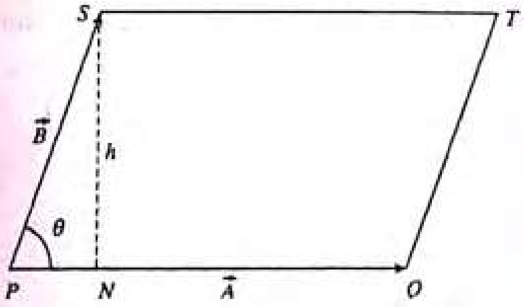
Cross product of two parallel vectors: Cross product of the parallel vectors is zero.

As $\theta = 0°$ (for parallel vectors)

So $(\vec{A} \times \vec{B}) = AB \sin 0°\, \hat{n} = 0$

Important Results

If two vectors represent the two adjacent sides of a parallelogram, then the magnitude of the cross product will give the area of the parallelogram. Mathematically:



Two vectors $\vec{A}$ and $\vec{B}$ are represented by the two adjacent sides PQ and PS, respectively, of the parallelogram as shown in the figure.
Now, from magnitude of cross product:

$$|\vec{A} \times \vec{B}| = AB\sin\theta = Ah$$

Illustration 2.14

(a) Prove that the vectors $\vec{A} = 3\hat{i} - 2\hat{j} + \hat{k}$, $\vec{B} = \hat{i} - 3\hat{j} + 5\hat{k}$, and $\vec{C} = 2\hat{i} + \hat{j} - 4\hat{k}$ form a right-angled triangle.

(b) Determine the unit vector parallel to the cross product of the vectors $\vec{A} = 3\hat{i} - 5\hat{j} + 10\hat{k}$ & $\vec{B} = 6\hat{i} + 5\hat{j} + 2\hat{k}$.

Solution.

(a) The given vectors will constitute a triangle only if one of the given vectors is equal to vector sum of the remaining two vectors. In the given problem, $\vec{B} + \vec{C} = \vec{A}$
So, the given vectors do form a triangle. This triangle will be right-angled only if the dot product of two vectors (out of the given three) is zero.

$$\vec{A}\cdot\vec{B} = (3\hat{i} - 2\hat{j} + \hat{k})\cdot(\hat{i} - 3\hat{j} + 5\hat{k})$$

$$= 3(\hat{i}\cdot\hat{i}) + 6(\hat{j}\cdot\hat{j}) + 5(\hat{k}\cdot\hat{k}) = 3 + 6 + 5 = 14$$

$$\vec{B}\cdot\vec{C} = (\hat{i} - 3\hat{j} + 5\hat{k})\cdot(2\hat{i} + \hat{j} - 4\hat{k})$$

$$= 2(\hat{i}\cdot\hat{i}) - 3(\hat{j}\cdot\hat{j}) - 20(\hat{k}\cdot\hat{k}) = 2 - 3 - 20 = -21$$

$$\vec{C}\cdot\vec{A} = (2\hat{i} + j - 4\hat{k})\cdot(3\hat{i} - 2\hat{j} + \hat{k})$$

$$= 6(\hat{i}\cdot\hat{i}) - 2(\hat{j}\cdot\hat{j}) - 4(\hat{k}\cdot\hat{k}) = 6 - 2 - 4 = 0$$

Since the dot product of $\vec{C}$ and $\vec{A}$ is zero, therefore, it implies that $\vec{C}$ is perpendicular to $\vec{A}$.

(b) The unit vector parallel to $(\vec{A} \times \vec{B})$ is given by

$$\hat{n} = \frac{\vec{A} \times \vec{B}}{|\vec{A} \times \vec{B}|}$$

So, let us first determine $\vec{A}\times\vec{B}$.

Now $\vec{A}\times\vec{B} = (3\hat{i}-5\hat{j}+10\hat{k})\times(6\hat{i}+5\hat{j}+2\hat{k})$

$$=\begin{vmatrix}\hat{i} & \hat{j} & \hat{k}\\ 3 & -5 & 10\\ 6 & 5 & 2\end{vmatrix}$$

$$=\hat{i}(-10-50)+\hat{j}(60-6)+\hat{k}(15+30)$$

$$=-60\hat{i}+54\hat{j}+45\hat{k}$$

Magnitude: $|\vec{A}\times\vec{B}|=\sqrt{(-60)^2+(54)^2+(45)^2}=\sqrt{8541}$

So, required unit vector: $\hat{n}=\dfrac{-60\hat{i}+54\hat{j}+45\hat{k}}{\sqrt{8541}}$

Concept Application Exercise 2.2

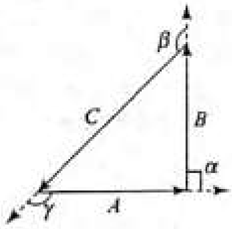
1. $\vec{A}=2\hat{i}+4\hat{j}+4\hat{k}$ and $\vec{B}=4\hat{i}+2\hat{j}-4\hat{k}$ are two vectors. Find the angle between them.
2. If two vectors $2\hat{i}+3\hat{j}-\hat{k}$ and $-4\hat{i}-6\hat{j}-\lambda\hat{k}$ are parallel to each other, then find the value of λ.
3. In Q. 2, if vectors are perpendicular to each other then find the value of λ.
4. If $\vec{A}=2\hat{i}+3\hat{j}-\hat{k}$ and $\vec{B}=-\hat{i}+3\hat{j}+4\hat{k}$, then find the projection of $\vec{A}$ on $\vec{B}$.
5. A body, acted upon by a force of 50 N, is displaced through a distance 10 m in a direction making an angle of 60° with the force. Find the work done by the force.
6. A particle moves from position $3\hat{i}+2\hat{j}-6\hat{k}$ to $14\hat{i}+13\hat{j}+9\hat{k}$ due to a uniform force of $4\hat{i}+\hat{j}+3\hat{k}$ N. If the displacement is in meters, then find the work done.
7. If for two vectors $\vec{A}$ and $\vec{B}$, sum $(\vec{A}+\vec{B})$ is perpendicular to the difference $(\vec{A}-\vec{B})$. Find the ratio of their magnitude.

Solved Examples

1. Given that $\vec{A}+\vec{B}+\vec{C}=0$ out of three vectors two are equal in magnitude and the magnitude of third vector is $\sqrt{2}$ times that of either of the two having equal magnitude. Then the angles between vectors are given by

(a) 30°, 60°, 90° (b) 45°, 45°, 90°
(c) 45°, 60°, 90° (d) 90°, 135°, 135°

Sol. (d) From polygon law, three vectors having summation zero should form a closed polygon (Triangle). Since the two vectors are having same magnitude and the third vector is $\sqrt{2}$ times that of either of two having equal magnitude. That is, the triangle should be right angled triangle



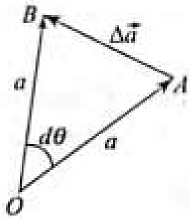
Angle between A and B, $\alpha = 90°$
Angle between B and C, $\beta = 135°$
Angle between A and C, $\gamma = 135°$

2. A vector $\vec{a}$ is turned without a change in its length through a small angle $d\theta$. The value of $|\Delta\vec{a}|$ and Δa are respectively

(a) $0, a\,d\theta$ (b) $a\,d\theta, 0$
(c) 0, 0 (d) None of these

Sol. (b) From the figure $|\vec{OA}|=a$ and $|\vec{OB}|=a$

Also from triangle rule $\vec{OB}-\vec{OA}=\vec{AB}=\Delta\vec{a}$



$\Rightarrow \quad |\Delta\vec{a}|=AB$

Using angle $=\dfrac{\text{arc}}{\text{radius}}$

$\Rightarrow \quad AB=a\cdot d\theta$

So $\quad |\Delta\vec{a}|=a\,d\theta$

Δa means change in magnitude of vector, i.e., $|\vec{OB}|-|\vec{OA}|$

$\Rightarrow \quad a-a=0$

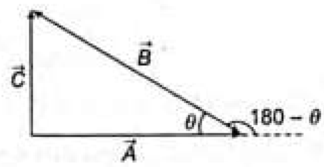
So $\quad \Delta a=0$

3. Given that $\vec{A}+\vec{B}=\vec{C}$ and that $\vec{C}$ is perpendicular to $\vec{A}$. Further if $|\vec{A}|=|\vec{C}|$, then what is the angle between $\vec{A}$ and $\vec{B}$?

(a) $\dfrac{\pi}{4}$ radian (b) $\dfrac{\pi}{2}$ radian
(c) $\dfrac{3\pi}{4}$ radian (d) π radian

Sol. (c) $A=C$

$\tan\theta=\dfrac{C}{A}=1$



$\Rightarrow \quad \theta=45°=\dfrac{\pi}{4}$

Angle between $\vec{A}$ and $\vec{B}$ is

$$180-\theta=180°-45°=135°=\frac{3\pi}{4}\text{rad}$$

4. Which pair of the following forces will never give resultant force of 2 N?

(a) 2 N and 2 N (b) 1 N and 1 N
(c) 1 N and 3 N (d) 1 N and 4 N

Sol. (d) If two vectors A and B are given then range of their resultant can be written as $(A-B)\le R\le(A+B)$.

i.e. $\quad R_{max}=A+B$ and $R_{min}=A-B$

If $B = 1$ and $A = 4$ then their resultant will lies in between 3 N and 5 N. It can never be 2 N.

If these three vectors are represented by three sides of triangle then they form equilateral triangle.

5. If the sum of two unit vectors is a unit vector, then magnitude of difference is

(a) $\sqrt{2}$ (b) $\sqrt{3}$

(c) $1/\sqrt{2}$ (d) $\sqrt{5}$

Sol. (b) Let $\hat{n}_1$ and $\hat{n}_2$ are the two unit vectors, then the sum is

$$\hat{n}_s = \hat{n}_1 + \hat{n}_2 \text{ or } n_s^2 = n_1^2 + n_2^2 + 2n_1n_2\cos\theta$$
$$= 1 + 1 + 2\cos\theta$$

Since it is given that n_s is also a unit vector, therefore

$$1 = 1 + 1 + 2\cos\theta \Rightarrow \cos\theta = -\frac{1}{2}$$

$\therefore \quad \theta = 120°$

Now the difference vector is

$$\hat{n}_d = \hat{n}_1 - \hat{n}_2$$

or $\quad n_d^2 = n_1^2 + n_2^2 - 2n_1n_2\cos\theta = 1 + 1 - 2\cos(120°)$

$\therefore \quad n_d^2 = 2 - 2(-1/2) = 2 + 1 = 3 \Rightarrow n_d = \sqrt{3}$

6. The sum of the magnitudes of two forces acting at point is 18 and the magnitude of their resultant is 12. If the resultant is at 90° with the force of smaller magnitude, what are the magnitudes of forces?

(a) 12, 5 (b) 14, 4

(c) 5, 13 (d) 10, 8

Sol. (c) Let P be the smaller force and Q be the greater force, then according to the problem

$$P + Q = 18 \quad \text{...(i)}$$

$$R = \sqrt{P^2 + Q^2 + 2PQ\cos\theta} = 12 \quad \text{...(ii)}$$

$$\tan\phi = \frac{Q\sin\theta}{P + Q\cos\theta} = \tan 90 = \infty$$

$\therefore \quad P + Q\cos\theta = 0 \quad$ ...(iii)

By solving (i), (ii) and (iii) we will get $P = 5$, and $Q = 13$

7. A person moves 30 m north and then 20 m towards east and finally $30\sqrt{2}$ m in south-west direction. The displacement of the person from the origin will be

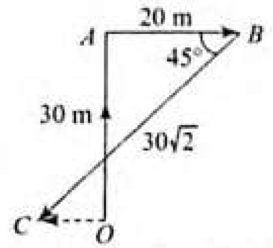
(a) 10 m along north

(b) 10 m long south

(c) 10 m along west

(d) Zero

Sol. (c) From figure, $\overline{OA} = 0\hat{i} + 30\hat{j}, \overline{AB} = 20\hat{i} + 0\hat{j}$



$$\overline{BC} = -30\sqrt{2}\cos 45°\hat{i} - 30\sqrt{2}\sin 45°\hat{j} = -30\hat{i} - 30\hat{j}$$

$\therefore \quad$ Net displacement, $\overline{OC} = \overline{OA} + \overline{OB} + \overline{BC} = -10\hat{j} + 0\hat{j}$

$|\overline{OC}| = 10$ m

8. If a vector $2\hat{i} + 3\hat{j} + 8\hat{k}$ is perpendicular to the vector $4\hat{j} - 4\hat{i} + \alpha\hat{k}$. Then the value of α is

(a) -1 (b) $\frac{1}{2}$

(c) $-\frac{1}{2}$ (d) 1

Sol. (c) Given vectors can be rewritten as $\vec{A} = 2\hat{i} + 3\hat{j} + 8\hat{k}$ and $\vec{B} = -4\hat{i} + 4\hat{j} + \alpha\hat{k}$

Dot product of these vectors should be equal to zero because they are perpendicular.

$\therefore \quad \vec{A}\cdot\vec{B} = -8 + 12 + 8\alpha = 0 \Rightarrow 8\alpha = -4 \Rightarrow \alpha = -1/2$

9. The vector sum of two forces is perpendicular to their vector differences. In that case, the forces

(a) are equal to each other in magnitude

(b) are not equal to each other in magnitude

(c) cannot be predicted

(d) are equal to each other

Sol. (a) If two vectors are perpendicular then their dot product must be equal to zero. According to problem

$$(\vec{A} + \vec{B}).(\vec{A} - \vec{B}) = 0 \Rightarrow \vec{A}.\vec{A} - \vec{A}.\vec{B} + \vec{B}.\vec{A} - \vec{B}.\vec{B} = 0$$

$\Rightarrow \quad A^2 - B^2 = 0 \Rightarrow A^2 = B^2$

$\therefore \quad A = B$ i.e., two vectors are equal to each other in magnitude.

10. If for two vector $\vec{A}$ and $\vec{B}$, sum $(\vec{A} + \vec{B})$ is perpendicular to the difference $(\vec{A} - \vec{B})$. The ratio of their magnitude is

(a) 1 (b) 2

(c) 3 (d) None of these

Sol. (a) $(\vec{A} + \vec{B})$ is perpendicular to $(\vec{A} - \vec{B})$. Thus

$$(\vec{A} + \vec{B})\cdot(\vec{A} - \vec{B}) = 0$$

or $\quad A^2 + \vec{B}\cdot\vec{A} - \vec{A}\cdot\vec{B} - B^2 = 0$

Because of commutative property of dot product $\vec{A}\cdot\vec{B} = \vec{B}\cdot\vec{A}$

$\therefore \quad A^2 - B^2 = 0$ or $A = B$

Thus the ratio of magnitudes $A/B = 1$

11. If $\vec{A} \times \vec{B} = \vec{C}$, then which of the following statements is wrong

(a) $\vec{C} \perp \vec{A}$ (b) $\vec{C} \perp \vec{B}$

(c) $\vec{C} \perp (\vec{A} + \vec{B})$ (d) $\vec{C} \perp (\vec{A} \times \vec{B})$

Sol. (d) From the property of vector product, we notice that $\vec{C}$ must be perpendicular to the plane formed by vector $\vec{A}$ and $\vec{B}$. Thus $\vec{C}$ is perpendicular to both $\vec{A}$ and $\vec{B}$ and $(\vec{A} + \vec{B})$ vector also must lie in the plane formed by vector $\vec{A}$ and $\vec{B}$. Thus $\vec{C}$ must be perpendicular to $(\vec{A} + \vec{B})$ but the cross product $(\vec{A} \times \vec{B})$ gives a vector $\vec{C}$ which cannot be perpendicular to itself. Thus the last statement is wrong.

12. A vector $\vec{A}$ points vertically upward and $\vec{B}$ points towards north. The vector product $\vec{A} \times \vec{B}$ is

(a) Zero (b) Along west

(c) Along east (d) Vertically downward

Sol. (b) Direction of vector A is along z-axis

$\therefore \quad \vec{A} = a\hat{k}$

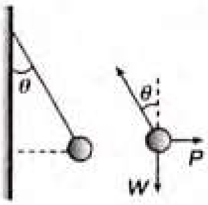
Direction of vector B is towards north

$\therefore \quad \vec{B} = b\hat{j}$

Now $\vec{A} \times \vec{B} = a\hat{k} \times b\hat{j} = ab(-\hat{i})$

$\therefore$ The direction is $\vec{A} \times \vec{B}$ is along west.

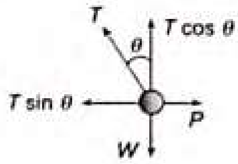
13. A metal sphere is hung by a string fixed to a wall. The sphere is pushed away from the wall by a stick. The forces acting on the sphere are shown in the second diagram. Which of the following statements is wrong?



(a) $P = W \tan \theta$ (b) $\vec{T} + \vec{P} + \vec{W} = 0$

(c) $T^2 = P^2 + W^2$ (d) $T = P + W$

Sol. (c)



As the metal sphere is in equilibrium under the effect of three forces therefore $\vec{T} + \vec{P} + \vec{W} = 0$

From the figure

$$T \cos \theta = W \qquad \text{...(i)}$$

$$T \sin \theta = P \qquad \text{...(ii)}$$

From equations (i) and (ii), we get $P = W \tan \theta$ and $T^2 = P^2 + W^2$

EXERCISES

Vector Addition

1. The magnitudes of vectors $\vec{A}, \vec{B}$ and are 3, 4 and 5 units respectively. If $\vec{A} + \vec{B} = \vec{C}$, the angle between $\vec{A}$ and $\vec{B}$ is

(a) $\frac{\pi}{2}$ (b) $\cos^{-1}(0.6)$

(c) $\tan^{-1}\left(\frac{7}{5}\right)$ (d) $\frac{\pi}{4}$

2. Five equal forces of 10 N each are applied at one point and all are lying in one plane. If the angles between them are equal, the resultant force will be

(a) Zero (b) 10 N

(c) 20 N (d) $10\sqrt{2}$ N

3. A car travels 6 km towards north at an angle of 45° to the east and then travels distance of 4 km towards north at an angle of 135° to the east. How far is the point from the starting point? What angle does the straight line joining its initial and final position makes with the east?

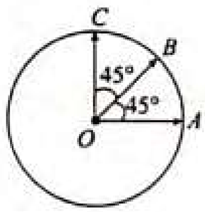
(a) $\sqrt{50}$ km and $\tan^{-1}(5)$

(b) 10 km and $\tan^{-1}(\sqrt{5})$

(c) $\sqrt{52}$ km and $\tan^{-1}(5)$

(d) $\sqrt{52}$ km and $\tan^{-1}(\sqrt{5})$

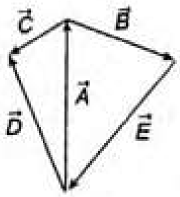
4. Find the resultant of three vectors $\overline{OA}, \overline{OB}$ and $\overline{OC}$ shown in the following figure. Radius of the circle is R.



(a) $2R$ (b) $R(1 + \sqrt{2})$

(c) $R\sqrt{2}$ (d) $R(\sqrt{2} - 1)$

5. In figure, $\vec{E}$ equals



(a) $\vec{A}$ (b) $\vec{B}$
(c) $\vec{A}+\vec{B}$ (d) $-(\vec{A}+\vec{B})$

6. If $\vec{P}=\vec{Q}$ then which of the following is NOT correct
(a) $\hat{P}=\hat{Q}$ (b) $|\vec{P}|=|\vec{Q}|$
(c) $P\hat{Q}=Q\hat{P}$ (d) $\vec{P}+\vec{Q}=\hat{P}+\hat{Q}$

7. Three concurrent forces of the same magnitude are in equilibrium. What is the angle between the forces? Also name the triangle formed by the forces as sides
(a) 60° equilateral triangle
(b) 120° equilateral triangle
(c) 120°, 30°, 30° an isosceles triangle
(d) 120° an obtuse angled triangle

8. A force is inclined at 60° to the horizontal. If its rectangular component in the horizontal direction is 50 N, then magnitude of the vertical component of force is approximately
(a) 25 N (b) 84 N
(c) 87 N (d) 90 N

9. In the following options you are given the magnitudes of three forces in Newton acting simultaneously on a body. Find the set for which the resultant force on the body can be zero.
(a) 10, 8, 2 (b) 15, 30, 14
(c) 40, 19, 17 (d) 10, 20, 35

10. Given that $\vec{A}+\vec{B}=\vec{C}$ and that $\vec{C}$ is perpendicular to $\vec{A}$. Further if $|\vec{A}|=|\vec{C}|$, then what is the angle between $\vec{A}$ and $\vec{B}$?
(a) $\frac{\pi}{4}$ radian (b) $\frac{\pi}{2}$ radian
(c) $\frac{3\pi}{4}$ radian (d) π radian

Resultant of Vectors

11. What is the angle between $\vec{P}$ and the resultant of $(\vec{P}+\vec{Q})$ and $(\vec{P}-\vec{Q})$
(a) Zero (b) $\tan^{-1}(P/Q)$
(c) $\tan^{-1}(Q/P)$ (d) $\tan^{-1}(P-Q)/(P+Q)$

12. A force of 6 kg and another of 8 kg can be applied together to produce the effect of a single force of
(a) 1 kg (b) 9 kg
(c) 15 kg (d) 22 kg

13. There are two force vectors, one of 5 N and other of 12 N at what angle the two vectors be added to get resultant vector of 17 N, 7 N and 13 N respectively
(a) 0°, 180° and 90° (b) 0°, 90° and 180°
(c) 0°, 90° and 90° (d) 180°, 0° and 90°

14. Let $\vec{C}=\vec{A}+\vec{B}$ then
(a) $|\vec{C}|$ is always greater then $|\vec{A}|$
(b) It is possible to have $|\vec{C}|<|\vec{A}|$ and $|\vec{C}|<|\vec{B}|$
(c) C is always equal to $A+B$
(d) C is never equal to $A+B$

15. When two vectors of magnitudes P and Q are inclined at an angle θ the magnitude of their resultant $2P$. When the inclination is changed to $180-\theta$ the magnitude of the resultant is halved. Find the ratio of P to Q.
(a) $\sqrt{2}:\sqrt{3}$ (b) $1:\sqrt{3}$
(c) $1:\sqrt{2}$ (d) $\sqrt{3}:\sqrt{2}$

16. Two forces of magnitudes P and Q are inclined at an angle (θ) the magnitude of their resultant is $3Q$. When the inclination is changed to $(180-\theta)$ the magnitude of the resultant force becomes Q. The ratio of the forces $\left(\frac{P}{Q}\right)$ is
(a) $\frac{4}{1}$ (b) $\frac{2}{1}$
(c) $\frac{1}{4}$ (d) $\frac{1}{2}$

17. Two forces, each of magnitude F have a resultant of the same magnitude F. The angle between the two forces is
(a) 45° (b) 120°
(c) 150° (d) 60°

18. The resultant of $\vec{A}+\vec{B}$ is $\vec{R}_1$ On reversing the vector $\vec{B}$ the resultant becomes $\vec{R}_2$. What is the value of $R_1^2+R_2^2$?
(a) A^2+B^2 (b) A^2-B^2
(c) $2(A^2+B^2)$ (d) $2(A^2-B^2)$

19. The sum of two forces acting at a point is 16 N. If the resultant force is 8 N and its direction is perpendicular to minimum force then the forces are
(a) 6 N and 10 N (b) 8 N and 8 N
(c) 4 N and 12 N (d) 2 N and 14 N

20. If vectors P, Q and R have magnitude 5, 12 and 13 units and $\vec{P}+\vec{Q}=\vec{R}$, the angle between Q and R is
(a) $\cos^{-1}\frac{5}{12}$ (b) $\cos^{-1}\frac{5}{13}$
(c) $\cos^{-1}\frac{12}{13}$ (d) $\cos^{-1}\frac{7}{13}$

Expressing Vectors in Unit Vector Notation

21. The expression $\left(\frac{1}{\sqrt{2}}\hat{i}+\frac{1}{\sqrt{2}}\hat{j}\right)$ is a
(a) Unit vector
(b) Null vector
(c) Vector of magnitude $\sqrt{2}$
(d) Scalar

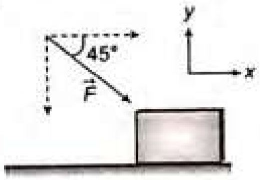
22. The unit vector along $\hat{i}+\hat{j}$ is
(a) $\hat{k}$ (b) $\hat{i}+\hat{j}$
(c) $\frac{\hat{i}+\hat{j}}{\sqrt{2}}$ (d) $\frac{\hat{i}+\hat{j}}{2}$

23. A vector is represented by $3\hat{i}+\hat{j}+2\hat{k}$. Its length in XY plane is
(a) 2 (b) $\sqrt{14}$
(c) $\sqrt{10}$ (d) $\sqrt{5}$

24. The angle made by the vector $A=\hat{i}+\hat{j}$ with x- axis is
(a) 90° (b) 45°
(c) 22.5° (d) 30°

25. If a unit vector is represented by $0.5\hat{i}+0.8\hat{j}+c\hat{k}$, then the value of '$c$' is
(a) 1 (b) $\sqrt{0.11}$
(c) $\sqrt{0.01}$ (d) $\sqrt{0.39}$

26. A person pushes a box kept on a horizontal surface with force of 100 N. In unit vector notation force can be expressed as



(a) $100(\hat{i}+\hat{j})$ (b) $100(\hat{i}-\hat{j})$
(c) $50\sqrt{2}(\hat{i}-\hat{j})$ (d) $50\sqrt{2}(\hat{i}+\hat{j})$

27. Determine a vector which when added to the resultant of $\vec{A}=2\hat{i}+5\hat{j}-\hat{k}$ and $\vec{B}=3\hat{i}-4\hat{j}-\hat{k}$ gives unit vector along negative y direction.
(a) $-5\hat{i}-2\hat{j}+2\hat{k}$ (b) $-5\hat{i}-\hat{j}+\hat{k}$
(c) $-5\hat{i}-\hat{j}+2\hat{k}$ (d) $5\hat{i}-\hat{j}+2\hat{k}$

28. If a particle moves from point P (2,3,5) to point Q (3,4,5). Its displacement vector be
(a) $\hat{i}+\hat{j}+10\hat{k}$ (b) $\hat{i}+\hat{j}+5\hat{k}$
(c) $\hat{i}+\hat{j}$ (d) $2\hat{i}+4\hat{j}+6\hat{k}$

29. Following forces start acting on a particle at rest at the origin of the co-ordinate system simultaneously
$\vec{F}_1=-4\hat{i}-5\hat{j}+5\hat{k}$, $\vec{F}_2=5\hat{i}+8\hat{j}+6\hat{k}$, $\vec{F}_3=-3\hat{i}+4\hat{j}-7\hat{k}$ and $\vec{F}_4=2\hat{i}-3\hat{j}-2\hat{k}$ then the particle will move
(a) In x–y plane (b) In y–z plane
(c) In x–z plane (d) Along x-axis

30. The unit vector parallel to the resultant of the vectors $\vec{A}=4\hat{i}+3\hat{j}+6\hat{k}$ and $\vec{B}=-\hat{i}+3\hat{j}-8\hat{k}$ is
(a) $\frac{1}{7}(3\hat{i}+6\hat{j}-2\hat{k})$ (b) $\frac{1}{7}(3\hat{i}+6\hat{j}+2\hat{k})$
(c) $\frac{1}{49}(3\hat{i}+6\hat{j}-2\hat{k})$ (d) $\frac{1}{49}(3\hat{i}-6\hat{j}+2\hat{k})$

Dot Product

31. Angle between the vectors $(\hat{i}+\hat{j})$ and $(\hat{j}-\hat{k})$ is
(a) 90° (b) 0°
(c) 180° (d) 60°

32. Two forces $\vec{F}_1=5\hat{i}+10\hat{j}-20\hat{k}$ and $\vec{F}_2=10\hat{i}-5\hat{j}-15\hat{k}$ act on a single point. The angle between $\vec{F}_1$ and $\vec{F}_2$ is nearly
(a) 30° (b) 45°
(c) 60° (d) 90°

33. Let $\vec{A}=\hat{i}A\cos\theta+\hat{j}A\sin\theta$ be any vector. Another vector $\vec{B}$ which is normal to A is
(a) $\hat{i}B\cos\theta+\hat{j}B\sin\theta$ (b) $\hat{i}B\sin\theta+\hat{j}B\cos\theta$
(c) $\hat{i}B\sin\theta-\hat{j}B\cos\theta$ (d) $\hat{i}B\cos\theta-\hat{j}B\sin\theta$

34. The angles which a vector $\hat{i}+\hat{j}+\sqrt{2}\,\hat{k}$ makes with X, Y and Z axes respectively are
(a) 60°, 60°, 60° (b) 45°, 45°, 45°
(c) 60°, 60°, 45° (d) 45°, 45°, 60°

35. If a vector $\vec{P}$ making angles α, β, and γ respectively with the X, Y and Z axes respectively.
Then $\sin^2\alpha+\sin^2\beta+\sin^2\gamma=$
(a) 0 (b) 1
(c) 2 (d) 3

36. Consider a vector $\vec{F}=4\hat{i}-3\hat{j}$. Another vector that is perpendicular to $\vec{F}$ is
(a) $4\hat{i}+3\hat{j}$ (b) $6\hat{i}$
(c) $7\hat{k}$ (d) $3\hat{i}-4\hat{j}$

37. If $|\vec{V}_1+\vec{V}_2|=|\vec{V}_1-\vec{V}_2|$ and V_2 is finite, then
(a) V_1 is parallel to V_2
(b) $\vec{V}_1=\vec{V}_2$
(c) V_1 and V_2 are mutually perpendicular
(d) $|\vec{V}_1|=|\vec{V}_2|$

38. If $\vec{P}\cdot\vec{Q} = PQ$, then angle between $\vec{P}$ and $\vec{Q}$ is
(a) $0°$ (b) $30°$
(c) $45°$ (d) $60°$

39. When $\vec{A}\cdot\vec{B} = -|A|\,|B|$ then
(a) $\vec{A}$ and $\vec{B}$ are perpendicular to each other
(b) $\vec{A}$ and $\vec{B}$ act in the same direction
(c) $\vec{A}$ and $\vec{B}$ act in the opposite direction
(d) $\vec{A}$ and $\vec{B}$ can act in any direction

40. The component of vector $A = 2\hat{i} + 3\hat{j}$ along the vector $\hat{i}+\hat{j}$ is
(a) $\dfrac{5}{\sqrt{2}}$ (b) $10\sqrt{2}$
(c) $5\sqrt{2}$ (d) 5

Cross Product

41. Vector $\vec{A}$ makes equal angles with x, y and z axis. Value of its components (in terms of magnitude of $\vec{A}$) will be
(a) $\dfrac{A}{\sqrt{3}}$ (b) $\dfrac{A}{\sqrt{2}}$
(c) $\sqrt{3}A$ (d) $\dfrac{\sqrt{3}}{A}$

42. If for two vectors $\vec{A}$ and $\vec{B}$, $\vec{A}\times\vec{B} = 0$, the vectors
(a) are perpendicular to each other
(b) are parallel to each other
(c) act at an angle of $60°$
(d) act at an angle of $30°$

43. What is the angle between $(\vec{P}+\vec{Q})$ and $(\vec{P}\times\vec{Q})$?
(a) 0 (b) $\dfrac{\pi}{2}$
(c) $\dfrac{\pi}{4}$ (d) π

44. What is the unit vector perpendicular to the following vectors $2\hat{i}+2\hat{j}-\hat{k}$ and $6\hat{i}-3\hat{j}+2\hat{k}$?
(a) $\dfrac{\hat{i}+10\hat{j}-18\hat{k}}{5\sqrt{17}}$ (b) $\dfrac{\hat{i}-10\hat{j}+18\hat{k}}{5\sqrt{17}}$
(c) $\dfrac{\hat{i}-10\hat{j}-18\hat{k}}{5\sqrt{17}}$ (d) $\dfrac{\hat{i}+10\hat{j}+18\hat{k}}{5\sqrt{17}}$

45. If A = 5 units, B = 6 units and $|\vec{A}\times\vec{B}| = 15$ units, then what is the angle between $\vec{A}$ and $\vec{B}$?
(a) $30°$ (b) $60°$
(c) $90°$ (d) $120°$

46. Three vectors $\vec{A}, \vec{B}$ and $\vec{C}$ satisfy the relation $\vec{A}.\vec{B} = 0$ and $\vec{A}.\vec{C} = 0$. The vector $\vec{A}$ is parallel to
(a) $\vec{B}$ (b) $\vec{C}$
(c) $\vec{B}\times\vec{C}$ (d) $\vec{B}+\vec{C}$

47. If a vector $\vec{A}$ is parallel to another vector $\vec{B}$, then the resultant of the vector $\vec{A}\times\vec{B}$ will be equal to
(a) A (b) $\vec{A}$
(c) Zero vector (d) Zero

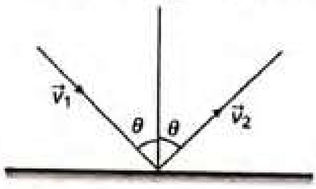
48. Which of the following is the unit vector perpendicular to $\vec{A}$ and $\vec{B}$?
(a) $\dfrac{\hat{A}\times\hat{B}}{AB\sin\theta}$ (b) $\dfrac{\hat{A}\times\hat{B}}{AB\cos\theta}$
(c) $\dfrac{\vec{A}\times\vec{B}}{AB\sin\theta}$ (d) $\dfrac{\vec{A}\times\vec{B}}{AB\cos\theta}$

49. Two vector $\vec{A}$ and $\vec{B}$ have equal magnitudes. Then the vector $\vec{A}+\vec{B}$ is perpendicular to
(a) $\vec{A}\times\vec{B}$ (b) $\vec{A}-\vec{B}$
(c) $3\vec{A}-3\vec{B}$ (d) All of these

50. The value of $(\vec{A}+\vec{B})\times(\vec{A}-\vec{B})$ is
(a) 0 (b) $A^2 - B^2$
(c) $\vec{B}\times\vec{A}$ (d) $2(\vec{B}\times\vec{A})$

Problems Based on Mixed Concepts

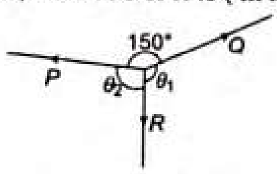
51. An object of m kg with speed of v m/s strikes a wall at an angle θ and rebounds at the same speed and same angle. The magnitude of the change in momentum of the object will be



(a) $2\,mv\cos\theta$ (b) $2\,mv\sin\theta$
(c) 0 (d) $2\,mv$

52. Three vectors $\vec{a}, \vec{b}$ and $\vec{c}$ satisfy the relation $\vec{a}\cdot\vec{b} = 0$ and $\vec{a}.\vec{c} = 0$. The vector $\vec{a}$ is parallel to
(a) $\vec{b}$ (b) $\vec{c}$
(c) $\vec{b}.\vec{c}$ (d) $\vec{b}\times\vec{c}$

53. P, Q and R are three coplanar forces acting at a point and are in equilibrium. Given P = 1.9318 kg wt, $\sin\theta_1 = 0.9659$, the value of R is (in kg wt.)



(a) 0.9659 (b) 2
(c) 1 (d) $\dfrac{1}{2}$

54. If the resultant of two forces of magnitude p and $2p$ is perpendicular to p, then the angle between the forces is
   (a) $\frac{2\pi}{3}$ (b) $\frac{3\pi}{4}$
   (c) $\frac{4\pi}{5}$ (d) $\frac{5\pi}{6}$

55. A car is moving on a straight road due north with a uniform speed of 50 km h^{-1} when it turns left through 90°. If the speed remains unchanged after turning, the change in the velocity of the car in the turning process is
   (a) zero
   (b) $50\sqrt{2}$ km h^{-1} S-W direction
   (c) $50\sqrt{2}$ km h^{-1} N-W direction
   (d) 50 km h^{-1} due west

56. What can be the angle between $(\vec{P}+\vec{Q})$ and $(\vec{P}-\vec{Q})$?
   (a) 90°
   (b) 0° only
   (c) any angle between 0° and 180°
   (d) 180° only

57. A sail boat sails 2 km due East, 5 km 37° South of East and finally an unknown displacement. If the final displacement of the boat from the starting point is 6 km due East, determine the third displacement.
   (a) 3 km, North (b) 4 km, South
   (c) 5 km, East (a) 3 km, West

58. A particle travels with speed 50 m/s from the point (3 m, −7 m) in a direction $7\hat{i}-24\hat{j}$. Find its position vector after 3 seconds.
   (a) $(45\hat{i}-125\hat{j})$ m (b) $(45\hat{i}-151\hat{j})$ m
   (c) $(45\hat{i}+125\hat{j})$ m (b) $(35\hat{i}-115\hat{j})$ m

59. A particle moves so that its position vector varies with time as $\vec{r}=A\cos\omega t\,\hat{i}+A\sin\omega t\,\hat{j}$. The initial velocity of the particle is
   (a) $A\omega\hat{i}$ (b) $A\omega\hat{j}$
   (c) $A\omega(\hat{i}+\hat{j})$ (d) $A\omega(\hat{i}-\hat{j})$

60. A vector of magnitude 10 N acting in XY-plane has components 8 N and 6 N along positive X-axis and positive Y-axis, respectively. The coordinate system is rotated about Z-axis through angle 90° in anti-clockwise direction. Find x-component and y-component in new coordinate system.
   (a) $F_x = 8\,\text{N}, F_y = 6\,\text{N}$
   (b) $F_x = 6\,\text{N}, F_y = 8\,\text{N}$
   (c) $F_x = 6\,\text{N}, F_y = -8\,\text{N}$
   (d) $F_x = 6\,\text{N}, F_y = -8\,\text{N}$

ARCHIVES

1. A particle moves towards east with velocity 5 m/s. After 10 seconds its direction changes towards north with same velocity. The average acceleration of the particle is
   (a) Zero (b) $\frac{1}{\sqrt{2}}$ m/s^2 N – W
   (c) $\frac{1}{\sqrt{2}}$ m/s^2 N – E (d) $\frac{1}{\sqrt{2}}$ m/s^2 S – W
   (IIT-JEE 1982)

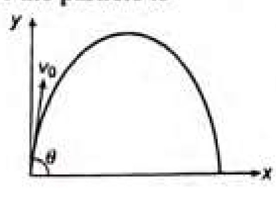
2. A force $\vec{F}=-K(y\hat{i}+x\hat{j})$ (where K is a positive constant) acts on a particle moving in the x-y plane. Starting from the origin, the particle is taken along the positive x-axis to the point $(a, 0)$ and then parallel to the y-axis to the point (a, a). The total work done by the forces $\vec{F}$ on the particle is
   (a) $-2Ka^2$ (b) $2Ka^2$
   (c) $-Ka^2$ (d) Ka^2 **(IIT-JEE 1998)**

3. The sum of the magnitudes of two forces acting at point is 18 and the magnitude of their resultant is 12. If the resultant is at 90° with the force of smaller magnitude, what are the, magnitudes of forces
   (a) 12, 5 (b) 14, 4
   (c) 5, 13 (d) 10, 8
   (AIEEE 2002)

4. If $\vec{A}\times\vec{B}=\vec{B}\times\vec{A}$ then the angle between A and B is
   (a) $\pi/2$ (b) $\pi/3$
   (c) π (d) $\pi/4$ **(AIEEE 2004)**

5. A particle has an initial velocity $3\hat{i}+4\hat{j}$ and an acceleration of $0.4\hat{i}+0.3\hat{j}$. Its speed after 10 s
   (a) 10 units (b) $7\sqrt{2}$ units
   (c) 7 units (d) 8.5 units
   (AIEEE 2009)

6. A small particle of mass m is projected at an angle q with the x-axis with an initial velocity v_0 in the x-y plane as shown in the figure. At a time $t<\frac{v_0\sin\theta}{g}$, the angular momentum of the particle is

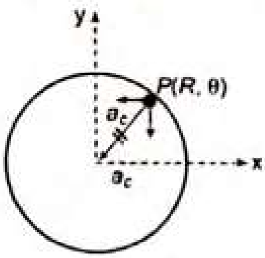


(a) $-mgv_0t^2\cos\theta\,\hat{j}$ (b) $mgv_0t\cos\theta\,\hat{k}$

(c) $-\frac{1}{2}mgv_0t^2\cos\theta\,\hat{k}$ (d) $\frac{1}{2}mgv_0t^2\cos\theta\,\hat{i}$

(AIEEE 2010)

7. For a particle in uniform circular motion the acceleration $\vec{a}$ at a point $P(R, \theta)$ on the circle of radius R is (here θ is measured from the x-axis)



(a) $-\frac{v^2}{R}\cos\theta\,\hat{i}+\frac{v^2}{R}\sin\theta\,\hat{j}$

(b) $-\frac{v^2}{R}\sin\theta\,\hat{i}+\frac{v^2}{R}\cos\theta\,\hat{j}$

(c) $-\frac{v^2}{R}\cos\theta\,\hat{i}-\frac{v^2}{R}\sin\theta\,\hat{j}$

(d) $\frac{v^2}{R}\hat{i}+\frac{v^2}{R}\hat{j}$ **(AIEEE 2010)**

8. A particle is moving with velocity $\vec{v}=K(y\hat{i}+x\hat{j})$, where K is a constant. The general equation for its path is

(a) $y=x^2+\text{constant}$ (b) $y^2=x+\text{constant}$

(c) $xy=\text{constant}$ (d) $y^2=x^2+\text{constant}$

(AIEEE 2010)

9. A projectile is given an initial velocity of $(\hat{i}+2\hat{j})$ m/s where $\hat{i}$ is along the ground and $\hat{j}$ is along the vertical. If $g = 10$ m/s^2, the equation of its trajectory is

(a) $y=x-5x^2$ (b) $y=2x-5x^2$

(c) $4y=2x-5x^2$ (d) $4y=2x-25x^2$

(JEE Main 2013)

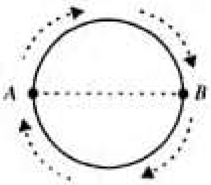
Chapter 3

Motion in One Dimension

DISPLACEMENT AND DISTANCE

When we speak of distance, we should not mistake it as displacement. These two are entirely different quantities. Displacement is a vector quantity. Its magnitude is equal to the "shortest distance" between the initial position and final position of the particle.

ILLUSTRATION 3.1 A particle is moving in a circle of radius R as shown in figure.



(a) What is its displacement when it covers (i) half the circle, (ii) full circle?

(b) What is its distance when it covers (i) half the circle and (ii) full circle?

Solution.

(a) Displacement is the vector drawn from the initial position to the final position, and its magnitude is equal to the shortest distance between the initial and final positions.

(i) Hence, displacement is equal to the diameter of the circle = $2R$.

(ii) As initial and final positions are same, i.e., displacement will be zero.

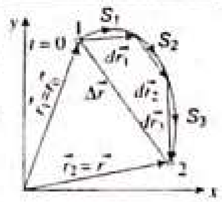
(b) Distance is the length of the path travelled by the particle. Hence, distance travelled in case (i) will be equal to πR. Hence, distance travelled in case (ii) will be equal to $2\pi R$.

Important Results

- Distance is a scalar quantity and displacement is a vector quantity.
- Distance between a given set of initial and final positions can have infinite values but displacement is unique.
- Displacement can be negative, zero, or positive, but distance is never negative. When a body returns to its initial position of starting, its displacement is zero but distance or path length is not zero.
- The magnitude of displacement can never be greater than distance.
- In uniform motion, displacement is equal to distance.
- Displacement is zero if particle returns to initial position.
- Distance does not decrease with time and never be a zero for a moving body.
- Displacement can decrease with time, can be zero or even be negative if the body is returning to its initial position, got initial position, and moves back to the initial position. So the magnitude of displacement is not equal to distance; however, it can be so if the motion is along a straight line without change in direction.
- In general, distance ≥ displacement.

AVERAGE VELOCITY AND AVERAGE SPEED

Average velocity: If at any time t_1 position vector of the particle is and at time t_2 position is $\vec{r}_2$.
Hence, on an average, the position vector changes with time at a rate $\Delta\vec{r}/\Delta t$.



$$\vec{v}_{av} = \frac{\Delta\vec{r}}{\Delta t} = \frac{\vec{r}_2 - \vec{r}_1}{t_2 - t_1}$$

To find the average velocity, we need to know only the total displacement from initial to final position and need not consider the nature of motion between initial and final positions.

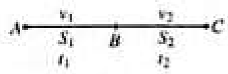
Physical meaning of average velocity: It is that uniform velocity with which if the object is made to move, it will cover the same displacement in a given time as it does with its actual velocity in the same time.

Average speed: If the particle is going a distance D during the time $\Delta t(= t_2 - t_1)$, the average rate of distance covered by it is $D/\Delta t$ for this time interval. We can call this ratio, "average speed" denoted by v_{av}. It is the ratio of total distance d travelled by the particle to the total time taken t in which this distance is travelled.

$$v_{av} = \frac{\text{Total distance}}{\text{Total time taken}} = \frac{s_1 + s_2 + s_3}{\Delta t}$$

NOTE: If motion takes place in same direction, then average speed and average velocity are same.

In the figure, a particle goes from A to C. Distances, velocities and time taken are shown.



$$S_1 = v_1 t_1 \Rightarrow t_1 = \frac{S_1}{v_1};$$

$$S_2 = v_2 t_2 \Rightarrow t_2 = \frac{S_2}{v_2}$$

$$v_{av} = \frac{S_1 + S_2}{t_1 + t_2} = \frac{v_1 t_1 + v_2 t_2}{t_1 + t_2} = \frac{S_1 + S_2}{\frac{S_1}{v_1} + \frac{S_2}{v_2}}$$

NOTE:

- If $t_1 = t_2 = t$, then $v_{av} = \frac{v_1 + v_2}{2}$; average speed is equal to the arithmetical mean of individual speeds.
- If $S_1 = S_2 = S$, then $v_{av} = \frac{2v_1 v_2}{v_1 + v_2}$; average speed is equal to the harmonic mean of individual speeds.

ILLUSTRATION 3.2 A train travels from city A to city B with a constant speed of 10 m s^{-1} and returns back to city A with a constant speed of 20 m s^{-1}. Find its average speed during its entire journey.

Solution. Let the distance between the two cities A and B be x m.

Time taken by the train to travel from A to B $= \frac{x}{10} = t_1$ (say)

Time taken to come back from B to A $= \frac{x}{20} = t_2$ (say)

$$\text{Average speed} = \frac{\text{Total distance}}{\text{Total time}} = \frac{x + x}{t_1 + t_2} = \frac{2x}{\frac{x}{10} + \frac{x}{20}} = \frac{40}{3}\ \text{m s}^{-1}$$

INSTANTANEOUS VELOCITY

When you move to some position and come back to same initial position, you undergo a zero displacement. Hence, your average velocity is zero. It does not mean that you were not moving. The average velocity cannot always define the motion of a particle. Then we require to define the instantaneous velocity. We need to know the instantaneous value of the velocity and speed of a particle to understand its motion.

The time rate of change of position (x) or displacement (s) at any instant of time (t) is known as *instantaneous velocity* or simply *velocity* at that instant of time. It is denoted by v.

Mathematically: $\vec{v} = \lim_{\Delta t \to 0}\left(\frac{\Delta \vec{x}}{\Delta t}\right) = \frac{d\vec{x}}{dt}$

or $\quad \vec{v} = \frac{d\vec{x}}{dt} \quad \left[\text{Also } \vec{v} = \left(\frac{d\vec{s}}{dt}\right)\right]$

In general, if the particle moves in space, then $\vec{r}$ will change and the time rate of change of position vector is known as velocity. Thus,

$$\vec{v} = \frac{d\vec{r}}{dt} = \frac{d}{dt}\left[x\hat{i} + y\hat{j} + z\hat{k}\right]$$

$$= \frac{dx}{dt}\hat{i} + \frac{dy}{dt}\hat{j} + \frac{dz}{dt}\hat{k}$$

$$\Rightarrow \quad \vec{v} = v_x\hat{i} + v_y\hat{j} + v_z\hat{k}$$

where $v_x = \frac{dx}{dt}$, $v_y = \frac{dy}{dt}$, and $v_z = \frac{dz}{dt}$.

ILLUSTRATION 3.3 A particle moves so that its position vector varies with time as $\vec{r} = A\cos\omega t\,\hat{i} + A\sin\omega t\,\hat{j}$. Find the

(a) initial velocity of the particle.

(b) angle between the position vector and velocity of the particle at any time, and

(c) speed at any instant.

Solution.

(a) Position at time t

$\vec{r} = A\cos\omega t\,\hat{i} + A\sin\omega t\,\hat{j}$

Instantaneous velocity, $\vec{v} = \frac{d\vec{r}}{dt}$

We have $\vec{v} = A\frac{d}{dt}(\cos\omega t)\hat{i} + A\frac{d}{dt}(\sin\omega t)\hat{j}$

$= -A\omega\sin\omega t\,\hat{i} + A\omega\cos\omega t\,\hat{j}$

At $t = 0, v = -A\omega\sin 0\,\hat{i} + A\omega\cos 0\,\hat{j} = A\omega\hat{j}$

(b) For calculating the angle between two vectors, we use the concept of dot product of the vectors. The angle θ between $\vec{r}$ and $\vec{v}$ can be given as

$$\theta = \cos^{-1}\frac{\vec{r}.\vec{v}}{|\vec{r}||\vec{v}|}$$

where

$\vec{r}.\vec{v} = (A\cos\omega t\,\hat{i} + A\sin\omega t\,\hat{j}).(-A\omega\sin\omega t\,\hat{i} + A\omega\cos\omega t\,\hat{j})$

$= \omega A^2\,(-\cos\omega t\sin\omega t + \sin\omega t\cos\omega t) = 0$

Hence, $\theta = \cos^{-1} 0 = \pi/2$

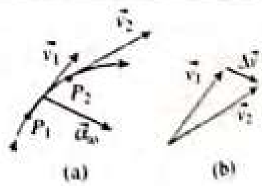
That means $\vec{v} \perp \vec{r}$.

(c) Speed at any time is the magnitude of instantaneous velocity, i.e.,

$v = |\vec{v}| = \sqrt{(-A\omega\sin\omega t)^2 + (A\omega\cos\omega t)^2} = A\omega$

AVERAGE ACCELERATION

If the velocity of a particle at instant t is $\vec{v}_1$ and at instant t_2 is $\vec{v}_2$, then the average acceleration is mathematically given by:



$$\vec{a}_{av} = \frac{\vec{v}_2 - \vec{v}_1}{t_2 - t_1} = \frac{\Delta\vec{v}}{\Delta t}$$

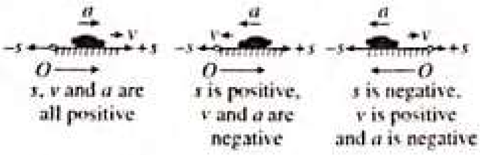
(**Remember** Change in velocity = Final velocity – Initial velocity)

The time rate of change of velocity at any instant of time is known as *instantaneous acceleration* or simply *acceleration* $\left(\vec{a} = \frac{d\vec{v}}{dt}\right)$. Actually, acceleration at an instant is defined as the limit of the average acceleration as the time interval Δt around that instant becomes infinitesimally small.

$$\vec{a} = \lim_{\Delta t \to 0}\left(\frac{\Delta\vec{v}}{\Delta t}\right) = \frac{d\vec{v}}{dt}$$

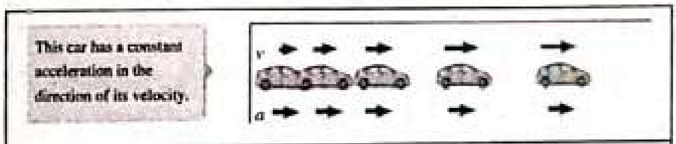
MOTION IN A STRAIGHT LINE

While moving in a straight line, we have two possible directions for acceleration, velocity, and displacement of the particle. Hence, for the sake of simplicity, we need not mention them with their usual vector symbols. Rather we prefer to write them like scalars a, v, s and r and use plus (+) and minus (–) to treat them as vectors keeping their senses (directions) in our minds. Hence, we call the given quantities (s, v, and a) as "algebraic scalars." Conventionally, when $\vec{a}, \vec{v}$, and $\vec{s}$, are directed along positive s-axis we write them as $+a$, $+v$, and $+s$, respectively. If they are directed along negative s-axis, we can write them as negative quantities such as $-a$, $-v$, and $-s$, respectively, as shown in the figure.



Formulae and Concepts for Uniformly Accelerated Motion in a Straight Line

NOTE: Acceleration is said to be constant when both the magnitude and direction of acceleration remain constant. There will be one-dimensional motion if the initial velocity and acceleration are parallel or anti-parallel to each other.



Scalar form	Vector form
$v = u + at$	$\vec{v} = \vec{u} + \vec{a}t$
$s = ut + \frac{1}{2}at^2$	$\vec{s} = \vec{u}t + \frac{1}{2}\vec{a}t^2$
$v^2 = u^2 + 2as$	$\vec{v}.\vec{v} - \vec{u}.\vec{u} = 2\vec{a}.\vec{s}$
$s = \left(\frac{u+v}{2}\right)t$	$\vec{s} = \frac{1}{2}(\vec{u} + \vec{v})t$
$s_n = u + \frac{a}{2}(2n-1)$	$\vec{s}_n = \vec{u} + \frac{\vec{a}}{2}(2n-1)$

ILLUSTRATION 3.4 Consider a particle initially moving with a velocity of 5 m s^{-1} starts decelerating at a constant rate of 2 m s^{-2}.

(a) Determine the time at which the particle becomes stationary.

(b) Find the distance travelled in the second second.

(c) Find the distance travelled in the third second.

Solution.

(a) Here $u = 5$ m s^{-1}, $a = -2$ m s^{-2}, $v = 0$, $t = ?$

Using $v = u + at$, where

$0 = 5 - 2t$

$\Rightarrow \quad t = 2.5$ s

(b) Here $u = 5$ m s^{-1}, $a = -2$ m s^{-2}, $n = 2$.

Using $x_n = u + \frac{a}{2}(2n-1) = 5 - \frac{2}{2}[2(2)-1)] = 2$ m

(c) Here, if we use the above formula, we will get $x_n = 0$, but in reality it is not zero. This formula is not applicable for the third second because velocity becomes zero in the third second, i.e., at $t = 2.5$ s.

The particle has a turning point at $t = 2.5$ s. We have to indirectly calculate the distance travelled in this particular second. That is, we have to determine the distance travelled between 2 s $\le t \le$ 2.5 s and 2.5 s $\le t \le$ 3 s, and then add the two.

Displacement of the particle at $t = 2.5$ s is

$$x_{2.5} = \frac{u^2}{2a} = \frac{(5)^2}{2(2)} = 6.25 \text{ m}$$

Due to symmetry, the displacement of the particle at $t = 2$ s and $t = 3$ s are same, i.e.,

$$x_3 = x_2 = 5(2) + \frac{1}{2}(-2)(2)^2 = 6 \text{ m}$$

Thus, the distance travelled in the third second is

$$x = (x_{2.5} - x_2) + (x_{2.5} - x_3)$$
$$= (6.25 - 6) + (6.25 - 6) = 0.5 \text{ m}$$

Important Results

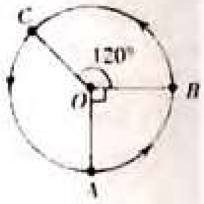
- If a body starts from rest and moves with uniform acceleration, then distance covered by the body in t seconds is proportional to t^2 (i.e. $s \propto t^2$). So we can say that the ratio of distance covered in 1 s, 2 s, and 3 s is or 1 : 4 : 9.
- If a body starts from rest and moves with uniform acceleration, then distance covered by the body in nth second is proportional to $(2n - 1)$ [i.e., $s_n \propto (2n - 1)$].
- So we can say that the ratio of distance covered in I second, II second, and III second is 1 : 3 : 5.
- A body moving with a velocity u is stopped by the application of brakes after covering a distance s. If the same body moves with velocity nu and same braking force is applied on it, then it will come to rest after covering a distance of n^2s. As $v^2 = u^2 - 2as$

  $\Rightarrow 0 = u^2 - 2as \Rightarrow s = u^2/2a \quad \Rightarrow s \propto u^2$ [since a is constant] So we can say that if u becomes n times, then s becomes n^2 times that of previous value.
- A particle moving with uniform acceleration from A to B along a straight line has velocities v_1 and v_2 at A and B, respectively. If C is the mid-point between A and B, then velocity of the particle at C is equal to

  $$v = \sqrt{\frac{v_1^2 + v_2^2}{2}}$$

Concept Application Exercise 3.1

1. A body covers 10 m in the seconds second and 25 m in fifth second of its motion. If the motion is uniformly accelerated, how far will it go in the seventh second?
2. A body moving with uniform acceleration in a straight line describes 25 m in the fifth second and 33 m in the seventh second. Find its initial velocity and acceleration.
3. Figure shows a particle starting from point A, traveling up to B with a speed s, then up to point C with a speed $2s$, and finally upto A with a speed of $3s$. Determine is average speed.



4. A particle moving in a straight line covers half the distance with a speed of 3 ms^{-1}. The other half of the distance is covered in two equal time intervals with speeds of 4.5 ms^{-1} and 7.5 ms^{-1}, respectively. Find the average speed of the particle during this motion.
5. Find the ratio of the distance moved by a free-falling body from rest in fourth and fifth seconds of its journey.
6. Two balls of different masses (one lighter and other heavier) are thrown vertically upwards with the same speed. Which one will pass through the point of projection in the downward direction with greater speed?
7. A car runs at a constant speed on a circular track of radius 200 m, taking 62.8 s on each lap. Find the average velocity and average speed on each lap.
8. A train accelerates from rest for time t_1 at a constant rate a and then it retards at the constant rate b for time t_2 and comes to rest. Find the ratio t_1/t_2.

ONE-DIMENSIONAL MOTION IN A VERTICAL LINE (MOTION UNDER GRAVITY)

When the motion takes place under the effect of *gravitational attractive force* only, the motion is known as free fall. Here free fall does not mean that the particle is falling down only. Even if the particle is rising up or may be momentarily at rest at highest point, but if only gravitational force is acting on it, then also motion will be called free fall.

Sign convention: Any vector quantity directed upward will be taken as positive and directed downward will be taken as negative. According to this sign convention,

1. Displacement will be taken as positive if the final position lies above initial position and negative if the final position lies below initial position.

2. Velocity (initial or final) will be taken as positive if it is upward and negative if it is downward.
3. Acceleration a is always taken to be $-g$.

In equations of motions, when we replace a by $-g$ (minus sign, because acceleration is always directed downward), we get

$$v = u - gt$$

$$s = ut - \frac{1}{2}gt^2$$

$$v^2 = u^2 - 2gs$$

Important Results

- The motion is independent of the mass of the body, as in any equation of motion, mass is not involved. That is why a heavy and light body when released from the same height, reach the ground simultaneously and with same velocity, i.e., $t = \sqrt{(2h/g)}$ and $v = \sqrt{2gh}$.
- In case of motion under gravity, time taken to go up is equal to the time taken to fall down through the same distance.

  Time of descent (t_1) = Time of ascent $(t_2) = u/g$

  $\therefore$ Total time of flight, $T = t_1 + t_2 = \dfrac{2u}{g}$
- In case of motion under gravity, the speed with which a body is projected up is equal to the speed with which it comes back to the point of projection.

  As well as the magnitude of velocity at any point on the path is same whether the body is moving in upwards or downward direction.
- A body is thrown vertically upwards. If air resistance is to be taken into account, then the time of ascent is less than the time of descent $(t_2 > t_1)$.

  Let u be the initial velocity of body, then time of ascent

  $$t_1 = \frac{u}{g+a} \quad \text{and} \quad h = \frac{u^2}{2(g+a)}$$

  where g is acceleration due to gravity and a is retardation by air resistance and for upward motion both will act vertically downward.

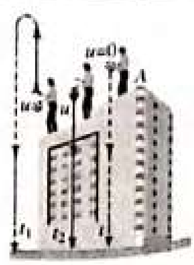
  For downward motion, a and g will act in opposite direction because a always acts in direction opposite to motion and g always acts vertically downward.

  So $h = \frac{1}{2}(g-a)t_2^2$

  $$\Rightarrow \frac{u^2}{2(g+a)} = \frac{1}{2}(g-a)t_2^2 \Rightarrow t_2 = \frac{u}{\sqrt{(g+a)(g-a)}}$$

  Comparing t_1 and t_2, we can say that $t_2 > t_1$ since $(g+a) > (g-a)$

ILLUSTRATION 3.5 A body is thrown vertically upwards from A, the top of a tower (figure). It reaches the ground in time t_1. If it is thrown vertically downwards from A with the same speed it reaches the ground in time t_2. If it is allowed to fall freely from A, then find the time it takes to reach the ground.



Solution. Suppose the body be projected vertically upwards from A with a speed u_0.

Using equation $\quad s = ut + \left(\frac{1}{2}\right)at^2$

For first case, $\quad -h = u_0t_1 - \left(\frac{1}{2}\right)gt_1^2 \qquad$ (i)

For second case, $\quad -h = -u_0t_2 - \left(\frac{1}{2}\right)gt_2^2 \qquad$ (ii)

From (i) − (ii) $\Rightarrow \; 0 = u_0(t_2 + t_1) + \left(\frac{1}{2}\right)g(t_2^2 - t_1^2)$

or $\quad u_0 = \left(\frac{1}{2}\right)g(t_1 - t_2) \qquad$ (iii)

Put the value of u_0 in (ii), we get

$$-h = -\left(\frac{1}{2}\right)g(t_1 - t_2)t_2 - \left(\frac{1}{2}\right)gt_2^2$$

$\Rightarrow \quad h = \frac{1}{2}gt_1t_2 \qquad$ (iv)

For third case, $u = 0$, $t = ?$

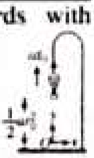
$$-h = 0 \times t - \left(\frac{1}{2}\right)gt^2$$

or $\quad h = \left(\frac{1}{2}\right)gt^2 \qquad$ (v)

Combining (iv) and (v), we get

$$\frac{1}{2}gt^2 = \frac{1}{2}gt_1t_2 \quad \text{or} \quad t = \sqrt{t_1t_2}$$

ILLUSTRATION 3.6 A balloon starts rising upwards with constant acceleration a and after time t_0 second, a packet is dropped from it which reaches the ground after t seconds of dropping (figure). Determine the value of t.



Solution. *Analysis of situation:* $t = 0$ is the time when the balloon started rising up. At $t = t_0$, when the packet is dropped, the balloon is moving up with velocity $v = 0 + at_0 = at_0$. Hence, initial velocity of the packet will be $v_0 = at_0$ (upward). As the balloon has started rising upwards with constant acceleration a, so after t_0 seconds, its height from the ground is $y_0 = \frac{1}{2}at_0^2$.

For packet: $s = ut - -gt$

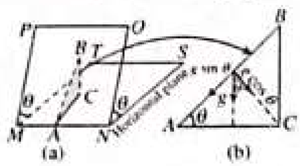
$$\Rightarrow \quad -\frac{1}{2}at_0^2 = at_0t - \frac{1}{2}gt^2 \quad \Rightarrow \quad gt^2 - 2at_0t - at_0^2 = 0$$

Solving the quadratic equation, we get $t = \frac{at_0}{g}\left[1 + \sqrt{1 + \frac{g}{a}}\right]$

MOTION UPON AN INCLINED PLANE

Any plane inclined to the horizontal at a definite angle is said to be an inclined plane, and the corresponding angle is known as the angle of inclination (or simly inclination).

Figure shows a horizontal plane $MNST$ being cut by an inclined plane $MNOP$. Along the line MN, consider any point B upon the inclined. From B, drop perpendiculars BA and BC to the line MN and horizontal plane $MNST$, respectively. Then $\angle BAC$ is said to be the *angle of inclination of the inclined plane.*

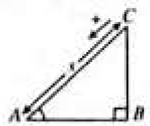


Line AB is said to be the line of greatest slope. If a body is allowed to move freely along the inclined plane, it always chooses the line of greatest slope to move. However, it can be made to move along other line by allowing it to slide along a groove in the desired direction. Figure (b) shows an inclined plane AB with angle of inclination θ. θ is such that $\sin\theta = l/n$. Usually l is chosen as 1.

The inclination is often referred to as "1 in n." It implies that a "1 in n" inclination is such that, there is a vertical rise of 1 unit for every n unit distance travelled along the plane up.

ILLUSTRATION 3.7 (a) Show that the velocity acquired by a particle in sliding down an inclined plane is the same as that acquired by a particle falling freely from rest through a distance equal to the height of the inclined plane. (b) Find the time taken in sliding a particle down the whole length of the incline.

Solution.



(a) Let a particle sliding from C to A along the inclined plane CA acquire a final velocity v_1, covering a distance s (figure). If θ is the angle of inclination, then

$$\sin\theta = \frac{h}{s}$$

Now for the sliding particle, $s = s$, $u = 0$, $a = g\sin\theta$, $v = v_1$.
[Taking the direction C to A as positive]
Using, $v^2 = u^2 + 2as$

$$\Rightarrow \quad v_1^2 = 2(g\sin\theta)s = 2g\left[\frac{h}{s}\right]s = 2gh$$

$\therefore \quad v_1 = \sqrt{2gh} \qquad$ ...(i)

Again, let a particle fall from rest along a distance h and acquire a velocity v_2, then from $v^2 = u^2 + 2as$,

$v_2^2 = 0 + 2gh \Rightarrow v_2 = \sqrt{2gh} \qquad$ ...(ii)

From (i) and (ii), we get the same result.

(b) Time taken in sliding a particle down the entire length of the incline:
For the motion of particle from C to A (figure), $u = 0$, $s = s$, $a = g\sin\theta$, $t = ?$.
Using $s = ut + \frac{1}{2}at^2$, we get $s = \frac{1}{2}(g\sin\theta)t^2$

$$\Rightarrow \quad t^2 = \frac{2s}{g\sin\theta} = \frac{2h}{g\sin^2\theta} \quad \left[\because \sin\theta = \frac{h}{s}\right]$$

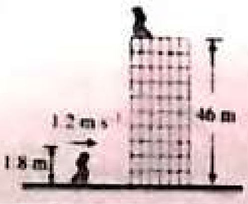
$$\therefore \quad t = \sqrt{\frac{2h}{g}}\operatorname{cosec}\theta$$

Thus, the time taken varies directly as the cosecant of the angle of inclination. Now, since cosecant is a decreasing function in the first quadrant with an increase in θ, time t would decrease.

CONCEPT APPLICATION EXERCISE 3.2

1. A ball is dropped from an elevator at an altitude of 200 m (figure). How much time will the ball take to reach the ground if the elevator is

   (a) Stationary?
   (b) Ascending with velocity 10 m s^{-1}?
   (c) Descending with velocity 10 m s^{-1}?
2. A particle is projected vertically upwards. Prove that it will be at three-fourth of its greatest height at times which are in the ratio 1 : 3.
3. A balloon rises from rest on the ground with constant acceleration $g/8$. A stone is dropped from the balloon when the balloon has risen to a height of H. Find the time taken by the stone to reach the ground.
4. A parachutist, after bailing out, falls 50 m without friction. When the parachute opens, it decelerates at 2 m s^{-2}. He reaches the ground with a speed of 3 m s^{-1}. At what height did he bail out?
5. A ball is dropped from the top of a tower of height h. It covers a distance of $h/2$ in the last second of its motion. How long does the ball remain in air?
6. When a ball is thrown up, it reaches a maximum height h travelling 5 m in the last second. Find the velocity with which the ball should be thrown up.
7. You are on the roof of the physics building, 46.0 m above the ground (figure). Your physics professor, who is 1.80 m tall, is walking alongside the building at a constant speed of 1.20 m s^{-1}. If you wish to drop a flower on your professor's head, where should the professor be when you release the flower? Assume that the flower is in free fall.



RELATIVE MOTION IN ONE DIMENSION

Consider the motion of a car moving towards right and two observers O_1 and O_2 are coming from opposite directions as shown in the figure.

Observer O_1 finds that the car is moving slower while observer O_2 finds that the car is moving faster in comparison to when observer is at rest. The motion of same object looks different for two different observers. To understand such observations, there is need of introduction of the concept of relative velocity.

In figure, two particles A and B are moving with velocities v_A and v_B and accelerations a_A and a_B, respectively.

If x_A and x_B are their respective displacements with respect to the fixed origin, then

- The relative displacement of B w.r.t A is defined as

$$\vec{x}_{BA} = \vec{x}_B - \vec{x}_A \quad \text{...(i)}$$

Differentiating (i) w.r.t time.

- The relative velocity of B with respect to A is defined as

$$\vec{v}_{BA} = \vec{v}_B - \vec{v}_A \quad \text{...(ii)}$$

Differentiating (ii) w.r.t time.

- The relative acceleration of B with respect to A is defined as

$$\vec{a}_{BA} = \vec{a}_B - \vec{a}_A$$

The equations of motion in one dimension are modified as:

$$\vec{v}_{BA} = \vec{u}_{BA} + \vec{a}_{BA}t \quad \Rightarrow \vec{v}_{rel} = \vec{v}_{rel} + \vec{v}_{rel}t$$

$$\vec{x}_{BA} = \vec{u}_{BA}t + \frac{1}{2}\vec{a}_{BA}t^2 \quad \Rightarrow \quad \vec{x}_{rel} = \vec{u}_{rel}t + \frac{1}{2}\vec{a}_{rel}t^2$$

$$v_{rel}^2 - u_{rel}^2 = 2a_{rel}\, x_{rel}$$

The relative velocity of a particle A with respect to B is defined as the velocity with which A appears to move if B is considered to be at rest. In other words, it is the velocity with which A appears to move as seen by B considering itself to be at rest.

NOTE: All velocities are relative and have no significance unless observer is specified. However, when we say "velocity of A," what we mean is that the velocity of A w.r.t. ground which is assumed to be at rest.

$$\vec{v}_{\text{Object, Observer}} = \vec{v}_{\text{Object}} - \vec{v}_{\text{Observer}}$$

or $\quad \vec{v}_{rel} = \vec{v}_{\text{Object}} - \vec{v}_{\text{Observer}}$

ILLUSTRATION 3.8 A car A moves with velocity 20 m s^{-1} and car B with velocity 15 m s^{-1} as shown in figure. Find the relative velocity of B w.r.t. A and A w.r.t. B.

Solution. Let us assume that the right direction is positive.

We are given: $v_A = 20 \text{ m s}^{-1}$, $v_B = 15 \text{ m s}^{-1}$.

Relative velocity of B w.r.t. A:

$$v_{B/A} = v_B - v_A = 15 - 20 = -5 \text{ m s}^{-1}$$

(Negative sign indicates that this relative velocity is in the left direction.)

Relative velocity of A w.r.t. B:

$$v_{A/B} = v_A - v_B = 20 - 15 = 5 \text{ m s}^{-1}$$

(Positive sign indicates that this relative velocity is in the right direction.)

Here the separation between A and B is decreasing with time, hence the velocity of approach of A w.r.t. B is 5 m s^{-1}

ILLUSTRATION 3.9 A car A moves with velocity 15 m s^{-1} and B with velocity 20 m s^{-1} are moving in opposite directions as shown in figure. Find the relative velocity of B w.r.t. A and A w.r.t. B.

Solution. Here also let us assume right direction is positive, then left direction will be negative.

Given: $v_A = -15 \text{ m s}^{-1}$, $v_B = 20 \text{ m s}^{-1}$.

Relative velocity of B w.r.t. A:

$$v_{B/A} = v_B - v_A = 20 - (-15) = 35 \text{ m s}^{-1}$$

(Positive sign indicates that this relative velocity is in right direction.)

Relative velocity of A w.r.t. B:

$$v_{A/B} = v_A - v_B = -15 - 20 = -35 \text{ m s}^{-1}$$

(Negative sign indicates that this relative velocity is in backward direction.)

Here the separation between A and B is increasing with time, hence the velocity of separation is 35 m s^{-1}.

NOTE: $\vec{v}_{B/A}$ and $\vec{v}_{A/B}$ are of equal magnitude but have opposite directions.

ILLUSTRATION 3.10 Two towns A and B are connected by a regular bus service with a bus leaving in either direction every T min. A man cycling with a speed of 20 km h^{-1} in the direction A to B notices that a bus goes past him every 18 min in the direction of his motion, and every 6 min in the opposite direction. What is the period T of the bus service and with what speed (assumed constant) do the buses ply on the road?

Solution. Let speed of each bus $= v \text{ km h}^{-1}$

The distance between the nearest buses plying on either car $= vT$ km ...(i)

For buses going from town A to B:

Relative speed of bus in the direction of motion of man $= (v - 20)$

Buses plying in this direction go past the cyclist after every 18 min. Therefore, separation between the buses $= (v-20)\times\dfrac{18}{60}$

From (i), $(v-20)\times\dfrac{18}{60} = vT$ ...(ii)

For buses coming from B to A:

The relative velocity of bus with respect to man $= (v + 20)$

Buses coming from town B past the cyclist after every 6 min,

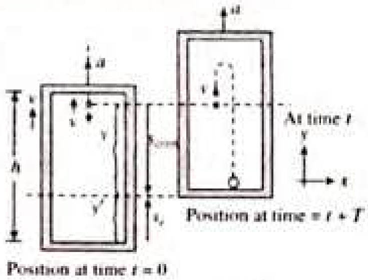
$$\therefore \quad (v+20)\times\frac{6}{60} = vT \qquad \text{... (iii)}$$

Solving (ii) and (iii), we get $v = 40 \text{ km h}^{-1}$ and $T = \dfrac{2}{30}$ h

ILLUSTRATION 3.11 An elevator is moving with an upward acceleration a. A coin is dropped from rest from the roof of the elevator, relative to you. After what time the coin will strike the base of the elevator?

***Solution.* Method 1:** Observation from ground frame

Let us assume that the elevator has a velocity v_0 when the coin loses contact with the elevator at time t. Let the coin strike the base of the elevator after time $t = T$, just below the point of loosing contact with roof of the coin.



In time T, the elevator moves up the displacement y' (upward) and the coin has net displacement $(h - y') = y$ (downward)

For motion of coin

Displacement of coin $= -y = -(h - y)$

Using equation $S = ut + \dfrac{1}{2}at^2$,

$$-(h - y') = v_0 T - \frac{1}{2}gT^2 \qquad \text{(i)}$$

For motion of elevator:

Displacement of elevator during time $T = +y'$

$$+y' = v_0 T + \frac{1}{2}aT^2 \qquad \text{(ii)}$$

Adding (i) and (ii), we have $h = \dfrac{1}{2}(g+a)T^2$

This yields $T = \sqrt{\dfrac{2h}{g+a}}$

Method 2: Analyze the motion of coin with respect to the observer standing in the elevator. As the coin releases from rest inside elevator, its velocity with respect to ground is equal to the velocity of elevator.

Initial relative velocity of coin w.r.t. observer in the elevator,

$$[\vec{u}_{coin}]_{elevator} = [\vec{u}_{coin}]_{ground} - [\vec{u}_{elevator}]_{ground} = u - u = 0$$

and acceleration of coin with respect to the observer in the elevator,

$$[\vec{a}_{coin}]_{elevator} = [\vec{a}_{coin}]_{ground} - [\vec{a}_{elevator}]_{ground}$$

$$= -g - (+a) = -(g + a)$$

Now using second equation for relative motion

$$[\vec{s}_{coin}]_{elevator} = [\vec{u}_{coin}]_{elevator}[\vec{u}_{coin}]_{elevator}t + \frac{1}{2}[\vec{a}_{coin}]_{elevator}t^2$$

$$-h = 0 - \frac{1}{2}(g + a)t^2$$

This yields $t = \sqrt{\dfrac{2h}{g+a}}$

River–Man Problem in One Dimension

The velocity of river water current is u and that of man in still water is v, i.e., man can swim in water with velocity v.

Case 1: Man swimming downstream (along the direction of river flow)

In this case, velocity of river $v_R = +u$

Velocity of man w.r.t. river $v_{mR} = +v$

(a)

Now $\vec{v}_m = \vec{v}_{mR} + \vec{v}_R = u + v$

Case 2: Man swimming upstream (opposite to the direction of river flow)

In this case, velocity of river $\vec{v}_R = -u$

(b)

Velocity of man w.r.t. river $\vec{v}_{mR} = +v$

Now $\vec{v}_m = \vec{v}_{mR} + \vec{v}_R = (v - u)$

ILLUSTRATION 3.12 A swimmer capable of swimming with velocity v relative to water jumps in a flowing river having velocity u. The man swims a distance d down stream and returns back to the original position. Find out the time taken in complete motion.

Solution. Total time = Time of swimming downstream + Time of swimming upstream

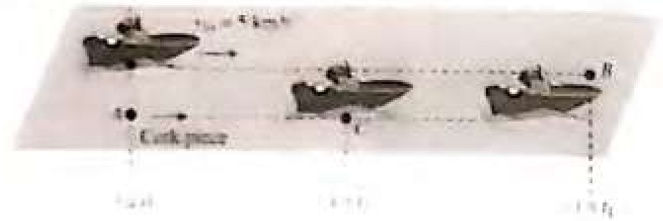
Velocity of the man during swimming downstream = $v + u$

Velocity of the man during swimming upstream = $v - u$

$$t = t_{down} + t_{up} = t_{down} + t_{up} = \frac{d}{v+u} + \frac{d}{v-u} = \frac{2dv}{v^2 - u^2}$$

ILLUSTRATION 3.13 Let us consider a boat which moves with a velocity $v_{bw} = 5\ \text{km h}^{-1}$ relative to water. At time $t = 0$, the boat passes through a piece of cork floating in water while moving downstream. If it turns back at time $t = t_1$, when does the boat meet the cork again? Assume $t_1 = 30$ min.

Solution. Time of travelling of boat from A to B (t_1) and then B to C (t_1') = time of moving the cork from A to C.



Velocity of boat from A to B

$$\vec{v}_{b,w} + \vec{v}_w = (5 + u)\ \text{km h}^{-1}$$

And velocity of boat from B to C

$$\vec{v}_{b,w} - \vec{v}_w = (5 - u)\ \text{km h}^{-1}$$

Distance moved by boat in time t_1

$$AB = (5 + 4)t_1$$

And distance moved by boat in time $t_1' = BC = (5 - u)t_1'$

Distance moved by cork during this time

$$AC = u(t_1 + t_1')$$

But $AB = AC + BC$

$$(5 + u)t_1 = u(t_1 + t_1') + (5 - u)t_1'$$

$$5t_1 = 5t_1' \Rightarrow t_1' = t_1 = 30 \text{ min}$$

Hence, the cork meets the boat again after 1 h.

CONCEPT APPLICATION EXERCISE 3.3

1. A train 200 m long is moving with a velocity of 72 km h^{-1}. Find the time taken by the train to cross the bridge 1 km long.
2. Two cars A and B are moving on the straight parallel paths with speeds 36 km h^{-1} and 72 km h^{-1}, respectively, starting from the same point in the same direction. After 20 min, how much behind is car A from car B?
3. Two trains 110 m and 90 m long, respectively, are running in opposite directions with velocities 36 km h^{-1} and 54 km h^{-1}. Find the time taken by the two trains to completely cross each other.
4. A moving sidewalk in an airport terminal building moves at a speed of 1.0 m s^{-1} and is 35.0 m long. If a woman steps on at one end and walks at 1.5 m s^{-1} relative to the moving sidewalk, then find the time that she requires to reach the opposite end (a) when she walks in the same direction the sidewalk is moving and (b) when she walks in the opposite direction.

5. A passenger and a good train are headed in the same direction on parallel tracks. The passenger train is 240 m long and has a constant velocity 72 km h^{-1}. Beginning from the time the engine of the passenger train approaches the last wagon of the goods train, it takes 25 s to be in level with the engine of the goods train. It took 30 s more to completely overtake the goods train. Determine the length and speed of the goods train.

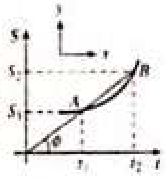
GRAPHS IN MOTION IN ONE DIMENSION

Graphical Representation of Motion

For graphical representation, we require two coordinate (reference) axes, one variable being taken along one axis. The usual practice is to take the independent variable along x-axis and the dependent on along y-axis. In general cases, involving time as one of the variables, time being independent, is usually taken along x-axis.

Graphs play very important role in analyzing a motion. Some times it becomes difficult to solve the problems analytically. But with the help of graphs, we can solve the problems easily and without much calculation.

Position–Time Relation



Let us take a general motion of a particle and plot its position–time graph. From the graph the position of the particle in time interval from t_1 to t_2 changes from s_1 to s_2.

Hence, average velocity, $v_{av} = \dfrac{\Delta s}{\Delta t} = \tan\phi$.

$v_{av} = \dfrac{\Delta s}{\Delta t}$ = Slope of the line joining the points in s–t graph.

NOTE: The slope of a straight line connecting any two points in s–t graph gives the velocity averaged over the time interval $(t_2 - t_1)$.

Different Cases in Position–Time Graph

Particle is stationary: Let a particle be at some point P at time $t = 0$ which is at a distance x_0 from origin. Since the particle is stationary. So at any further time the particle will remain at point P. Hence, position–time graph for a stationary particle is parallel to time axis (figure).

Particle is moving with constant velocity towards right: Equation to be used: $x = x_0 + vt$. Graph will be a straight line. Let the particle be at some point P initially at time $t = 0$ which is at a distance of x_0 from origin. Since the particle is moving towards right so its distance from origin goes on increasing. Hence, the position–time graph for a particle moving with constant velocity towards right will be a straight line inclined to time axis making an acute angle α (figure).

Recall that $\tan\alpha$ is the slope of position–time graph which is equal to the velocity of particle.

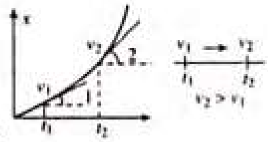
Particle is moving with constant velocity towards left: Equation to be used: $x = x_0 - vt$. Graph will be a straight line.

Let the particle be at some point P at time $t = 0$ which is at a distance of x_0 from origin. Since the particle is moving toward left so first its distance from origin goes on decreasing and then its distance from the origin goes on increasing in negative direction. Hence, position–time graph for a particle moving with constant velocity towards left will be a straight line inclined to time axis making an obtuse angle α (figure). Here $\tan\alpha$, the slope, will be negative, which indicates negative velocity.

Particle is moving with constant acceleration directed rightward (positive acceleration): Since acceleration is towards right so velocity increases in right direction. Hence, slope of position–time graph goes on increasing.

Equation to be used:

$$x = ut + \frac{1}{2}at^2$$



Graph will be a curved line (parabolic).

$$v_1 = \tan\alpha_1,\ v_2 = \tan\alpha_2$$

It is clear from the figure that as time passes, slope goes on increasing.

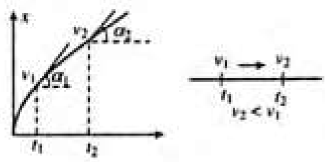
Now $\alpha_2 > \alpha_1 \Rightarrow \tan\alpha_1 > \tan\alpha_2 \Rightarrow v_2 > v_1$

So, velocity goes on increasing.

Particle is moving with constant acceleration directed leftward (negative acceleration): Since acceleration is towards left so velocity decreases in right direction and increases in left direction.

Equation to be used:

$$x = ut + \frac{1}{2}at^2$$



Graph will be a curved line (parabola).

$$v_1 = \tan\alpha_1,\ v_2 = \tan\alpha_2$$

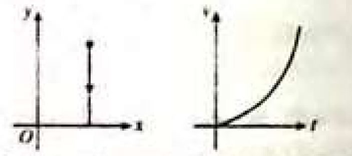
It is clear from the figure that as time passes, slope goes on decreasing.

Now $\alpha_2 < \alpha_1 \Rightarrow \tan\alpha_2 < \tan\alpha_1 \Rightarrow v_2 < v_1$

So, velocity goes on decreasing.

Important Result

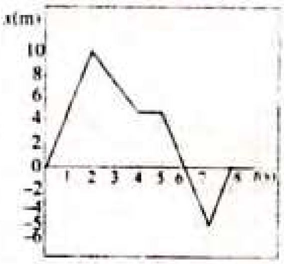
When the displacement of a particle along y-axis is expressed as the function of displacement of the particle along x-axis, we call it "locus equation" or "equation of trajectory." But when the displacement of a particle along y-axis is expressed as the function of time, it is displacement–time graph. For example, when we drop a stone from rest, it moves down in a straight line. Hence, the locus is a straight line.



Trajectory of a particle Position–time graph

If you plot the displacement versus time you will get a parabola. We call it displacement (or position)–time (r–t) graph which shows the variation of position with time.

ILLUSTRATION 3.14 The position versus time graph for a certain particle moving along the x-axis is shown in figure. Find the average velocity in the time intervals (a) 0 to 2 s, (b) 2 s to 4 s, and (c) 4 s to 7 s.



Solution. We are given the values of time, but the values of the position are to obtained from the graph corresponding to the given time interval under consideration. We know that the slope of the displacement–time graph represents velocity.

Formula to be used: $v_{av} = \dfrac{x_2 - x_1}{t_2 - t_1}$, where x_1 and x_2 are the initial and final positions, respectively, and t_1 and t_2 are the initial and final values of time, respectively.

(a) Here $x_1 = 0$ m, $x_2 = 10$ m, $t_1 = 0$ s, $t_2 = 2$ s.
Therefore, the required average velocity is given by

$$v_{av} = \frac{10-0}{2-0} = 5\,\mathrm{m\,s^{-1}}$$

(b) Here $x_1 = 10$ m, $x_2 = 5$ m, $t_1 = 2$ s, $t_2 = 4$ s.
So the required value of average velocity is given by

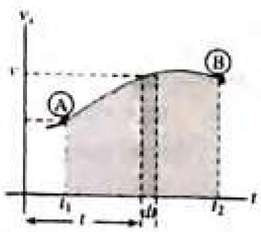
$$v_{av} = \frac{5-10}{4-2} = -2.5\ \mathrm{m\,s^{-1}}$$

(c) Here $x_1 = 5$ m, $x_2 = -5$ m, $t_1 = 4$ s, $t_2 = 7$ s.
So the required value of average velocity is given by

$$v_{av} = \frac{-5-5}{7-4} = \frac{-10}{3} = -3.3\ \mathrm{m\,s^{-1}}$$

Velocity–Time Graph

From v–t graph, we can find (a) displacement, (b) distance, (c) average acceleration, and (d) instantaneous acceleration.

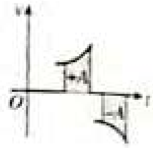


Displacement: When the velocity of a particle is given as the function of time, i.e., $v = f(t)$, we find the total displacement $\vec{s}$ by summing up (integrating) the elementary displacements $d\vec{s}$.

The elementary displacement $d\vec{s} = \vec{v}\,dt$ can be given as the area of the shaded elementary strip. Summing up all the elementary areas between $t = t_1$ and $t = t_2$, we have the total area under v–t graph enclosed within the time interval which gives the total displacement of the particle during the time interval $t(= t_2 - t_1)$.

$$\vec{s} = \int \vec{v}\,dt = A(= \text{Area under } v\text{–}t \text{ graph})$$

When the area lies above the time axis, it is said to be negative. A positive area reveals a positive displacement (displacement directed along positive directions of coordinate system) and negative area signifies a negative displacement.



Distance: Since the distance covered D is given as $D = \int |\vec{v}|\,dt$, it can be given graphically as the sum of the magnitude of positive and negative areas under v–t graph.

$$D = \int |\vec{v}|\,dt = |A_+| + |A_-|$$

Average acceleration: As derived earlier, the average acceleration, $\vec{a}_{av} = \dfrac{\Delta\vec{v}}{\Delta t}$

Then, $\vec{a}_{av}$ = slope of the line joining A and B in v–t graph as shown in figure.

The slope of the straight line AB that joins two points of time t_i and t_f under consideration gives the average acceleration over the time interval, $\Delta t = t_2 - t_1$.

Instantaneous acceleration: The instantaneous acceleration is given as $\vec{a} = \dfrac{d\vec{v}}{dt}$.

Then, $\vec{a}$ = slope of v–t graph.

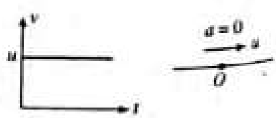
As we reduce the time interval Δt, the slope of the straight line AB tends to be equal to the slope of the tangent drawn at B. The slope of a line on v–t graph, that is (dv/dt) gives the acceleration.

If the slope of v–t graph is positive at any point of time on the graph, the acceleration of the particle is positive at that time. If the slope of v–t graph is zero, it signifies that the acceleration is zero. When the slope of v–t graph is negative, it means negative acceleration (or retardation).

Velocity–Time Graph of Various Types of Motions of a Particle

Particle is moving with a constant velocity Since velocity is constant, so $a = 0$.

Let at any time velocity of the particle is u. Since velocity remains constant so at any time velocity remains same. Hence, velocity–time graph for a particle moving with constant velocity is a straight line parallel to time axis.



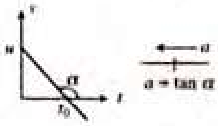
Particle is moving with a constant positive acceleration: Equation to be used: $v = u + at$.

As the time passes, velocity goes on increasing. Hence, velocity-time graph for a particle moving with constant positive acceleration is a straight line inclined to time axis making an acute angle α. Here, $\tan\alpha$ is the slope of velocity-time graph (figure).

Note that the slope of velocity-time graph is equal to acceleration.

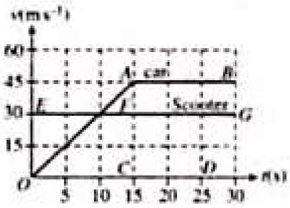
Particle is moving with a constant negative acceleration (Retardation): Equation to be used: $v = u + at$.

As the time passes, the velocity goes on decreasing; at time $t = t_0$, velocity becomes zero and after that it increases in negative direction. Hence, velocity-time graph for a particle moving with constant retardation is a straight line inclined to time axis making an obtuse angle α (figure).



Since α is obtuse angle, hence slope $\tan\alpha$ becomes negative. Hence, acceleration is negative.

ILLUSTRATION 3.15 As soon as a car just starts from rest in a certain direction, a scooter moving with a uniform speed overtakes the car. Their velocity-time graph is shown in the figure. Calculate



(a) The difference between the distances travelled by the car and the scooter in 15 s.

(b) The distance of car and scooter from the starting point at that instant.

Solution.

(a) The distance travelled by car in 15 s

= Area of ΔOAC

$= \frac{1}{2}\times 15\times 45 = 337.5$ m

Distance travelled by scooter in 15 s

= Area of rectangle $OCEF$

$= 15 \times 30 = 450$ m

Thus, difference between distance travelled by them

$= 450$ m $- 337.5$ m $= 112.5$ m

(b) Let after time t from start car will catch up the scooter. In time t, the distance travelled by them are equal.

Distance travelled by car $= -\times 15\times 45 + 45(\ -15)$

Distance travelled by scooter $= 30t$

$$\frac{1}{2}\times 15\times 45 + 45(t-15) = 30t$$

which gives $t = 22.5$ s

Distance travelled by car or scooter in 22.5 s $= 30 \times 22.5$

$= 675$ m

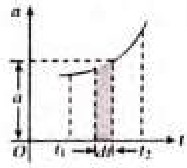
So the car catches the scooter when both are at 67.5 m from the starting point.

Acceleration–Time Graph

Let the acceleration be given as the function of time, i.e., $a = f(t)$. Then the elementary change in velocity during a time dt is: $d\vec{v} = \vec{a}\,dt$.

We can observe that in a–t graph, $\vec{a}\,dt$ is equal to the area of the shaded elementary strip (rectangle of sides a and dt; (see figure). Summing up all the elementary areas dA, we have the total area

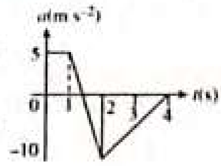
$$A = \int dA = \int \vec{a}\,dt$$



Since $\int_{t_1}^{t_2} \vec{a}\,dt = \int_{v_1}^{v_2} d\vec{v} = \Delta\vec{v}$

we have $\Delta\vec{V} = \int \vec{a}\,dt = A$ = Area under $a - t$ graph

ILLUSTRATION 3.16 A particle moves along x-axis with an initial speed $v_0 = 5$ m s^{-1}. If its acceleration varies with time as shown in a–t graph in figure.



(a) Find the velocity of the particle at $t = 4$ s.

(b) Find the time when the particle starts moving along $-x$ direction.

Solution. The velocity of the particle at $t = 4$ s can be given as

$$\vec{v}_4 = \vec{v}_0 + \Delta\vec{v} \qquad \text{...(i)}$$

where $\Delta\vec{v} \equiv A$

(= area under a–t graph during first four seconds)

Referring to a–t graph (figure), we have

$$A = A_1 + A_2 - A_3 - A_4 \qquad \text{...(ii)}$$

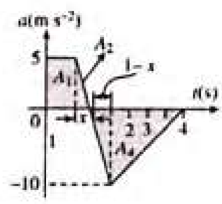
where $A_1 = 5\times 1 = 5$, $A_2 = \frac{1}{2}\times x\times 5$,

$$A_3 = \frac{1}{2}\times(1-x)\times 10, \text{ and } A_4 = \frac{1}{2}\times 2\times 10 = 10$$

We can find x as following:

Using properties of similar triangles, we have $\frac{x}{5} = \frac{1-x}{10}$

This yields $x = \frac{1}{3}$.



Substituting $x = \frac{1}{3}$ in $A_2 = \frac{1}{2}\times x\times 5$

and $A_3 = \frac{1}{2}(1-x)\times 10$, we have

$$A_2 = \frac{5}{6} \text{ and } A_3 = \frac{10}{3}.$$

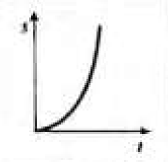
Then substituting A_1, A_2, A_3, and A_4 in (ii), we have $A = -7.5$. Negative area tells us that change in velocity is along $-x$ direction

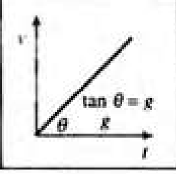
$$\Delta\vec{v} = -7.5 \text{ m s}^{-1}$$

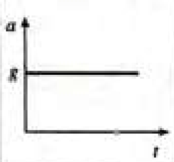
Hence, substituting in (i), $\vec{v}_0 = 5 \text{ m s}^{-1}$ and $\Delta\vec{v} = -7.5 \text{ m s}^{-1}$, we have $\vec{v}_4 = \vec{v}_0 + \Delta\vec{v} = 5 - 7.5 = -2.5 \text{ m s}^{-1}$.

Graphical Representation of Motion of A Particle Moving Under Gravity

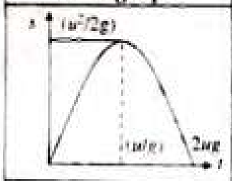
If a body dropped from some height (initial velocity zero): Taking initial position as origin and direction of motion (i.e., downward direction) as a positive.

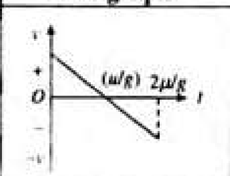
	Position–time graph	Velocity–time graph	Acceleration–time graph
			






If a body is projected vertically upward: Taking initial position as origin and direction of motion (i.e., vertically up) as positive.

Position–time graph	Velocity–time graph	Acceleration–time graph
		




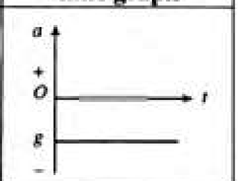


ILLUSTRATION 3.17 A car starts moving rectilinearly, first with acceleration $\alpha = 5 \text{ m s}^{-2}$ (the initial velocity is equal to zero), then uniformly, and finally, decelerating at the same rate α comes to a stop. The total time of motion equals $t = 25$ s. The average velocity during this time is equal to $\langle v \rangle = 72 \text{ km h}^{-1}$. How long does the car move uniformly?

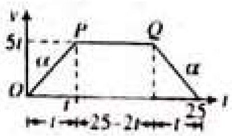
Solution. Let t be the time up to which the car accelerates or decelerates. The maximum velocity attained in this duration is $5t$. The time upto which car moves uniformly $= 25 - 2t$. The velocity–time graph of the motion of car is drawn as shown in the figure.

Given the average velocity is whole time of motion

$$v_{av} = \frac{72 \times 5}{18} = 20 \text{ m s}^{-1}$$



The average velocity from the graph can be obtained as

$$v_{av} = \frac{\text{Total displacement}}{\text{Total time}}$$

$$= \frac{\text{Area of } \vec{v} - t \text{ graph}}{\text{Total time}}$$

$$20 = \frac{\frac{1}{2} \times [25 + (25 - 2t)] \times 5t}{25} = \frac{\frac{1}{2} \times [50 - 2t)] \times 5t}{25}$$

$$200 = 50t - 2t^2$$

$\Rightarrow$ $t^2 - 25t + 100 = 0$

$\Rightarrow$ $(t - 20)(t - 5) = 0 \Rightarrow t = 5 \text{ s or } 20 \text{ s}$

But $t = 20$ s is not possible.

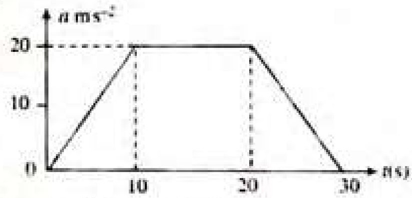
Hence, $t = 5$ s

The time up to which car moves uniformly

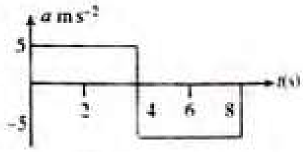
$= 25 - 2t = 25 - 2 \times 5 = 15$ s

CONCEPT APPLICATION EXERCISE 3.4

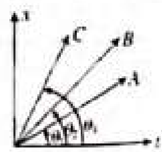
1. See figure. Find the average acceleration in first 20 s. (**Hint:** Area under $a - t$ graph is equal to the change in velocity)



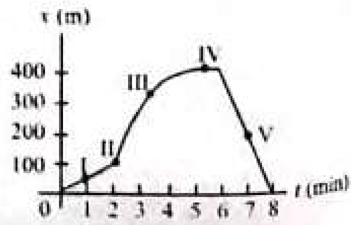
2. At $t = 0$, a particle starts from rest and moves along a straight line, whose acceleration–time graph is shown in figure. Convert this graph into velocity–time graph. From the velocity–time graph, find the maximum velocity attained by the particle. Also find from v–t graph, the displacement and distance travelled by the particle from 2 to 6 s.



3. You are given the position–time graph of three different bodies A, B, and C. Find which will have greater velocity and which will have least velocity.

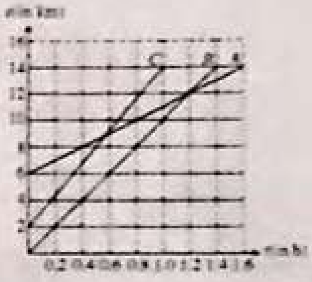


4. A physics professor leaves her house and walks along the sidewalk towards campus. After 5 min, it starts to rain and she returns home. Her distance from her house as a function of time is shown in figure. At which of the labeled points is her velocity?



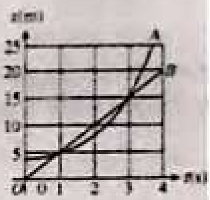
(a) Zero
(b) Constant and positive
(c) Constant and negative
(d) Increasing in magnitude

5. Figure shows the position–time graphs of three cars A, B, and C. On the basis of the graphs, answer the following questions:



(a) Which car has the highest speed and which the lowest?
(b) Are the three cars ever at the same point on the road?
(c) When C passes A, where is B?
(d) What is the time interval during car A travel between the time it passed cars B and C?
(e) What is the relative velocity of car C with respect to car A?
(f) What is the relative velocity of car B with respect to car C?

6. Two cars, A and B, move along the x-axis. Car A starts from rest with constant acceleration while car B moves with constant velocity.



(a) At what time(s), t(s), if any, do A and B have the same position?
(b) At what time(s), if any, do A and B have the same velocity? What is the velocity of car B at this time.
(c) Graph velocity versus time for both A and B.
(d) At what time(s), if any, does car A pass car B?
(e) At what time(s), if any, does car B pass car A?

SOLVED EXAMPLES

1. A thief is running away on a straight road in jeep moving with a speed of 9 ms^{-1} A police man chases him on a motor cycle moving at a speed of 10 ms^{-1}. If the instantaneous separation of the jeep from the motorcycle is 100 m, how long will it take for the police to catch the thief

(a) 1 s (b) 19 s
(c) 90 s (d) 100 s

Sol. (d) The relative velocity of policeman w.r.t. thief
$= 10 - 9 = 1$ m/s.

$\therefore$ Time taken by police to catch the thief $= \dfrac{100}{1} = 100$ s

2. Two trains one of length 100 m and another of length 125 m, are moving in mutually opposite directions along parallel lines, meet each other, each with speed 10 m/s. If their acceleration are 0.3 m/s^2 and 0.2 m/s^2, respectively, then the time they take to pass each other will be

(a) 5 s (b) 10 s
(c) 15 s (d) 20 s

Sol. (b) Relative velocity of one train w.r.t. other
$= 10 + 10 = 20$ m/s.

Relative acceleration $= 0.3 + 0.2 = 0.5\ m/s^2$

If trains cross each other, then from $s = ut + \dfrac{1}{2}at^2$

As, $s = s_1 + s_2 = 100 + 125 = 225$

$\Rightarrow \quad 225 = 20t + \dfrac{1}{2} \times 0.5 \times t^2 \quad \Rightarrow 0.5t^2 + 40t - 450 = 0$

$\Rightarrow \quad t = -\dfrac{40 \pm \sqrt{1600 + 4.(005) \times 450}}{1} = -40 \pm 50$

$\therefore \quad t = 10$ sec (Taking +ve value).

3. A body starts from rest with uniform acceleration. If its velocity after n second is v, then its displacement in the last two seconds is

(a) $\dfrac{2v(n+1)}{n}$ (b) $\dfrac{v(n+1)}{n}$

(c) $\dfrac{v(n-1)}{n}$ (d) $\dfrac{2v(n-1)}{n}$

Sol. (d) $\because v = 0 + na \Rightarrow a = v/n$

Now, distance travelled in n sec $\alpha \Rightarrow S_n = \dfrac{1}{2}an^2$ and distance travelled in $(n-2)$ sec $\Rightarrow S_{n-2} = \dfrac{1}{2}a(n-2)^2$

$\therefore$ Distance travelled in last two seconds,

$= S_n - S_{n-2} = \dfrac{1}{2}an^2 - \dfrac{1}{2}a(n-2)^2$

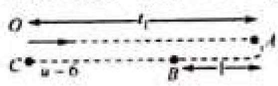
$= \dfrac{a}{2}[n^2 - (n-2)^2] = \dfrac{a}{2}[n + (n-2)][n - (n-2)]$

$= a(2n-2) = \dfrac{v}{n}(2n-2) = \dfrac{2v(n-1)}{n}$

4. A particle is moving in a straight line and passes through a point O with a velocity of 6 ms^{-1}. The particle moves with a constant retardation of 2 ms^{-2} for 4 s and there after moves with constant velocity. How long after leaving O does the particle return to O?

(a) 3 s (b) 8 s
(c) Never (d) 4 s

Sol. (b) Let the particle moves toward right with velocity 6 m/s. Due to retardation, after time t_1, its velocity becomes zero.



From $v = u - at \Rightarrow 0 = 6 - 2 \times t_1$

$\Rightarrow \quad t_1 = 3$ sec

But retardation works on it for 4 sec. It means after reaching point A, direction of motion gets reversed and acceleration works on the particle for next one second.

$$S_{OA}=ut_1-\frac{1}{2}at_1^2=6\times 3-\frac{1}{2}(2)(3)^2=18-9=9\text{m}$$

$$S_{AB}=\frac{1}{2}\times 2\times(1)^2=1\text{ m}$$

$\therefore$ $S_{BC}=S_{OA}-S_{AB}=9-1=8$ m

Now velocity of the particle at point B in return journey

$v=0+2\times 1=2$ m/s

In return journey from B to C, particle moves with constant velocity 2 m/s to cover the distance 8 m.

$$\text{Time taken}=\frac{\text{Distance}}{\text{Velocity}}=\frac{8}{2}=4\text{ s}$$

Total time taken by particle to return at point O is

$T=t_{OA}+t_{AB}+t_{BC}=3+1+4=8$ s.

5. A particle is projected with velocity v_0 along x-axis. The deceleration on the particle is proportional to the square of the distance from the origin i.e., $a=\alpha x^2$. The distance at which the particle stops is

(a) $\sqrt{\frac{3v_0}{2\alpha}}$ (b) $\left(\frac{3v_0}{2\alpha}\right)^{\frac{1}{3}}$

(c) $\sqrt{\frac{3v_0^2}{2\alpha}}$ (d) $\left(\frac{3v_0^2}{2\alpha}\right)^{\frac{1}{3}}$

Sol. (d) $a=\frac{dv}{dt}=\frac{dv}{dx}\frac{dx}{dt}=v\frac{dv}{dx}=-\alpha x^2$ (Given)

$$\Rightarrow \int_{v_0}^{0} v\,dv=-\alpha\int_0^S x^2dx \Rightarrow \left[\frac{v^2}{2}\right]_{v_0}^{0}=-\alpha\left[\frac{x^3}{3}\right]_0^S$$

$$\Rightarrow \frac{v_0^2}{2}=\frac{\alpha S^3}{3} \Rightarrow S=\left(\frac{3v_0^2}{2\alpha}\right)^{\frac{1}{3}}$$

6. A body is projected vertically up with a velocity v and after some time it returns to the point from which it was projected. The average velocity and average speed of the body for the total time of flight are

(a) $\vec{v}/2$ and $v/2$ (b) 0 and $v/2$

(c) 0 and 0 (d) $\vec{v}/2$ and 0

Sol. (b) Average velocity = 0 because net displacement of the body is zero.

$$\text{Average speed}=\frac{\text{Total distance covered}}{\text{Time of flight}}=\frac{2H_{max}}{2u/g}$$

$$\Rightarrow v_{av}=\frac{2u^2/2g}{2u/g} \Rightarrow v_{av}=u/2$$

Velocity of projection = v (given)

$\therefore$ $v_{av}=v/2$

7. A balloon rises from rest with a constant acceleration $g/8$. A stone is released from it when it has risen to height h. The time taken by the stone to reach the ground is

(a) $4\sqrt{\frac{h}{g}}$ (b) $2\sqrt{\frac{h}{g}}$

(c) $\sqrt{\frac{2h}{g}}$ (d) $\sqrt{\frac{g}{h}}$

Sol. (b) The velocity of balloon at height h, $v=\sqrt{2\left(\frac{g}{8}\right)h}$

When the stone is released from this balloon, it will go upward with velocity, $v=\frac{\sqrt{gh}}{2}$ (same as that of balloon). In this condition, time taken by stone to reach the ground is

$$t=\frac{v}{g}\left[1+\sqrt{1+\frac{2gh}{v^2}}\right]$$

$$=\frac{\sqrt{gh}/2}{g}\left[1+\sqrt{1+\frac{2gh}{gh/4}}\right]=\frac{2\sqrt{gh}}{g}=2\sqrt{\frac{h}{g}}$$

8. A body falls freely from the top of a tower. It covers 36% of the total height in the last second before striking the ground level. The height of the tower is

(a) 50 m (b) 75 m

(c) 100 m (d) 125 m

Sol. (d) Let height of tower is h and body takes t time to reach to ground when it fall freely.

$$\therefore h=\frac{1}{2}gt^2 \quad ...(i)$$

In last second, i.e., t^{th} sec body travels = $0.36h$

It means in rest of the time i.e. in $(t-1)$ sec it travels

$=h-0.36h=0.64h$

Now applying equation of motion for $(t-1)$ sec, we get

$$0.64h=\frac{1}{2}g(t-1)^2 \quad ...(ii)$$

From (i) and (ii), we get $t=5$ sec and $h=125$ m.

9. A projectile is fired vertically upwards with an initial velocity u. After an interval of T seconds, a second projectile is fired vertically upwards, also with initial velocity u.

(a) They meet at time $t=\frac{u}{g}$ and at a height $\frac{u^2}{2g}+\frac{gT^2}{8}$

(b) They meet at time $t=\frac{u}{g}+\frac{T}{2}$ and at a height $\frac{u^2}{2g}+\frac{gT^2}{8}$

(c) They meet at time $t=\frac{u}{g}+\frac{T}{2}$ and at a height $\frac{u^2}{2g}-\frac{gT^2}{8}$

(d) They never meet

Sol. (c) For first projectile, $h_1 = ut - \frac{1}{2}gt^2$

For second projectile, $h_2 = u(t-T) - \frac{1}{2}g(t-T)^2$

When both meet i.e. $h_1 = h_2$:

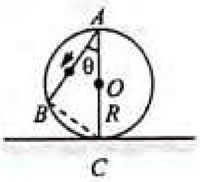
$$ut - \frac{1}{2}gt^2 = u(t-T) - \frac{1}{2}g(t-T)^2$$

$$\Rightarrow \quad uT + \frac{1}{2}gT^2 = gtT$$

$$\Rightarrow \quad t = \frac{u}{g} + \frac{T}{2}$$

and $h_1 = u\left(\frac{u}{g} + \frac{T}{2}\right) - \frac{1}{2}g\left(\frac{u}{2} + \frac{T}{2}\right)^2 = \frac{u^2}{2g} - \frac{gT^2}{8}$

10. A frictionless wire AB is fixed on a sphere of radius R. A very small spherical ball slips on this wire. The time taken by this ball to slip from A to B is



(a) $\frac{2\sqrt{gR}}{g\cos\theta}$

(b) $2\sqrt{gR}\cdot\frac{\cos\theta}{2}$

(c) $2\sqrt{\frac{R}{g}}$

(d) $\frac{gR}{\sqrt{g\cos\theta}}$

Sol. (c) Acceleration of body along AB is

Distance travelled in time t sec = $AB = \frac{1}{2}(g\cos\theta)t^2$

From ΔABC, $AB = 2R\cos\theta$; $2R\cos\theta = \frac{1}{2}g\cos\theta t^2$

$$\Rightarrow \quad t^2 = \frac{4R}{g} \text{ or } t = 2\sqrt{\frac{R}{g}}$$

11. A body is slipping from an inclined plane of height h and length l. If the angle of inclination is θ, the time taken by the body to come from the top to the bottom of this inclined plane is

(a) $\sqrt{\frac{2h}{g}}$ (b) $\sqrt{\frac{2l}{g}}$

(c) $\frac{1}{\sin\theta}\sqrt{\frac{2h}{g}}$ (d) $\sin\theta\sqrt{\frac{2h}{g}}$

Sol. (c) Force down the plane = $mg\sin\theta$

Acceleration down the plane = $g\sin\theta$

Since $l = 0 + \frac{1}{2}g\sin\theta t^2$

$$t^2 = \frac{2}{g\sin\theta} = \frac{2h}{g\sin^2\theta} \Rightarrow t = \frac{1}{\sin\theta}\sqrt{\frac{2h}{g}}$$

12. A particle moving in a straight line covers half the distance with speed of 3 m/s. The other half of the distance is covered in two equal time intervals with speed of 4.5 m/s and 7.5 m/s respectively. The average speed of the particle during this motion is

(a) 4.0 m/s (b) 5.0 m/s

(c) 5.5 m/s (d) 4.8 m/s

Sol. (a) If t_2 and $2t_2$ are the time taken by particle to cover first and second half distance, respectively, then

$$t_1 = \frac{x/2}{3} = \frac{x}{6} \quad \text{...(i)}$$

$x_1 = 4.5\,t_2$ and $x_2 = 7.5\,t_2$

So, $x_1 = x_2 = \frac{x}{2} \Rightarrow 4.5t_2 + 7.5t_2 = \frac{x}{2}$

$$t_2 = -\frac{x}{24} \quad \text{...(ii)}$$

Total time $t_1 + x_2 + 2t_2 = \frac{x}{6} + \frac{x}{12} = \frac{x}{4}$

So, average speed 4 m/sec.

13. A car accelerates from rest at a constant rate α for some time, after which it decelerates at a constant rate β and comes to rest. If the total time elapsed is t, then the maximum velocity acquired by the car is

(a) $\left(\frac{\alpha^2+\beta^2}{\alpha\beta}\right)t$ (b) $\left(\frac{\alpha^2-\beta^2}{\alpha\beta}\right)t$

(c) $\frac{(\alpha-\beta)t}{\alpha\beta}$ (d) $\frac{\alpha\beta t}{\alpha+\beta}$

Sol. (d) Let the car accelerate at rate α for time t_1. Then maximum velocity attained, $v = 0 + \alpha t_1 + \alpha t_1$

Now, the car decelerates at a rate β for time $(t - t_1)$ and finally comes to rest. Then,

$$0 = v\,\beta(t - t_1) \Rightarrow 0 = \alpha t_1 - \beta t + \beta t_1$$

$$\Rightarrow \quad t_1 = \frac{\beta}{\alpha+\beta}t$$

$$\therefore \quad v = \frac{\alpha\beta}{\alpha+\beta}t$$

14. A ball is thrown vertically upwards. Which of the following graph/graphs represent velocity-time graph of the ball during its flight (air resistance is neglected)

(a) 
(b) 
(c) 
(d) 
Sol. (d) In the positive region, the velocity decreases linearly (during rise) and in the negative region, velocity increases linearly (during fall) and the direction is opposite to each other during rise and fall. Hence, fall is shown in the negative region.

15. A ball is dropped vertically from a height d above the ground. It hits the ground and bounces up vertically to a height $d/2$. Neglecting subsequent motion and air resistance, its velocity v varies with the height h above the ground is correctly shown in

(a) (b) 
(c) (d) 

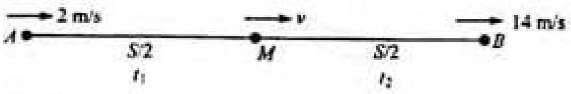
Sol. (a) For the given condition, initial height $h = d$ and velocity of the ball is zero. When the ball moves downward its velocity increases and it will be maximum when the ball hits the ground; just after the collision, it becomes half and in opposite direction. As the ball moves upward, its velocity again decreases and becomes zero at height $d/2$. This explanation match with graph (A).

16. A particle moves with uniform acceleration along a straight line AB. Its velocities at A and B are 2 m/s and 14 m/s, respectively. M is the mid-point of AB. The particle takes t_1 seconds to go from A to M and t_2 seconds to go from M to B. Then t_2/t_1 is

(a) 1 : 1 (b) 2 : 1
(c) 1 : 2 (d) 3 : 1

Sol. (c) $v^2 = 2^2 + \frac{2as}{2}$



$\Rightarrow \quad v^2 - 4 = as$ (i)

$$14^2 - v^2 = \frac{2as}{2}$$

$\Rightarrow \quad 196 - v^2 = as$ (ii)

From (i) and (ii),

$$v^2 - 4 = 196 - v^2 \Rightarrow v = 10 \text{ m/s}$$

Now $t_1 = \frac{v-2}{a} = \frac{10-2}{a} = \frac{8}{a}$

$$t_2 = \frac{14-v}{a} = \frac{14-10}{a} = \frac{4}{a} \Rightarrow \frac{t_2}{t_1} = \frac{4/a}{8/a} = \frac{1}{2}$$

17. A ball is thrown straight upward with a velocity v_0 from a height h above the ground. The time taken for the ball to strike the ground is

(a) $\frac{v_0}{g}\left(1+\frac{2gh}{v_0^2}\right)$ (b) $\frac{v_0}{g}\left(\sqrt{1+\frac{2gh}{v_0^2}}\right)$

(c) $\frac{v_0}{g}\left(1-\sqrt{1+\frac{2gh}{v_0^2}}\right)$ (d) $\frac{v_0}{g}\left(1+\sqrt{1+\frac{2gh}{v_0^2}}\right)$

Sol. (d) Apply $s = ut + \frac{1}{2}at^2$

$$\Rightarrow \quad -h = v_0 t - \frac{1}{2}gt^2 \Rightarrow gt^2 - 2v_0 t - 2h = 0$$

$$\Rightarrow \quad t = \frac{2v_0 \pm \sqrt{4v_0^2 + 8gh}}{2g}$$

As t is not negative, so ignoring negative sign, we get

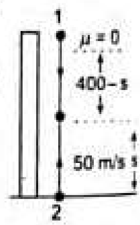
$$t = \frac{2v_0 + 2\sqrt{v_0^2 + 2gh}}{2g} = \frac{v_0}{g}\left[1 + \sqrt{1+\frac{2gh}{v_0^2}}\right]$$

18. From the top of the tower of height 400 m, a ball is dropped by a man, simultaneously from the base of the tower, another ball is thrown up with a velocity 50 m/s; at what distance will they meet from the base of the tower?

(a) 100 m (b) 320 m
(c) 80 m (d) 240 m

Sol. (c) Let the first ball meet at a height s from ground

$$400 - s = \frac{1}{2}gt^2 \quad \text{...(i)}$$



and for second ball: $s = 50t - \frac{1}{2}gt^2$ ...(ii)

Adding $50\,t = 400$, we get

$t = 8$ sec.

Now substituting the value of 't' in (ii),

we get $s = 50 \times 8 - \frac{1}{2} \times 10 \times 64 = 80$ m

19. A student is standing at a distance of 50 metres from a bus. As soon as the bus begins its motion (starts moving away from student) with an acceleration of 1 m s^{-2}, the student starts running towards the bus with a uniform velocity u. Assuming the motion to be along a straight road, the minimum value of u, so that the student is able to catch the bus is:

(a) 5 m s^{-1} (b) 8 m s^{-1}
(c) 10 m s^{-1} (d) 12 m s^{-1}

Sol. (c) $50 + x = ut$ ...(1)

and $x = \frac{t^2}{2}$ ...(2)

From (1) and (2),

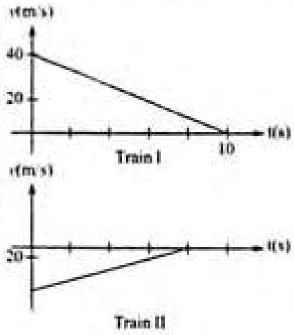
$$50+\frac{t^2}{2}=ut \Rightarrow t^2-2ut+100=0$$

For real roots, discriminant = 0

For minimum velocity, discriminant = 0

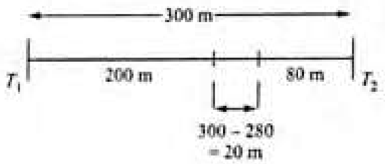
$\Rightarrow \quad 4u^2-400=0 \quad \Rightarrow u=10$ m/s

20. Two trains, which are moving along different tracks in opposite directions, are put on the same track due to a mistake. Their drivers, on noticing the mistake, start slowing down the trains when the trains are 300 m apart. Graphs given below show their velocities as function of time as the trains slow down. The separation between the trains when both have stopped is



(a) 120 m (b) 280 m
(c) 60 m (d) 20 m

Sol. (d) Initial distance between trains is 300 m. Displacements of trains can be calculated by area under V-t graph.



$$\text{Displacement of train 1} = \frac{1}{2}\times 10\times 40 = 200 \text{ m}$$

$$\text{Displacement of train 2} = \frac{1}{2}\times 8\times(-20) = -80 \text{ m}$$

which means it moves towards left.

$\therefore$ Distance between the two is 300 – 200 – 80 = 20 m.

EXERCISES

General Kinematics and Motion with Constant Acceleration

1. The magnitude of displacement is equal to the distance covered in a given interval of time if the particle
(a) Moves with constant acceleration along any path
(b) Moves with constant speed
(c) Moves in same direction with constant velocity or with variable velocity
(d) Moves with constant velocity

2. The distance travelled by a particle in a straight line motion is directly proportional to $t^{1/2}$, where t is the time elapsed. What is the nature of motion?
(a) Increasing acceleration
(b) Decreasing acceleration
(c) Increasing retardation
(d) Decreasing retardation

3. The position x of a particle varies with time (t) as $x=at^2-bt^3$. The acceleration at time t of the particle will be equal to zero, where t is equal to
(a) $\frac{2a}{3b}$ (b) $\frac{a}{b}$ (c) $\frac{a}{3b}$ (d) zero

4. Between two stations, a train accelerates from rest uniformly at first, then moves with constant velocity, and finally retards uniformly to come to rest. If the ratio of the time taken is 1 : 8 : 1 and the maximum speed attained be 60 kmh^{-1}, then what is the average speed over the whole journey?
(a) 48 kmh^{-1} (b) 52 kmh^{-1}
(c) 54 kmh^{-1} (d) 56 kmh^{-1}

5. The velocity acquired by a body moving with uniform acceleration is 30 ms^{-1} in 2 s and 60 ms^{-1} in 4 s. The initial velocity is
(a) zero (b) 2 ms^{-1} (c) 3 ms^{-1} (d) 10 ms^{-1}

6. A particle starts from the origin with a velocity of 10 ms^{-1} and moves with a constant acceleration till the velocity increases to 50 ms^{-1}. At that instant, the acceleration is suddenly reversed. What will be the velocity of the particle, when it returns to the starting point?
(a) Zero (b) 10 ms^{-1} (c) 50 ms^{-1} (d) 70 ms^{-1}

7. When the speed of a car is u, the minimum distance over which it can be stopped is s. If the speed becomes nu, what will be the minimum distance over which it can be stopped during the same time?
(a) s/n (b) ns (c) s/n^2 (d) n^2s

8. The relation between time t and distance x is $t=\alpha x^2+\beta x$ where α and β are constants. The retardation is
(a) $2\alpha v^3$ (b) $2\beta v^3$ (c) $2\alpha\beta v^3$ (d) $2\beta^2 v^3$

9. The displacement x of a particle moving in one dimension under the action of a constant force is related to time t by the equation $t=\sqrt{x}+3$, where x is in meters and t is in seconds. Find the displacement of the particle when its velocity is zero.
(a) Zero (b) 12 m (c) 6 m (d) 18 m

10. A drunkard is walking along a straight road. He takes five steps forward and three steps backward and so on. Each step is 1 m long and takes 1 s. There is a pit on the road 11 m away from the starting point. The drunkard will fall into the pit after
(a) 29 s (b) 21 s (c) 37 s (d) 31 s

11. A body travels 200 cm in the first 2 s and 220 cm in the next 4 s with deceleration. The velocity of the body at the end of the seventh second is
(a) $5\ cm s^{-1}$ (b) $10\ cm s^{-1}$
(c) $15\ cm s^{-1}$ (d) $20\ cm s^{-1}$

12. A body starts from rest and travels a distance S with uniform acceleration, then moves uniformly a distance $2S$ uniformly, and finally comes to rest after moving further $5S$ under uniform retardation. The ratio of the average velocity to maximum velocity is
(a) 2/5 (b) 3/5 (c) 4/7 (d) 5/7

13. A police party is chasing a dacoit in a jeep which is moving at a constant speed v. The dacoit is on a motorcycle. When he is at a distance x from the jeep, he accelerates from rest at a constant rate. Which of the following relations is true if the police is able to catch the dacoit?
(a) $v^2 \le \alpha x$ (b) $v^2 \le 2\alpha x$
(c) $v^2 \ge 2\alpha x$ (d) $v^2 \ge \alpha x$

14. A moving car possesses average velocities of $5\ m s^{-1}$, $10\ m s^{-1}$, and $15\ m s^{-1}$ in the first, second, and third seconds, respectively. What is the total distance covered by the car in these 3 s?
(a) 15 m (b) 30 m
(c) 55 m (d) None of these

15. The average velocity of a body moving with uniform acceleration after travelling a distance of 3.06 m is $0.34\ m s^{-1}$. If the change in velocity of the body is 0.18 $m s^{-1}$ during this time, its uniform acceleration is
(a) $0.01\ m s^{-2}$ (b) $0.02\ m s^{-2}$
(c) $0.03\ m s^{-2}$ (d) $0.04\ m s^{-2}$

16. A point moves with uniform acceleration and v_1, v_2, and v_3 denote the average velocities in the three successive intervals of time t_1, t_2, and t_3. Which of the following relations is correct?
(a) $(v_1 - v_2):(v_2 - v_3) = (t_1 - t_2):(t_2 + t_3)$
(b) $(v_1 - v_2):(v_2 - v_3) = (t_1 + t_2):(t_2 + t_3)$
(c) $(v_1 - v_2):(v_2 - v_3) = (t_1 - t_2):(t_1 - t_3)$
(d) $(v_1 - v_2):(v_2 - v_3) = (t_1 - t_2):(t_2 - t_3)$

17. A 2-m wide truck is moving with a uniform speed $v_0 = 8\ m s^{-1}$ along a straight horizontal road. A pedestrian starts to cross the road with a uniform speed v when the truck is 4 m away from him. The minimum value of v so that he can cross the road safely is
(a) $2.62\ m s^{-1}$ (b) $4.6\ m s^{-1}$
(c) $3.57\ m s^{-1}$ (d) $1.414\ m s^{-1}$

Problems Based on Motion Under Gravity

18. A ball is released from the top of a tower of height h. It takes time T to reach the ground. What is the position of the ball (from ground) after time $T/3$?
(a) $h/9$ m (b) $7h/9$ m (c) $8h/9$ m (d) $17h/18$ m

19. A body is released from the top of a tower of height H m. After 2 s, it is stopped and then instantaneously released. What will be its height after next 2 s?
(a) $(H - 5)$ m (b) $(H - 10)$ m
(c) $(H - 20)$ m (d) $(H - 40)$ m

20. A stone is dropped from the top of a tower of height h. After 1 s another stone is dropped from the balcony 20 m below the top. Both reach the bottom simultaneously. What is the value of h? Take $g = 10\ m s^{-2}$.
(a) 3125 m (b) 312.5 m (c) 31.25 m (d) 25.31 m

21. A person is throwing two balls in the air one after the other. He throws the second ball when the first ball is at the highest point. If he is throwing the balls every second, how high do they rise?
(a) 5 m (b) 3.75 m (c) 2.50 m (d) 1.25 m

22. A stone thrown upwards with speed u attains maximum height h. Another stone thrown upwards from the same point with speed $2u$ attains maximum height H. What is the relation between h and H?
(a) $2h = H$ (b) $3h = H$ (c) $4h = H$ (d) $5h = H$

23. A body dropped from the top of a tower covers a distance $7x$ in the last second of its journey, where x is the distance covered in the first second. How much time does it take to reach the ground?
(a) 3 s (b) 4 s (c) 5 s (d) 6 s

24. The distances moved by a freely falling body (starting from rest) during 1st, 2nd, 3rd, ..., nth second of its motion are proportional to
(a) Even numbers (b) Odd numbers
(c) All integral numbers (d) Squares of integral numbers

25. A stone is dropped from a certain height which can reach the ground in 5 s. It is stopped after 3 s of its fall and then it is again released. The total time taken by the stone to reach the ground will be
(a) 6 s (b) 6.5 s (c) 7 s (d) 7.5 s

26. A body sliding on a smooth inclined plane requires 4 s to reach the bottom, starting from rest at the top. How much time does it take to cover one-fourth the distance starting from rest at the top?
(a) 1 s (b) 2 s (c) 4 s (d) 16 s

27. B_1, B_2, and B_3 are three balloons ascending with velocities v, $2v$, and $3v$, respectively. If a bomb is dropped from each when they are at the same height, then
(a) Bomb from B_1 reaches ground first
(b) Bomb from B_2 reaches ground first
(c) Bomb from B_3 reaches ground first
(d) They reach the ground simultaneously

28. A ball is thrown from the top of a tower in vertically upward direction. The velocity at a point h meter below the point of projection is twice of the velocity at a point h meter above the point of projection. Find the maximum height reached by the ball above the top of tower.
(a) $2h$ (b) $3h$ (c) $(5/3)h$ (d) $(4/3)h$

29. A juggler keeps on moving four balls in air throwing the balls after regular intervals. When one ball leaves his hand (speed = 20 m s^{-1}), the position of other balls (height in meter) will be (take $g = 10$ m s^{-2})
(a) 10, 20, 10 (b) 15, 20, 15
(c) 5, 15, 20 (d) 5, 10, 20

30. A particle slides from rest from the topmost point of a vertical circle of radius r along a smooth chord making an angle θ with the vertical. The time of descent is
(a) Least for $\theta = 0$ (b) Maximum for $\theta = 0$
(c) Least for $\theta = 45°$ (d) Independent of θ

31. A body is thrown vertically upwards from A, the top of a tower. It reaches the ground in time t_1. If it is thrown vertically downwards from A with the same speed, it reaches the ground in time t_2. If it is allowed to fall freely from A, then the time it takes to reach the ground is given by
(a) $t = \dfrac{t_1 + t_2}{2}$ (b) $t = \dfrac{t_1 - t_2}{2}$
(c) $t = \sqrt{t_1 t_2}$ (d) $t = \sqrt{\dfrac{t_1}{t_2}}$

32. A stone is dropped from the 25th storey of a multistoried building and it reaches the ground in 5 s. In the first second, it passes through how many storeys of the building? ($g = 10$ m s^{-2})
(a) 1 (b) 2
(c) 3 (d) none of these

33. A body is projected upwards with a velocity u. It passes through a certain point above the ground after t_1. The time after which the body passes through the same point during the return journey is
(a) $\left(\dfrac{u}{g} - t_1^2\right)$ (b) $2\left(\dfrac{u}{g} - t_1\right)$
(c) $3\left(\dfrac{u^2}{g} - t_1\right)$ (d) $3\left(\dfrac{u^2}{g^2} - t_1\right)$

34. A parachutist drops first freely from an aeroplane for 10 s and then his parachute opens out. Now he descends with a net retardation of 2.5 m s^{-2}. If he bails out of the plane at a height of 2495 m and $g = 10$ m s^{-2}, his velocity on reaching the ground will be
(a) 5 m s^{-1} (b) 10 m s^{-1}
(c) 15 m s^{-1} (d) 20 m s^{-1}

35. Water drops fall from a tap on the floor 5 m below at regular intervals of time, the first drop striking the floor when the fifth drop begins to fall. The height at which the third drop will be from ground (at the instant when the first drop strikes the ground) will be ($g = 10$ m s^{-2})
(a) 1.25 m (b) 2.15 m (c) 2.75 m (d) 3.75 m

Relative Velocity in One Dimension

36. A thief is running away on a straight road in a jeep moving with a speed of 9 m s^{-1}. A policeman chases him on a motor cycle moving at a speed of 10 m s^{-1}. If the instantaneous separation of the jeep from the motor cycle is 100 m, how long will it take for the policeman to catch the thief?
(a) 1 s (b) 19 s (c) 90 s (d) 100 s

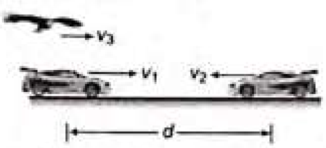
37. A train 100 m long travelling at 40 m s^{-1} starts overtaking another train 200 m long travelling at 30 m s^{-1}. The time taken by the first train to pass the second train completely is
(a) 30 s (b) 40 s (c) 50 s (d) 60 s

38. A train is moving at a constant speed V when its driver observes another train in front of him on the same track and moving in the same direction with constant speed v. If the distance between the trains is x, then what should be the minimum retardation of the train so as to avoid collision?
(a) $\dfrac{(V+v)^2}{x}$ (b) $\dfrac{(V-v)^2}{x}$
(c) $\dfrac{(V+v)^2}{2x}$ (d) $\dfrac{(V-v)^2}{2x}$

39. A person A is sitting in one train while another person B is in the second train. The trains are moving with velocities 60 m/s and 40 m/s, respectively, in the same direction. Then the velocity of B relative to A will be
(a) 100 m/s in the direction of trains
(b) 20 m/s in the direction of trains
(c) 100 m/s in the direction opposite to that of trains
(d) 20 m/s in the direction opposite to that of the trains

40. Imagine yourself standing in an elevator which is moving with an upward acceleration $a = 2$ m/s^2. A coin is dropped from rest from the roof of the elevator, relative to you. The roof to floor height of the elevator is 1.5 m. (Take $g = 10$ m/s^2). Find the velocity of the coin relative to you when it strikes the base of the elevator.
(a) 3 m/s (b) 6 m/s (c) 2 m/s (d) 1.5 m/s

41. A bird flies to and fro between two cars which move with velocities $v_1 = 20$ m/s and $v_2 = 30$ m/s. If the speed of the bird is $v_3 = 10$ m/s and the initial distance of separation between them is $d = 2$ km, find the total distance covered by the bird till the cars meet.



(a) 2000 m (b) 1000 m (c) 400 m (d) 200 m

42. A man swimming downstream overcome a float at a point M. After travelling distance D he turned back and passed the float at a distance of $D/2$ from the point M, then the ratio of speed of swimmer with respect to still water to the speed of the river will be
(a) 2 (b) 3 (c) 4 (d) 2.5

43. It takes one minute for a passenger standing on an escalator to reach the top. If the escalator does not move it takes him 3 minute to walk up. How long will it take for the passenger to arrive at the top if he walks up the moving escalator?
(a) 30 sec (b) 45 sec (c) 40 sec (d) 35 sec

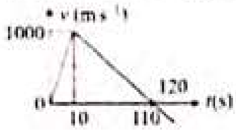
44. A bus is moving with a velocity 10 ms^{-1} on a straight road. A scooterist wishes to overtake the bus in 100 s. If the bus is at a distance of 1 km from the scooterist, with what velocity should the scooterist chase the bus?
(a) 50 ms^{-1} (b) 40 ms^{-1} (c) 30 ms^{-1} (d) 20 ms^{-1}

Understanding Motion Through Graphs

45. The variation of velocity of a particle moving along a straight line is shown in figure. The distance travelled by the particle in 12 s is

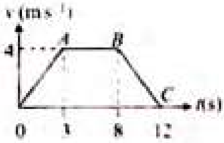
(a) 37.5 m
(b) 32.5 m
(c) 35.0 m
(d) None of these

46. The following graph (figure) shows the variation of velocity of a rocket with time. Then the maximum height attained by the rocket is



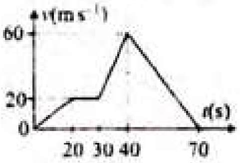
(a) 1.1 km
(b) 5 km
(c) 55 km
(d) None of these

47. From the velocity–time graph, given in figure of a particle moving in a straight line, one can conclude that



(a) Its average velocity during the 12 s interval is 24/7 $m\,s^{-1}$.
(b) Its velocity for the first 3 s is uniform and is equal to 4 $m\,s^{-1}$.
(c) The body has a constant acceleration between $t = 3$ s and $t = 8$ s.
(d) The body has a uniform retardation from $t = 8$ s to $t = 12$ s.

48. The velocity–time graph of a body is given in figure. The maximum acceleration in $m\,s^{-2}$ is



(a) 4 (b) 3
(c) 2 (d) 1

49. An object is thrown up vertically. The velocity–time graph for the motion of the particle is

(a) (b) (c) (d) 
50. From a high tower, at time $t = 0$, one stone is dropped from rest and simultaneously another stone is projected vertically up with an initial velocity. The graph of distance S between the two stones plotted against time t will be

(a) (b) (c) 
(d) 
51. An object is vertically thrown upwards. Then the displacement–time graph for the motion is as shown in

(a) (b) (c) (d) 
52. The acceleration versus time graph of a particle is shown in figure. The respective v–t graph of the particle is

(a) (b) (c) (d) 
53. The displacement–time graph of a moving particle with constant acceleration is shown in figure. The velocity–time graph is given by

(a) (b) (c) (d) 
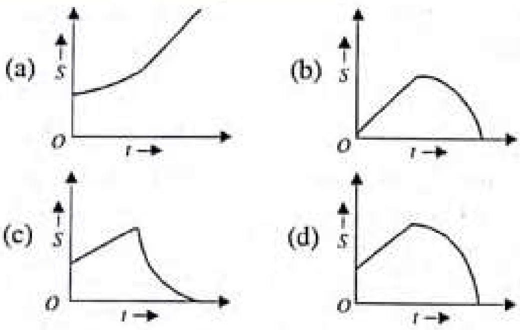
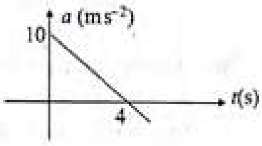
54. Two balls are dropped from the top of a high tower with a time interval of t_0 second, where t_0 is smaller than the time taken by the first ball to reach the floor, which is perfectly inelastic. The distance S between the two balls, plotted against the time lapse t from the instant of dropping the second ball, is best represented by

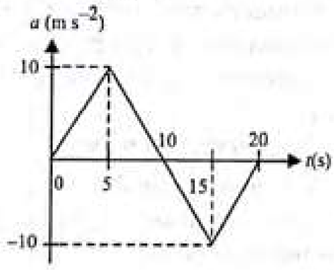


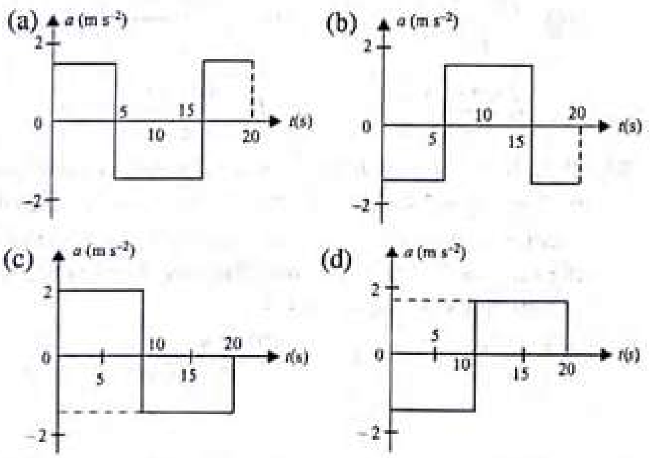
55. The acceleration–time graph of a particle moving along a straight line is as shown in figure. At what time the particle acquires its initial velocity?



(a) 12 s (b) 5 s (c) 8 s (d) 16 s

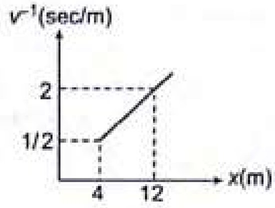
56. Plot the acceleration–time graph of the velocity–time graph given in the figure.





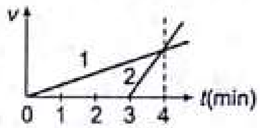
Problems Based on Mixed Concepts

57. Graph of $(1/v)$ vs. x for a particle under motion is as shown, where v is velocity and x is position. The time taken by particle to move from $x = 4$ m to $x = 12$ m is



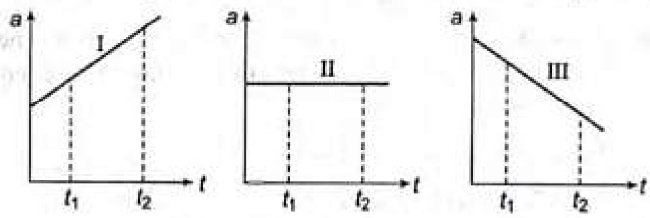
(a) 16/3 sec (b) 10 sec
(c) 8 sec (d) 12 sec

58. The drawing shows velocity (v) versus time (t) graphs for two cyclists moving along the same straight segment of a highway from the same point. The second cyclist starts moving at $t = 3$ min. At what time do the two cyclists meet?



(a) 4 min (b) 6 min (c) 8 min (d) 12 min

59. Each of the three graphs represents acceleration versus time for an object that already has a positive velocity at time t_1. Which graphs show an object whose speed is increasing for the entire time interval between t_1 and t_2?



(a) graph I, only (b) graphs I and II, only
(c) graphs I and III, only (d) graphs I, II and III

60. A lift performs the first part of ascent with uniform acceleration a and the remainder with uniform retardation $2a$. The lift starts from rest and finally comes to rest. If t is the time of ascent. Find the height ascended by lift.

(a) $\frac{at^2}{4}$ (b) $\frac{at^2}{3}$ (c) $\frac{at^2}{2}$ (d) $\frac{at^2}{8}$

61. A train normally travels at a uniform speed of 72 km/h on a long stretch of straight level track. On a particular day, the train was forced to make a 2.0 minute stop at a station along this track. If the train decelerates at a uniform rate of 1.0 m/s^2 and accelerates at a rate of 0.50 m/s^2, how much time is lost in stopping at the station?

(a) 2 min (b) 2 min 30 s
(c) 30 s (d) 2 min 20 s

62. A particle is thrown up inside a stationary lift of sufficient height. The time of flight is T. Now it is thrown again with same initial speed v_0 with respect to lift. At the time of second throw, lift is moving up with speed v_0 and uniform acceleration g upward (the acceleration due to gravity). The new time of flight is

(a) $\sqrt{2}\,T$ (b) $\frac{T}{2}$

(c) T (d) $2T$

63. A particle is projected upwards from the top of a tower. Treat point of projection as origin and upwards as positive. Consider three point on its path such that at (s represents displacement from origin and v represents velocity)
(i) $s > 0, v > 0$ (ii) $s > 0, v < 0$
(iii) $s < 0, v < 0$
Which of the following correctly indicates the distance travelled by particle since its projection to respective points in appropriate order
(a) (i) > (ii) > (iii)
(b) (i) = (ii) < (iii)
(c) (i) < (ii) < (iii)
(d) ordering depends on exact location of points

64. Two objects moving along the same straight line are leaving point A with an acceleration a, $2a$ and velocity $2u$, u respectively at time $t = 0$. The distance moved by the object with respect to point A when one object overtakes the other is
(a) $\frac{3u^2}{a}$ (b) $\frac{2u^2}{a}$ (c) $\frac{4u^2}{a}$ (d) $\frac{6u^2}{a}$

65. Each of the four particles move along an x-axis. Their coordinates (in metres) as function of time (in seconds) are given by
Particle 1: $x(t) = 3.5 - 2.7t^3$
Particle 2: $x(t) = 3.5 + 2.7t^3$
Particle 3: $x(t) = 3.5 + 2.7t^2$
Particle 4: $x(t) = 3.5 - 3.4t - 2.7t^2$
which of these particles is speeding up for $t > 0$?
(a) All four (b) only 1
(c) only 1, 2 and 3 (d) only 2, 3 and 4

66. When two bodies move uniformly towards each other, the distance between them diminishes by 16 m every 10 s. If bodies move with velocities of the same magnitude and in the same direction as before the distance between then will decrease 3 m every 5 s. The velocity of each body is.
(a) 1.5 m/s, 0.8 m/s (b) 1.1 m/s, 0.5 m/s
(c) 2.4 m/s, 1.5 m/s (d) 3.0 m/s, 1.5 m/s

67. Two particles P and Q start from rest and move for equal time on a straight line. Particle P has an acceleration of X m/s^2 for the first half of the total time and $2X$ m/s^2 for the second half. The particle Q has an acceleration of $2X$ m/s^2 for the first half of the total time and Xm/s^2 for the second half. Which particle has covered larger distance?
(a) both have covered the same distance
(b) P has covered the larger distance
(c) Q has covered the larger distance
(d) none of these

68. A particle is thrown upwards from ground. It experiences a constant air resistance force which can produce a retardation of 2 m/s^2. The ratio of time of ascent to the time of descent is
(a) 1 : 1 (b) $\sqrt{\frac{2}{3}}$ (c) $\frac{2}{3}$ (d) $\sqrt{\frac{3}{2}}$

69. An insect moving along a straight line, travels in every second distance equal to the magnitude of time elapsed. Assuming acceleration to be constant, and the insect starts at $t = 0$. Find the magnitude of initial velocity of insect
(a) $\frac{3}{2}$ unit (b) $\frac{5}{4}$ unit (c) 2 unit (d) $\frac{1}{2}$ unit

70. A particle moving along a straight line with a constant acceleration of -4 m/s^2 passes through a point A on the line with a velocity of +8 m/s at some moment. Find the distance travelled by the particle in 5 seconds after that moment.
(a) 26 m (b) 18 m (c) 9 m (d) 32 m

71. A stone is dropped from the top of a tower. When it has fallen by 5 m from the top, another stone is dropped from a point 25 m below the top. If both stones reach the ground at the same moment, then height of the tower is (take $g = 10$ m/s^2)
(a) 45 m (b) 50 m (c) 60 m (d) 65 m

72. A particle starts from rest with uniform acceleration and its velocity after n seconds is v. The displacement of the body in last two seconds is
(a) $\frac{v(n+1)}{n}$ (b) $\frac{2v(n+1)}{n}$
(c) $\frac{2v(n-1)}{n}$ (d) $\frac{v(n-1)}{n}$

73. Two bikes A and B start from a point. A moves with uniform speed 40 m/s and B starts from rest with uniform acceleration 2 m/s^2. If B starts at $t = 10$ and A starts from the same point at $t = 10$ s, then the time during the journey in which A was ahead of B is
(a) 20 s (b) 8 s
(c) 10 s (d) A is never ahead of B

ARCHIVES

1. If a body loses half of its velocity on penetrating 3 cm in a wooden block, then how much will it penetrate more before coming to rest?
(a) 1 cm (b) 2 cm
(c) 3 cm (d) 4 cm **(AIEEE 2002)**

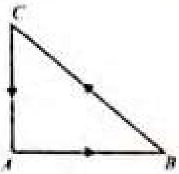
2. Two balls A and B of same masses are thrown from the top of a building. A, thrown upward with velocity V and B, thrown downward with velocity V, then
(a) Velocity of A is more than B at the ground
(b) Velocity of B is more than A at the ground

(c) Both A and B strike the ground with same velocity
(d) None of these **(AIEEE 2002)**

3. Speed of two identical cars are u and $4u$ at a specific instant. The ratio of the respective distances in which the two cars are stopped from that instant is
(a) 1 : 1 (b) 1 : 4
(c) 1 : 8 (d) 1 : 16 **(AIEEE 2002)**

4. A car moving with a speed of 50 km/h can be stopped by brakes after at least 6 m. If the same car is moving at a speed of 100 km/h, the minimum stopping distance is
(a) 12 m (b) 18 m
(c) 24 m (d) 6 m
(AIEEE 2003)

5. Three forces start acting simultaneously on a particle moving with velocity $\vec{v}$. These forces are represented in magnitude and direction by the three sides of a triangle ABC (as shown). The particle will now move with velocity



(a) $\vec{v}$ remaining unchanged.
(b) less than $\vec{v}$.
(c) greater than $\vec{v}$.
(d) $|\vec{v}|$ in the direction of the largest force BC.
(AIEEE 2003)

6. A ball is released from the top of a tower of height h metre. It takes T second to reach the ground. What is the position of the ball at $T/3$ second?
(a) $(8h)/9$ metre from the ground
(b) $(7h)/9$ metre from the ground
(c) $h/9$ metre from the ground
(d) $(17h)/18$ metre from the ground
(AIEEE 2004)

7. A car travelling with a speed of 60 km/h can stop within a distance of 20 m. If the car is going twice as fast, i.e., 120 km/h, the stopping distance will be
(a) 60 m (b) 40 m
(c) 20 m (d) 80 m **(AIEEE 2004)**

8. A car starting from rest accelerates at the rate f through a distance S, then continues at constant speed for time t and then decelerates at the rate $f/2$ to come to rest. If the total distance traversed is $15S$, then
(a) $S = \frac{1}{4}ft^2$ (b) $S = \frac{1}{2}ft^2$
(c) $S = \frac{1}{6}ft^2$ (d) $S = ft$ **(AIEEE 2005)**

9. The relation between time t and distance x is $t = ax^2 + bx$, where a and b are constants. The acceleration is
(a) $2av^2$ (b) $-2av^3$
(c) $2bv^3$ (d) $-2abv^2$ **(AIEEE 2005)**

10. A parachutist after bailing out falls 50 m without friction. When his parachute opens, it decelerates at 2 m/s^2. He reaches the ground with a speed of 3 m/s. At what height did he bail out?
(a) 111 m (b) 293 m
(c) 182 m (d) 91 m **(AIEEE 2005)**

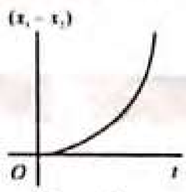
11. A bullet fired into a fixed target loses half of its velocity after penetrating 3 cm. How much further it will penetrate before coming to rest assuming that it faces constant resistance to motion?
(a) 1.0 cm (b) 1.5 cm
(c) 2.0 cm (d) 3.0 cm **(AIEEE 2005)**

12. A particle located at $x = 0$ at time $t = 0$ starts moving along the positive x-direction with a velocity v that varies as $v = \alpha\sqrt{x}$. The displacement of the particle varies with time as
(a) $t^{1/2}$ (b) t^3
(c) t^2 (d) t **(AIEEE 2006)**

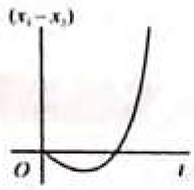
13. The velocity of a particle is $v = v_0 + gt + ft^2$. If its position is $x = 0$ at $t = 0$, then its displacement after unit time ($t = 1$) is
(a) $v_0 + (g/2) + (f/3)$ (b) $v_0 + g + f$
(c) $v_0 + (g/2) + f$ (d) $v_0 + 2g + 3f$
(AIEEE 2007)

14. A body is at rest at $x = 0$. At $t = 0$, it starts moving in the positive x-direction with a constant acceleration. At the same instant another body passes through $x = 0$ moving in the positive x-direction with a constant speed. The position of the first body is given by $x_1(t)$ after time t and that of the second body by $x_2(t)$ after the same time interval. Which of the following graphs correctly describes $(x_1 - x_2)$ as a function of time t?

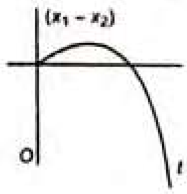
(a)



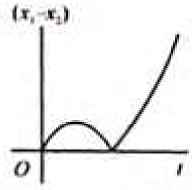
(b)



(c)



(d)



(AIEEE 2008)

15. A particle has an initial velocity $3\hat{i} + 4\hat{j}$ and an acceleration of $0.4\hat{i} + 0.3\hat{j}$. Its speed after 10 s is
(a) 10 units (b) $7\sqrt{2}$ units
(c) 7 units (d) 8.5 units **(AIEEE 2009)**

16. A particle is moving with velocity $\vec{v} = K(y\hat{i} + x\hat{j})$, where K is a constant. The general equation for its path is
(a) $y = x^2 +$ constant (b) $y^2 = x +$ constant
(c) $xy =$ constant (d) $y^2 = x^2 +$ constant
(AIEEE 2010)

17. An object moving with a speed of 6.25 m/s, is decelerated at a rate given by:
$$\frac{dv}{dt} = -2.5\sqrt{v}$$

where v is instantaneous speed. The time taken by the object, to come to rest, would be:

(a) 1 s (b) 2 s

(c) 4 s (d) 8 s **(AIEEE 2011)**

18. A boy can throw a stone up to a maximum height of 10 m. The maximum horizontal distance that the boy can throw the same stone up to will be

(a) $20\sqrt{2}$ m (b) 10 m

(c) $10\sqrt{2}$ m (d) 20 m **(AIEEE 2012)**

19. Two stones are thrown up simultaneously from the edge of a cliff 240 m high with initial speed of 10 m/s and 40 m/s respectively. Which of the following graphs best represents the time variation of relative position of the second stone with respect to the first ?

(Assume stones do not rebound after hitting the ground and neglect air resistance, take $g = 10$ m/s^2)

(The figures are schematic and not drawn to scale.)

(a) 
(b) 
(c) 
(d) 
(JEE Main 2015)

20. A body is thrown vertically upwards. Which one of the following graphs correctly represent the velocity vs. time?

(a) 
(b) 
(c) 
(d) 
(JEE Main 2017)

21. All the graphs below are intended to represent the same motion. One of them does it incorrectly. Pick it up.

(a) 
(b)

Chapter 4

Motion in Two Dimensions

PROJECTILE MOTION

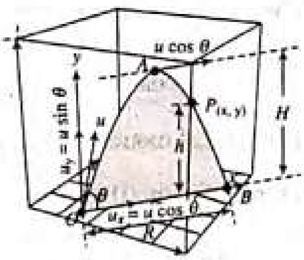
Generally "projectile motion" refers to the motion of a point object thrown in earth's gravitational field. However, the above definition of a projectile is still valid when you throw a point object in gravitational field of any other planet which may not be practically possible for everyone. This tells us that the motion of rockets, crackers, etc., driven by some other external forces other than gravity, cannot be termed as projectile motion in general sense.

The assumptions of projectile motion are as follows:

- There is no resistance due to air.
- The effect due to the curvature of earth is negligible.
- The effect due to the rotation of earth is negligible.
- For all points of the trajectory, the acceleration due to gravity g is constant in magnitude and direction.

Calculation of Various Parameters in Projectile Motion

Let a particle is projected with velocity u at angle θ with the horizontal from point O as shown in the figure. We can write the x and y components of the initial velocity as $u_x = u\cos\theta$, $u_y = u\sin\theta$.



The acceleration of the particle in x- and y-direction is $a_x = 0$ and $a_y = -g$.

Time of Flight

The total time taken by the projectile to go up (O to A) and come down (A to B) to the same level from which it was projected is called **time of flight.**

For vertical upward motion, using $v_y = u_y + a_y t$, we get $u_y = u\sin\theta$ and $a_y = -g$

Hence, $0 = u_y + a_y t = u\sin\theta - gt$

$$\Rightarrow \quad t = \frac{u_y}{g} = \frac{u\sin\theta}{g}$$

Now as the time taken to go up is equal to the time taken to come down, so time of flight, L

$$T = 2t = \frac{2u_y}{g} = \frac{2u\sin\theta}{g}$$

Some important points regarding time of flight

- For complementary angles of projection θ and $90° - \theta$,

  Ratio of time of flight $= \dfrac{T_1}{T_2} = \dfrac{2u\sin\theta / g}{2u\sin(90-\theta)/g}$

  which gives $\dfrac{T_1}{T_2} = \tan\theta$

- If t_1 is the time taken by the projectile from point O to P and t_2 is the time taken in moving from point P to B at ground level, then $t_1 + t_2 = \dfrac{2u\sin\theta}{g} =$ time of flight.

  $u\sin\theta = \dfrac{g(t_1+t_2)}{2}$ and height of the point P is given by

  $$h = u\sin\theta\, t_1 - \frac{1}{2}gt_1^2 = g\frac{(t_1+t_2)}{2}t_1 - \frac{1}{2}gt_1^2$$

  By solving, we get $h = \dfrac{g t_1 t_2}{2}$.

Maximum Height

It is the maximum height from the point of projection, a projectile can reach.

Using $v^2_y = u^2_y + 2a_y s \Rightarrow 0 = (u\sin\theta)^2 - 2gH$, we get

$$H = \frac{u^2\sin^2\theta}{2g}$$

Some important points regarding maximum height

- Maximum height can also be expressed as:

  $$H = \frac{u_y^2}{2g}$$

  where u_y is the vertical component of initial velocity.

- $H_{max} = \dfrac{u^2}{2g}$ (when $\sin^2\theta = \max = 1$ i.e., $\theta = 90°$)

  i.e., for maximum height, the body should be projected vertically upward. So it falls back to the point of projection after reaching the maximum height.

- For complementary angles of projection θ and $90° - \theta$
- Ratio of maximum height

$$= \frac{H_1}{H_2} = \frac{u^2 \sin^2\theta/2g}{u^2 \sin^2(90° - \theta)2g} = \frac{\sin^2\theta}{\cos^2\theta} = \tan^2\theta$$

ILLUSTRATION 4.1 Which of the path (I) or (II) of a projectile has more time of flight? Use necessary assumptions.

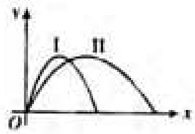
Solution. Given $H_1 = H_2$.

$$\frac{(u_y)_1^2}{2g} = \frac{(u_y)_2^2}{2g} \Rightarrow \frac{u_1^2\sin^2\theta_1}{2g} = \frac{u_2^2\sin^2\theta_2}{2g}$$

$\Rightarrow \quad u_1 \sin\theta_1 = u_2 \sin\theta_2$ Or $(u_y)_1 = (u_y)_2$

We know $T_1 = \frac{2(u_y)_1}{2} = \frac{2(u_y)_2}{2} = T_2$

Hence, both paths take same time.



Horizontal Range

It is the horizontal distance travelled by a body during the time of flight.

In horizontal direction, the acceleration of the particle is zero, i.e., horizontal component of the velocity is constant. Hence, displacement in the horizontal direction can be written as $x = R = u_x \times T$.

$$\Rightarrow \quad R = u\cos\theta\, T = u\cos\theta \times \left(\frac{2u\sin\theta}{g}\right)$$

$$= \frac{u^2(2\sin\theta\cdot\cos\theta)}{g} = \frac{u^2\sin 2\theta}{g}$$

ILLUSTRATION 4.2 A batsman hits a ball at an angle of 30° with an initial speed of 30 m s^{-1}. Assuming that the ball travels in a vertical plane, calculate

(a) The time at which the ball reaches the highest point
(b) The maximum height reached
(c) The horizontal range of the ball
(d) The time for which the ball is in the air

Solution. Here $\theta = 30°$, $u = 30$ m s^{-1}.

(a) The time taken by the ball to reach the highest point is half the total time of flight. As the time of ascending and descending is same for a projectile without air resistance, the time to reach the highest point

$$t_H = \frac{T}{2} = \frac{u\sin\theta}{g} = \frac{30}{10} \times \sin 30° = 1.5\text{ s}$$

(b) The maximum height reached is

$$\frac{u^2\sin^2\theta}{2g} = \frac{(30)^2 \times (\sin 30°)^2}{2g} = \frac{900}{2 \times 10 \times 4} = 11.25\text{ m}$$

(c) Horizontal range $= \frac{u^2 \sin 2\theta}{g}$

$$= \frac{(30)^2 \sin 2(30°)}{10}$$

$$= \frac{900\sqrt{3}}{20} = 45\sqrt{3}\text{ m}$$

(d) The time for which the ball is in air is same as its time of flight, i.e.,

$$\frac{2u\sin\theta}{g} = \frac{2 \times 30 \times \sin 30°}{10} = 3\text{ s}$$

ILLUSTRATION 4.3 A bullet with muzzle velocity 100 m s^{-1} is to be shot at a target 30 m away in the same horizontal line. How high above the target must the rifle be aimed so that the bullet will hit the target?

Solution. Horizontal range of bullet is 30 m.

Using range formula, $R = \frac{u^2\sin 2\theta}{g} = 30$

or $\quad \sin 2\theta = \frac{30 \times 10}{(100)^2}$ or $\sin 2\theta = 0.03$

For small θ, $\sin\theta \approx \theta = \tan\theta$, i.e., $2\theta = 0.03$

Therefore, $\theta = 0.015$ rad

In ΔOAP, $\tan\theta = \frac{AP}{OP} \Rightarrow AP = OP\tan\theta$

The rifle must be aimed at an angle $\theta = 0.015$ above horizontal.

Height to be aimed = 30 tan $\theta \approx 30(\theta) = 30 \times 0.015 = 45$ cm

Equation of Trajectory

A projectile thrown with velocity u at an angle θ with the horizontal. The velocity u can be resolved into two rectangular components: $u\cos\theta$ component along X-axis and $u\sin\theta$ component along Y-axis.

For horizontal motion, $x = u\cos\theta \times t$

$$\Rightarrow \quad t = \frac{x}{u\cos\theta} \quad \text{...(i)}$$

For vertical motion, $y = (u\sin\theta)t - \frac{1}{2}gt^2 \quad$ ...(ii)

From equation (i) and (ii),

$$y = u\sin\theta\left(\frac{x}{u\cos\theta}\right) - \frac{1}{2}g\left(\frac{x^2}{u^2\cos^2\theta}\right)$$

$$= x\tan\theta - \frac{1}{2}\frac{gx^2}{u^2\cos^2\theta} \quad \text{...(iii)}$$

This equation shows that the trajectory of projectile is parabolic because it is similar to the equation of parabola.

$y = ax - bx^2$

It is known as the equation of trajectory. It is an equation of parabola. Hence, path of a projectile is parabolic.

Equation (iii) can also be written as:

$$y = x\tan\theta - \frac{x^2}{\frac{2u^2\cos^2\theta}{g}}$$

$$= x\tan\theta - \frac{x^2}{\left(\frac{2u^2\cos\theta\cdot\sin\theta}{g}\right)}\frac{\sin\theta}{\cos\theta}$$

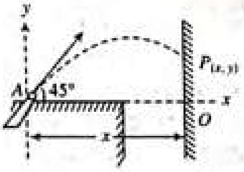
$$= x\tan\theta - \frac{x^2\tan\theta}{R} \quad y = x\tan\theta\left(1-\frac{x}{R}\right)$$

NOTE: The equation of oblique projectile also can be written as $y = x\tan\theta\left[1-\frac{x}{R}\right]$

(where R = horizontal range $= \frac{u^2\sin 2\theta}{g}$)

The shape of the curve above x-axis is symmetrical about a vertical line passing through the highest point.

ILLUSTRATION 4.4 A jet of water is projected at an angle $\theta = 45°$ with horizontal from point A which is situated at a distance $x = OA$ = (a) 1/2 m, (b) 2 m from a vertical wall. If the speed of projection is $v_0 = \sqrt{10}\ \text{m s}^{-1}$, find point P of striking of the water jet with the vertical wall.



Solution. Point P lies at the trajectory of jet of water. Hence, the coordinate of point P (x, y) should satisfy the trajectory equation.

$$y = x\tan\theta\left(1-\frac{x}{R}\right) \quad \text{...(i)}$$

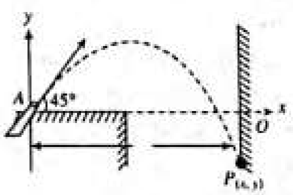
$$R = \frac{u^2\sin 2\theta}{g} = \frac{(\sqrt{10})^2\cdot\sin 2\times 45°}{10} = 1\ \text{m}$$

(a) If $x = 1/2$ m, from (i), $y = \frac{1}{2}\tan 45°\left(1-\frac{1/2}{1}\right) = \frac{1}{2}\times\frac{1}{2} = \frac{1}{4}$ m

Hence, the coordinate of $P = \left(\frac{1}{2}\text{m}, \frac{1}{4}\text{m}\right)$

(b) If $x = 2$ m, from (i),

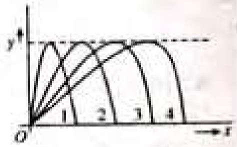
$$y = 2\cdot\tan 45°\left(1-\frac{2}{1}\right) = -1\ \text{m}$$



Hence, water jet will strike below the horizontal dotted line (x-axis) at coordinate (2 m, –1m).

CONCEPT APPLICATION EXERCISE 4.1

1. A particle is thrown with velocity u at an angle α from the horizontal. Another particle is thrown with the same velocity at an angle α from the vertical. What will be the ratio of times of flight of two particles?
2. The friction of the air causes vertical retardation equal to one-tenth of the acceleration due to gravity (take $g = 10\ \text{m s}^{-2}$). Find the decrease in the time of flight.
3. A boy playing on the roof of a 10 m high building throws a ball with a speed of 10 m s^{-1} at an angle of 30° with the horizontal. How far from the throwing point will the ball be at the height of 10 m from the ground ($g = 10\ \text{m s}^{-2}$, $\sin 30° = \frac{1}{2}$, $\cos 30° = \frac{\sqrt{3}}{2}$.
4. Figure shows four paths for a kicked football. Ignoring the effects of air on the flight, rank the paths according to the initial horizontal velocity component, highest first.



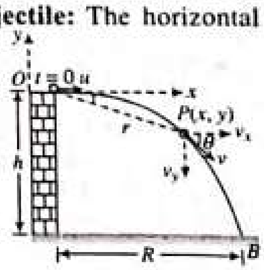
5. A projectile is thrown into space so as to have maximum horizontal range R. Taking the point of projection as origin, find out the co-ordinates of the point where the speed of the particle is minimum.
6. A large number of bullets are fired in all directions with same speed u. What is the maximum area on the ground on which these bullets will spread?
7. A projectile thrown with an initial speed u and the angle of projection 15° to the horizontal has a range R. If the same projectile is thrown at an angle of 45° to the horizontal with speed $2u$, what will be its range?
8. The range R of a projectile is same when its maximum heights are h_1 and h_2. What is the relation between R and h_1 and h_2?

HORIZONTAL PROJECTILE

A body is projected horizontally from a certain height y vertically above the ground with initial velocity u. If friction is considered to be absent, then there will be no other horizontal forces which can affect the horizontal motion. The horizontal velocity, therefore, remains constant and so the object covers equal distance in horizontal direction in equal intervals of time.

- **Trajectory of horizontal projectile:** The horizontal displacement x is governed by the equation

$$x = ut \Rightarrow t = \frac{x}{u} \quad \text{...(i)}$$



The vertical displacement y is governed by

$$y = -\frac{1}{2}gt^2 \quad \text{...(ii)}$$

(Since the initial vertical velocity is zero)

By substituting the value of t in (ii), $y = -\frac{1}{2}\frac{gx^2}{u^2}$

- **Displacement of projectile ($\vec{r}$):** After time t, horizontal displacement $x = ut$ and vertical displacement $y = \frac{1}{2}gt^2$.

  So, position vector, $\vec{r} = ut\,\hat{i} - \frac{1}{2}gt^2\,\hat{j}$

  $$\therefore \quad r = ut\sqrt{1+\left(\frac{gt}{2u}\right)^2}$$

  and $\alpha = \tan^{-1}\left(\frac{gt}{2u}\right) = \tan^{-1}\left(\sqrt{\frac{gy}{2}}\Big/u\right)\left(\text{as } t = \sqrt{\frac{2y}{g}}\right)$

- **Instantaneous velocity:** Throughout the motion, the horizontal component of the velocity is $v_x = u$.
  The vertical component of velocity increases with time and is given by

  $$v_y = 0 - g\,t = -g\,t \qquad (\text{from } v = u + gt)$$

  So, $\vec{v} = v_x\hat{i} - v_y\hat{j} = \vec{v} = u\hat{i} - gt\,\hat{j}$

  i.e., $v = \sqrt{u^2 + (gt)^2} = u\sqrt{1+\left(\frac{gt}{u}\right)^2}$

  Again $\vec{v} = u\hat{i} - \sqrt{2gy}\,\hat{j}$

  i.e., $v = \sqrt{u^2 + 2gy}$

- **Direction of instantaneous velocity:** $\tan\phi = \frac{v_y}{v_x}$

  $$\Rightarrow \quad \phi = \tan^{-1}\left(\frac{v_y}{v_x}\right) = \tan^{-1}\left(\frac{\sqrt{2gy}}{u}\right) = \tan^{-1}\left(\frac{gt}{u}\right)$$

  where ϕ is the angle of instantaneous velocity from the horizontal.

- **Time of flight:** If a body is projected horizontally from a height h with velocity u and the time taken by the body to reach the ground is T, then for vertical motion,

  $$-h = 0 - \frac{1}{2}gT^2 \quad \Rightarrow \quad T = \sqrt{\frac{2h}{g}}$$

- **Horizontal range:** Let R be the horizontal distance travelled by the body. The acceleration in x-direction is zero. Hence,

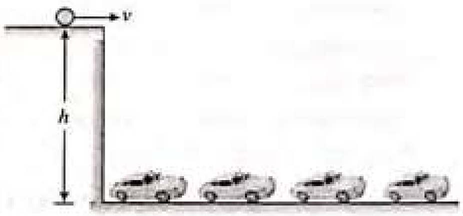
  $$R = uT + \frac{1}{2}\,0\,T^2 \quad \Rightarrow \quad R = u\sqrt{\frac{2h}{g}}$$

Important Points

1. If projectiles A and B are projected horizontally with different initial velocity from same height and a third particle C is dropped from same point, then

   (a) All three particles will take equal time to reach the ground.
   (b) Their net velocity would be different but all three particles possess same vertical component of velocity.
   (c) The trajectory of projectiles A and B will be straight line w.r.t. particle C.
2. If a particle is released from an airplane moving horizontally at a certain height, the analysis of the motion of the particle will be same as the particle thrown from the certain height as discussed above.

ILLUSTRATION 4.5 A rubber ball escapes from the horizontal roof with a velocity $v = 5\ \text{m s}^{-1}$. The roof is situated at a height, h = 20 m. If the length of each car is equal to x_0 = 4 m, with which car will the ball hit?



Solution. The initial velocity of the ball is in horizontal direction. The initial velocity in vertical direction is zero.

For vertical motion, $u_x = 5\ \text{m s}^{-1}$, $u_y = 0$.

Displacement in vertical direction, $y = -h = -20$ m

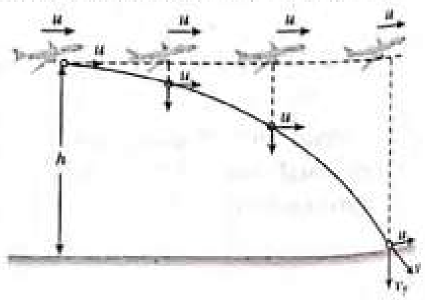
$$-h = \frac{1}{2} - gt^2 \Rightarrow \frac{2\times 20}{10} = t^2 \Rightarrow t = 2\ \text{s}$$

Horizontal displacement: Distance covered in 2 s,

$$x = d = u_x \times t = 5\times 2 = 10\ \text{m}$$

Since the length of one car is 4 m, it will hit the third car for which 8 m < d < 12 m.

ILLUSTRATION 4.6 A relief food package is dropped from a airplane which is moving horizontal with a velocity of $30\ \text{m s}^{-1}$ at a height $h = 50$ m. Find the (a) time of flight of the package, (b) location of the point of striking of the food package, (c) velocity of the package at the time of striking the ground, and (d) displacement of the food package.



Solution. $u_x = 30 \text{ m s}^{-1}$, $u_y = 0 \text{ m s}^{-1}$, and $h = 50$ m.

$$h = u_y t + \frac{1}{2} g t^2$$

$$\Rightarrow \quad \frac{50 \times 2}{10} = t^2 \Rightarrow t = \sqrt{10} \text{ s}$$

Distance (horizontally) covered in $t = \sqrt{10}$ s

$$x = u_x t = 30\sqrt{10} \text{ m}$$

$$v_x = u_x = 30 \text{ m s}^{-1}$$

$$v_y = u_y + gt = 10\sqrt{10} \text{ m s}^{-1}$$

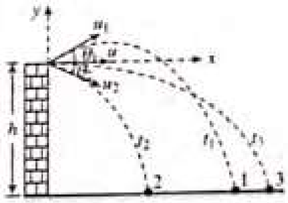
$$v = \sqrt{900 + 1000} = 10\sqrt{19} \text{ m s}^{-1}$$

$$\text{Displacement} = \sqrt{h^2 + x^2} = \sqrt{2500 + 9000} = 10\sqrt{115} \text{ m}$$

Projectile from Height at Certain Angle with Horizontal

Case I	**Case II**
Projection at an angle θ above horizontal $u_x = u\cos\theta$; $a_y = -g$ 	Projection at an angle θ below horizontal $u_x = u\cos\theta$; $u_y = -u\sin\theta$; $a_y = -g$ 
Equation of motion between A and B (in Y direction) $S_y = -h$, $u_y = u\sin\theta$, $a_y = -g$, $t = T$ $S_y = u_y t + \frac{1}{2} a_y t^2$ $\Rightarrow -h = (u\sin\theta)T - \frac{1}{2} gT^2$ Solving the above equation, we will get the time of flight, T. Range, $R = u_x T = u\cos\theta\, T$ Also, $v_y^2 = u_y^2 + 2a_y S_y$ $= u^2\sin^2\theta + 2gh$ $v_x = u\cos\theta$ $v_B = \sqrt{v_y^2 + v_x^2}$ $v_B = \sqrt{u^2 + 2gh}$	$S_y = u_y t + \frac{1}{2} a_y t^2$ $S_y = -h$, $u_y = -u\sin\theta$ $t = T$, $a_y = -g$ $\Rightarrow -h = -(u\sin\theta)T - \frac{1}{2} gT^2$ $\Rightarrow \quad h = (u\sin\theta)T + \frac{1}{2} gT^2$. Solving the above equation, we will get the time of flight, T. Range, $R = u_x T = u\cos\theta\, T$ $v_x = u\cos\theta$ $v_y^2 = u_y^2 + 2a_y S_y$ $= u^2\sin^2\theta + 2(-g)(-h)$ $= u^2\sin^2\theta + 2gh$ $v_B = \sqrt{v_x^2 + v_y^2} = \sqrt{u^2 + 2gh}$

Important observation: If three objects are thrown from the same height in different directions as shown in the figure, then



- if $\quad u_1 = u_2 = u$
  All the three objects will strike the ground with the same final speed.
  $u_1 \neq u_2 \neq u$, then all the three objects will strike the ground with the different final speeds.
- If $|u_1 \sin\theta_1| = |u_2 \sin\theta_2|$, then the time of flights of the objects are related as
  $t_3 = \sqrt{t_1 t_2}$

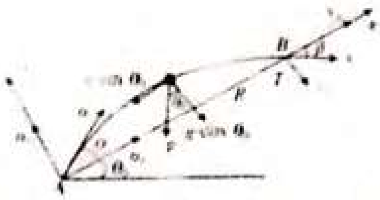
Projectile from a Moving Platform

In given four cases an observer 'A' is moving with constant velocity and he throws a ball. An another observer 'B' is standing on ground and observing the ball.

Case I	**Case II**
The observer B standing on road will see the ball moving in a parabolic path. The horizontal speed of the ball is equal to the speed of the skateboard.	The horizontal and vertical components of ball's velocity w.r.t. observer B standing on the ground, respectively, is $u_x = u\cos\theta + v$ $u_y = u\sin\theta$.
Case III	**Case IV**
The horizontal and vertical components of ball's velocity w.r.t. observer B standing on the ground, respectively, is $u_x = u\cos\theta - v$ $u_y = u\sin\theta$	The horizontal and vertical components of ball's velocity w.r.t. observer B sitting on the ground, respectively, is $u_x = u\cos\theta$ $u_y = u\sin\theta + v$

Projectile Motion on an Inclined Plane

Consider a plane is inclined at an angle θ_0 with horizontal. Let a projectile is projected from the foot of the inclined pane A, with velocity u and at an angle α with the inclined plane as shown in the figure. The particle strikes the plane at point B. We want to find the range of projectile on the inclined plane which is $R = AB$.



Take x-axis parallel to the inclined plane and y-axis perpendicular to the inclined plane as shown in the figure. We can write the following:

$u_x = u\cos\alpha$, $u_y = u\sin\alpha$, $a_x = -g\sin\theta_0$, $a_y = -g\cos\theta_0$

From A to B: $s_x = R$, $s_y = 0$ and let time taken from A to B is T

From A to B, apply $s_y = u_yt + \frac{1}{2}a_yt^2$, we get

$$0 = (u\sin\alpha)T - \frac{1}{2}g\cos\theta_0 T^2 \Rightarrow T^2 = \frac{2u\sin\alpha}{g\cos\theta_0} \quad \text{...(i)}$$

Now apply $s_x = u_xt + \frac{1}{2}a_xt^2$, we get

$$R = (u\cos\alpha)T - \frac{1}{2}g\sin\theta_0 T^2 \quad \text{...(ii)}$$

Put the value of T from (i) in (ii), we get

$$R = u\cos\theta\frac{2u\sin\alpha}{g\cos\theta_0} - \frac{1}{2}g\sin\theta_0\left(\frac{2u\sin\alpha}{g\cos\theta_0}\right)^2$$

$$= \frac{2u^2\sin\alpha\cos\alpha}{g\cos\theta_0} - \frac{2u^2\sin^2\alpha\sin\theta_0}{g\cos^2\theta_0}$$

$$= \frac{u^2}{g\cos^2\theta_0}[\sin 2\alpha\cos\theta_0 - \sin\theta_0 2\sin^2\alpha]$$

$$= \frac{u^2}{g\cos^2\theta_0}[\sin 2\alpha\cos\theta_0 - \sin\theta_0(1-\cos 2\alpha)]$$

$$= \frac{u^2}{g\cos^2\theta_0}[\sin(2\alpha+\theta_0) - \sin\theta_0] \quad \text{...(iii)}$$

The above equation (iii) gives the range of a projectile on an inclined plane.

Maximum range: We want to find angle α for which the range of the projectile is maximum on an inclined plane.

Range will be maximum if $\sin(2\alpha + \theta_0) = 1$

$$\Rightarrow \quad 2\alpha + \theta_0 = \pi/2 \Rightarrow \alpha = \frac{\pi}{4} - \frac{\theta_0}{2} \quad \text{...(iv)}$$

The above equation (iv) gives the angle α for which the range is maximum. Put the vale of α in (iii), we get

$$R_{max} = \frac{u^2}{g\cos^2\theta_0}\left[\sin\left[2\left(\frac{\pi}{4}-\frac{\theta_0}{2}\right)+\theta_0\right] - \sin\theta_0\right]$$

$$= \frac{u^2}{g\cos^2\theta_0}[1 - \sin\theta_0]$$

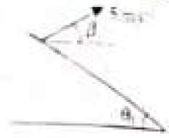
$$= \frac{u^2(1-\sin\theta_0)}{g(1-\sin^2\theta_0)} = \frac{u^2}{g(1+\sin\theta_0)} \quad \text{...(v)}$$

The above equation (v) gives the maximum range.

Important Points

As the projectile accelerates down perpendicular to the inclined plane with an acceleration $g\cos\beta$, its speed perpendicular to the inclined plane decreases from $v_0\sin\phi$ at O to zero at P and gradually increases to $v_0\sin\phi$ at Q just before striking.

ILLUSTRATION 4.7 An inclined plane makes an angle $\theta_0 = 30°$ with the horizontal. A particle is projected from this plane with a speed of 5 m s^{-1} at an angle of elevation $\beta = 30°$ with the horizontal as shown in the figure.



(a) Find the range of the particle on the plane when it strikes the plane.

(b) Find the range of the particle for $\beta = 120°$.

Solution.

(a) $\alpha' = \theta_0 + \beta = 60°$

$$R = \frac{u^2}{g\cos^2\theta_0}[\sin(2\alpha' - \theta_0) + \sin\theta_0]$$

$$= \frac{5^2}{10\cos^2 30°}[\sin(2\times 60° - 30°) + \sin 30°] = 5\text{ m}$$

(b) $\alpha + \theta_0 + 120° = 180° \Rightarrow \alpha = 30°$

$$R = \frac{u^2}{g\cos^2\theta_0}[\sin(2\alpha + \theta_0) - \sin\theta_0]$$

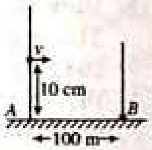
$$= \frac{5^2}{10\cos^2 30°}[\sin(2\times 30° + 30°) - \sin 30°] = 5/3\text{ m}$$

CONCEPT APPLICATION EXERCISE 4.2

1. A staircase contains three steps each 10 cm high and 20 cm wide. What should be the minimum horizontal velocity of a ball rolling off the uppermost plane so as to hit directly the lowest plane?

2. For a given velocity of projection from a point on the inclined plane, the maximum range down the plane is three times the maximum range up the incline. Then find the angle of inclination of the inclined plane.
3. A shell is fired from a gun from the bottom of a hill along its slope. The slope of the hill is $\alpha = 30°$ and the angle of the barrel to the horizontal $\beta = 60°$. The initial velocity v of the shell is 21 m s^{-1}. Then find the distance of point from the gun at which the shell will fall. (use $g = 9.8$ m/s^2)

4. The maximum range of a rifle bullet on the horizontal ground is 6 km. Find its maximum range on an inclined of 30°.
5. A motorcycle stunt rider rides off the edge of a cliff. Just at the edge his velocity is horizontal, with magnitude $9.0\ \mathrm{m\,s^{-1}}$. Find the motorcycle's position, distance from the edge of the cliff and velocity after 0.5 s.
6. A fighter plane moving with a speed of $50\sqrt{2}\ \mathrm{m\,s^{-1}}$ upward at an angle of 45° with the vertical releases a bomb when it was at a height 1000 m from ground. Find
   (a) the time of flight
   (b) the maximum height of the bomb above ground
7. A bullet is fired from the bottom of the inclined plane at angle $\theta = 37°$ with the inclined plane. The angle of incline is 30° with the horizontal. Find the (a) position of the maximum height of the bullet from the inclined plane; (b) time of light; (c) range along the incline; (d) the value of θ at which the range will be maximum; (e) maximum range.
8. Two paper screens A and B are separated by a distance of 100 m. A bullet pierces A and then B. The hole in B is 10 cm below the hole in A. If the bullet is travelling horizontally at the time of hitting the screen A, calculate the velocity of the bullet when it hits the screen A. Neglect the resistance of paper and air.

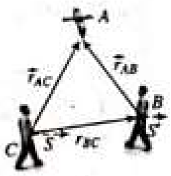


RELATIVE MOTION

Analysis of Relative Motion in General

Let us assume that observers B and C are fixed with the reference frames S' and S, respectively, and observe the motion of object A.

Let the observers B and C measure the position vectors of A as $\vec{r}_{AB}$ and $\vec{r}_{AC}$, respectively. If the position vector of B relative to C is $\vec{r}_{BC}$, following the triangle law of vectors, we have $\vec{r}_{AC} = \vec{r}_{AB} + \vec{r}_{BC}$



Differentiating the above expression with time, we have

$$\frac{d\vec{r}_{AC}}{dt} = \frac{d\vec{r}_{AB}}{dt} + \frac{d\vec{r}_{BC}}{dt}$$

Substituting $\dfrac{d\vec{r}_{AB}}{dt} = \vec{v}_{AB}, \dfrac{d\vec{r}_{AC}}{dt} = \vec{v}_{AC}$, and $\dfrac{d\vec{r}_{BC}}{dt} = \vec{v}_{BC}$, we have

$$\vec{v}_{AC} = \vec{v}_{AB} + \vec{v}_{BC}$$

The above expression tells us that simultaneously different observers (B and C) will record different velocities ($\vec{v}_{AB}$ and $\vec{v}_{BC}$) of the object (A).

$$\vec{v}_{AC} = \vec{v}_{AB} + \vec{v}_{BC}$$

If observer B is located on ground $\vec{v}_{AC} = \vec{v}_{A,\text{Earth}} + \vec{v}_{\text{Earth},C}$

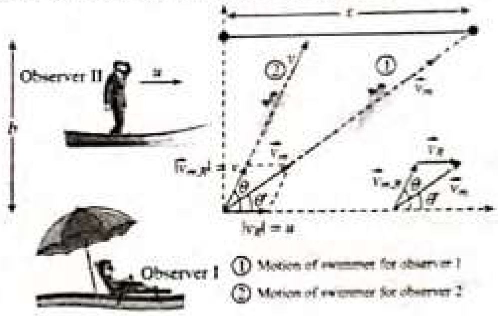
or $\quad \vec{v}_{A,C} = \vec{v}_{A,\text{Earth}} - \vec{v}_{C,\text{Earth}} = \vec{v}_A - \vec{v}_C$

or $\quad \vec{v}_{\text{Object, Observer}} = \vec{v}_{\text{Object}} - \vec{v}_{\text{Observer}}$

or $\quad \vec{v}_{\text{rel}} = \vec{v}_{\text{Object}} - \vec{v}_{\text{Observer}}$

Motion of Man Swimming in a River

Consider a man swimming in a river with a velocity of $\vec{v}_{m,R}$ relative to river water at an angle of θ with the river flow(figure).



The velocity of river water is $\vec{V}_R$.

Let there be two observers I and II, observer I is on ground and observer II is on a raft floating along with the river and hence moving with the same velocity as the river. Hence motion w.r.t. observer II is same as motion w.r.t. river, i.e., the man will appear to swim at an angle θ with the river flow for observer II.

For observer I, the velocity of man will be

$$\vec{v}_m = \vec{v}_{m,R} + \vec{v}_R$$

Hence, the swimmer will appear to move at an angle θ' with the river flow.

River Problem in Two Dimensions (Crossing River)

Consider a man swimming in a river with a velocity of $\vec{v}_{m,R}$ relative to river at an angle of θ with the river flow.

The velocity of river is $\vec{v}_R$ and the width of the river is d.

$$\vec{v}_m = \vec{v}_{m,R} + \vec{v}_R$$
$$= (v\cos\theta\,\hat{i} + v\sin\theta\,\hat{j}) + u\,\hat{i}$$
$$= (v\cos\theta + u)\hat{i} + v\sin\theta\,\hat{j}$$

Here $v \sin\theta$ is the component of the velocity of man in the direction perpendicular to the river flow.

This component of velocity is responsible for the man crossing the river. Hence, if the time to cross the river is t, then

$$t = \frac{d}{v_y} = \frac{d}{v\sin\theta}$$

It is defined as the displacement of man in the direction of river flow.

It is simply the displacement along x-axis during the period the man crosses the river. ($v\cos\theta + u$) is the component of the velocity of man in the direction of river flow, and this component of velocity is responsible for drift along the river flow. If the drift is x, then

Drift $= v_x \times t$

$$x = (v\cos\theta + u) \times \frac{d}{v\sin\theta}$$

Crossing the River in Shortest Time

As we know that $t = d/v \sin\theta$. Clearly t will be minimum when $\theta = 90°$, i.e., time to cross the river will be minimum if the man swims perpendicular to the river flow. Which is equal to d/v.

Crossing the River in Shortest Path, Minimum Drift

The minimum possible drift is zero. In this case, the man swims in the direction perpendicular to the river flow as seen from the ground. This path is known as *shortest path*.

Here $x_{min} = 0 \Rightarrow (v\cos\theta + u) = 0$

or $\quad \cos\theta = -\dfrac{u}{v}$

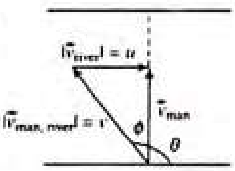
Since $\cos\theta$ is –ve, therefore, $\theta > 90°$, i.e., for minimum drift the man must swim at some angle ϕ with the perpendicular in upstream direction, where

$$\sin\phi = \frac{|\vec{v}_R|}{|\vec{v}_{m,R}|} = \frac{u}{v}$$

$$\Rightarrow \quad \theta = \cos^{-1}\left(\frac{-v_R}{v_{m,R}}\right) \Rightarrow \frac{u}{v} \le 1$$

i.e., $u \le v$

i.e., minimum drift is zero if and only if the velocity of man in still water is greater than or equal to the velocity of river.



Time to cross the river along the shortest path.

$$t = \frac{d}{v\sin\theta} = \frac{d}{\sqrt{v^2 - u^2}}$$

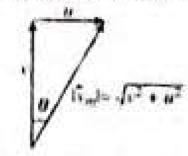
NOTE:

If $|\vec{v}_R| > |\vec{v}_{m,R}|$, then it is not possible to have zero drift. In this case, the minimum drift (corresponding to shortest possible path is non-zero and the condition for minimum drift can be proved to be $\cos\theta = -\dfrac{v}{u}$ or $\sin\phi = \dfrac{u}{v}$ or $\theta = \dfrac{\pi}{2} + \sin^{-1}\left(\dfrac{u}{v}\right)$ for minimum but non-zero drift.

ILLUSTRATION 4.8 A man wishes to cross a river in a boat. If he crosses the river in minimum time he takes 10 min with a drift of 120 m. If he crosses the river taking shortest route, he takes 12.5 min. Find the velocity of the boat with respect to water.

Solution. **Case 1:** If the man crosses the river in minimum time he should move perpendicular to bank or normal to the direction of water flow.

Let $|\vec{v}_{m,w}| = v$ and $|\vec{v}_w| = u$

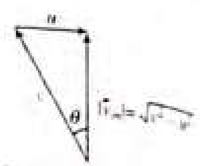


(a) Man crossing river taking minimum time

Time to cross river, $t_1 = 10 = \dfrac{d}{v} \Rightarrow d = 10\,v$.

$x = ut_1 \Rightarrow 120u = u \times 10 \Rightarrow u = 12$ m min^{-1}

Case 2: If the man crosses river taking the shortest route, the drift should be zero. Time to cross river,



(b) Man crossing river taking shortest

$$t_2 = 12.5 = \frac{d}{\sqrt{v^2 - u^2}}$$

From case 1, $d = 10v$ and $v = 12$ m s^{-1}

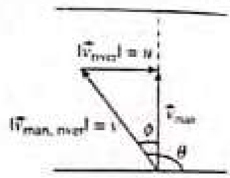
$$12.5 = \frac{10v}{\sqrt{v^2 - 12^2}} \Rightarrow v = 20\,\text{m s}^{-1}$$

ILLUSTRATION 4.9 A man can swim at the rate of 5 km h^{-1} in still water. A 1-km wide river flows at the rate of 3 km h^{-1}. The man wishes to swim across the river directly opposite to the starting point.

(a) Along what direction must the man swim?
(b) What should be his resultant velocity?
(c) How much time will he take to cross the river?

Solution.

(a) Velocity of man with respect to river water, $v = 5$ km h^{-1}. This is greater than the river flow velocity. Therefore, he can cross the river directly (along the shortest path or no drift condition from flow velocity). The angle of swim,



$$\theta = \frac{\pi}{2} + \sin^{-1}\left(\frac{u}{v}\right)$$

$$= 90° + \sin^{-1}\left(\frac{u}{v}\right)$$

$$= 90° + \sin^{-1}\left(\frac{3}{5}\right) = 90° + 37° = 127° \text{ w.r.t. the river}$$

flow or 37° w.r.t. perpendicular in upstream direction

(b) Resultant velocity or velocity of mass will be

$$v_m = \sqrt{v^2 - u^2} = \sqrt{5^2 - 3^2} = 4\,\text{km h}^{-1}$$

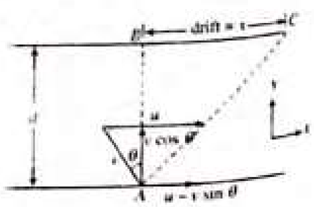
In the direction perpendicular to the river flow.

(c) time taken to cross the river

$$t = \frac{d}{\sqrt{v^2 - u^2}} = \frac{1\,\text{km}}{4\,\text{km h}^{-1}} = \frac{1}{4}\,\text{h} = 15\,\text{min}$$

ILLUSTRATION 4.10 A boat moves relative to water with a velocity v which is n times less than the river flow velocity u. At what angle to the stream direction must the boat move to minimize drifting?

Solution. In this case, the velocity of boat is less than the river flow velocity. Hence, boat cannot reach the point directly opposite to its starting point, i.e., drift can never be zero. Suppose the boat starts at an angle θ from the normal direction up stream as shown in the figure.



Component of the velocity of boat along the river,

$v_x = u - v\sin\theta$

and velocity perpendicular to the river, $v_y = v\cos\theta$.

Time taken to cross the river is $t = \dfrac{d}{v_y} = \dfrac{d}{v\cos\theta}$

Drift $x = (v_x)t = (u - v\sin\theta)\dfrac{d}{v\cos\theta} = \dfrac{ud}{v}\sec\theta - d\tan\theta$

The drift x is minimum when $\dfrac{dx}{d\theta} = 0$

or $\left(\dfrac{ud}{v}\right)(\sec\theta\cdot\tan\theta) - d\sec^2\theta = 0$

or $\dfrac{u}{v}\sin\theta = 1 \Rightarrow \qquad \sin\theta = \dfrac{v}{u}$

i.e., for minimum drift, the boat must move at an angle $\theta = \sin^{-1}\theta$

$= \sin^{-1}\left(\dfrac{v}{u}\right) = \sin^{-1}\dfrac{1}{n}$ from the normal direction.

Rain–Man Problems

If rain is falling vertically with a velocity $\vec{v}_r$ and an observer is moving horizontally with velocity $\vec{v}_m$, the velocity of rain relative to the observer will be

$$\vec{v}_{r,m} = \vec{v}_r - \vec{v}_m \text{ or } v_{r,m} = \sqrt{v_r^2 + v_m^2}$$

and direction $\theta = \tan^{-1}\left(\dfrac{v_m}{v_r}\right)$ with the vertical as shown in the figures.

Different situations in rain-man problem

The man is stationary and the rain is falling at his back at an angle ϕ with the vertical. 	The man starts moving forward. The relative velocity of rain w.r.t man shifts towards vertical direction. As the man further increases his speed, then at a particular value, the rain appears to be falling vertically. 	If the man increases his speed further more, then the rain appears to be falling from the forward direction. 
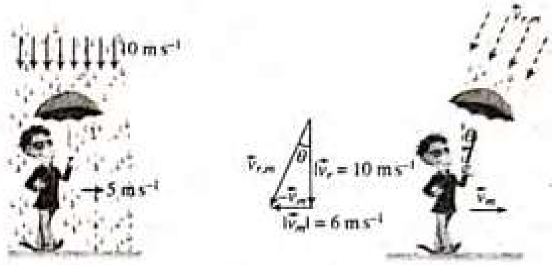
ILLUSTRATION 4.11 Rain is falling vertically and a man is moving with velocity 6 m s^{-1}. Find the angle at which the man should hold his umbrella to avoid getting wet.

Solution. $\vec{v}_{\text{rain}} = -10\hat{j} \Rightarrow \vec{v}_{\text{man}} = 6\hat{j}$

$\vec{v}_{\text{rain w.r.t man}} = -10\hat{j} - 6\hat{i}$

$\tan\theta = \dfrac{6}{10} \Rightarrow \theta = \tan^{-1}\left(\dfrac{3}{5}\right)$

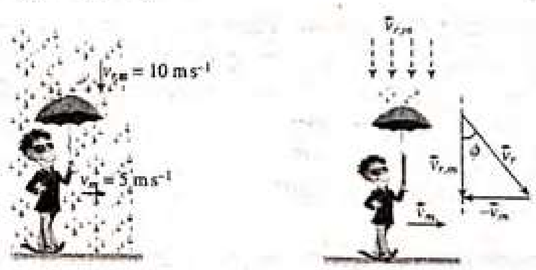


where θ is the angle with vertical.

ILLUSTRATION 4.12 A man moving with 5 m s^{-1} observes rain falling vertically at the rate of 10 m s^{-1}. Find the speed and direction of the rain with respect to ground.

Solution. $\vec{v}_{r,m} = -10\hat{j}\,\text{m s}^{-1}, \vec{v}_m = 5\hat{i}\,\text{m s}^{-1}$

$\vec{v}_{r,m} = \vec{v}_r - \vec{v}_m$



$\vec{v}_r = \vec{v}_{r,m} + \vec{v}_m = (-10\hat{j}) + (5\hat{i})\,\text{m s}^{-1}$

$\Rightarrow \quad |\vec{v}_r| = 5\sqrt{5}\ \text{m s}^{-1}$

Inclination of the rain with vertical, $\tan\theta = \dfrac{1}{2}$

$\Rightarrow \quad \theta = \tan^{-1}\dfrac{1}{2}$

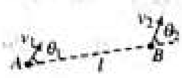
Velocity of Approach

If two particles are moving with velocities $\vec{v}_1$ and $\vec{v}_2$, as shown in the figure, at any time, the separation between the particles is l. Then the velocity of approach of the particles can be written as:

$$V = v_1\cos\theta_1 + v_2\cos\theta_2 = -\frac{dl}{dt}$$

If particles are moving in same direction as in the figure,

$$v_1\cos\theta_1 - v_2\cos\theta_2 = -\frac{dl}{dt}$$



(provided $v_1\cos\theta_1 > v_2\cos\theta_2$)

ILLUSTRATION 4.13 Two particles A and B are moving with constant velocities v_1 and v_2. At $t = 0$, v_1 makes an angle θ_1 with the line joining A and B and v_2 makes an angle θ_2 with the line joining A and B. Find their velocity of approach.

Solution. Velocity of approach is the relative velocity along line AB

$$v_{APP} = v_1 \cos \theta_1 + v_2 \cos \theta_2$$

Condition for Uniformly Moving Particles to Collide

If two particles are moving with uniform velocities and the relative velocity of one particle w.r.t. other particle is directed towards each other, then they will collide.

ILLUSTRATION 4.14 Two particles A and B are moving with constant velocities v_1 and v_2. At $t = 0$, v_1 makes an angle θ_1 with the line joining A and B and v_2 makes an angle θ_2 with the line joining A and B.

(a) Find the condition for A and B to collide.

(b) Find the time after which A and B will collide if separation between them is d at $t = 0$

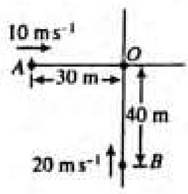
Solution.

(a) For A and B to collide, their relative velocity must be directed along the line joining them.
Therefore their relative velocity along the perpendicular to this line must be zero.
Thus $v_1 \sin\theta_1 = v_2 \sin\theta_2$.

(b) $v_{App} = v_1 \cos\theta_1 + v_2 \cos\theta_2$

$$t = \frac{d}{v_{app}} = \frac{d}{v_1 \cos\theta_1 + v_2 \cos\theta_2}$$

ILLUSTRATION 4.15 Two particles A and B are moving with uniform velocity as shown in figure given below at $t = 0$.

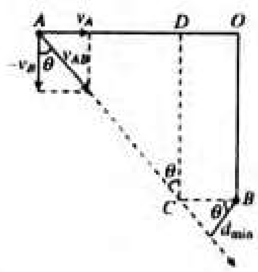


(a) Will the two particles collide?

(b) Find out the shortest distance between two particles.

Solution. Observing A from the frame of B

Let us draw $\vec{v}_{AB}$,



$$\vec{v}_{AB} = \vec{v}_A - \vec{v}_B = \vec{v}_A + (-\vec{v}_B)$$

$$\tan\theta = \frac{10}{20} = \frac{1}{2}$$

Again $\quad \tan\theta = \frac{AD}{CD} = \frac{AD}{40} = \frac{1}{2}$

$\Rightarrow \quad AD = 20 \Rightarrow DO = 10$

$\Rightarrow \quad BC = 10$

Hence, the shortest distance between the particles

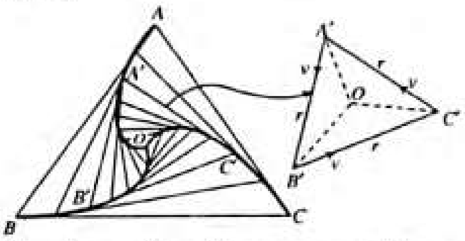
$$d_{short} = BC' \cos\theta = 10\cos\theta = \frac{10 \times 2}{\sqrt{5}} = 4\sqrt{5}\text{ m}$$

Since the closest distance is non-zero, therefore, the particles will not collide.

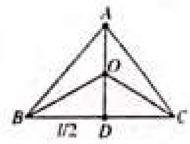
ILLUSTRATION 4.16 Three particles A, B and C are situated at the vertices of an equilateral triangle of side r at $t = 0$. The particle A heads towards B, B towards C, C towards A with constant speeds v. Find the time of their meeting.

Solution. The motion of the particles is roughly sketched in figure. By symmetry they will meet at the centroid O of the triangle. As the speed of all the particles is equal they will cover equal distance in any given interval of time.

If we join the instantaneous position of the particle at any time, the particles will form an equilateral triangle of same centroid as initial triangle.



Let us consider the motion of any one particle say A. At any instant, its velocity makes an angle 30° with line AO.



The component of the velocity along AO is $v \cos 30°$. This component will be equal to the rate of change of distance between A and O.

At $t = 0$, distance between A and O,

$$AO = \frac{2}{3}AD = \frac{2}{3}\sqrt{l^2 - \left(\frac{l}{2}\right)^2} = \frac{l}{\sqrt{3}}$$

At time $t = T$, the separation between A and O is zero.

Hence, time taken for AO to become zero,

$$T = \frac{(l/\sqrt{3})}{v\cos 30°} = \frac{(l/\sqrt{3})}{v(\sqrt{3}/2)} = \frac{2d}{3v}$$

After time t, let the distance of separation between the insect be r. The velocity of approach (component of relative velocity v_{rel} between the insects along the line of their separation) is $= v + v \cos 60° = 3v/3$

Since $(v_{rel})_{\parallel} dt = -dr$, substituting $(v_{rel})_{\parallel} = \frac{3v}{2}$, we obtain

$$\frac{3v}{2}dt = -dr$$

As at time of meeting, integrating both sides, we have

$$\frac{3v}{2}\int_0^t dt = -\int_l^0 dr$$

This gives $t = \frac{2l}{3v}$

Concept Application Exercise 4.3

1. A 400-m wide river is flowing at a rate of 2.0 m s^{-1}. A boat is sailing with a velocity of 10 m s^{-1} with respect to the water, in a direction perpendicular to the river.
   (a) Find the time taken by the boat to reach the opposite bank.
   (b) How far from the point directly opposite to the starting point does the boat reach the opposite bank?
   (c) In what direction does the boat actually move?
2. A man wishing to cross a river flowing with velocity u jumps at an angle θ with the river flow.
   (a) Find the net velocity of the man with respect to ground if he can swim with speed v in still water.
   (b) In what direction does the boat actually move?
   (c) Find how far from the point directly opposite to the starting point does the boat reach the opposite bank, if the width of the river is d.
3. Find the time an aeroplane having velocity v takes to fly around a square with side a if the wind is blowing at a velocity u along one side of the square.
4. A boatman finds that he can save 6 s in crossing a river by the quickest path than by the shortest path. If the velocity of the boat and the river be, respectively, 17 m s^{-1} and 8 m s^{-1}, find the river width.
5. A man directly crosses a river in time t_1 and swims down the current a distance equal to the width of the river in time t_2. If u and v be the speed of the current and the man respectively, show that $t_1 : t_2 :: \sqrt{v+u} : \sqrt{v-u}$.

KINEMATICS OF CIRCULAR MOTION

To express the linear quantities, i.e., position vector, displacement, velocity, let us choose the center of the circular as the origin of the coordinate system.

Angular Position

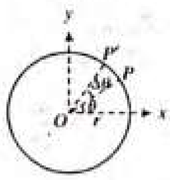
To decide the angular position of a point in space, we need to specify (1) origin and (2) reference line.

The angle made by the position vector w.r.t. origin, with the reference line is called *angular position.*

Clearly angular position depends on the choice of the origin as well as the reference line.

Angular Displacement

Angle through which the position vector of the moving particle rotates in a given time interval is called its *angular displacement*. Angular displacement depends on origin, but it does not depend on the reference line. As the particle moves on above circle its angular position θ changes. Suppose the point rotates through an angle $\Delta\theta$ in time, Δt, then $\Delta\theta$ is angular displacement.



☞ Important Points

- Angular displacement is a dimensionless quantity. Its SI unit is radian; some other units are degree and revolution.
  2π rad = 360° = 1 rev
- Infinitesimally small angular displacement is a vector quantity, but finite angular displacement is a scaler, because while the addition of the infinitesimally small angular displacements is commutative, the addition of finite angular displacement is not.
  $d\vec{\theta}_1 + d\vec{\theta}_2 = d\vec{\theta}_2 + d\vec{\theta}_1$ but $\theta_1 + \theta_2 \neq \theta_2 + \theta_1$
- The direction of small angular displacement is decided by right hand thumb rule. When the fingers are directed along the motion of the point, then the thumb will represent the direction of angular displacement.

Average Angular Velocity

It is defined as the total angular displacement divided by the total time taken.

or $$\omega_{av} = \frac{\text{Angular displacement}}{\text{Total time taken}}$$

$$= \frac{\theta_2 - \theta_1}{t_2 - t_1} = \frac{\Delta\theta}{\Delta t}$$

where θ_1 and θ_2 are angular position of the particle at time t_1 and t_2, respectively. Since angular displacement is a scalar, average angular velocity is also a scalar quantity.

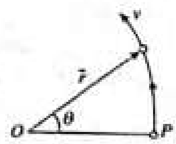
Angular Speed and Angular Velocity

It is the limit of average angular velocity as Δt approaches zero, i.e.,

$$\vec{\omega} = \lim_{\Delta t \to 0} \frac{\Delta\vec{\theta}}{\Delta t} = \frac{d\vec{\theta}}{dt}$$

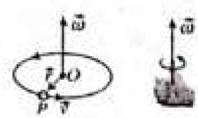
When point P moves in a circular path, the angle θ made by radius vector $\vec{r}$ changes with time.

The unit of ω is radian per second. If ω is more, the particle turns more quickly about O and vice-versa.



Since infinitesimally small angular displacement $\overline{d\theta}$ is a vector quantity, instantaneous angular velocity $\vec{\omega}$ is given by "right hand thumb rule." The magnitude of the angular velocity is given as angular speed.

If we wrap the fingers of the right hand in the sense of revolution (turning) of the point P, the extended thumb will give us the direction of the angular velocity.



Angular Acceleration

The angular acceleration of P relative to O can be given as, $\alpha = d\omega/dt$.

where $\omega = \dfrac{d\theta}{dt}$

Then, $\alpha = \dfrac{d^2\theta}{dt^2}$

When ω increases, $\vec{\alpha}$ is directed along $\vec{\omega}$; when ω decreases, $\vec{\alpha}$ is directed opposite to $\vec{\omega}$.

Important Points

- Angular velocity has dimension of $[T^{-1}]$ and SI unit rad/s.
- If a body makes n rotations in t seconds, then the average angular velocity in radian per second will be
  $\omega_{av} = \dfrac{2\pi n}{t}$
- If T is the period and f the frequency of uniform circular motion.
  $\omega_{av} = \dfrac{2\pi}{T} = 2\pi f$
- Even though $\vec{v}$ is tangential for all curvilinear motion, it is not always essentially perpendicular to the position vector $\vec{r}$. However, in circular motion, the velocity of the particle always perpendicular to its position vector drawn relative to the center of the circle.
- Both average and instantaneous angular acceleration are axial vectors with dimension $[T^{-2}]$ and unit rad s^{-2}.
- If $\alpha = 0$, circular motion is said to be uniform.
- Angular displacement in time t, $\theta = \omega t$.

Centripetal Acceleration

It is responsible for change in the direction of velocity. In circular motion, there is always a centripetal acceleration.

Centripetal acceleration is always considered variable because it changes in direction. It is also called radial acceleration or normal acceleration.

It is given by $a_r = \dfrac{v^2}{R}$; Here v is the speed of the particle and R is the radius of the circle.

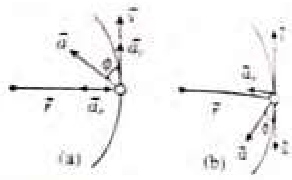
Tangential Acceleration

When a particle moves in a curve, the magnitude of its velocity, that is, the speed of the particle may change. Since the velocity changes its magnitude along the tangent to the path, the rate at which the magnitude of velocity changes along the tangent is called *tangential acceleration*.

It is defined as, $a_t = \dfrac{dv}{dt} = \dfrac{d|\vec{v}|}{dt}$ = Rate of change of speed.
$a_t = \alpha t$

In vector form, it is given as $\vec{a}_t = \dfrac{d|\vec{v}|}{dt}\hat{\tau}$, where $\hat{\tau} = \dfrac{\vec{v}}{|\vec{v}|}$

If the speed $|\vec{v}|$ increases, $d|\vec{v}|/dt$ is positive. Then $\vec{a}_t$ points in the direction of motion $(\vec{v})$. We can call it "tangential acceleration." If the speed $|\vec{v}|$ decreases, $d|\vec{v}|/dt$ is negative. Hence, $\vec{a}_t$ is directed opposite to the direction of motion $(\vec{v})$. We can call it "retardation" or "deceleration."

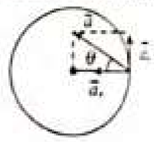


Important Points

- In vector form, $\vec{a}_t = \vec{\alpha} \times \vec{r}$
- If tangential acceleration is directed in the direction of velocity, then the speed of the particle increases.
- If tangential acceleration is directed opposite to the velocity, then the speed of the particle decreases.

Total Acceleration

Total acceleration is the vector sum of centripetal acceleration and tangential acceleration.



$$\vec{a} = \frac{d\vec{v}}{dt} = \vec{a}_r + \vec{a}_t$$

$$a = \sqrt{a_t^2 + a_r^2}\ ;\ \tan\theta = \frac{a_r}{a_t}$$

Important Points

- Differentiation of speed gives tangential acceleration.
- Differentiation of velocity $(\vec{v})$ gives total acceleration.
- $\left|\dfrac{d\vec{v}}{dt}\right|$ and $\dfrac{d|\vec{v}|}{dt}$ are not same physical quantity. $\left|\dfrac{d\vec{v}}{dt}\right|$ is the magnitude of rate of the change of velocity, i.e., magnitude of the total acceleration and $\dfrac{d|\vec{v}|}{dt}$ is the rate of change of speed, i.e., tangential acceleration.

ILLUSTRATION 4.17 A particle moves in a circle of radius 2 cm at a speed given by $v = 4t$, where v is in cm s^{-1} and t is in seconds.

(a) Find the tangential acceleration at $t = 1$s.

(b) Find total acceleration at $t = 1$s.

Solution.

(a) Tangential acceleration,

$$a_t = \frac{dv}{dt} = \frac{d}{dt}(4t) = 4\,\text{cm s}^{-2}$$

(b) $a_c = \dfrac{v^2}{R} = \dfrac{(4)^2}{2} = 8\ \text{cm s}^{-2}$

$\therefore \quad a = \sqrt{a_t^2 + a_C^2} = \sqrt{(4)^2 + (8)^2} = 4\sqrt{5}\ \text{cm s}^{-2}$

ILLUSTRATION 4.18 A particle moves on a circle of radius r with centripetal acceleration as function of time as $a_c = k^2rt^2$, where k is a positive constant. Find the following quantities as function of time at an instant:

(a) The speed of the particle
(b) The tangential acceleration of the particle
(c) The resultant acceleration, and
(d) Angle made by the resultant with tangential direction.

Solution.

(a) In the problem, it is given that $a_c = k^2rt^2$

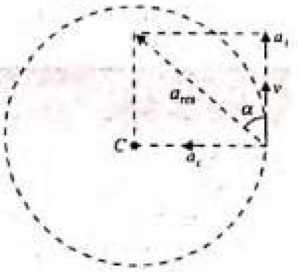
Since $a_c = \dfrac{v^2}{r} \Rightarrow \dfrac{v^2}{r} = k^2rt^2$

$\Rightarrow \quad v^2 = k^2r^2t^2$

Taking square root on both sides, we get $v = krt$

(b) Tangential acceleration,

$$a_t = \frac{dv}{dt} = \frac{d}{dt}(krt) = kr$$



(c) Resultant acceleration,

$$a_{res} = \sqrt{a_c^2 + a_t^2}$$

$$= \sqrt{(k^2rt^2)^2 + (kr)^2}$$

$$= kr\sqrt{k^2t^4 + 1}$$

(d) From figure, $\tan\alpha = \dfrac{a_c}{a_t} = \dfrac{k^2rt^2}{kr} = kt^2$

$\Rightarrow \quad \alpha = \tan^{-1}(kt^2)$

ILLUSTRATION 4.19 A particle moves in a circular path such that its speed v varies with distance s as $v = \alpha\sqrt{s}$ where α is a positive constant. Find the acceleration of the particle after traversing a distance s.

Solution. Total acceleration, $a = \sqrt{a_t^2 + a_r^2} = \sqrt{\left(\dfrac{dv}{dt}\right)^2 + \left(\dfrac{v^2}{R}\right)^2}$

where $v = \alpha\sqrt{s}$

Differentiating $v = \alpha\sqrt{s}$ with respect to time, we have

$$\frac{dv}{dt} = \alpha\frac{s^{-1/2}}{2}\frac{ds}{dt}$$

Substituting $\dfrac{ds}{dt} = \alpha\sqrt{s}$, we have $\dfrac{dv}{dt} = \dfrac{\alpha^2}{2}$

Now substituting dv/dt and v in the expression of a, we have

$$a = \sqrt{\left(\frac{\alpha^2}{2}\right)^2 + \left[\frac{\alpha\sqrt{s}}{R}\right]^2}$$

This gives $a = \alpha^2\sqrt{\dfrac{1}{4} + \dfrac{s^2}{R^2}}$

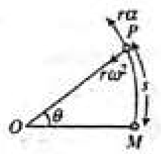
Motion with Constant Angular Acceleration

Circular motion with constant angular acceleration is analogous to one-dimensional translational motion with constant acceleration. Hence, even here, the equations of motion have same form.

$\omega = \omega_0^2 + \alpha t$	$\omega_0 \Rightarrow$ Initial angular velocity
$\theta = \omega_0 t + \dfrac{1}{2}\alpha t^2$	$\omega \Rightarrow$ Final angular velocity
$\omega^2 = \omega_0^2 + 2\alpha\theta$	$\alpha \Rightarrow$ Constant angular acceleration
$\theta = \left(\dfrac{\omega + \omega_0}{2}\right)t$	$\theta \Rightarrow$ Angular displacement
$\theta_{n\text{th}} = \omega_0 + \dfrac{\alpha}{2}(\theta_n - \theta_{n-1})$	

Relation between Linear and Angular Quantities

Let point P describe an arc MP whose length s can be given as $s = r\,\theta$.



Differentiating both sides with time, we have $\dfrac{ds}{dt} = r\dfrac{d\theta}{dt}$, where $ds/dt = v$ and $d\theta/dt = \omega$. Then, $v = r\omega$

Vector relation between speed and angular velocity: $\vec{v} = \vec{\omega} \times \vec{r}$. Here, $\vec{v}$ is the velocity of the particle, $\vec{\omega}$ is the angular velocity about the center of circular motion and $\vec{r}$ is the position of particle w.r.t. the center of circular motion.

Again differentiating both sides with time, we have

$$\frac{dv}{dt} = r\frac{d\omega}{dt}$$

where $dv/dt = a_t$ and $d\omega/dt = \alpha$. Then, $a_t = r\omega$

Since the radial acceleration $a_r = v^2/r$, putting $v = r\omega$, we have $a_r = r\omega^2$.

ILLUSTRATION 4.20 A fan is rotating with angular velocity $100\ \text{rev s}^{-1}$. Then it is switched off. It takes 5 min to stop.

(a) Find the total number of revolution made before the fan stops. (assume uniform angular retardation).
(b) Find the value of angular retardation.
(c) Find the average angular velocity during this interval.

Solution.

(a) $\theta = \left(\dfrac{\omega + \omega_0}{2}\right)t = \left(\dfrac{100+0}{2}\right) \times 5 \times 60 = 15000$ rev.

(b) $\omega = \omega_0 + \alpha t$

$\Rightarrow \quad 0 = 100 - \alpha(5 \times 60) \Rightarrow \alpha = \dfrac{1}{3}$ rev s^{-2}

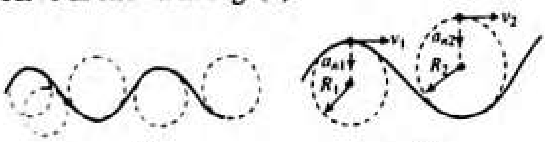
(c) $\omega_{av} = \dfrac{\text{Total angle of rotation}}{\text{Total time taken}}$

$= \dfrac{15000}{50 \times 60} = 50$ rev s^{-1}

Radius of Curvature

When a particle moves in a curve, it has a tangential acceleration $\vec{a}_t$ due to change in its speed and it must have a radial (normal) acceleration $\vec{a}_r$ because of the change in the direction of its velocity. Then, the total acceleration, $\vec{a} = \vec{a}_t + \vec{a}_n$, where $a_t = d|\vec{v}|/dt$ and $a_n = v^2/R$.

Any curved path can be assumed to be made of infinite circular arcs. The radius of curvature at a point is defined as the radius of that circular arc which fits at that particular point on the curve as shown in Fig. (a).



(a) (b)

If we know the magnitude and direction of the total acceleration $\vec{a}$ of the particle, resolving $\vec{a}$ perpendicular to the velocity of the particle, we have $\vec{a}_r = \vec{a}_n = a\cos\theta$, where θ is the angle between $\vec{a}$ and $\vec{v}$. Substituting $a_n = v$, we have

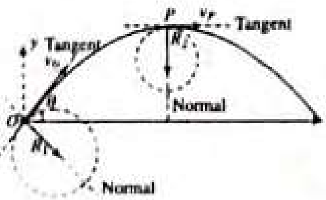
$$R = \frac{v^2}{a_n}$$

where R is the radius of the effective circle at any instant when the particle has a velocity $\vec{v}$ and acceleration $\vec{a}$. This is known as *radius of curvature* of the path followed by the particle at the given position (or time).

ILLUSTRATION 4.21 A particle is projected at angle θ with horizontal with velocity v_0 at $t = 0$. Find

(a) tangential and normal acceleration of the particle at $t = 0$ and at highest point of its trajectory.

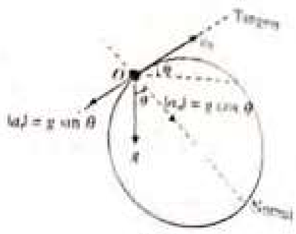
(b) the radius of curvature at $t = 0$ and highest point.



Solution.

(a) The direction of tangential acceleration is in the line of velocity and the direction perpendicular to velocity direction. The tangential and normal directions at O and P are shown in Figs. (a) and (b), respectively.

The net acceleration of the particle during motion is acceleration due to gravity, i.e., g is acting vertically downward.



(a)

At O (at $t = 0$):

Tangential acceleration,

$a_t = -g \sin\theta$

Normal acceleration,

$a_n = g\cos\theta$

At P (at highest point):

Tangential acceleration,

$a_t = 0$ and $a_n = g$

(b)

(b) Let the radius of curvature at O be R_0. The normal acceleration at O be $g\cos\theta$.

$$a_n = \frac{v^2}{R} \Rightarrow R_0 = \frac{v_0^2}{a_n} = \frac{v_0^2}{g\cos\theta}$$

Radius of curvature at P:

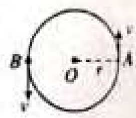
Normal acceleration at P is g. Hence,

$$R_P = \frac{v^2}{a_n} = \frac{(v_0\cos\theta)^2}{g} = \frac{v_0^2\cos^2\theta}{g}$$

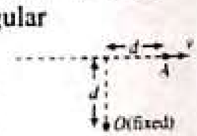
CONCEPT APPLICATION EXERCISE 4.4

1. A particle is moving with constant speed in a circle as shown in figure. Find the angular velocity of the particle A with respect to fixed point B and C if angular velocity with respect to O is ω.

2. Particles A and B move with constant and equal speeds in a circle as shown in figure. Find the angular velocity of the particle A with respect to B, if the angular velocity of particle A w.r.t. O is ω.



3. Find the angular velocity of A with respect to O at the instant shown in figure.



4. A particle travels in a circle of radius 20 cm at a speed that uniformly increases. If the speed changes from 5.0 m s^{-1} to 6.0 m s^{-1} in 2.0 s, find the angular acceleration.
5. Find the magnitude of the acceleration of a particle moving in a circle of radius 10 cm with uniform speed completing the circle in 4 s.

SOLVED EXAMPLES

1. A stone projected with a velocity u at an angle θ with the horizontal reaches maximum height H_1. When it is projected with velocity u at an angle $\left(\dfrac{\pi}{2} - \theta\right)$ with the horizontal, it reaches maximum height H_2. The relation between the horizontal range R of the projectile, H_1 and H_2 is

(a) $R = 4\sqrt{H_1 H_2}$ (b) $R = 4(H_1 - H_2)$

(c) $R = 4(H_1 + H_2)$ (d) $R = \frac{H_1^2}{H_2^2}$

Sol. (a) $H_1 = \frac{u^2\sin^2\theta}{2g}$ and $H_2 = \frac{u^2\sin^2(90-\theta)}{2g} = \frac{u^2\cos^2\theta}{2g}$

$$H_1 H_2 = \frac{u^2\sin^2\theta}{2g} \times \frac{u^2\cos^2\theta}{2g} = \frac{(u^2\sin 2\theta)^2}{16g^2} = \frac{R^2}{16}$$

$\therefore$ $R = 4\sqrt{H_1 H_2}$

2. An object is projected with a velocity of 20 m/s making an angle of 45° with horizontal. The equation for the trajectory is $h = Ax - Bx^2$ where h is height, x is horizontal distance. A and B are constants. The ratio $A : B$ is ($g = 10\ \text{ms}^{-2}$)

(a) 1 : 5 (b) 5 : 1

(c) 1 : 40 (d) 40 : 1

Sol. (d) Standard equation of projectile motion

$$y = x\tan\theta - \frac{gx^2}{2u^2\cos^2\theta}$$

Comparing with given equation

$$A = \tan\theta \text{ and } B = \frac{g}{2u^2\cos^2\theta}$$

So $\frac{A}{B} = \frac{\tan\theta \times 2u^2\cos^2\theta}{g} = 40$

(As $\theta = 45°$, $u = 20$ m/s, $g = 10\ \text{m/s}^2$)

3. For a given velocity, a projectile has the same range R for two angles of projection if t_1 and t_2 are the times of flight in the two cases then

(a) $t_1 t_2 \propto R^2$ (b) $t_1 t_2 \propto R$

(c) $t_1 t_2 \propto \frac{1}{R}$ (d) $t_1 t_2 \propto \frac{1}{R^2}$

Sol. (b) For same range angle of projection should be θ and $90 - \theta$

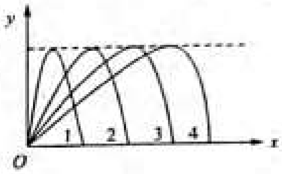
So, time of flights $t_1 = \frac{2u\sin\theta}{g}$ and

$$t_2 = \frac{2u\sin(90-\theta)}{g} = \frac{2u\cos\theta}{g}$$

By multiplying $t_1 t_2 = \frac{4u^2\sin\theta\cos\theta}{g^2}$

$$t_1 t_2 = \frac{2}{g}\frac{(u^2\sin 2\theta)}{g} = \frac{2R}{g} \Rightarrow t_1 t_2 \propto R$$

4. Figure shows four paths for a kicked football. Ignoring the effects of air on the flight, rank the paths according to initial horizontal velocity component, highest first



(a) 1, 2, 3, 4

(b) 2, 3, 4, 1

(c) 3, 4, 1, 2

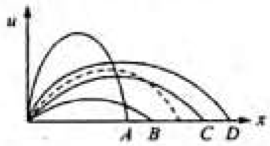
(d) 4, 3, 2, 1

Sol. (d) $R = \frac{u^2\sin 2\theta}{g} = \frac{2u_x \upsilon_y}{g}$

$\therefore$ Range υ horizontal initial velocity (u_x)

In path 4 range is maximum so football possess maximum horizontal velocity in this path.

5. The path of a projectile in the absence of air drag is shown in the figure by dotted line. If the air resistance is not ignored then which one of the path shown in the figure is appropriate for the projectile



(a) B

(b) A

(c) D

(d) C

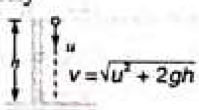
Sol. (a) If air resistance is taken into consideration then range and maximum height, both will decrease.

6. A man standing on the roof of a house of height h throws one particle vertically downwards and another particle horizontally with the same velocity u. The ratio of their velocities when they reach the earth's surface will be

(a) $\sqrt{2gh+u^2} : u$ (b) 1 : 2

(c) 1 : 1 (d) $\sqrt{2gh+u^2} : \sqrt{2gh}$

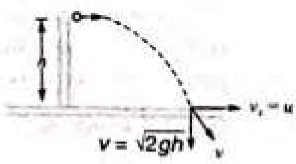
Sol. (c) When particle is thrown in vertical downward direction with velocity u, then the final velocity at the ground level is



$$v^2 = u^2 + 2gh$$

$\therefore$ $v = \sqrt{u^2 + 2gh}$

Another particle is thrown horizontally with same velocity then at the surface of earth.



Horizontal component of velocity $v_x = u$

Therefore, resultant velocity,

$$v = \sqrt{u^2 + 2gh}$$

For both the particles, final velocities when they reach the earth's surface are equal.

7. A cannon on a level plane is aimed at an angle θ above the horizontal and a shell is fired with a muzzle velocity v_0 towards a vertical cliff a distance D away. Then the height from the bottom at which the shell strikes the side walls of the cliff is

(a) $D\sin\theta - \dfrac{gD^2}{2v_0^2\sin^2\theta}$ (b) $D\cos\theta - \dfrac{gD^2}{2v_0^2\cos^2\theta}$

(c) $D\tan\theta - \dfrac{gD^2}{2v_0^2\cos^2\theta}$ (d) $D\tan\theta - \dfrac{gD^2}{2v_0^2\sin^2\theta}$

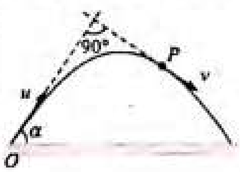
Sol. (c) Equation of trajectory for oblique projectile motion

$$y = x\tan\theta - \frac{gx^2}{2u^2\cos^2\theta}$$

Substituting $x = D$ and $u = v_0$

$$h = D\tan\theta - \frac{gD^2}{2u_0^2\cos^2\theta}.$$

8. A particle is projected from point O with velocity u in a direction making an angle α with the horizontal. At any instant its position is at point P at right angles to the initial direction of projection. Its velocity at point P is

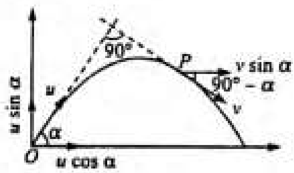


(a) $u\tan\alpha$
(b) $u\cot\alpha$
(c) $u\operatorname{cosec}\alpha$
(d) $u\sec\alpha$

Sol. (b) Horizontal velocity at point $'O' = u\cos\alpha$

Horizontal velocity at point $'P'$ $= v\sin\alpha$

In projectile motion horizontal component of velocity remains constant throughout the motion



$\therefore$ $v\sin\alpha = u\cos\alpha$

$\Rightarrow$ $v = u\cot\alpha$

9. Two seconds after projection a projectile is travelling in a direction inclined at 30° to the horizontal after one more second, it is travelling horizontally, the magnitude and direction of its velocity are

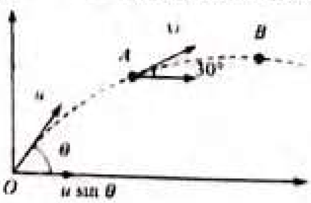
(a) $2\sqrt{20}$ m/s, 60° (b) $20\sqrt{3}$ m/s, 60°

(c) $6\sqrt{40}$ m/s, 30° (d) $40\sqrt{6}$ m/s, 30°

Sol. (b) Let in 2 seconds, the body reaches up to point A and after one more second up to point B.

Total time of ascent for a body is given 3 sec, i.e., $t = \dfrac{u\sin\theta}{g} = 3$

$\therefore u\sin\theta = 10\times 3 = 30$ ...(i)



Horizontal component of velocity remains always constant

$u\cos\theta = v\cos 30°$ ...(ii)

For vertical upward motion between point O and A,

$v\sin 30° = u\sin\theta - g\times 2$ [Using $v = u - gt$]

$v\sin 30° = 30 - 20$ [As $u\sin\theta = 30$]

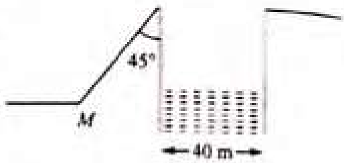
$\therefore v = 20$ m/s.

Substituting this value in equation (ii),

$u\cos\theta = 20\cos 30° = 10\sqrt{3}$ ....(iii)

From equations (i) and (iii), $u = 20\sqrt{3}$ and $\theta = 60°$

10. A body is projected up a smooth inclined plane (length = $20\sqrt{2}$ m) with velocity u from the point M as shown in the figure. The angle of inclination is 45° and the top is connected to a well of diameter 40 m. If the body just manages to cross the well, what is the value of v?



(a) 40 m s^{-1} (b) $40\sqrt{2}$ m s^{-1}

(c) 20 m s^{-1} (d) $20\sqrt{2}$ m s^{-1}

Sol. (d) At point N, the angle of projection of the body will be 45°. Let, the velocity of projection at this point is v.

If the body just manages to cross the well, then

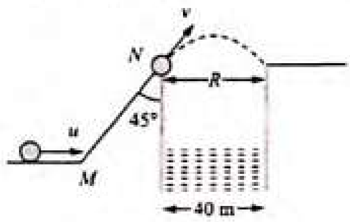
Range = Diameter of well

$$\frac{v^2\sin 2\theta}{g} = 40$$

[As $\theta = 45°$]

$v^2 = 400$

$\Rightarrow v = 20$ m s^{-1}



But we have to calculate the velocity (u) of the body at point M.

For motion along the inclined plane (from M to N)

Final velocity (v) = 20 m s,

acceleration (a) = $-g\sin\alpha = -g\sin 45°$, distance of inclined plane (s) = $20\sqrt{2}$ m

$$(20) = u^2 - 2\frac{g}{\sqrt{2}}\cdot 20\sqrt{2} \qquad \text{[Using } v^2 = u^2 + 2as\text{]}$$

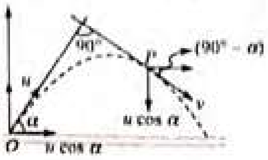
$u^2 = 20^2 + 400 \Rightarrow 20\sqrt{2}$ m/s.

11. A particle is projected from a point O with a velocity u in a direction making an angle α upward with the horizontal. After some time at point P, it is moving at right angle with its initial direction of projection. The time of flight from O to P is

(a) $\dfrac{u\sin\alpha}{g}$ (b) $\dfrac{u\operatorname{cosec}\alpha}{g}$

(c) $\dfrac{u\tan\alpha}{g}$ (d) $\dfrac{u\sec\alpha}{g}$

Sol. (b) When the body projected with initial velocity $\vec{u}$ by making angle α with the horizontal, then after time t, (at point P) its direction is perpendicular to $\vec{u}$. Magnitude of velocity at point P is given by $v = u \cot \alpha$.



For vertical motion: Initial velocity (at point O) = $u \sin \alpha$

Final velocity (at point P) = $-v \cos \alpha = -u \cot \alpha \cos \alpha$

Time of flight (from point O to P) = t

Applying first equation of motion $v = u - gt$

$$-u \cot \alpha \cos \alpha = u \sin \alpha - g\,t$$

$$\therefore \quad t = \frac{u \sin\alpha + \cot\alpha\cos\alpha}{g}$$

$$= \frac{u}{g \sin\alpha}[\sin^2\alpha + \cos^2\alpha] = \frac{u\,\mathrm{cosec}\alpha}{g}$$

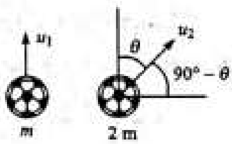
12. Pankaj and Sudhir are playing with two different balls of masses m and $2m$, respectively. If Pankaj throws his ball vertically up and Sudhir at an angle θ, both of them stay in our view for the same period. The height attained by the two balls are in the ratio

(a) 2 : 1 (b) 1 : 1
(c) 1 : cosθ (d) 1 : secθ

Sol. (b) Time of flight for the ball thrown by Pankaj, $T_1 = \frac{2u_1}{g}$

Time of flight for the ball thrown by Sudhir

$$T_2 = \frac{2u^2 \sin(90° - \theta)}{g} = \frac{2u^2 \cos\theta}{g}$$



According to problem $T_1 = T_2$

$$\Rightarrow \frac{2u_1}{g} = \frac{2u^2 \cos\theta}{g}$$

$$\Rightarrow u_1 = u_2 \cos\theta$$

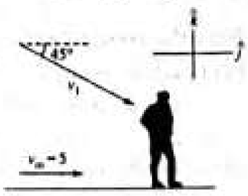
Height of the ball thrown by Pankaj $H_1 = \frac{u_1^2}{2g}$

Height of the ball thrown by Sudhir

$$H_2 = \frac{u_2^2 \sin^2(90° - \theta)}{2g} = \frac{u_2^2 \cos^2\theta}{2g}$$

$$\therefore \quad \frac{H_1}{H_2} = \frac{u_1^2/2g}{u_2^2 \cos^2\theta/2g} = 1 \qquad [\text{As } u_1 = u_2 \cos\theta]$$

13. A man walks horizontally in rain with a velocity of 5 m/s. The raindrops strike on his back at angle of 45° with the horizontal. Then for the actual rain's velocity



(a) horizontal component = vertical component
(b) horizontal component > vertical component
(c) horizontal component < vertical component
(d) none of these

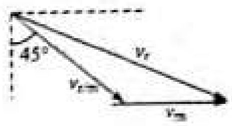
Sol. (b) Velocity of man: $\vec{v}_m = 5\hat{i}$

Velocity of rain w.r.t man:

$$\vec{v}_{r/m} = v_1 \cos 45° \hat{i} - v_1 \sin 45° \hat{k} = \frac{v_1}{\sqrt{2}}\hat{i} - \frac{v_1}{\sqrt{2}}\hat{k}$$

Hence, velocity of rain:

$$\vec{v}_r = \vec{v}_{r/m} + \vec{v}_m$$



$$\Rightarrow \vec{v}_r = \left(\frac{v_1}{\sqrt{2}} + 5\right)\hat{i} - \frac{v_1}{\sqrt{2}}\hat{k}$$

Horizontal component of rain's velocity $= \frac{v_1}{\sqrt{2}} + 5$

Vertical component of rain's velocity $= \frac{v_1}{\sqrt{2}}$

So horizontal component > vertical component

14. A ship A sailing due east with a velocity of 10 km/h happens to appear sailing due north with a velocity of 5 km/h, to a person, sitting in a moving ship B. Determine the velocity (absolute) of ship B.

(a) $5\sqrt{5}$ km/h, $\tan^{-1}(1/2)$ S of E

(b) $5\sqrt{5}$ km/h, $\tan^{-1}(1/2)$ E of S

(c) $4\sqrt{5}$ km/h, $\tan^{-1}(1/2)$ S of E

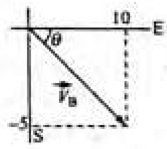
(d) $4\sqrt{5}$ km/h, $\tan^{-1}(1/2)$ E of S

Sol. (a) Here we are given velocity of 'A', $\vec{v}_A = 10\hat{i}$

Velocity of 'A' w.r.t 'B', $\vec{v}_{A/B} = 5\hat{j}$

Now $\vec{v}_{A/B} = \vec{v}_A - \vec{v}_B$

$$5\hat{j} = 10\hat{i} - \vec{v}_B \Rightarrow \vec{v}_B = 10\hat{i} - 5\hat{j}$$



Hence velocity of B,

$$v_B = \sqrt{10^2 + 5^2} = 5\sqrt{5} \text{ km/h}$$

$$\tan\theta = \frac{5}{10} = \frac{1}{2}$$

$$\theta = \tan^{-1}\left(\frac{1}{2}\right) \text{ S of E}$$

15. A helicopter is flying horizontally at 8 m/s at an altitude 180 m when a package of emergency medical supplies is ejected horizontally backward with a speed of 12 m/s relative to the helicopter. Ignoring air resistance, what is the horizontal distance between the package and the helicopter when the package hits the ground?

(a) 120 m (b) 24 m
(c) 36 m (d) 72 m

Sol. (d) Time taken by packet to reach the ground:

$$T=\sqrt{\frac{2\times 180}{10}}=6\,\text{s}$$

Horizontal distance travelled by helicopter in this time
$= 8 \times 6 = 48$ m.

Velocity of package w.r.t. ground
$= 12 - 8 = 4$ m/s in backward direction.

Horizontal distance travelled by package in time,
$T = 4 \times 6 = 24$ m.

So, horizontal distance between them $= 48 + 24 = 72$ m

16. In horizontal level, ground to ground projectile if at any instant velocity becomes perpendicular to initial velocity, then what can you say about projection angle with horizontal?

(a) $\theta = 45°$
(b) $\theta \le 45°$
(c) $\theta \le 45°$
(d) for any value of θ it is possible

Sol. (b) Velocity at any time, $\vec{v}=\vec{u}+\vec{g}\,t$

$$\Rightarrow \quad \vec{v}=u\cos\theta\, i+(u\sin\theta-gt)\, j$$

Let at any time, this velocity becomes perpendicular to initial velocity. Then $\vec{v}\cdot\vec{u}=0$

Solve to get $t=\dfrac{u}{g\sin\theta}$

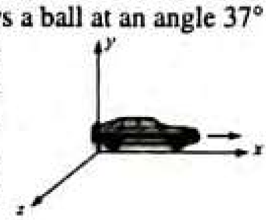
Now t should be less than/equal to time of flight.

So $\quad t \le T$

$$\frac{u}{g\sin\theta}\le\frac{2u\sin\theta}{g}\ \Rightarrow\ \sin^2\theta\ge\frac{1}{2}$$

$$\Rightarrow \quad \sin\theta\ge\frac{1}{\sqrt{2}}\ \Rightarrow\ \theta\ge 45°$$

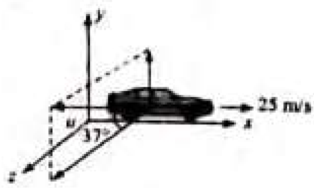
17. A car is traveling on a highway at a speed of 25 m/s along x-axis. A passenger in a car throws a ball at an angle 37° with horizontal in a plane perpendicular the motion of the car. The ball is projected with a speed of 10 m/s relative to car. What may be the initial velocity of ball in unit vector notation?



(a) $25\hat{i}+8\hat{j}+6\hat{k}$ (b) $10\hat{i}+8\hat{j}+6\hat{k}$

(c) $10\hat{i}+25\hat{j}+6\hat{k}$ (d) $25\hat{i}+6\hat{j}+8\hat{k}$

Sol. (d) Velocity of the car, $\vec{v}_c=25\hat{i}$



Velocity of ball with respect to car

$$\vec{v}_{b/c}=u\sin 37°\hat{j}+u\cos 37°\hat{k}$$

$$=10\times\frac{3}{5}\hat{j}+10\times\frac{4}{5}\hat{k}=6\hat{j}+8\hat{k}$$

Now: using $\vec{v}_{b/c}=\vec{v}_b-\vec{v}_c$

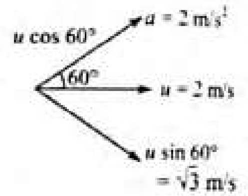
$$\Rightarrow \quad \vec{v}_b=\vec{v}_b+\vec{v}_{b/c}=25\hat{i}+6\hat{j}+8\hat{k}$$

18. Velocity of a particle at time $t = 0$ is 2 m/s. A constant acceleration of 2 m/s^2 act on the particle for 2 s at an angle 60° with the initial velocity. The magnitude of velocity of particle at the end of 2 s will be

(a) $2\sqrt{5}$ m/s (b) $2\sqrt{7}$ m/s

(c) $2\sqrt{6}$ m/s (d) $2\sqrt{3}$ m/s

Sol. (b) Let us make the components of initial velocity in the direction and perpendicular to the direction of acceleration as shown in the figure.



In the direction of acceleration:

Using $v = u + at$, we get

$$v_1=u\cos 60°+at$$

$$=2\times\frac{1}{2}+2\times 2=5\,\text{m/s}$$

Velocity perpendicular to direction of acceleration remains same, which is

$$u\sin 60°=\sqrt{3}\,\text{m/s}$$

So net velocity at the end of 2 s:

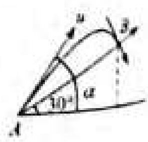
$$v=\sqrt{v_1^2+(\sqrt{3})^2}=\sqrt{5^2+3}=\sqrt{28}=2\sqrt{7}\,\text{m/s}$$

19. A particle is projected with a certain velocity at an angle α above the horizontal from the foot of an inclined plane of inclination 30°. If the particle strikes the plane normally, then α is equal to

(a) $30°+\tan^{-1}\left(\dfrac{\sqrt{3}}{2}\right)$ (b) 45°

(c) 60° (d) $30°+\tan^{-1}(2\sqrt{3})$

Sol. (a) t_{AB} = time of flight of projectile



$$=\frac{2u\sin(\alpha-30°)}{g\cos 30°}$$

Now the component of velocity along the plane becomes zero at point B.

$$0=u\cos(\alpha-30°)-g\sin 30°\times t_{AB}$$

or $\quad u\cos(\alpha-30°)=g\sin 30°\times\dfrac{2u\sin(\alpha-30°)}{g\cos 30°}$

or $\quad \tan(\alpha-30°)=\dfrac{\cot 30°}{2}=\dfrac{\sqrt{3}}{2}$

$$\alpha = 30^\circ + \tan^{-1}\left(\frac{\sqrt{3}}{2}\right)$$

20. A simple pendulum is oscillating without damping. When the displacement of the bob is less than maximum, its acceleration vector $\vec{a}$ is correctly shown in

(a) 
(b) 
(c) 
(d) 
Sol. (c) a_c = centripetal acceleration
a_t = tangential acceleration
a_N = net acceleration = Resultant of a_c and a_t

EXERCISES

Problems Based on Basic Concept of Projectile Motion

1. A particle is projected with a velocity v so that its range on a horizontal plane is twice the greatest height attained. If g is acceleration due to gravity, then its range is

(a) $\frac{4v^2}{5g}$ (b) $\frac{4g}{5v^2}$ (c) $\frac{4v^3}{5g^2}$ (d) $\frac{4v}{5g^2}$

2. During a projectile motion, if the maximum height equals the horizontal range, then the angle of projection with the horizontal is

(a) $\tan^{-1}(1)$ (b) $\tan^{-1}(2)$ (c) $\tan^{-1}(3)$ (d) $\tan^{-1}(4)$

3. A particle is projected from ground at some angle with the horizontal. Let P be the point at maximum height H. At what height above the point P should the particle be aimed to have range equal to maximum height?

(a) H (b) $2H$ (c) $H/2$ (d) $3H$

4. A shot is fired from a point at a distance of 200 m from the foot of a tower 100 m high so that it just passes over it horizontally. The direction of shot with horizontal is

(a) 30° (b) 45° (c) 60° (d) 70°

5. A projectile has a time of flight T and range R. If the time of flight is doubled, keeping the angle of projection same, what happens to the range?

(a) $R/4$ (b) $R/2$ (c) $2R$ (d) $4R$

6. A ball is thrown from a point with a speed v_0 at an angle of projection θ. From the same point and at the same instant, a person starts running with a constant speed $v_0/2$ to catch the ball. Will the person be able to catch the ball? If yes, what should be the angle of projection?

(a) Yes, 60° (b) Yes, 30° (c) No (d) Yes, 45°

7. Two paper screens A and B are separated by 150 m. A bullet pierces A and B. The hole in B is 15 cm below the hole in A. If the bullet is travelling horizontally at the time of hitting A, then the velocity of the bullet at A is ($g = 10\ \text{m s}^{-2}$)

(a) $100\sqrt{3}\ \text{m s}^{-1}$ (b) $200\sqrt{3}\ \text{m s}^{-1}$

(c) $300\sqrt{3}\ \text{m s}^{-1}$ (d) $500\sqrt{3}\ \text{m s}^{-1}$

8. A projectile can have same range R for two angles of projection. It t_1 and t_2 are the times of flight in the two cases, then what is the product of two times of flight?

(a) $t_1t_2 \propto R^2$ (b) $t_1t_2 \propto R$

(c) $t_1t_2 \propto \frac{1}{R}$ (d) $t_1t_2 \propto \frac{1}{R^2}$

9. A ball is thrown at different angles with the same speed u and from the same point and it has the same range in both the cases. If y_1 and y_2 are the heights attained in the two cases, then $y_1 + y_2$ is equal to

(a) $\frac{u^2}{g}$ (b) $\frac{2u^2}{g}$ (c) $\frac{u^2}{2g}$ (d) $\frac{u^2}{4g}$

10. The equation of motion of a projectile is $y = 12x - \frac{3}{4}x^2$. The horizontal component of velocity is $3\ \text{m s}^{-1}$. What is the range of the projectile?

(a) 18 m (b) 16 m (c) 12 m (d) 21.6 m

11. The range R of projectile is same when its maximum heights are h_1 and h_2. What is the relation between R, h_1, and h_2?

(a) $R = \sqrt{h_1h_2}$ (b) $R = \sqrt{2h_1h_2}$

(c) $R = 2\sqrt{h_1h_2}$ (d) $R = 4\sqrt{h_1h_2}$

12. At what angle with the horizontal should a ball be thrown so that the range R is related to the time of flight as $R = 5T^2$? (Take $g = 10\ \text{m s}^{-2}$)

(a) 30° (b) 45° (c) 60° (d) 90°

13. A ball thrown by one player reaches the other in 2 s. The maximum height attained by the ball above the point of projection will be about

(a) 2.5 m (b) 5 m (c) 7.5 m (d) 10 m

14. At a height 0.4 m from the ground, the velocity of a projectile in vector form is $\vec{v} = (6\hat{i} + 2\hat{j})\ \text{m s}^{-1}$. The angle of projection is

(a) 45° (b) 60° (c) 30° (d) $\tan^{-1}(3/4)$

15. A projectile is thrown in the upward direction making an angle of 60° with the horizontal direction with a velocity of $150\ \text{m s}^{-1}$. Then the time after which its inclination with the horizontal is 45° is

(a) $15(\sqrt{3}-1)$ s (b) $15(\sqrt{3}+1)$ s

(c) $7.5(\sqrt{3}-1)$ s (d) $7.5(\sqrt{3}+1)$ s

16. A number of bullets are fired in all possible directions with the same initial velocity u. The maximum area of ground covered by bullets is

(a) $\pi\left(\frac{u^2}{g}\right)^2$ (b) $\pi\left(\frac{u^2}{2g}\right)^2$

(c) $\pi\left(\frac{u}{g}\right)^2$ (d) $\pi\left(\frac{u}{2g}\right)^2$

17. Two stones are projected with the same speed but making different angles with the horizontal. Their ranges are equal. If the angle of projection of one is $\pi/3$ and its maximum height is h_1, then the maximum height of the other will be

(a) $3h_1$ (b) $2h_1$ (c) $h_1/2$ (d) $h_1/3$

18. A ball is projected from the ground at angle θ with the horizontal. After 1 s, it is moving at angle 45° with the horizontal and after 2 s it is moving horizontally. What is the velocity of projection of the ball?

(a) $10\sqrt{3}$ ms (b) $20\sqrt{3}\ \text{m s}^{-1}$

(c) $10\sqrt{5}\ \text{m s}^{-1}$ (d) $20\sqrt{2}\ \text{m s}^{-1}$

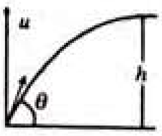
19. A hose lying on the ground shoots a stream of water upward at an angle of 60° to the horizontal with the velocity of $16\ \text{m s}^{-1}$. The height at which the water strikes the wall 8 m away is

(a) 8.9 m (b) 10.9 m (c) 12.9 m (d) 6.9 m

20. A golfer standing on level ground hits a ball with a velocity of $u = 52\ \text{m s}^{-1}$ at an angle α above the horizontal. If $\tan\alpha = 5/12$, then the time for which the ball is at least 15 m above the ground will be (take $g = 10\ \text{m s}^{-2}$)

(a) 1 s (b) 2 s (c) 3 s (d) 4 s

21. If a stone is to hit at a point which is at a distance d away and at a height h (see figure) above the point from where the stone starts, then what is the value of initial speed u if the stone is launched at an angle θ?



(a) $\frac{g}{\cos\theta}\sqrt{\frac{d}{2(d\tan\theta - h)}}$ (b) $\frac{d}{\cos\theta}\sqrt{\frac{g}{2(d\tan\theta - h)}}$

(c) $\sqrt{\frac{gd^2}{h\cos^2\theta}}$ (d) $\sqrt{\frac{gd^2}{(d-h)}}$

22. The speed of a projectile at its maximum height is $\sqrt{3}/2$ times its initial speed. If the range of the projectile is P times the maximum height attained by it, P is equal to

(a) 4/3 (b) $2\sqrt{3}$ (c) $4\sqrt{3}$ (d) 3/4

23. The trajectory of a projectile in a vertical plane is $y = ax - bx^2$, where a and b are constants and x and y are, respectively, horizontal and vertical distances of the projectile from the point of projection. The maximum height attained by the particle and the angle of projection from the horizontal are

(a) $\frac{b^2}{2a}, \tan^{-1}(b)$ (b) $\frac{a^2}{b}, \tan^{-1}(2b)$

(c) $\frac{a^2}{4b}, \tan^{-1}(a)$ (d) $\frac{2a^2}{b}, \tan^{-1}(a)$

24. A projectile is given an initial velocity of $\hat{i} + 2\hat{j}$. The cartesian equation of its path is ($g = 10\ \text{m s}^{-2}$).

(a) $y = 2x - 5x^2$ (b) $y = x - 5x^2$

(c) $4y = 2x - 5x^2$ (d) $y = 2x - 25x^2$

25. A particle is projected from the ground with an initial speed of v at an angle θ with horizontal. The average velocity of the particle between its point of projection and highest point of trajectory is

(a) $\frac{v}{2}\sqrt{1+2\cos^2\theta}$ (b) $\frac{v}{2}\sqrt{1+2\cos^2\theta}$

(c) $\frac{v}{2}\sqrt{1+3\cos^2\theta}$ (d) $v\cos\theta$

26. Two balls A and B are thrown with speeds u and $u/2$, respectively. Both the balls cover the same horizontal distance before returning to the plane of projection. If the angle of projection of ball B is 15° with the horizontal, then the angle of projection of A is

(a) $\sin^{-1}\left(\frac{1}{8}\right)$ (b) $\frac{1}{2}\sin^{-1}\left(\frac{1}{8}\right)$

(c) $\frac{1}{3}\sin^{-1}\left(\frac{1}{8}\right)$ (d) $\frac{1}{4}\sin^{-1}\left(\frac{1}{8}\right)$

27. The horizontal range and maximum height attained by a projectile are R and H, respectively. If a constant horizontal acceleration $a = g/4$ is imparted to the projectile due to wind, then its horizontal range and maximum height will be

(a) $(R+H), \frac{H}{2}$ (b) $\left(R+\frac{H}{2}\right), 2H$

(c) $(R+2H), H$ (d) $(R+H), H$

28. A particle is projected with a certain velocity at an angle α above the horizontal from the foot of an inclined plane of

inclination 30°. If the particle strikes the plane normally, then α is equal to

(a) $30° + \tan^{-1}\left(\frac{\sqrt{3}}{2}\right)$ (b) 45°

(c) 60° (d) $30° + \tan^{-1}(2\sqrt{3})$

Projectile from Moving Frame and from Inclined Plane

29. Two bullets are fired horizontally with different velocities from the same height. Which will reach the ground first?
(a) Slower one
(b) Faster one
(c) Both will reach simultaneously
(d) Cannot be predicted

30. A ball rolls off the top of a staircase with a horizontal velocity u $\mathrm{m\,s^{-1}}$. If the steps are h metre high and b metre wide, the ball will hit the edge of the nth step, if

(a) $n = \frac{2hu}{gb^2}$ (b) $n = \frac{2hu^2}{gb}$

(c) $n = \frac{2hu^2}{gb^2}$ (d) $n = \frac{hu^2}{gb^2}$

31. A body is projected horizontally from the top of a tower with initial velocity 18 $\mathrm{m\,s^{-1}}$. It hits the ground at angle 45°. What is the vertical component of velocity when strikes the ground?

(a) 9 $\mathrm{ms^{-1}}$ (b) $9\sqrt{2}$ $\mathrm{ms^{-1}}$

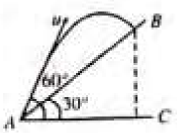
(c) 18 $\mathrm{m\,s^{-1}}$ (d) $18\sqrt{2}$ $\mathrm{ms^{-1}}$

32. A plane flying horizontally at 100 $\mathrm{m\,s^{-1}}$ releases an object which reaches the ground in 10 s. At what angle with horizontal it hits the ground?
(a) 55° (b) 45° (c) 60° (d) 75°

33. A body of mass m is projected horizontally with a velocity v from the top of a tower of height h and it reaches the ground at a distance x from the foot of the tower. If a second body of mass 2m is projected horizontally from the top of a tower of height 2 h, it reaches the ground at a distance $2x$ from the foot of the tower. The horizontal velocity of the second body is
(a) v (b) $2v$ (c) $\sqrt{2}v$ (d) $v/2$

34. A car is moving horizontally along a straight line with a uniform velocity of 25 $\mathrm{m\,s^{-1}}$. A projectile is to be fired from this car in such a way that it will return to it after it has moved 100 m. The speed of the projection must be
(a) 10 $\mathrm{ms^{-1}}$ (b) 20 $\mathrm{ms^{-1}}$ (c) 15 $\mathrm{ms^{-1}}$ (d) 25 $\mathrm{ms^{-1}}$

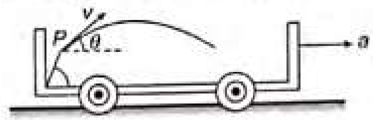
35. In the figure, the time taken by the projectile to reach from A to B is t. Then the distance AB is equal to



(a) $\frac{ut}{\sqrt{3}}$ (b) $\frac{\sqrt{3}ut}{2}$

(c) $\sqrt{3}\,ut$ (d) $2ut$

36. A particle is projected from a trolley car with a velocity $\bar{v}$. If the trolley car moves with an acceleration $\vec{a}$ towards right, which of the following remain unchanged relative to both ground and trolley car?



(a) Range (b) Maximum range
(c) Time of flight (d) Horizontal velocity

37. A boy projects a stone vertically perpendicular to the trolley car with a speed v. If the trolley car moves with a constant velocity u, the time of flight of the stone is:

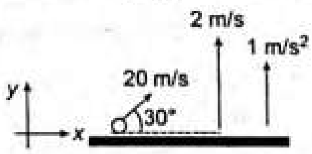
(a) $\frac{u+v}{g}$ (b) $\frac{2v}{g}$

(c) $\frac{2u}{g}$ (d) none of these

38. An aeroplane is flying with speed 60 m/s at angle 30° with the horizontal. A shell is fired horizontally from the aeroplane. Find the direction and magnitude of velocity of the shell so that it falls vertically along a straight line with respect to the observer on the ground.

(a) horizontally opposite to motion of plane with velocity $30\sqrt{3}$ m/s
(b) horizontally opposite to motion of plane with velocity 60 m/s
(c) at angle 30° with the horizontal opposite to motion of plane with velocity 60 m/s
(d) at angle 30° with the horizontal opposite to motion of plane with velocity $30\sqrt{3}$ m/s.

39. A very broad elevator plateform is going up vertically with a constant acceleration 1 $\mathrm{ms^{-2}}$. At the instant when the velocity of the lift is 2 m/s, a stone is projected from the plateform with a speed of 20 m/s relative to the floor at an elevation 30°. The time taken by the stone to return to the floor will be



(a) $\frac{30}{11}$ sec (b) $\frac{70}{11}$ sec

(c) $\frac{20}{11}$ sec (d) $\frac{90}{11}$ sec

40. A particle is projected up with a velocity of $v_0 = 10$ m/s at an angle of $\theta_0 = 60°$ with horizontal onto an inclined plane. The angle of inclination of the plane is 30°. The time of flight of the particle till it strikes the plane is (take $g = 10$ m/s^2)

(a) 1 s (b) 1/2 s

(c) $\frac{2}{\sqrt{3}}$ s (d) $\frac{1}{2\sqrt{3}}$ s

41. Referring to question-40, the time after which the particle attains maximum height is

(a) $\frac{1}{2\sqrt{3}}$ s (b) $\frac{\sqrt{3}}{2}$ s

(c) $\frac{2}{\sqrt{3}}$ s (d) 1 s

42. Referring to question-40, the ratio of the range of the particle and its maximum range in the inclined plane is

(a) 1 : 2 (b) $1:\sqrt{2}$

(c) $1:\sqrt{3}$ (d) 1 : 1

43. Referring to question-40, if the particle is projected down onto the inclined plane at same speed and angle with the inclined plane the ratio of the time of flight and time of flight for upward projection is

(a) $1:\sqrt{2}$ (b) $\sqrt{2}:1$

(c) 1 : 1 (d) None of these

44. Referring to question-40, the ratio of ranges for upward and downward projection is

(a) 1 : 2 (b) 1 : 3

(c) 1 : 4 (d) 1 : 1

45. Referring to question-40, the ratio of component of velocity striking perpendicular to the inclined plane for upward and downward projection is

(a) 1 : 1 (b) 1 : 2

(c) 1 : 3 (d) $1:\sqrt{3}$

46. Referring to question-40, the ratio of speeds of striking for upward and downward projection is

(a) 1 : 1 (b) $1:\sqrt{3}$

(c) $1:\sqrt{5}$ (d) $1:\sqrt{7}$

Relative Velocity in Two Dimensions

47. A bird is flying towards north with a velocity 40 km h^{-1} and a train is moving with velocity 40 km h^{-1} towards east. What is the velocity of the bird noted by a man in the train?

(a) $40\sqrt{2}$ km h^{-1} N-E (b) $40\sqrt{2}$ km h^{-1} S-E

(c) $40\sqrt{2}$ km h^{-1} N-W (d) $40\sqrt{2}$ km h^{-1} S-W

48. A river is flowing from west to east at a speed of 5 m min^{-1}. A man on the south bank of the river, capable of swimming at 10 m min^{-1} in still water, wants to swim across the river in the shortest time. Finally, he will move in a direction

(a) $\tan^{-1}(2)$ E of N (b) $\tan^{-1}(2)$ N of E

(c) 30° E of N (d) 60° E of N

49. A boat is moving with a velocity $3\hat{i}+4\hat{j}$ with respect to ground. The water in the river is moving with a velocity $-3\hat{i}-4\hat{j}$ with respect to ground. The relative velocity of the boat with respect to water is

(a) $8\hat{j}$ (b) $-6\hat{i}-8\hat{j}$ (c) $6\hat{i}+8\hat{j}$ (d) $5\sqrt{2}$

50. A car is moving towards east with a speed of 25 km h^{-1}. To the driver of the car, a bus appears to move towards north with a speed of $25\sqrt{3}$ km h^{-1}. What is the actual velocity of the bus?

(a) 50 km h^{-1}, 30° E of N

(b) 50 km h^{-1}, 30° N of E

(c) 25 km h^{-1}, 30° E of N

(d) 25 km h^{-1}, 30° N of E

51. A swimmer wishes to cross a 500-m river flowing at 5 km h^{-1}. His speed with respect to water is 3 km h^{-1}. The shortest possible time to cross the river is

(a) 10 min (b) 20 min (c) 6 min (d) 7.5 min

52. A train of 150 m length is going toward north direction at a speed of 10 m s^{-1}. A parrot flies at a speed of 5 m s^{-1} toward south direction parallel to the railway track. The time taken by the parrot to cross the train is equal to

(a) 12 s (b) 8 s (c) 15 s (d) 10 s

53. A man can swim in still water with a speed of 2 m s^{-1}. If he wants to cross a river of water current speed $\sqrt{3}$ m s^{-1} along the shortest possible path, then in which direction should he swim?

(a) At an angle 120° to the water current

(b) At an angle 150° to the water current

(c) At an angle 90° to the water current

(d) None of these

54. A river flows with a speed more than the maximum speed with which a person can swim in still water. He intends to cross the river by the shortest possible path (i.e., he wants to reach the point on the opposite bank which directly opposite to the starting point). Which of the following is correct?

(a) He should start normal to the river bank.

(b) He should start in such a way that he moves normal to the bank, relative to the bank.

(c) He should start in a particular (calculated) direction making an obtuse angle with the direction of water current.

(d) The man cannot cross the river in that way.

55. Rain, driven by the wind, falls on a railway compartment with a velocity of 20 m s^{-1}, at an angle of 30° to the vertical. The train moves, along the direction of wind flow, at a speed of 108 km h^{-1}. Determine the apparent velocity of rain for a person sitting in the train.

(a) $20\sqrt{7}$ m s^{-1} (b) $10\sqrt{7}$ m s^{-1}

(c) $15\sqrt{7}$ m s^{-1} (d) $10\sqrt{7}$ km h^{-1}

56. An aeroplane is flying vertically upwards. When it is at a height of 1000 m above the ground and moving at a speed of 367 m/s, a shot is fired at it with a speed of 567 m/s from a point directly below it. What should be the acceleration of aeroplane so that it may escape from being hit?
(a) $>5\ m/s^2$ (b) $>10\ m/s^2$
(c) $<10\ m/s^2$ (d) Not possible

57. A boat travels from south bank to north bank of a river with a maximum speed of 8 km/h. To arrive at a point opposite to the point of start, the boat should start at an angle
(a) $\tan^{-1}(1/2)$ W of N (b) $\tan^{-1}(1/2)$ N of W
(c) 30° W of N (d) 30° N of W

58. A swimmer crosses a flowing stream of width w to and fro in time t_1. The time taken to cover the same distance up and down the stream is t_2. If t_3 is the time the swimmer would take to swim a distance $2w$ in still water, then
(a) $t_1^2 = t_2 t_3$ (b) $t_2^2 = t_1 t_3$
(c) $t_3^2 = t_1 t_2$ (d) $t_3 = t_1 + t_2$

59. A man who can swim at the rate of 2 km/hr (in still river) crosses a river to a point exactly opposite on the other bank by swimming in a direction of 120° to the flow of the water in the river. The velocity of the water current in km/hr is
(a) 1 (b) 2
(c) 1/2 (d) 3/2

60. A man wishes to cross a river in a boat. If he crosses the river in minimum time he takes 10 minutes with a drift of 120 m. If he crosses the river taking shortest route, he takes 12.5 minutes, find velocity of the boat with respect to water.
(a) 20 m/min (b) 12 m/min
(c) 10 m/min (d) 8 m/min

61. Wind is blowing in the north direction at speed of 2 m/s which causes the rain to fall at some angle with the vertical. With what velocity should a cyclist drive so that the rain appears vertical to him?
(a) 2 m/s south (b) 2 m/s north
(c) 4 m/s west (d) 4 m/s south

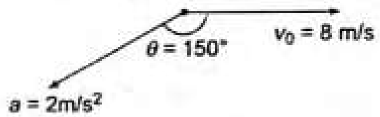
62. A person walks at the rate of 3 km/hr. Rain appears to him in vertical direction at the rate of $3\sqrt{3}$ km/hr. Find the magnitude and direction of true velocity of rain.
(a) 6 km/hr, inclined at an angle of 45° to the vertical towards the person's motion.
(b) 3 km/hr, inclined at an angle of 30° to the vertical towards the person's motion.
(c) 6 km/hr, inclined at an angle of 30° to the vertical towards the person's motion.
(d) 6 km/hr, inclined at an angle of 60° to the vertical towards the person's motion.

63. A swimmer crosses the river along the line making an angle of 45° with the direction of flow. Velocity of the river water is 5 m/s. Swimmer takes 12 seconds to cross the river of width 60 m. The velocity of the swimmer with respect to water will be
(a) 10 m/s (b) 5 m/s
(c) $5\sqrt{5}$ m/s (d) $5\sqrt{2}$ m/s

64. A jet airplane travelling from east to west at a speed of 500 km h^{-1} ejected out gases of combustion at a speed of 1500 km h^{-1} with respect to the jet plane. What is the velocity of the gases with respect to an observer on the ground?
(a) 1000 km h^{-1} in the direction west to east
(b) 1000 km h^{-1} in the direction east to west
(c) 2000 km h^{-1} in the direction west to east
(d) 2000 km h^{-1} in the direction east to west

Kinematics of Circular Motion

65. The figure shows the velocity and acceleration of a point like body at the initial moment of its motion. The acceleration vector of the body remains constant. The minimum radius of curvature of trajectory of the body is



(a) 2 m (b) 3 m
(c) 8 m (d) 16 m

66. A body is moving in a circle with a speed of 1 m s^{-1}. This speed increases at a constant rate of 2 m s^{-1} every second. Assume that the radius of the circle described is 25 m. The total acceleration of the body after 2 s is
(a) 2 ms^{-2} (b) 25 ms^{-2}
(c) $\sqrt{5}$ ms^{-2} (d) $\sqrt{7}$ ms^{-2}

67. A body is moving in a circular path with a constant speed. It has
(a) A constant velocity
(b) A constant acceleration
(c) An acceleration of constant magnitude
(d) An acceleration which varies with time in magnitude

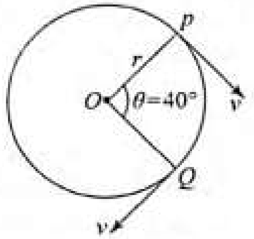
68. A particle is moving along a circular path with uniform speed. Through what angle does its angular velocity change when it completes half of the circular path?
(a) 0° (b) 45° (c) 180° (d) 360°

69. A particle is moving along a circular path. The angular velocity, linear velocity, angular acceleration, and centripetal acceleration of the particle at any instant, respectively, are $\vec{\omega}, \vec{v}, \vec{\alpha}$, and $\vec{a}_c$. Which of the following relations is not correct?
(a) $\vec{\omega} \perp \vec{v}$ (b) $\vec{\omega} \perp \vec{\alpha}$ (c) $\vec{\omega} \perp \vec{a}_c$ (d) $\vec{v} \perp \vec{a}_c$

70. The angular velocity of a particle moving in a circle of radius 50 cm is increased in 5 min from 100 revolutions per minute to 400 revolutions per minute. Find the tangential acceleration of the particle.

(a) 60 m s^{-2} (b) $\pi/30$ m s^{-2}
(c) $\pi/15$ m s^{-2} (d) $\pi/60$ m s^{-2}

71. A particle is moving on a circular path of radius r with uniform velocity v. The change in velocity when the particle moves from P to Q is ($\angle POQ = 40°$)



(a) $2v\cos 40°$ (b) $2v\sin 40°$
(c) $2v\sin 20°$ (d) $2v\cos 20°$

72. A particle P is moving in a circle of radius 'a' with a uniform speed v. C is the centre of the circle and AB is a diameter. When passing through B the angular velocity of P about A and C are in the ratio

(a) 1 : 1 (b) 1 : 2
(c) 2 : 1 (d) 4 : 1

73. When a ceiling fan is switched off its angular velocity reduces to 50% while it makes 36 rotations. How many more rotation will it make before coming to rest (Assume uniform angular retardation)?

(a) 18 (b) 12
(c) 36 (d) 48

74. A car is travelling with linear velocity v on a circular road of radius r. If it is increasing its speed at the rate of 'a' meter/sec^2, then the resultant acceleration will be

(a) $\sqrt{\left\{\frac{v^2}{r^2}-a^2\right\}}$ (b) $\sqrt{\left\{\frac{v^4}{r^2}+a^2\right\}}$

(c) $\sqrt{\left\{\frac{v^4}{r^2}-a^2\right\}}$ (d) $\sqrt{\left\{\frac{v^2}{r^2}+a^2\right\}}$

75. Position vector of a particle moving in xy plane at time t is $\vec{r} = a(1-\cos\omega t)\hat{i} + a\sin\omega t\,\hat{j}$. The path of the particle is

(a) a circle of radius a and center at $(a, 0)$
(b) a circle of radius a and center at $(0, 0)$
(c) an ellipse
(d) neither a circle nor an ellipse

76. A particle moves in xy plane. The position vector at any time t is $\vec{r} = \{(2t)\hat{i} + (2t^2)\hat{j}\}$ m. The rate of change of θ at time t = 2 second (where θ is the angle which its velocity vector makes with positive x-axis) is

(a) $\frac{2}{17}$ rad/s (b) $\frac{1}{14}$ rad/s
(c) $\frac{4}{7}$ rad/s (d) $\frac{6}{5}$ rad/s

77. A train 1 moves from east to west and another train 2 moves from west to east on the equator with equal speeds relative to ground. The ratio of their centripetal accelerations $\frac{a_1}{a_2}$ relative to centre of earth is:

(a) > 1 (b) = 1
(c) < 1 (d) ≥1

78. In uniform circular motion which of the following remains constant?

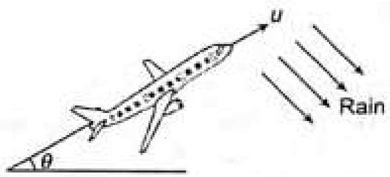
(a) $\vec{r}$ (b) $\vec{a}$
(c) $\vec{v}$ (d) $|\vec{a}|$

79. The diagram shows a CD rotating clockwise (as seen from above) in the CD-player. After turning it off, the CD slows down. Assuming it has not come to a stop yet, the direction of the acceleration of point P at this instance is

(a) ↘ (b) ↓
(c) ↗ (d) →

Problems Based on Mixed Concepts

80. Rain is falling with speed $12\sqrt{2}$ m/s at an angle of 45° with vertical line. A man in a glider going at a speed of u at angle of 37° with respect to ground. Find the speed of glider so that rain appears to him falling vertically. Consider motion of glider and rain drops in same vertical plane.



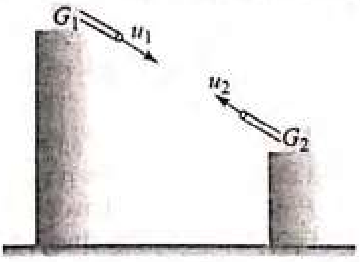
(a) 15 m/s (b) 30 m/s
(c) 10 m/s (d) 25 m/s

81. A stone is projected from a horizontal plane. It attains maximum height 'H' and strikes a stationary smooth wall and falls on the ground vertically below the maximum height. Assuming the collision to be elastic the height of the point on the wall where ball will strike is

(a) $\frac{H}{2}$ (b) $\frac{H}{4}$

(c) $\frac{3H}{4}$ (d) None of these

82. Two guns are mounted (fixed) on two vertical cliffs that are very high from the ground as shown in figure. The muzzle velocity of the shell from G_1 is u_1 and that from G_2 is u_2. The guns aim exactly towards each other The ratio $u_1 : u_2$ such that the shells collide with each other in air is (Assume that there is no resistance of air)



(a) 1 : 2
(b) 1 : 4
(c) will not collide for any ratio
(d) will collide for any ratio

83. Two particles are projected from the same point with the same speed at different angles θ_1 and θ_2 to the horizontal. They have the same range. Their times of flight are t_1 and t_2 respectively.

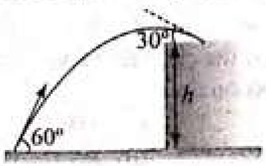
(a) $\frac{t_1}{t_2} = \tan^2\theta_1$ (b) $\frac{t_1}{\sin\theta_1} = \frac{t_2}{\cos\theta_2}$

(c) $\frac{t_1}{t_2} = \tan\theta_1$ (d) $\frac{t_1}{t_2} = \tan^2\theta_2$

84. Three stones A, B and C are simultaneously projected from same point with same speed. A is thrown upwards, B is thrown horizontally and C is thrown downwards from a building. When the distance between stone A and C becomes 10 m, then distance between A and B will be

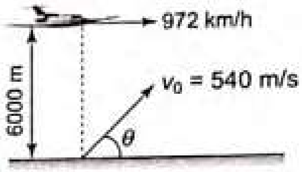
(a) 10 m (b) 5 m
(c) $5\sqrt{2}$ m (d) $10\sqrt{2}$ m

85. A stone projected at an angle of 60° from the ground level strikes at an angle of 30° on the roof of a building of height 'h'. Then the speed of projection of the stone is:



(a) $\sqrt{2gh}$ (b) $\sqrt{6gh}$
(c) $\sqrt{3gh}$ (d) $\sqrt{gh}$

86. An aircraft moving with a speed of 1000 km/h is at a height of 6000 m, just overhead of an anti-aircraft gun. If the muzzle velocity of the gun is 540 m/s, the firing angle θ for the bullet to hit the aircraft should be



(a) 73° (b) 30°
(c) 60° (d) 45°

87. An aeroplane is to go along straight line from A to B, and back again. The relative speed with respect to wind is V. The wind blows perpendicular to line AB with speed v. The distance between A and B is l. The total time for the round trip is:

(a) $\frac{2\ell}{\sqrt{V^2 - v^2}}$ (b) $\frac{2v\ell}{V^2 - v^2}$

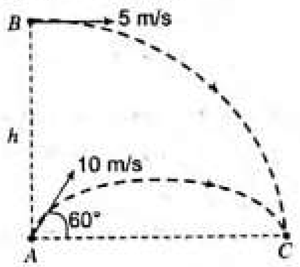
(c) $\frac{2V\ell}{V^2 - v^2}$ (d) $\frac{2\ell}{\sqrt{V^2 + v^2}}$

88. A cat runs along a straight line with constant velocity of magnitude v. A dog chases the cat such that the velocity of dog is always directed towards the cat. The speed of dog is 'u' and always constant. At the instant both are separated by distance x and their velocities are mutually perpendicular, the magnitude of acceleration of dog is.

(a) $\frac{uv}{x}$ (b) $\frac{u^2}{x}$

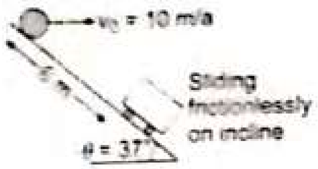
(c) $\frac{v^2}{x}$ (d) $\frac{u^2+v^2}{x}$

89. A particle A is projected from the ground with an initial velocity of 10 m/s at an angle of 60° with horizontal. From what height h should an another particle B be projected horizontally with velocity 5 m/s so that both the particles collide in ground at point C if both are projected simultaneously (g = 10 m/s^2)



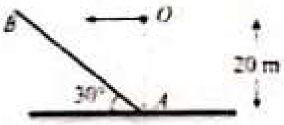
(a) 10 m (b) 30 m
(c) 15 m (d) 25 m

90. A ball is projected horizontally from an incline so as to strike a cart sliding on the incline. Neglect height of cart and point of projection of ball above incline. At the instance the ball is thrown, the speed of cart is v (in m/s). Find v so that the ball strikes the cart.



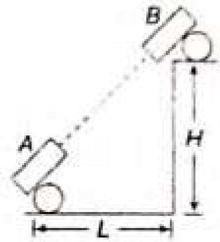
(a) 4 (b) 6
(c) 2 (d) 8

91. AB is an inclined plane of inclination 30° with horizontal. Point O is 20 m above point A. A particle is projected horizontally from O leftwards, and it collides with the plane AB perpendicularly. Speed of the particle at the time of projection should be ($g = 10$ m/s^2)



(a) 13 m/s (b) $8\sqrt{3}$ m/s
(c) $4\sqrt{5}$ m/s (d) $2\sqrt{3}$ m/s

92. Canon A is located on a plain a distance L from a wall of height H. On top of this wall is an identical cannon (cannon B). Ignore air resistance throughout this problem. Also ignore the size of the cannons relative to L and H. The two groups of gunners aim the cannons directly at each other. They fire at each other simultaneously, with equal muzzle speed v_0. What is the value of v_0 for which the two cannon balls collide just as they hit the ground?



(a) $\frac{1}{2}\sqrt{\frac{g(L^2+H^2)}{H}}$ (b) $\sqrt{\frac{g(L^2+H^2)}{H}}$

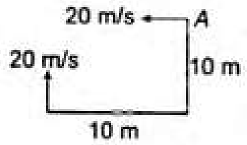
(c) $\sqrt{\frac{2g(L^2+H^2)}{H}}$ (d) $\sqrt{\frac{g(L^2+H^2)}{2H}}$

93. A particle is projected vertically upwards from O with velocity v and a second particle is projected at the same instant from P (at a height h above O) with velocity v at an angle of projection θ. The time when the distance between them is minimum is

(a) $\frac{h}{2v\sin\theta}$ (b) $\frac{h}{2v\cos\theta}$

(c) h/v (d) $h/2v$

94. Two balls are thrown from A and B simultaneously. Find the minimum distance between them during the motion.



(a) 1 m (b) zero
(c) 4 m (d) 2 m

ARCHIVES

1. A ball is projected with kinetic energy E at an angle of 45° to the horizontal. At the highest point during its flight, its kinetic energy will be

(a) Zero (b) $\frac{E}{2}$
(c) $\frac{E}{\sqrt{2}}$ (d) E **(AIEEE 2002)**

2. In a projectile motion, velocity at maximum height is

(a) $\frac{u\cos\theta}{2}$ (b) $u\cos\theta$
(c) $\frac{u\sin\theta}{2}$ (d) None of these

(AIEEE 2002)

3. The coordinates of a moving particle at any time t are given by $x = \alpha t^3$ and $y = \beta t^3$. The speed of the particle at time t is given by

(a) $\sqrt{\alpha^2+\beta^2}$ (b) $3t\sqrt{\alpha^2+\beta^2}$
(c) $3t^2\sqrt{\alpha^2+\beta^2}$ (d) $t^2\sqrt{\alpha^2+\beta^2}$ **(AIEEE 2003)**

4. A boy playing on the roof of a 10 m high building throws a ball with a speed of 10 m/s at an angle of 30° with the horizontal. How far from the throwing point will the ball be at the height of 10 m from the ground? $g = 10$ m/s^2

(a) 8.66 m (b) 5.20 m
(c) 4.33 m (d) 2.60 m **(AIEEE 2003)**

5. A projectile can have the same range R for two angles of projection. If T_1 and T_2 are the times of flight in the two cases, then the product of the two times of flight is directly proportional to

(a) R (b) $1/R$
(c) $1/R^2$ (d) R^2 **(AIEEE 2004)**

6. Which of the following statements is false for a particle moving in a circle with a constant angular speed?

(a) The acceleration vector points to the centre of the circle.
(b) The acceleration vector is tangent to the circle.

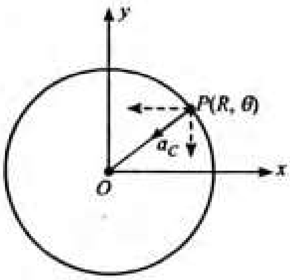
(c) The velocity vector is tangent to the circle.
(d) The velocity and acceleration vectors are perpendicular to each other. **(AIEEE 2004)**

7. A ball is thrown from a point with a speed v_0 at an elevation of angle θ. From the same point and at the same instant, a person starts running with a constant speed $v_0/2$ to catch the ball. Will the person be able to catch the ball? If yes, what should be the angle of projection θ?
(a) No (b) Yes, 30°
(c) Yes, 60° (d) Yes, 45° **(AIEEE 2004)**

8. For a given velocity, a projectile has the same range R for two angles of projection. If t_1 and t_2 are the times of flight in the two cases then
(a) $t_1t_2 \propto R^2$ (b) $t_1t_2 \propto R$
(c) $t_1t_2 \propto \frac{1}{R}$ (d) $t_1t_2 \propto \frac{1}{R^2}$ **(AIEEE 2004)**

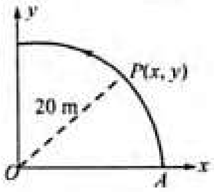
9. A particle is moving eastwards with a velocity of 5 m/s. In 10 s, the velocity changes to 5 m/s northwards. The average acceleration in this time is
(a) $1/\sqrt{2}$ m/s² towards north-west
(b) zero
(c) 1/2 m/s² towards north
(d) $1/\sqrt{2}$ m/s² towards north-east **(AIEEE 2005)**

10. For a particle in uniform circular motion the acceleration $\vec{a}$ at a point $P(R, \theta)$ on the circle of radius R is (here θ is measured from the x-axis).



(a) $-\frac{v^2}{R}\cos\theta\,\hat{i}+\frac{v^2}{R}\sin\theta\,\hat{j}$
(b) $-\frac{v^2}{R}\sin\theta\,\hat{i}+\frac{v^2}{R}\cos\theta\,\hat{j}$
(c) $-\frac{v^2}{R}\cos\theta\,\hat{i}-\frac{v^2}{R}\sin\theta\,\hat{j}$
(d) $\frac{v^2}{R}\hat{i}+\frac{v^2}{R}\hat{j}$ **(AIEEE 2010)**

11. A point P moves in counter-clockwise direction on a circular path as shown in the figure. The movement of 'P' is such that it sweeps out a length $s = t^3 + 5$, where s is in metres and t is in seconds. The radius of the path is 20 m. The acceleration of 'P' when $t = 2$ s is nearly



(a) 13 m/s² (b) 12 m/s²
(c) 7.2 m/s² (d) 14 m/s² **(AIEEE 2010)**

12. A water fountain on the ground sprinkles water all around it. If the speed of water coming out of the fountain is v, the total area around the fountain that gets wet is
(a) $\pi\frac{v^2}{g}$ (b) $\pi\frac{v^4}{g^2}$
(c) $\frac{\pi}{2}\frac{v^4}{g^2}$ (d) $\pi\frac{v^2}{g^2}$ **(AIEEE 2011)**

13. Two cars of masses m_1 and m_2 are moving in circles of radii r_1 and r_2, respectively. Their speeds are such that they make complete circles in the same time t. The ratio of their centripetal acceleration is
(a) $m_1 r_1 : m_2 r_2$ (b) $m_1 : m_2$
(c) $r_1 : r_2$ (d) 1 : 1 **(AIEEE 2012)**

14. A projectile is given an initial velocity of $(\hat{i}+2\hat{j})$ m/s, where $\hat{i}$ is along the ground and $\hat{j}$ is along thevertical. If $g = 10$ m/s², the equation of its trajectory is
(a) $y = 2x - 5x^2$ (b) $y = x - 5x^2$
(c) $4y = 2x - 5x^2$ (d) $y = 2x + 5x^2$
(JEE Main 2013)

15. From a tower of height H, a particle is thrown vertically upwards with a speed u. The time taken by the particle, to hit the ground, is n times that taken by it to reach the highest point of its path. The relation between H, u and n is:
(a) $2gH = nu^2(n-2)$ (b) $gH = (n-2)u^2$
(c) $2gH = n^2u^2$ (d) $gH = (n-2)2u^2$
(JEE Main 2014)

16. From a tower of height H, a particle is thrown vertically upwards with a speed u. The time taken by the particle, to hit the ground, is n times that taken by it to reach the highest point of its path. The relation between H, u and n is
(a) $2gH = nu^2(n-2)$ (b) $gH = (n-2)u^2$
(c) $2gH = n^2u^2$ (d) $gH = (n-2)2u^2$
(JEE Main 2014)

Chapter 5

Newton's Laws of Motion (Without Friction)

NEWTON'S LAWS OF MOTION

The entire classical mechanics is based upon Newton's laws of motion. These, in fact, are simply known as laws of motion. These laws provide the basis for understanding the effect that forces have on an object.

Newton's First Law of Motion

According to this law, a body continues to be in its state of rest or uniform motion along a straight line unless it is acted upon by some external force to change the state.

According to Newton's first law of motion, a body continues to be in the state of rest or of uniform motion along a straight line unless it is acted upon by an external force to change its state. This means a body, on its own, cannot change its state of rest or state of uniform motion along a straight line. This inability of a body to change by itself its state of rest or state of uniform motion along a straight line is called inertia of the body. Hence, Newton's first law defines inertia and is rightly called the *law of inertia*.

Inertia of rest It is the inability of a body to change by itself, its state of rest. This means a body at rest remains at rest and cannot start moving by its own.

Inertia of motion It is the inability of a body to change itself its state of uniform motion, i.e., a body in uniform motion can neither accelerate nor retard by its own.

Linear momentum, p Linear momentum is a vector quantity. It is the quantity of motion in a body. It is given by the product of mass and velocity. Thus,

$$p = mv$$

In vector form, $\vec{p} = m\vec{v}$. The direction of $\vec{p}$ is same as that of $\vec{v}$.

Newton's Second Law of Motion

According to this law, the rate of change of linear momentum of a body is directly proportional to the external force applied on the body and this change takes place always in the direction of the force applied.

When an unbalanced force is applied on a body, the momentum of the body changes. The rate of change of momentum with respect to time is defined as the net external force acting on the body, i.e., $\vec{F}_{ext} = d\vec{p}/dt$, where linear momentum $\vec{p} = m\vec{v}$, m is the mass of the body, and $\vec{v}$ is the instantaneous velocity.

$$\vec{F}_{ext} = \frac{d}{dt}(m\vec{v}) = \frac{dm}{dt}\vec{v} + m\frac{d\vec{v}}{dt}$$

If m is constant, i.e., $\dfrac{dm}{dt} = 0 \Rightarrow \vec{F}_{ext} = m\vec{a}$

If the mass of the body is constant, the acceleration of the body is inversely proportional to its mass and directly proportional to the resultant force acting on it, i.e., $\Sigma\vec{F} = m\vec{a}$. This vector equation is equivalent to three algebraic equations:

$$\Sigma F_x = ma_x, \Sigma F_y = ma_y, \text{ and } \Sigma F_z = ma_z$$

Important Results

- $\vec{F} = 0$, second law gives $\vec{a} = 0$; therefore, it is consistent with the first law.
- The second law of motion is a vector law. It means whatever be the direction of the instantaneous velocity of a particle, if any net external force is acting on it, this force will change only that component of the velocity which is in the direction of force.
- Strictly speaking, this law applies to particles, i.e., point masses only. However, with the introduction of the concept of the center of mass, this law can now be applied in case of extended bodies or a system of point masses also. You will study this in the chapter on systems of particles and rotational motion.
- The second law is a local law. This means that it applies to a particle at a particular instant without taking into consideration any history of the particle or its motion.
- As $\vec{F} = \dfrac{d\vec{p}}{dt}$, where $\vec{p}$ denotes momentum, the slope of momentum versus time graph gives force. In the figure, $\tan\alpha$ gives the force at $t = t_1$ and $\tan\beta$ gives the force at $t = t_2$. The force $\vec{F}$ in the law stands for the net external force. Any internal forces in the system are not included in $\vec{F}$.

Newton's Third Law of Motion

According to this law, to every action, there is always an equal and opposite reaction, i.e., the forces of action and reaction are always equal and opposite.

Whenever a body exerts a force on another body, the second body also exerts a force on the first. This force is equal in magnitude, is in the opposite direction, and has the same line of action, acting simultaneously.

Any of the two forces making action–reaction pair can be called action, and the other reaction.

Forces always occur in pairs. If body A exerts a force F on body B, then B will exert equal and opposite force on body A. We can write it as $\vec{F}_{BA} = -\vec{F}_{AB}$.

To every action, there is always an opposed equal reaction. It does not matter which force we call action and which we call reaction. The important thing is that they are co-pairs of a single interaction, and neither force exists without the other.

- When you walk, you interact with the floor. You push against the floor and the floor pushes against you. The pair of forces occurs at the same time (they are simultaneous).
- Likewise, the tires of a car push against the road while the road pushes back on the tires—the tires and road simultaneously push against each other.
- In swimming, you interact with water, pushing water backwards, while water simultaneously pushes you forward—you and water push against each other.

IMPULSE

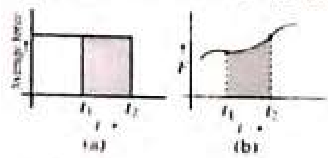
According to Newton's second law, the momentum of a particle changes if a net force acts on the particle. Knowing the change in momentum caused by a force is useful in solving some problems. To build a better understanding of this important concept, let us assume that a net force $\Sigma\vec{F}$ acts on a particle and that this force may vary with time. According to Newton's second law,

$$\Sigma\vec{F} = d\vec{P}/dt \quad \text{or} \quad d\vec{P} = \Sigma\vec{F}\,dt \qquad \text{...(i)}$$

We can integrate this expression to find the change in the momentum of a particle when the force acts over some time interval. If the momentum of the particle changes from $\vec{P}_i$, at time t_i, to $\vec{P}_f$, at time t_f, integrating Eq. (i) gives

$$\Delta\vec{P} = \vec{P}_f - \vec{P}_i = \int_{t_i}^{t_f} \sum \vec{F}\,dt \qquad \text{...(ii)}$$

Equation (ii) is an important statement known as the impulse–momentum theorem: if we plot a graph between average force and time [Fig. (a)], the area under the curve will give the impulse imparted during the time interval under consideration.



$$J = \int_{t_1}^{t_2} F\,dt = \int_{t_1}^{t_2} dp = \text{Total change in linear momentum} = \text{Impulse}$$

ILLUSTRATION 5.1 An iron ball of mass $m = 50$ g falls from a height of $h_1 = 5$ m and rises upto $h_2 = 3.2$ m after colliding with the horizontal surface. If the time of contact of the glass half is $\Delta t = 0.02$ s, find the average contact force exerted on the ball by the horizontal surface.

Solution. The change in linear momentum during collision is

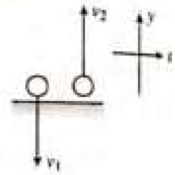
$$\Delta\vec{p} = m\vec{v}_2 - m\vec{v}_1$$
$$= m(\vec{v}_2 - \vec{v}_1)$$
$$= m[v_2\hat{j} - (-v_1\hat{j})] = m[(v_1 + v_2)]\hat{j}$$

The average force during the collision is

$$\vec{F} = \frac{\Delta\vec{p}}{\Delta t} = \frac{m(v_1 + v_2)\hat{j}}{\Delta t}$$

We can calculate v_1 and v_2 by using kinematics.

Using $v^2 = u^2 + 2as$



Putting $a = g$ and $s = h$, we get

$$v_1 = \sqrt{2gh_1}\,,\ v_2 = \sqrt{2gh_2}$$

or $$\vec{F} = \frac{m(\sqrt{2gh_1} + \sqrt{2gh_2})\hat{j}}{\Delta t}$$

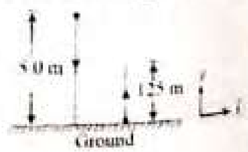
$$= \left(\frac{50}{1000}\right)\frac{(\sqrt{2\times10\times5} + \sqrt{2\times10\times3.2})}{0.02}\hat{j} = 45\hat{j}\text{ N}$$

During collision, the horizontal surface pushes the ball up with an average force of 45 N.

CONCEPT APPLICATION EXERCISE 5.1

1. Figure shows the position–time graph of a particle of mass 0.04 kg. Suggest a suitable physical context for this motion. What is the time between two consecutive impulses received by the particle? What is the magnitude of each impulse?

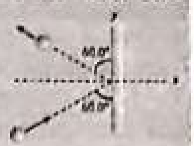
2. A rubber ball of mass 50 g falls from a height of 5 m and rebounds to a height of 1.25 m. Find the impulse and the average force between the ball and the ground if the time for which they are in contact was 0.1 s.



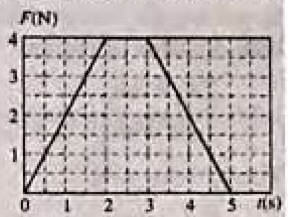
3. Water falls without splashing at a rate of 0.250 L s^{-1} from a height of 1.8 m into a 0.750 kg bucket placed on a scale. If the bucket is originally empty, what does the scale read 3 s after water starts to accumulate in it?

4. A liquid of density ρ is flowing with a speed v through a pipe of cross sectional area A. The pipe is bent in the shape of a right angle as shown. What force should be exerted on the pipe at the corner to keep it fixed?

5. A 3-kg steel ball strikes a wall with a speed of 10.0 ms^{-1} at an angle of 60.0° with the surface of the wall. The ball bounces off with the same speed and same angle (see figure). If the ball was in contact with the wall for 0.2 s, find the average force exerted by the wall on the ball.



6. The magnitude of the net force exerted in the x direction on a 2.50-kg particle varies with time as shown in (see figure). Find (a) the impulse of the force, (b) the final velocity the particle attains if it is originally at rest, (c) its final velocity if its original velocity is $-2.0\ ms^{-1}$, and (d) the average force exerted on the particle for the time interval between 0 and 5 s.



EQUILIBRIUM OF A PARTICLE

The equilibrium of a particle in mechanics refers to the situation when the net external force acting on the particle is zero.

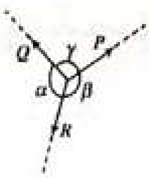
The above condition is correct and complete as far as the equilibrium of a particle (i.e., a point mass) is concerned. In case of rigid bodies (i.e., extended bodies), there are two conditions to be satisfied for such bodies to have equilibrium. First, the net external force acting on the body should be zero. Second, the net external torque acting on the body should be zero.

Concurrent Forces

If two or more forces act on the same particle, we call them concurrent forces.

Lami's Theorem

If three concurrent forces P, Q, and R acting on a particle keep the particle in equilibrium, then Lami's theorem states



$$\frac{P}{\sin\alpha}=\frac{Q}{\sin\beta}=\frac{R}{\sin\gamma}$$

Here α is the angle opposite to $\vec{P}$, β is the angle opposite to $\vec{Q}$, and γ is the angle opposite to $\vec{R}$.

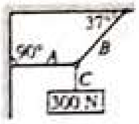
NOTE: If concurrent forces are coplanar but more than three, then it is generally convenient to resolve all of them along two mutually perpendicular directions and then the resultant of each set of these resolved components will be zero.

$$\Sigma F_x=0;\ \Sigma F_y=0$$

If the forces are not coplanar, then they can be resolved along any three mutually perpendicular directions and then the following conditions apply:

$$\Sigma F_x=0;\ \Sigma F_y=0;\ \Sigma F_z=0$$

ILLUSTRATION 5.2 A block of mass 30 kg is suspended by three strings as shown in figure. Find the tension in each string.



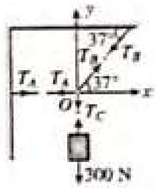
Solution. **Method I:** Considering equilibrium of each part of system The whole system is in equilibrium; therefore, for each part $\Sigma\vec{F}=0$. From the free-body diagram of block C, $T_C=300\ N$.

Now consider the equilibrium of point O,

$$\Sigma F_x=0 \text{ or } T_B\cos 37°-T_A=0$$

$$\therefore\quad T_A=T_B\cos 37°=T_B\cdot\frac{4}{5} \qquad ...(i)$$

and $\quad \Sigma F_y=0 \text{ or } T_B\sin 37°-T_C=0 \qquad ...(ii)$



$$\therefore\quad T_B=\frac{T_C}{\sin 37°}=\frac{300}{3/5}=500\,\text{N}$$

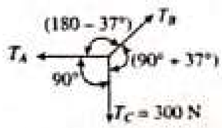
From Eq. (i), we get

$$T_A=\frac{4}{5}T_B=\frac{4}{5}\times 500=400\text{ N}$$

Method II: Using Lami's theorem, we have

$$\frac{T_A}{\sin(90+37°)}=\frac{T_B}{\sin 90°}=\frac{T_C}{\sin(180-37°)}$$

But $\quad TC=300$ N

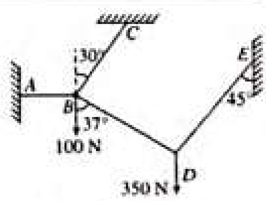


and $\quad T_B=\dfrac{T_C}{\sin 37°}=\dfrac{300}{3/5}=500\,\text{N}$

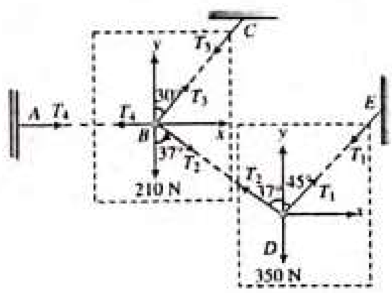
$$T_A=T_C\left(\frac{\sin(90+37°)}{\sin(180-37°)}\right)=300\left(\frac{\cos 37°}{\sin 37°}\right)=400\text{ N}$$

ILLUSTRATION 5.3 Two particles of masses 10 kg and 35 kg are connected with four strings at points B and D as shown in figure.

Determine the tensions in various segments of the string.



Solution. The free-body diagram of the whole system is shown in figure.



Analyzing the equilibrium of point D

$$\Sigma F_x = 0 \text{ or } T_1 \sin 45^\circ - T_2 \sin 37^\circ = 0 \quad \text{...(i)}$$

and $$\Sigma F_y = 0 \text{ or } T_1 \cos 45^\circ + T_2 \cos 37^\circ = 350 \quad \text{...(ii)}$$

From (i), we have $T_2 = \dfrac{T_1 \sin 45^\circ}{\sin 37^\circ}$

Now from (ii), $T_1 \cos 45^\circ + \dfrac{T_1 \sin 45^\circ}{\sin 37^\circ} \times \cos 37^\circ = 350$

or $$\frac{T_1}{\sqrt{2}} + \frac{T_1}{\sqrt{2}} \times \frac{4}{3} = 350$$

or $$\frac{T_1}{\sqrt{2}}\left[1 + \frac{4}{3}\right] = 350 \Rightarrow T_1 = 150\sqrt{2}\text{ N}$$

and $$T_2 = \frac{T_1 \sin 45^\circ}{\sin 37^\circ} = \frac{150\sqrt{2} \times \left(\frac{1}{\sqrt{2}}\right)}{3/5} = 250\text{ N}$$

Analyzing the equilibrium of point B

$$\Sigma F_x = 0 \text{ or } T_2 \sin 37^\circ + T_3 \sin 30^\circ - T_4 = 0 \quad \text{...(i)}$$

and $$\Sigma F_y = 0 \text{ or } T_3 \cos 30^\circ - T_2 \cos 37^\circ - 100 = 0 \quad \text{...(ii)}$$

From (ii), $T_3 \cos 30^\circ - 250 \times \dfrac{4}{5} - 100 = 0$

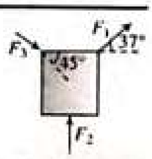
$\Rightarrow \quad T_3 = 200\sqrt{3}$ N

From (i), $T_4 = 150 + 100\sqrt{3} = 50(3 + 2\sqrt{3})$ N

APPLICATIONS OF NEWTON'S LAWS OF MOTION IN DIFFERENT SITUATIONS

We can better understand the application of Newton's laws of motion through studying different situations.

ILLUSTRATION 5.4 Three boys, each of mass 45 kg, pull simultaneously a block on a smooth surface. The mass of block is 20.0 kg.

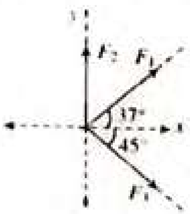


(a) Find the acceleration of the block.

(b) Find the acceleration of the boy exerting force F_1. Assume no friction between the boy and the surface.

[Given $F_1 = 90$ N, $F_2 = 114$ N, and $F_3 = 128\sqrt{2}$ N]

Solution. First we will resolve all the forces acting on the block into x and y components.



$$\Sigma F_x = F_1 \cos 30^\circ + F_3 \cos 45^\circ$$

$$\Sigma F_y = F_1 \sin 30^\circ + F_2 - F_3 \sin 45^\circ$$

Now, $a_x = \dfrac{\Sigma F_x}{m}$ and $a_y = \dfrac{\Sigma F_y}{m}$

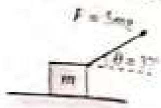
$$a_x = \frac{(90.0)\cos 37^\circ + 128\sqrt{2}\cos 45.0^\circ}{20.0} = 10\text{ ms}^{-2}$$

$$a_y = \frac{(90.0)(\sin 37^\circ) + 114 - (128\sqrt{2}\sin 45.0^\circ)}{20.0} = 2\text{ ms}^{-2}$$

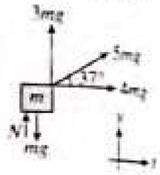
According to Newton's third law, the force exerted on the block by the boy must be equal to the force exerted on the boy by the block. Therefore,

$$a_1 = \frac{F_1'}{m} = \frac{90.0}{45} = 2\text{ ms}^{-2}$$

ILLUSTRATION 5.5 A block of mass m is placed on a horizontal surface. If the block is pulled by applying a force of magnitude $F = 5mg$ at an angle $\theta = 37^\circ$ with horizontal as shown in figure, find the acceleration of the block at the given instant.



Solution. Three forces act on the block (a) $mg \downarrow$ (b) $F = 5mg \nearrow$ (c) $N \uparrow$



Resolving the forces along x- and y-axis, we have equation of motion

$$\Sigma F_x = ma_x$$

$$4\,mg = ma_x$$

This gives $a_x = 4g$ ...(i)

$$\Sigma F_y = ma_y$$

$$3mg - mg + N = ma_y$$

$$2mg + N = ma_y \quad \text{...(ii)}$$

Let $a_y = 0$. Then $N = -2mg$

The negative result signifies that N will be directed down (opposite to the assumed direction), but the ground cannot pull the block down. Hence, the block will lose contact with the ground.

or $N = 0$

Hence, from (ii), $a_y = 2g \uparrow$

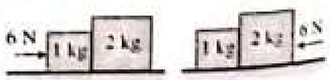
Hence, the net acceleration, $|\vec{a}| = \sqrt{a_x^2 + a_y^2}$

where $a_x = 4g$ from Eq. (i) and $a_y = 2g$ from Eq. (ii).

This gives $a = \sqrt{a_x^2 + a_y^2} = \sqrt{(4g)^2 + (20)^2} = 2\sqrt{5}\,g$

Analysis of Newton's laws of motion in connected bodies: Problems based on normal reaction

ILLUSTRATION 5.6 Two blocks of masses 1 kg and 2 kg are placed in contact on a smooth horizontal surface as shown in Figs. (a) and (b). A horizontal force of 6 N is applied (a) on a 1-kg block (b) a 2-kg block. Find the force of interaction of the blocks.



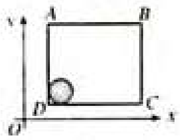
(a) (b)

Solution. Since both the blocks are in contact, therefore, they will move together with an acceleration

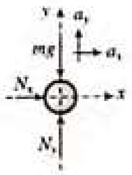
$$a = \frac{F_{net}}{M_{total}} = \frac{6}{2+1} = 2\text{ ms}^{-2}$$

	Let the force of interaction between them is R_1. By Newton's second law for 2-kg block. Normal reaction on 2-kg block. $R_1 = 2a = 2 \times 2 = 4$ N	Let the force of interaction between them is R_2. By Newton's second law for 1-kg block, normal reaction on 2-kg block. $R_2 = 1a = 1 \times 2 = 2$ N

ILLUSTRATION 5.7 A solid sphere of mass 2 kg is resting inside a cube as shown in figure. The cube is moving with a velocity $\vec{v} = (5t\hat{i} + 2t\hat{j})\,\text{m s}^{-1}$. Here t is time in seconds. All surfaces are smooth. The sphere is at rest with respect to the cube. What is the total force exerted by the sphere on the cube?



Solution. The velocity of the sphere is same as that of the cube, which is given as $\vec{v} = 5t\hat{i} + 2t\hat{j}$.



Hence, acceleration of the sphere: $\vec{a} = \dfrac{d\vec{v}}{dt}$

or $\quad \vec{a} = (5\hat{i} + 2\hat{j})\,\text{m s}^{-2}$

Hence, $a_x = 5\ \text{m s}^{-2}$ and $a_y = 2\ \text{m s}^{-2}$

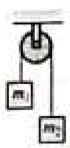
From FBD of sphere,

$$N_x = ma_x = 2 \times 5 = 10\ \text{N}$$

$$N_y - mg = ma_y \Rightarrow N_y = 2 \times 10 + 2 \times 2 = 24\ \text{N}$$

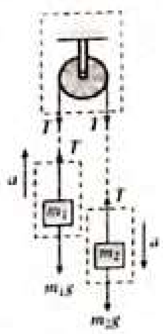
Total force $= \sqrt{N_x^2 + N_y^2} = \sqrt{(10)^2 + (24)^2} = 26\,\text{N}$

ILLUSTRATION 5.8 Two masses m_1 and m_2 are attached to a flexible inextensible massless rope, which passes over a frictionless and massless pulley. Find the accelerations of the masses and tension in the rope.



Solution. Fix an inertial reference frame to the ground to observe the motion of the masses.

Let the tension in the rope be T (in fact, tension is the property of a point of the rope). In this case with ideal pulley (massless and frictionless) and ideal rope (inextensible, massless, and flexible), the tension will remain constant throughout the rope.



Let the acceleration of m_2 be a, vertically downwards, and acceleration of m_1 will also be a, vertically upwards. This is because the rope is inextensible; during motion, the length of the rope must not change, and the rope must not slacken either.

From the above statement, you must not conclude that the accelerations of the masses connected by a rope are always equal. The relationship between the accelerations of the masses depends on the configuration of the pulley–rope system, which can be obtained from the fact that the length of an ideal rope must not change and the rope must not slacken.

Using equation $\sum \vec{F} = m\vec{a}$ for the force diagrams of m_1 and m_2,

$$T - m_1 g = m_1 a \qquad \text{(i)}$$

$$m_2 g - T = m_2 a \qquad \text{(ii)}$$

Adding (i) and (ii), $m_2 g - m_1 g = m_1 a + m_2 a$

$$a = \left(\frac{m_2 - m_1}{m_2 + m_1}\right) g \qquad \text{(iii)}$$

Substituting this value of a in (i), we get

$$T = m_1 g + m_1 \left(\frac{m_2 - m_1}{m_2 + m_1}\right) g = \frac{2m_1 m_2}{(m_1 + m_2)} g \qquad \text{(iv)}$$

☞ Important Results

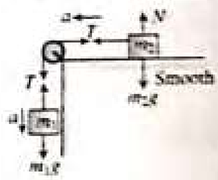
These type of problems in which all connected bodies have same acceleration magnitude can be solved by the following method:

For calculating a use $a = \dfrac{F_{\text{net}}}{M_{\text{total}}} = \dfrac{\text{unbalanced load}}{\text{Total mass}}$

For unbalanced load:

1. If mass moves vertically, take mg.
2. If mass moves horizontally, take zero.
3. If mass moves on inclined plane of inclination, take $mg \sin \theta$.

- Bodies accelerated on a horizontal surface by a falling body:



$$T = m_2 a \qquad \text{(i)}$$

$$m_1 g - T = m_1 a \qquad \text{(ii)}$$

Acceleration, $a = \left(\dfrac{m_1}{m_1 + m_2}\right) g$

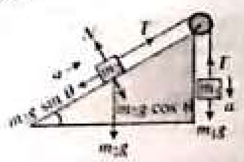
Tension, $T = \left(\dfrac{m_1 m_2}{m_1 + m_2}\right) g$

Solving this problem using shortcut method:

Here unbalanced forced $= m_1 g$.

$\Rightarrow$ Acceleration, $a = \dfrac{F_{\text{net}}}{M_{\text{total}}} = \dfrac{\text{Unbalanced load}}{\text{Total mass}} = \dfrac{m_1 g}{m_1 + m_2}$

- Motion on a smooth inclined plane:



$$m_1 g - T = m_1 a \qquad \text{...(i)}$$

$$T - m_2 g \sin \theta = m_2 a \qquad \text{...(ii)}$$

$$\therefore\ a = \left(\frac{m_1 - m_2 \sin \theta}{m_1 + m_2}\right) g$$

and $T = \dfrac{m_1 m_2 (1 + \sin \theta) g}{(m_1 + m_2)}$

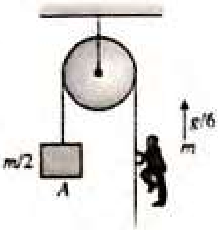
Solving this problem using shortcut method:

Here unbalanced forced = $m_1 g - m_2 g \sin\theta$.

$$\Rightarrow \text{Acceleration, } a = \frac{F_{net}}{M_{total}} = \frac{\text{Unbalanced load}}{\text{Total mass}}$$

$$= \frac{m_1 g - m_2 g \sin\theta}{m_1 + m_2}$$

ILLUSTRATION 5.9 Block A of mass $m/2$ is connected to one end of light rope which passes over a pulley as shown in figure. A man of mass m climbs the other end of rope with a relative acceleration of $g/6$ with respect to rope. Find the acceleration of block A and tension in the rope.



Solution. Let the acceleration of block be (a_0)up. The acceleration of man with respect to ground is a.

$$\vec{a}_{\text{man, rope}} = \vec{a}_{\text{man}} - \vec{a}_{\text{rope}}$$

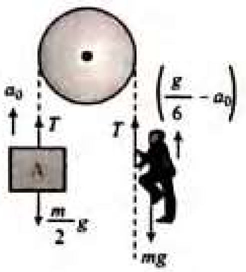
$$\vec{a}_{\text{man}} = \vec{a}_{\text{man, rope}} + \vec{a}_{\text{rope}}$$

$$= \frac{g}{6} + (-a_0) \qquad \Rightarrow \quad a = \frac{g}{6} - a_0$$

From the force diagram of man,

$$T - mg = ma = m\left(\frac{g}{6} - a_0\right) \quad \text{...(i)}$$

From force diagram of block A,



$$T - \frac{m}{2}g = \frac{m}{2}a_0 \qquad \text{...(ii)}$$

Subtracting (i) from (ii),

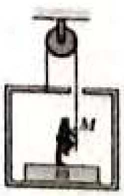
$$\frac{m}{2}g = \frac{m}{2}a_0 - \frac{mg}{6} + ma_0$$

$$\text{or} \quad \frac{3}{2}ma_0 = \frac{mg}{2} + \frac{mg}{6} \Rightarrow a_0 = \frac{4}{9}g$$

From (ii), $T = \frac{m}{2}a_0 + \frac{m}{2}g$

$$= \frac{m}{2} \times \frac{4}{9}g + \frac{m}{2}g \Rightarrow T = \frac{13mg}{18}$$

ILLUSTRATION 5.10 A man of mass M is standing on a plank kept in a box. The plank and box as a whole has mass m. A light string passing over a fixed smooth pulley connects the man and box. If the box remains stationary, find the tension in the string and force exerted by the man on the plank. (Given $M > m$)



Solution. The fixed pulley is taken as frame of reference. The forces on man and box with plank are shown in figure.

The forces are as follows:

(a) Weight of the man = Mg

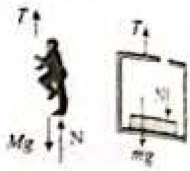
(b) Tension in the string = T

(c) Normal contact force between the man and the plank = N

(d) The weight of the plank and box = mg

The box remains at rest, the man will have to be at rest

Referring to free-body diagram of man, the equation of motion of the man is given as



$$T + N - Mg = 0 \qquad \text{...(i)}$$

Referring to the free-body diagram of lift,

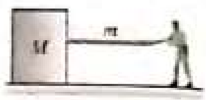
$$T - N - mg = 0 \qquad \text{...(ii)}$$

Solving (i) and (ii), we obtain

$$T = \frac{(M+m)g}{2} \text{ and } N = \frac{(M-m)g}{2}$$

Problems of string with mass

ILLUSTRATION 5.11 A block of mass M is being pulled with the help of a string of mass m and length L. The horizontal force applied by the man on the string is F.



Determine

(a) Find the force exerted by the string on the block and acceleration of system.

(b) Find the tension at the mid point of the string.

(c) Find the tension at a distance x from the end at which force is applied.

Assume that the block is kept on a frictionless horizontal surface and the mass is uniformly distributed in the string.

Solution.

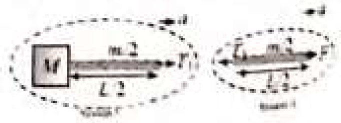
(a) Let the force applied by string to the block be T. For part (a), consider one system is block and other string. Let the acceleration of the system (block + string) be a. Now we apply Newton's law to each of them.

For system II: $F - T = ma$ ...(i)

For system I: $T = Ma$ ...(ii)

After solving (i) and (ii), $a = \frac{F}{M+m}$, $T = \frac{MF}{M+m}$

(b) Now we have to redefine our system. Choose system 1 as block and half string and system 2 as the other half string. On applying Newton's second law to system 1 and system 2, we have



System II: $F - T_1 = \frac{m}{2} \times a$ ...(iii)

Mass per unit length of string = m/L

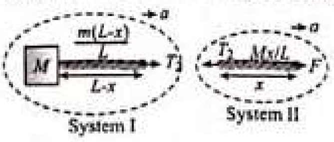
Hence, mass of $L/2$ length of string $= \frac{m}{L} \times \frac{L}{2} = \frac{m}{2}$

System I: $T_1 = \left(M + \frac{m}{2}\right)a$ ...(iv)

After solving, (iii) and (iv), we get

$$a = \frac{F}{M+m},\ T_1 = \frac{(M+m/2)F}{(M+m)}$$

(c) Now we can redefine our system in the block and string of length $L-x$ (system I) and string of length x (system II)



System II: $F - T_2 = \left(\frac{m}{L} \times x\right)a$ ...(v)

System I: $T_2 = \left\{\frac{m}{L}(L-x) + M\right\}a$ ...(vi)

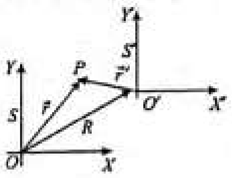
Solving, (v) and (vi), we get

$$a = \frac{F}{M+m} \quad \text{and} \quad T_2 = \frac{\{m(L-x)/L + M\}F}{M+m}$$

Here we see that acceleration in each part is same, but tension changes along the string.

NON-INERTIAL FRAME OF REFERENCE AND PSEUDO (FICTITIOUS) FORCE

A coordinate system whose origin either accelerates or rotates is called a non-inertial frame of reference. The motion of a particle (P) is studied from two frames of references, S and S'. S is an inertial frame of reference, and S' is a non-inertial frame of reference. At any time, the position vectors of the particle with respect to those two frames are $\vec{r}$ and $\vec{r}'$, respectively. At the same moment, the position vector of the origin of S' is $\vec{R}$ with respect to S as shown in figure.



From the vector triangle $OO'P$, we get $\vec{r}' = \vec{r} - \vec{R}$

Differentiating this equation twice with respect to time, we get

$$\frac{d^2\vec{r}'}{dt^2} = \frac{d^2(\vec{r})}{dt^2} - \frac{d^2}{dt^2}(\vec{R}) \Rightarrow \vec{a}' = \vec{a} - \vec{A}$$

Here $\vec{a}'$ is the acceleration of the particle P relative to S', is the acceleration of the particle relative to S, and $\vec{A}$ is the acceleration of S' relative to S.

Multiplying the above equation by m (mass of the particle), we get $m\vec{a}' = m\vec{a} - m\vec{A}$

$$\Rightarrow \quad \vec{F}' = \vec{F}_{(\text{real})} - m\vec{A} \Rightarrow \vec{F}' = \vec{F}_{(\text{real})} + (-m\vec{A})$$

We can observe an additional force $(-m\vec{A})$ apart from real face, that is acting on the particle as seen from an observer observing from reference frame S'.

This force has no existence in reality but has been included only to suit the calculations involved, by Newton's second law, while working out a problem w.r.t. a non-inertial reference frame. This imaginary force is known as "pseudo force" or "fictitious force" or "inertial force." (The term "pseudo" means something which is not real.)

ILLUSTRATION 5.12 A man of mass M stands on a weighing machine in an elevator accelerating upwards with an acceleration a. Draw the free-body diagram of the man as observed by the observer A (stationary on the ground) and observer B (stationary on the elevator). Also, calculate the reading of the weighing machine.

Solution. **Method 1:** Observation from observer. A on ground

From FBD of man w.r.t. A, using Newton's second law,

$$N - Mg = Ma \Rightarrow N = M(g+a)$$

FBD of the man w.r.t. observer A

N is the reading of weighing machine.

Method 2: Observation from observer B on elevator. The observer 'B' is moving in accelerated frame of reference. If he observes the man on weighing machine he will observe the man at rest w.r.t. elevator. If he is asked to draw a free-body diagram of M he will apply pseudo force on M apart from real forces acting on him.

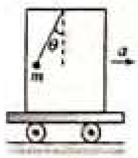
FBD of the man w.r.t. observer 'B'

From free-body diagram:

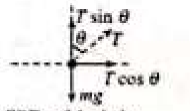
$$N = Mg + ma \Rightarrow N = M(g+a)$$

The value of N calculated from both the methods is same.

ILLUSTRATION 5.13 A bob of mass $m = 50$ g is suspended from the ceiling of a trolley by a light inextensible string. If the trolley accelerates horizontally, the string makes an angle $\theta = 37°$ with the vertical. Find the acceleration of the trolley.



Solution. **Method 1:** Problem solving from ground frame. The observer on the ground will observe the bob moving with acceleration a same as trolley. In FBD, he will observe only two real forces, weight and tension force.



FBD of the bob w.r.t observer standing on ground

The bob is at equilibrium in vertical direction, hence writing equation of motion in vertical direction

$$T\cos\theta = mg \quad ...(i)$$

Along horizontal direction, the bob is accelerating with acceleration a.

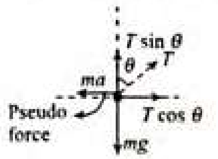
$$T\sin\theta = ma \quad ...(ii)$$

Using (i) and (ii), $\tan\theta = a/g$

$\therefore \quad a = g\tan\theta = 10\tan 37° = 7.5\ \text{m s}^{-2}$

Therefore, acceleration of the trolley is $7.5\ \text{m s}^{-2}$

Method 2: Problem solving from non-inertial frame. If an observer sitting in the trolley and observes the bob, he will observe the bob at rest. If he asks to draw free-body diagram of bob he will apply pseudo force apart from real forces acting on the bob.



FBD of the bob w.r.t. observer in trolley

The bob is at equilibrium in vertical direction, hence writing equation of motion in vertical direction

$$T\cos\theta = mg \qquad \text{...(iii)}$$

Along horizontal direction the bob is at rest.

$$T\sin\theta = ma \qquad \text{...(iv)}$$

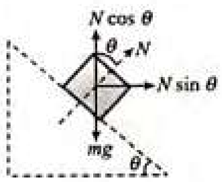
Using (iii) and (iv), $\tan\theta = a/g$

$\therefore \quad a = g\tan\theta = 10\tan 37° = 7.5\ \text{m s}^{-2}$

ILLUSTRATION 5.14 A block of mass m is placed on an inclined plane. With what acceleration A towards right should the system move on a horizontal surface so that m does not slide on the surface of inclined plane? Also calculate the force supplied by wedge on the block. Assume all surfaces are smooth.

Solution. **Method 1:** Analysis of forces on m relative to ground

If the motion of m is analyzed from ground, its acceleration is A and the forces acting on it are its weight mg and normal reaction N.



As m is at rest, moving with same acceleration as wedge in horizontal direction but in vertical direction, the block is at rest.

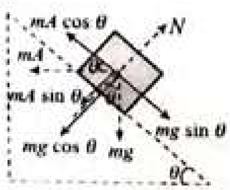
$$\Sigma \vec{F}_y = 0 \Rightarrow N\cos\theta = mg \qquad \text{...(i)}$$

$$\Sigma \vec{F}_x = \Sigma m_i \vec{a}_i \Rightarrow N\sin\theta = mA \qquad \text{...(ii)}$$

On solving (i) and (ii), we get $A = g\tan\theta$ and $N = \dfrac{mg}{\cos\theta}$

Method 2: Analysis of forces on m relative to the inclined plane

If the motion of m is analyzed from the view point of an observer standing on the inclined plane (i.e., relative to the plane), its acceleration is 0 and the forces acting on it are: its weight, the normal reaction, and a pseudo force of magnitude mA towards left.



$$mA\sin\theta = mA\cos\theta$$

$\Rightarrow \quad A = g\tan\theta$

Also: $N = mg\cos\theta + mA\sin\theta$

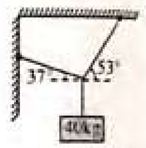
$$= mg\cos\theta + mg\tan\theta\sin\theta = \frac{mg}{\cos\theta}$$

NOTE: If we resolve the forces along the sloping side, we have net force along sloping direction $F = mA\cos\theta - mg\sin\theta$

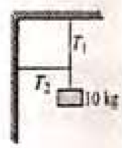
- If $mA\cos\theta > mg\sin\theta$, F is directed up along the slant. Then, the block will accelerate relative to the wedge with acceleration $a = A\cos\theta - g\sin\theta$
- If $mA\cos\theta = mg\sin\theta$, $F = 0$. Hence, the block remains stationary relative to the wedge (or more with constant velocity relative to the wedge).
- If $mA\cos\theta < mg\sin\theta$, F is directed down along the slant. Hence, the block accelerates down the slant with acceleration $a = g\sin\theta - A\cos\theta$

CONCEPT APPLICATION EXERCISE 5.2

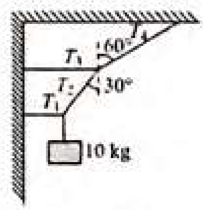
1. The object in the figure weighs 40 kg and hangs at rest. Find the tensions in the three cords that hold it.



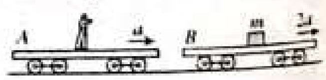
2. A block of mass m = 10 kg is suspended with the help of three strings as shown in the figure. Find the tensions T_1 and T_2.



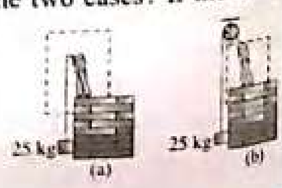
3. Determine tension T_4 in the figure.



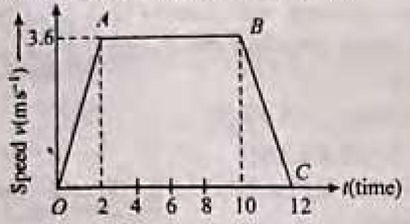
4. Two trolleys A and B are moving with accelerations a and $2a$, respectively, in the same direction. To an observer in trolley A, find the magnitude of the pseudo force acting on a block of mass m on trolley B.



5. A block of mass 25 kg is raised by a 50-kg man in two different ways as shown in the figure. What is the action on the floor by the man in the two cases? If the floor yields to a normal force of 700 N, which mode should the man adopt to lift the block without the floor yielding?



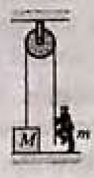
6. A homogeneous rod of length L is acted upon by two forces F_1 and F_2 applied to its ends and directed opposite to each other. With what force F will the rod be stretched at the cross section at a distance l from the end where F_1 is applied?
7. A lift is going up. The total mass of the lift and the passengers is 1500 kg. The variation in the speed of the lift is given by the graph (see figure).



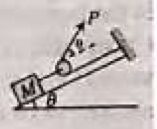
(a) What will be the tension in the rope pulling the lift at time t equal to
i. 1 s ii. 6 s iii. 11 s?
(b) What will be the average velocity and the average acceleration during the course of the entire motion?

8. A body hangs from a spring balance supported from the roof of an elevator.
(a) If the elevator has an upward acceleration of 2.45 ms^{-2} and the balance reads 50 N, what is the true weight of the body?
(b) Under what circumstances will the balance read 30 N?
(c) What will be the balance reading if the elevator cable breaks?

9. In the figure, the block of mass M is at rest on the floor. At what acceleration with which should a boy of mass m climb along the rope of negligible mass so as to lift the block from the floor?

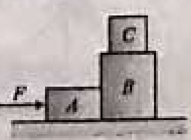


10. What should be the minimum force P to be applied to the string so that block of mass M just begins to move up the frictionless plane?



11. In the figure, the man and the platform together weigh 950 N. The pulley can be treated as frictionless. Determine how hard the man has to pull on the rope to lift himself upward above the ground with constant velocity. If the weight of man is 550 N, what is the normal reaction between them?

12. The masses of blocks A, B, and C are 1 kg, 2 kg, and 0.5 kg, respectively. All surfaces are smooth. If force $F = 50$ N acts as shown in figure at the instant shown, find the force which A exerts on B and the acceleration of C.



CONSTRAINT RELATIONS

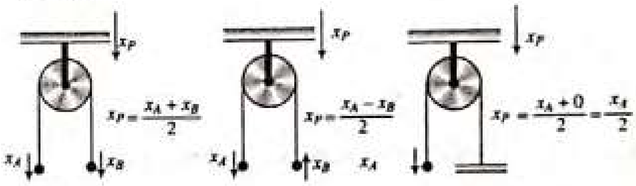
Constraints mean that two bodies (in this case the bodies which are attached to the pulley) are not free to move the way they want. The accelerations between them are dependent on each other. We need to find out the relationship to solve the problems of Newton's laws of motion.

The equations showing the relation of the motions of a system of bodies, in which one motion is constrained by the other motions, are called *constrained relations*.

Pulley Constraint

Pulley constraints are applicable when the bodies concerned are connected through pulleys and the rope connecting them is inextensible.

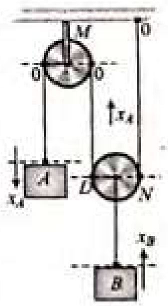
In the cases, where pulley moves along with the blocks connected on both sides, we can say that the displacement of the pulley is the average of the displacement on both sides of the pulley.



If one end of the string is connected with the fixed end, the displacement of that end can be considered zero.

Analysis of case I using shortcut method

- As pulley M is fixed, the displacement should be zero. If the displacement of block A is x_A (down), then the displacement of other end should be x_A (up).



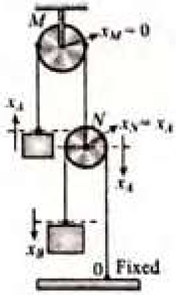
$$x_M = 0 = \frac{x_A + x_D}{2} \Rightarrow x_D = -x_A$$

- Displacement of block B = Displacement of pulley 2

$$x_B = \frac{x_A + 0}{2} \Rightarrow x_A = 2x_B$$

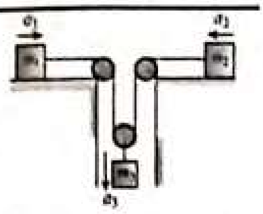
Analysis of case II using shortcut method

- As pulley M is fixed, $|x_{P,2}| = |x_A|$.
- If block A moves up by x_A, pulley N should move x_A in downward direction as shown in figure.
- For pulley 2,



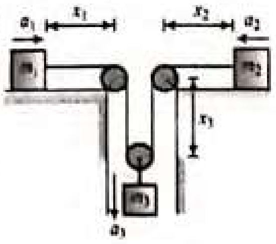
$$x_{P,2} = x_A = \frac{x_B + 0}{2} \Rightarrow x_B = 2x_A$$

ILLUSTRATION 5.15 In the arrangement of three blocks as shown in the figure, the string is inextensible. If the directions of accelerations are as shown in the figure, then determine the constraint relation.



Solution. Let us assume the respective distance of each block as shown in the figure. Since the length of the string is constant, $x_1 + x_2 + 2x_3 =$ constant.

On differentiating twice w.r.t. time, we get



$$\frac{d^2x_1}{dt^2}+\frac{d^2x_2}{dt^2}+2\frac{d^2x_3}{dt^2}=0$$

Since x_1 and x_2 are assumed to be decreasing with time,

$$\frac{d^2x_1}{dt^2}=-a_1 \text{ and } \frac{d^2x_2}{dt^2}=-a_2$$

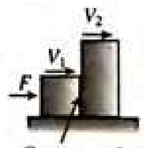
and x_3 is assumed to be increasing with time. Therefore,

$$\frac{d^2x_3}{dt^2}=+a_3$$

Thus, $-a_1-a_2+2a_3=0$ or $a_1+a_2=2a_3$

Wedge Constraint: Normal Constraint

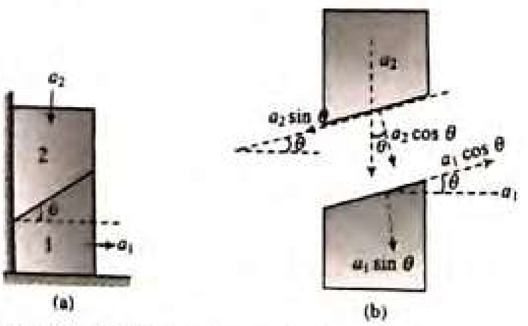
Consider two blocks moving on a surface and always remaining in contact. In order to maintain the contact component of velocity the vector perpendicular to the contact surface must be same, i.e., $\vec{V}_1=\vec{V}_2$.



Contact surface

Similarly, $\vec{a}_1=\vec{a}_2$

In the figure, find the relation between the accelerations of wedges 1 and 2.



(a) (b)

If wedges (1) and (2) are to remain in contact, the component of acceleration perpendicular to the contact surface must be same.

$$a_1 \sin\theta = a_2\cos\theta$$

$$\frac{a_1}{a_2}=\cot\theta$$

In the figure, plane 1 and wedge 2 are free to move. Obtain relation, between their acceleration $a_1 = a_2 \sin\theta$.

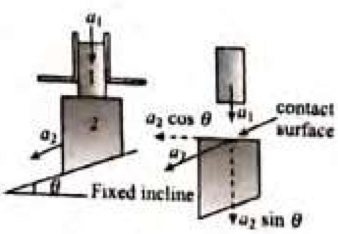


ILLUSTRATION 5.16 A block of mass m is placed on the inclined surface of a wedge as shown in the figure. Calculate the acceleration of the wedge and the block when the block is released. Assume all surfaces are frictionless.

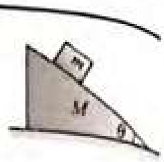
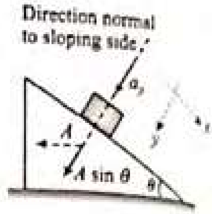


Solution. We consider the motion of the block parallel to incline and perpendicular to inclined surface. Let the components of acceleration of block with respect to ground along these direction are a_x and a_y, respectively.



Then we can write $a_y = A\sin\theta$.

For wedge: $N\sin\theta = MA$ (i)

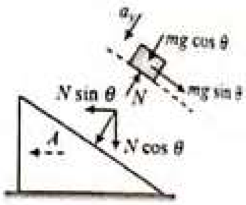
For block: considering the block in the direction perpendicular to sloping surface.

$$mg\cos\theta - N = ma_y$$

But $a_y = A\sin\theta$

Hence,

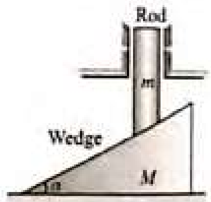
$$mg\cos\theta - N = mA\sin\theta \quad \text{(ii)}$$



From (i) and (ii), we get

$$A=\frac{mg\sin\theta\cos\theta}{M+m\sin^2\theta}$$

ILLUSTRATION 5.17 A rod of mass m is supported on a wedge of mass M shown in the figure. Find the accelerations of rod a and wedge A in the arrangement. The friction between all contact surfaces is negligible.

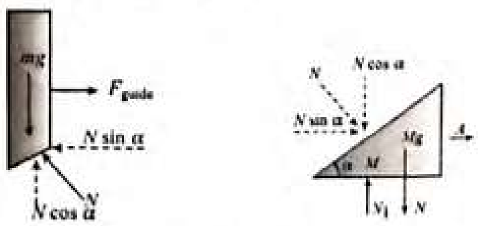


Solution. The rod is constrained to move in the vertical direction (with the help of the guides) and the wedge will move along the surface in the horizontal direction. Initially, the system is held at rest.

Constraint relation: The fact that the rod (or a particle on the wedge) and the wedge must not lose contact is usually called *wedge constraints*. For this, the component of the acceleration of the rod perpendicular to the wedge plane = component of acceleration of the wedge perpendicular to wedge plane.

$$a\cos\alpha = A\sin\alpha \Rightarrow a = A\tan\alpha$$

The forces acting on the rod are:



- The weight mg, vertically downwards
- The normal force N, normal to the bottom surface of the rod
- The force (F_{guide}) exerted by the guide to nullify the horizontal component of N as for the rod $a_{\text{Horizontal}} = 0$.

Motion in vertical direction

$$mg - N\cos\alpha = ma \quad \text{...(ii)}$$

and the forces acting on the wedge are

- The weight, Mg
- N, reaction of N acting on the rod
- N_1, normal force by the surface

The force equations are

$$N_1 - Mg - N\cos\alpha = 0 \quad \text{(iii)}$$

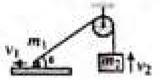
and $N\sin\alpha = MA$ (iv)

Solving the above equations for a and A, we get

$$a = \frac{mg\tan\alpha}{m\tan\alpha + M\cot\alpha} \text{ and } A = \frac{mg}{m\tan\alpha + M\cot\alpha}$$

General Constraints

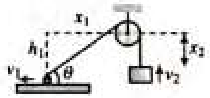
ILLUSTRATION 5.18 In the figure, a ball of mass m_1 and a block of mass m_2 are joined together with an inextensible string. The ball can slide on a smooth horizontal surface. If v_1 and v_2 are the respective speeds of the ball and the block, then determine the constraint relation between the two.



Solution. **Method 1:** Distances are assumed from the center of the pulley as shown in the figure.

Constraint: Length of the string remains constant.

$$\sqrt{x_1^2 + h_1^2} + x_2 = \text{constant}$$



Differentiating both the sides w.r.t. time, we get

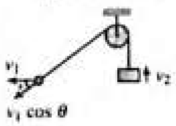
$$\frac{2x_1}{2\sqrt{x_1^2 + h_1^2}}\frac{dx_1}{dt} + \frac{dx_2}{dt} = 0$$

Since the ball moves so as to increase x_1 with time and block moves so as to decrease x_2 with time,

$$\frac{dx_1}{dt} = +v_1 \quad \text{and} \quad \frac{dx_2}{dt} = -v_2$$

Also $\frac{x_1}{\sqrt{x_1^2 + h_1^2}} = \cos\theta$ or $v_2 = v_1\cos\theta$

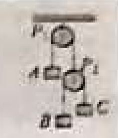
Method 2: The problem can be solved very easily if we look at the problem from a different viewpoint and identify a different constraint, i.e., the velocity of any two points along the string is same. Obviously, from the figure, we have $v_1\cos\theta = v_2$.



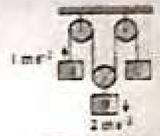
CONCEPT APPLICATION EXERCISE 5.3

1. In the figure, find the acceleration of B, if the acceleration of A is $2\ \text{m s}^{-2}$.

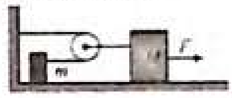
2. The three blocks shown in the figure move with constant velocities. Find the velocity of blocks A and B. Given $v_{P_2} = 10\ \text{ms}^{-1}\downarrow$, $v_C = 2\ \text{ms}^{-1}\uparrow$.



3. For the system as shown in the figure, find the acceleration of C. The acc0elerations of A and B with respect to ground are marked.

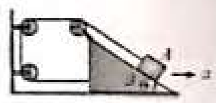


4. Find the acceleration of blocks in the figure. The pulley and the strings are massless.

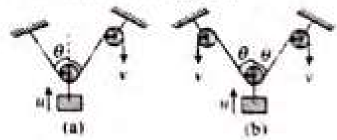


5. A ring A which can slide on a smooth wire is connected to one end of a string as shown in the figure. Other end of the string is connected to a hanging mass B. Find the speed of the ring when the string makes an angle θ with the wire and mass B is going down with a velocity v.

6. Figure shows a block A constrained to slide along the inclined plane of the wedge B shown. Block A is attached with a string which passes through three ideal pulleys and connected to the wedge B. If wedge is pulled toward right with an acceleration a, find
   (a) the acceleration of the block with respect to wedge.
   (b) the acceleration of the block with respect to ground.



7. If the string is inextensible, determine the velocity u of each block in terms of v and θ.



8. Calculate the accelerations of blocks A and B in cases (a), (b), and (c).

SPRING FORCE AND COMBINATIONS OF SPRINGS

In mechanics, we come across the system of bodies connected with springs. For this purpose, we need to develop the ideas how exactly a spring responds to an external force applied on it.

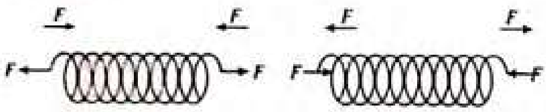
- The force offered by the spring, that is, "spring force" F_s points (acts) opposite to the displacement of the force end of the spring.
- The amount of springs force increase linearly with the deformation (compressi]on or elongation) of the spring; when we plot the variation of F_s versus x, we obtain a straight line up to certain (limited) value of x, which is known as elastic limit.

Robert Hooke experimented in seventh century who put forth all the above facts in a single vector formula in scalar form.

Force ∝ Stretch (or compression), i.e., $F = kx$ (i)

i.e., restoring force is linear. This force in a spring is not constant and depends on stretch (or compression) x. Greater the stretch (or compression), greater will be the force and vice-versa.

k is called the force constant of the spring and is equal to the slope of force versus–stretch curve. It has dimensions $[F/L] = [MT^{-2}]$ and units $\mathrm{N\,m^{-1}}$. Greater the force constant of a spring, lesser will be the stretch (or compression) for a given force and more stiffer is said to be the spring. The force constant k of a spring depends on wire (its length, radius r, and material) used to make the spring, radius of spring R, and length l of spring.



Stretching a spring   Compressing a spring

To produce extension or compression in a spring, two equal and opposite forces are to be applied and in equilibrium restoring force developed due to the elasticity of spring is equal to either force, i.e.,

$F = F'$ and always opposite to applied force.

For small stretch or compression, springs obey Hooke's law.

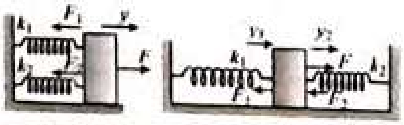
Force Constant of Composite Springs

If a number of springs are connected to a body and we want to produce it to a single spring, following three cases of common interest are possible.

Springs in Parallel

This situation is shown in the figure If the force F pulls the mass m by y, the stretch in each spring will be y.

i.e., $y_1 = y_2 = y$ (i)



Now as for a spring $F = ky$ and as force constants are not equal, so $F_1 \neq F_2$, but for equilibrium,

$$F = F_1 + F_2, \text{ i.e., } k_y = k_1y_1 + k_2y_2 \text{ [as } F = ky]$$

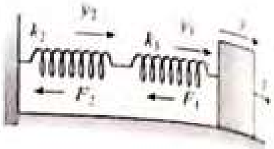
which in the light of (i) reduces to

$$k = k_1 + k_2 + \cdots$$

This is like capacitors in parallel or resistance in series.

Springs in Series

This situation is shown in the figure.



As springs are massless, force in these must be same, i.e.,

$$F = F_2 = F \quad \text{(i)}$$

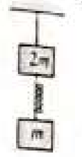
Now as $F = ky$ and force constants are not equal, stretches will not be equal, i.e., $y \neq y_2$.

But, $y = y_1 + y_2$ or $\dfrac{F}{k} = \dfrac{F_1}{k_1} + \dfrac{F_2}{k_2}$

[as for $F = ky$, $y = (F/k)$]

which in the light of Eq. (i) reduces to $\dfrac{1}{k} = \dfrac{1}{k_1} + \dfrac{1}{k_2} + \ldots$

ILLUSTRATION 5.19 Two blocks are connected by a spring. The combination is suspended, at rest, from a string attached to the ceiling, as shown in the figure. The string breaks suddenly.

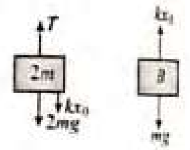


Immediately after the string breaks, what is the initial downward acceleration of the upper block of mass $2m$?

Solution. **Step I:** *Before cutting the string.*

From the force diagram of lower block,

$$kx_0 = mg$$



From the force diagram of upper block,

$$T = 2mg + kx_0$$

Step II: *After cutting the string.*

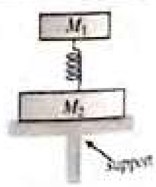
$$2mg + kx_0 = 2ma$$

or $\quad 2mg + mg = 2ma$

or $\quad 3mg = 2ma$

$\therefore \quad a = \dfrac{3}{2}g$

ILLUSTRATION 5.20 The system of two weights with masses M_1 and M_2 are connected with weightless spring as shown in the figure. The system is resting on the support S. Find the acceleration of each of the weights just after the support S is quickly removed.



Solution. The force of spring does not change instantaneously so find spring force at initial instant

Initially, $M_1g = kx$

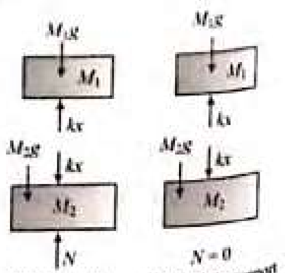
When support is removed, spring force does not change.

For M_1: $M_1g - kx = M_1a_1$

or $\quad a_1 = 0$

For M_2: $M_2g + kx = M_2a_2$

or $\quad a_2 = \dfrac{(M_1 + M_2)g}{M_2}$

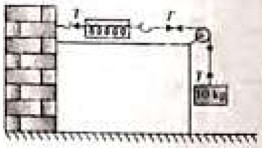


FBD initially   FBD when support is removed

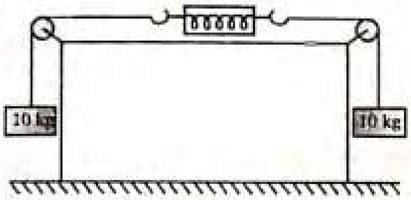
Concept Application Exercise 5.4

1. (a) A 10-kg block is supported by a cord that runs to a spring scale, which is supported by another cord from the ceiling as shown in the figure. What is the reading on the scale?

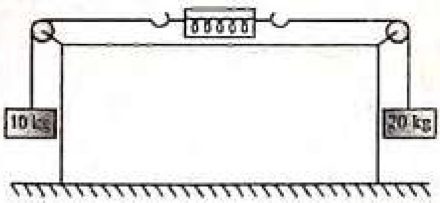
(b) In the figure, the block is supported by a cord that runs around a pulley and to a scale. The opposite end of the scale is attached by a cord to a wall. What is the reading of the scale?



(c) In the figure, the wall has been replaced with a second 10-kg block. What is the reading on the scale now?

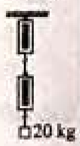


2. What is the reading of the spring balance in the following device?



3. Two blocks A and B of same mass m attached with a light spring are suspended by a string as shown in the figure. Find the acceleration of block A and B just after the string is cut.

4. A block of mass 20 kg is suspended through two light spring balances as shown in the figure. Calculate the:
   (a) reading of spring balance (1).
   (b) reading of spring balance (2).

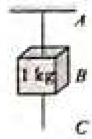


5. Two blocks A and B of same mass m attached with a light string are suspended by a spring as shown in the figure. Find the acceleration of block A and B just after the string is cut..

6. Find the acceleration of 3 kg mass when acceleration of 2 kg mass is 2 m s^{-2} as shown in the figure

Solved Examples

1. A mass of 1 kg is suspended by a string A. Another string C is connected to its lower end (see figure). If a sudden jerk is given to C, then
   (a) the portion AB of the string will break
   (b) the portion BC of the string will break
   (c) none of the strings will break
   (d) the mass will start rotating



Sol. (b) When a sudden jerk is given to C, an impulsive tension exceeding the breaking tension develops in C first, which breaks before this impulse can reach A as a wave through block.

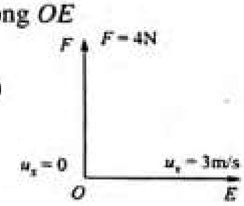
2. In the above question, if the string C is stretched slowly, then
   (a) the portion AB of the string will break
   (b) the portion BC of the string will break
   (c) none of the strings will break
   (d) none of the above

Sol. (a) When the spring C is stretched slowly, the tension in A is greater than that of C. This is due to the weight mg and the former reaches breaking point earlier.

3. A body of mass 2 kg has an initial velocity of 3 meters per second along OE and it is subjected to a force of 4 N in a direction perpendicular to OE. The magnitude of displacement of the body from O after 4 seconds will be
   (a) 12 m (b) 20 m
   (c) 8 m (d) 48 m

Sol. (b) Displacement of body in 4 s along OE

$s_x = v_x t = 3 \times 4 = 12$ m



Force along OF (perpendicular to OE) $= 4$ N

$\therefore \quad a_y = \dfrac{F}{m} = \dfrac{4}{2} = 2$ m/s^2

Displacement of body in 4 s along OF

$\Rightarrow \quad s_y = u_y t + \dfrac{1}{2} a_y t^2 = \dfrac{1}{2} \times 2 \times (4)^2 = 16$ m [As $u_y = 0$]

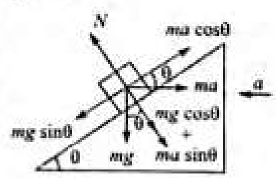
$\therefore \quad$ Net displacement $s = \sqrt{s_x^2 + s_y^2} = \sqrt{(12)^2 + (16)^2} = 20$ m

4. A block of mass m is placed on a smooth wedge of inclination θ. The whole system is accelerated horizontally so that the block does not slip on the wedge. The force exerted by the wedge on the block (g is acceleration due to gravity) will be
   (a) $mg\cos\theta$ (b) $mg\sin\theta$
   (c) mg (d) $mg/\cos\theta$

Sol. (d) When the whole system is accelerated towards left, then pseudo force (ma) works on a block towards right.

For the condition of equilibrium:

$mg\sin\theta = ma\cos\theta$



$\Rightarrow \quad a = \dfrac{g\sin\theta}{\cos\theta}$

Therefore, force exerted by the wedge on the block

$$N = mg\cos\theta + ma\sin\theta$$

$$= mg\cos\theta + m\left(\frac{g\sin\theta}{\cos\theta}\right)\sin\theta$$

$$= \frac{mg(\cos^2\theta+\sin^2\theta)}{\cos\theta} = \frac{mg}{\cos\theta}$$

5. A machine gun fires a bullet of mass 40 g with a velocity 1200 ms^{-1}. The man holding it can exert a maximum force of 144 N on the gun. How many bullets can he fire per second at the most?

(a) One (b) Four
(c) Two (d) Three

Sol. (d) u = Velocity of bullet

$\dfrac{dm}{dt}$ = Mass fired per second by the gun

Mass of bullet (m_B) × Bullets fired per sec (N)

Maximum force that man can exert, $F = u\left(\dfrac{dm}{dt}\right)$

$\therefore \quad F = u \times mB \times N$

$$\Rightarrow \quad N = \frac{F}{m_B \times u} = \frac{144}{40\times10^{-3}\times1200} = 3$$

6. N bullets each of mass m kg are fired with a velocity v ms^{-1} at the rate of n bullets per second upon a wall. The reaction offered by the wall to the bullets is given by

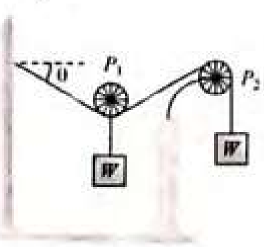
(a) nmv (b) $\dfrac{Nmv}{n}$
(c) $n\dfrac{Nm}{v}$ (d) $n\dfrac{Nv}{m}$

Sol. (a) Total mass of bullets = Nm, time $t = \dfrac{N}{n}$

Momentum of the bullets striking the wall = Nmv

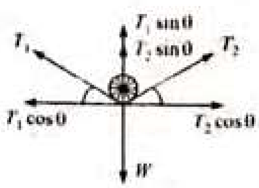
Rate of change of momentum (Force) = $\dfrac{Nmv}{t} = nmv$.

7. In the following diagram, pulley P_1 is movable and pulley P_2 is fixed. The value of angle θ will be



(a) 60°
(b) 30°
(c) 45°
(d) 15°

Sol. (b) From free body diagram of pulley P_1



At the pulley is in equilibrium, considering horizontal direction

For horizontal equilibrium,

$$T_1\cos\theta = T_2\cos\theta$$

$\Rightarrow \quad T_1 = T_2$ and $T_1 = T_2 = W$ ...(i)

Now considering for vertical equilibrium

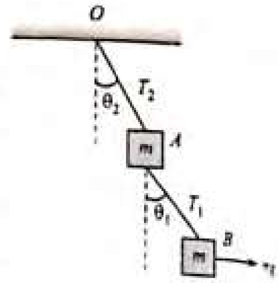
$$T_1\sin\theta + T_2\sin\theta = W \quad ...(ii)$$

From (i) & (ii), we get

$$W\sin\theta + W\sin\theta = W$$

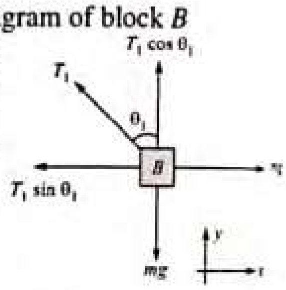
$\therefore \quad \sin\theta = \dfrac{1}{2}$ or $\theta = 30°$

8. In the following figure the masses of the blocks A and B are same and each equal to m. The tensions in the strings OA and AB are T_2 and T_1, respectively. The system is in equilibrium with a constant horizontal force mg on B. Then T_1 is



(a) mg (b) $\sqrt{2}\,mg$
(c) $\sqrt{3}\,mg$ (d) $\sqrt{5}\,mg$

Sol. (b) Considering free body diagram of block B



$\Sigma F_x = 0;\ T_1\cos\theta_1 = mg$ (i)

$\Sigma F_y = 0;\ T_1\cos\theta_1 = -mg$ (ii)

By squaring and adding equations (i) & (ii), we get

$$T_1^2(\sin^2\theta_1 + \cos^2\theta_1) = 2(mg)^2$$

$\therefore \ T_1 = \sqrt{2}mg$

9. In the previous problem, the angle θ_1 is

(a) 30° (b) 45°
(c) 60° (d) $\tan^{-1}\left(\dfrac{1}{2}\right)$

Sol. (b) From the solution of previous problem, if we divide equation(ii) by equation (i), we get

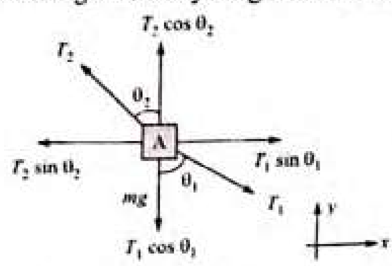
$$\frac{T_1\sin\theta_1}{T_1\cos\theta_1} = \frac{mg}{mg}$$

$\therefore \quad \tan\theta_1 = 1$ or $\theta_1 = 45°$

10. In the above question, tension T_2 will be

(a) mg (b) $\sqrt{2}\,mg$
(c) $\sqrt{3}\,mg$ (d) $\sqrt{5}\,mg$

Sol. (d) Considering free body diagram of block A



$\Sigma F_y = 0$; in vertical direction,

$$T_2\cos\theta_2 = mg + T_1\cos\theta_1$$

$$T_2\cos\theta_2 = mg + \sqrt{2}mg\cos45° \quad ....(i)$$

$$T_2\cos\theta_2 = 2mg$$

In horizontal direction $\Sigma F_x = 0$

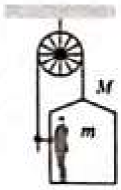
$$T_2 \sin\theta_2 = T_1 \sin\theta_1 = \sqrt{2}mg\sin 45^\circ$$

$$T_2 \sin\theta_2 = mg \quad \text{.....(ii)}$$

by squaring and adding (i) and (ii) equilibrium

$$T_2^2 = 5(mg)^2 \text{ or } T_2 = \sqrt{5}mg$$

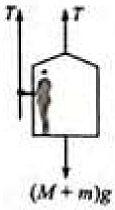
11. A man of mass m stands on a crate of mass M. He pulls on a light rope passing over a smooth light pulley. The other end of the rope is attached to the crate. For the system to be in equilibrium, the force exerted by the men on the rope will be



(a) $(M+m)g$ (b) $\frac{1}{2}(M+m)g$

(c) Mg (d) mg

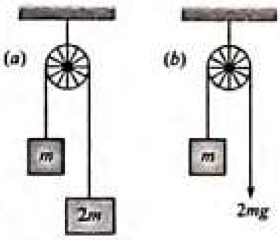
Sol. (b) Considering free body diagram of man and crate system in vertical direction.



$$2T = (M+m)g$$

$$\therefore \quad T = \frac{(M+m)g}{2}$$

12. The two pulley arrangements shown in the figure are identical. The mass of the rope is negligible. In (a) the mass m is lifted up by attaching a mass $2m$ to the other end of the rope. In (b), m is lifted up by pulling the other end of the rope with a constant downward force of $2mg$. The ratio of accelerations in two cases will be

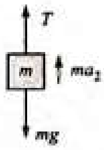


(a) 1 : 1 (b) 1 : 2

(c) 1 : 3 (d) 1 : 4

Sol. (c) For first case,

$$a_1 = \frac{m_2 - m_1}{m_1 + m_2} g = \frac{2m - m}{m + 2m} = \frac{g}{3} \quad \text{.....(i)}$$



For second case,

From free body diagram of m,

$$ma_2 = T - mg$$

$$ma_2 = 2mg - mg \quad [\text{As } T = 2mg]$$

$$a_2 = g \quad \text{........(ii)}$$

From (i) and (ii), $\frac{a_1}{a_2} = \frac{g/3}{g} = 1/3$

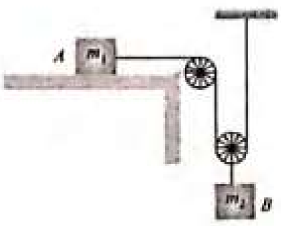
13. The acceleration of block B in the figure will be

(a) $\frac{m_2 g}{(4m_1 + m_2)}$

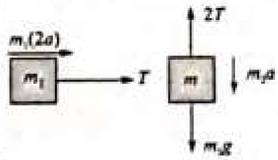
(b) $\frac{2m_2 g}{(4m_1 + m_2)}$

(c) $\frac{2m_1 g}{(m_1 + 4m_2)}$

(d) $\frac{2m_1 g}{(m_1 + m_2)}$



Sol. (a) When block m_2 moves downward with acceleration a, the acceleration of mass m_1 will be $2a$ because it covers double distance in the same time in comparison to m_2.



Let T be the tension in the string.

By drawing the free body diagram of A and B,

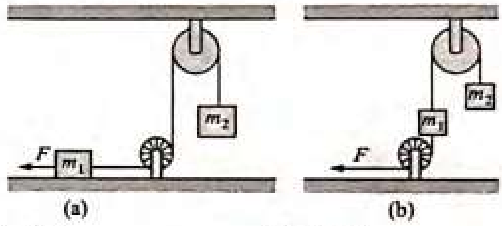
$$T = m_1\, 2a \quad \text{...(i)}$$

$$m_2 g - 2T = m_2 a \quad \text{...(ii)}$$

By solving (i) and (ii),

$$a = \frac{M_2 g}{(4m_1 + m_2)}$$

14. The ratio of tensions in the string connected to the block of mass m_2 in Figure (a) and Figure (b) respectively, is (friction is absent everywhere): [$m_1 = 50$ kg, $m_2 = 80$ kg and $F = 1000$ N].



(a) 7 : 2 (b) 2 : 7

(c) 3 : 4 (d) 4 : 3

Sol. (c) In Figure (a): Let tension in the string is T_1

$$F - T_1 = m_1 a$$

$$\Rightarrow \quad 1000 - T_1 = 50a \quad \text{(i)}$$

$$T_1 - m_2 g = m_2 a$$

$$\Rightarrow \quad T_1 - 80g = 80a \quad \text{(ii)}$$

From (i) and (ii) $T_1 = \frac{12000}{13}$ N

In Figure (b): Let tension in the string is T_2.

$$F + m_1 g - T_2 = m_1 a$$

$$\Rightarrow \quad 1000 + 50g - T_2 = 50a \quad \text{(iii)}$$

$$T_2 - 80g = 80a$$

$$T_2 - 80g = 80a \quad \text{(iv)}$$

From (iii) and (iv),

$$T_2 = \frac{16000}{13}\text{N} \Rightarrow \frac{T_1}{T_2} = \frac{12000}{16000} = \frac{3}{4}$$

15. Five forces $\vec{F}_1, \vec{F}_2, \vec{F}_3, \vec{F}_4$ and $\vec{F}_5$ are acting on a particle of mass 2.0 kg so that it is moving with 4 m/s^2 in east direction. If $\vec{F}_1$ force is removed, then the acceleration becomes 7 m/s^2 in north, then the acceleration of the block if only $\vec{F}_1$ is acting will be

(a) 16 m/s^2 (b) $\sqrt{65}$ m/s^2

(c) $\sqrt{260}$ m/s^2 (d) $\sqrt{33}$ m/s^2

Sol. (b) $\vec{F}_1 + \vec{F}_2 + \vec{F}_3 + \vec{F}_4 + \vec{F}_5 = 2(4\hat{i})$ (i)

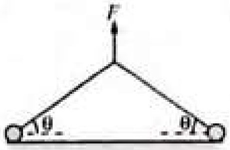
and $\vec{F}_2 + \vec{F}_3 + \vec{F}_4 + \vec{F}_5 = 2(7\hat{j})$ (ii)

From (i) and (ii), $\vec{F}_1 = 8\hat{i} - 14\hat{j}$

$$\vec{a}_1 = \frac{\vec{F}_1}{m} = 4\hat{i} - 7\hat{j}$$

$\Rightarrow$ $a_1 = \sqrt{16+49} = \sqrt{65}$ m/s^2

16. Two small spheres each of mass m connected by a string of length $2l$ are kept on a smooth horizontal surface. A vertical force F is applied at the middle of the string. What is maximum value of F for which the spheres do not lose contact with the surface?



(a) $2mg$ (b) mg

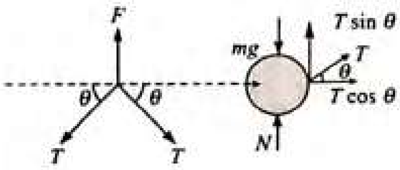
(c) $\frac{3mg}{2}$ (d) $4mg$

Sol. (a) $F = 2T\sin\theta$ or $T\sin\theta = \frac{F}{2}$ ...(i)

$T\sin\theta + N = mg$

$\Rightarrow$ $N = mg - T\sin\theta$ ...(ii)

For no loss of contact:



$N > 0$

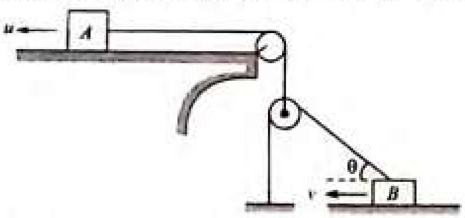
$\Rightarrow$ $mg - T\sin\theta > 0$

$\Rightarrow$ $mg - \frac{F}{2} > 0$

$\Rightarrow$ $F < 2mg$

So $F_{max} = 2mg$

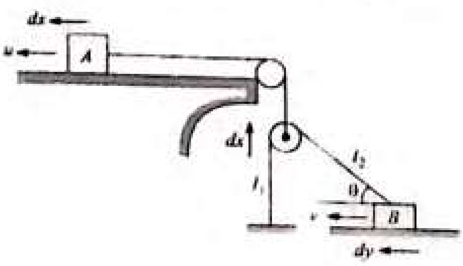
17. In figure, lower pulley is free to move in vertical direction only. Block A is given a uniform velocity u as shown, what is velocity of block B as a function of angle θ.



(a) $u\cos\theta$ (b) $\frac{u}{\cos\theta}$

(c) $\frac{u[1+\sin\theta]}{\cos\theta}$ (d) $\frac{u[1+\cos\theta]}{\sin\theta}$

Sol. (c)



Let in a small time dt, displacement of A is dx and displacement of B is dy. Increase in length $l_1 = dx$.

Increase in length $l_2 = dx\sin\theta - dy\cos\theta$

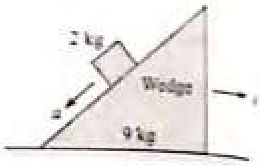
But net increase in length should be zero, so

$dx + dx\sin\theta - dy\cos\theta = 0$

$$\Rightarrow \quad dy = \frac{(1+\sin\theta)dx}{\cos\theta}$$

$$\Rightarrow \quad \frac{dy}{dt} = \left(\frac{1+\sin\theta}{\cos\theta}\right)\frac{dx}{dt} \Rightarrow v = \left(\frac{1+\sin\theta}{\cos\theta}\right)u$$

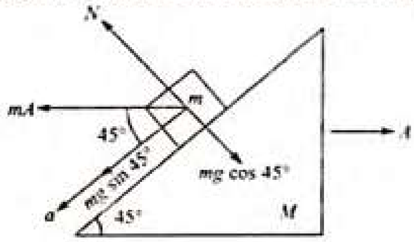
18. A block of mass 2 kg slides down the face of a smooth 45° wedge of mass 9 kg as shown in the figure. The wedge is placed on a frictionless horizontal surface. Determine the acceleration of the wedge.



(a) 2 m/s^2 (b) $\frac{11}{\sqrt{2}}$ m/s^2

(c) 1 m/s^2 (d) none of these

Sol. (c) Suppose a is the acceleration of block w.r.t. wedge.



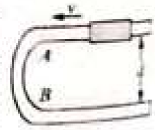
For block:

$N + mA\sin 45° = mg\cos 45°$ (i)

For wedge: $N\sin 45° = mA$ (ii)

From (i) and (ii) $A = 1$ m/s^2

19. A U-shaped wire has a rough semicircular bending between A and B as shown in the figure. A bead of mass m moving with uniform speed v through the wire enters the semicircular bend at A and leaves at B with velocity $v/2$ after time T. The average force, exerted by the bead on the part AB of the wire is



(a) $\frac{mv}{2T}$ (b) $\frac{3mv}{2T}$

(c) $\frac{3mv}{T}$ (d) None of these

Sol. (b) The momentum of the bead at A is $\vec{p}_i = -mv\hat{i}$

The momentum of the bead at B $\vec{p}_f = (mv/2)\hat{i}$

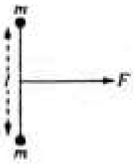
Therefore, the magnitude of the change in momentum between A and B is

$$\Delta p = |\vec{p}_f - \vec{p}_i| = (3/2)mv$$

Average force exerted by the bead on the wire is

$$F_{av} = \frac{\Delta p}{\Delta t} = \frac{3mv}{2T}$$

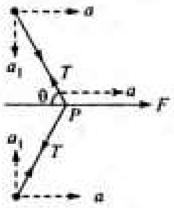
20. Two identical small masses each of mass m are connected by a light inextensible string on a smooth horizontal floor. A constant force F is applied at the mid point of the string as shown in the figure. The acceleration of each mass towards each other is,



(a) $\dfrac{F}{2\sqrt{3}m}$ (b) $\dfrac{\sqrt{3}F}{2m}$

(c) $\dfrac{2}{\sqrt{3}}\dfrac{F}{m}$ (d) None of these

Sol. (a) Let the tension in the string be T at any angular position θ, the acceleration of each ball along x and y axes be a and a_1 respectively. Writing the equation of motion of m, we obtain



$$\Sigma F_x = ma$$

$$\Rightarrow \quad T\cos\theta = ma \qquad \text{...(1)}$$

$$\Sigma F_y = ma_1$$

$$\Rightarrow \quad T\sin\theta = ma_1 \qquad \text{...(2)}$$

At point P, as it is accelerating with an acceleration a, therefore $F - 2T\cos\theta = m_p a$ where m_p = mass of the string at the point $P \cong 0$

$$\Rightarrow \quad F = 2T\,\text{sos}\theta \qquad \text{...(3)}$$

$$(2) \div (1) \Rightarrow \quad \tan\theta = \frac{a_1}{a}$$

$$\Rightarrow \quad a_1 = a\tan\theta$$

where $a = \dfrac{T\,cos\theta}{m}$ from (1).

Putting $T = \dfrac{F}{2\,cos\theta}$, from (3), we obtain

$$a_1 = \frac{F}{2m}\tan\theta$$

Putting $\theta = 30° \Rightarrow a_1 = \dfrac{F}{2\sqrt{3}m}$

EXERCISES

Problems Based on Basic Concept of Projectile Motion

1. Two skaters have weight in the ratio 4 : 5 and are 9 m apart, on a smooth frictionless surface. They pull on a rope stretched between them. The ratio of the distance covered by them when they meet each other will be

(a) 5 : 4 (b) 4 : 5 (c) 25 : 16 (d) 16 : 25

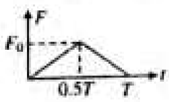
2. Three forces are acting on a particle of mass m initially in equilibrium. If the first two forces (R_1 and R_2) are perpendicular to each other and suddenly the third force (R_3) is removed, then the acceleration of the particle is

(a) $\dfrac{R_3}{m}$ (b) $\dfrac{R_1+R_2}{m}$ (c) $\dfrac{R_1-R_2}{m}$ (d) $\dfrac{R_1}{m}$

3. n balls each of mass m impinge elastically each second on a surface with velocity u. The average force experienced by the surface will be

(a) mnu (b) 2 mnu (c) 4 mnu (d) $mnu/2$

4. A ball of mass m moving with a velocity u rebounds from a wall. The collision is assumed to be elastic and the force of interaction between the ball and wall varies as shown in the figure. Then the value of F_0 is



(a) mu/T (b) $2\,mu/T$ (c) $4\,mu/T$ (d) $mu/2\,T$

5. A rope is stretched between two boats at rest. A sailor in the first boat pulls the rope with a constant force of 100 N. First boat with the sailor has a mass of 250 kg whereas the mass of second boat is double of this mass. If the initial distance between the boats was 120 m, the time taken for two boats to meet each other is (neglect water resistance between boats and water)

(a) 15 s (b) 20 s (c) 5 s (d) 30 s

6. A particle of mass 2 kg moves with an initial velocity of $\vec{v} = 4\hat{i} + 4\hat{j}$ m s^{-1}. A constant force of $\vec{F} = 20\,\hat{j}$ N is applied on the particle. Initially, the particle was at (0, 0). The x-coordinate of the particle when its y-coordinate again becomes zero is given by

(a) 1.2 m (b) 4.8 m (c) 6.0 m (d) 3.2 m

7. A block of metal weighing 2 kg is resting on a frictionless plane. It is struck by a jet releasing water at a rate of 1 kg s^{-1} and at a speed of 5 m s^{-1}. The initial acceleration of the block is

(a) $\dfrac{5}{3}$ m s^{-2} (b) $\dfrac{25}{4}$ m s^{-2}

(c) $\dfrac{26}{6}$ m s^{-2} (d) $\dfrac{5}{2}$ m s^{-2}

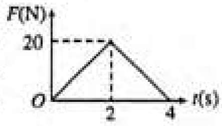
8. A wooden box is placed on a table. The normal force on the box from the table is N_1. Now another identical box is kept on first box and the normal force on lower block due to upper block is N_2 and normal force on lower block by the table is N_3. For this situation, mark out the correct statement(s).

(a) $N_1 = N_2 = N_3$ (b) $N_1 < N_2 = N_3$

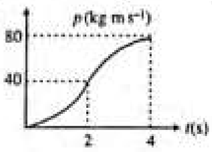
(c) $N_1 = N_2 < N_3$ (d) $N_1 = N_2 > N_3$

9. A particle of mass 2 kg moves with an initial velocity of $(4\hat{i}+2\hat{j})\ \text{m s}^{-1}$ on the x-y plane. A force $\vec{F}=(2\hat{i}-8\hat{j})$ N acts on the particle. The initial position of the particle is (2 m, 3 m). Then for $y = 3$ m,
   (a) Possible value of x is only $x = 2$ m
   (b) Possible value of x is not only $x = 2$ m, but there exists some other value of x also
   (c) Time taken is 2 s
   (d) All of the above

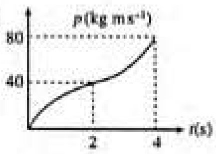
10. Figure shows the variation of force acting on a body with time. Assuming the body to start from rest, the variation of its momentum with time is best represented by which plot?



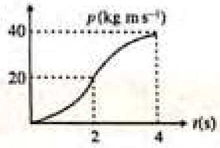
(a)



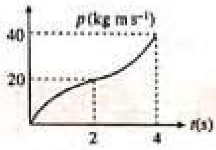
(b)



(c)



(d)



11. A particle is moving in the x-y plane. At certain instant of time, the components of its velocity and acceleration are as follows: $v_x = 3\ \text{m s}^{-1}$, $v_y = 4\ \text{m s}^{-1}$, $a_x = 2\ \text{m s}^{-2}$ and $a_y = 1\ \text{m s}^{-2}$. The rate of change of speed at this moment is
   (a) $\sqrt{10}\ \text{m s}^{-2}$ (b) $4\ \text{m s}^{-2}$
   (c) $\sqrt{5}\ \text{m s}^{-2}$ (d) $2\ \text{m s}^{-2}$

12. A machine gun is mounted on a 2000 kg car on a horizontal frictionless surface. At some instant the gun fires bullets of mass 10 gm with a velocity of 500 m/sec with respect to the car. The number of bullets fired per second is ten. The average thrust on the system is
   (a) 550 N (b) 50 N
   (c) 250 N (d) 250 dyne

13. A body of mass 2 kg has an initial velocity of 3 meters per second along OE and it is subjected to a force of 4 N in a direction perpendicular to OE. The distance of the body from O after 4 seconds will be
   (a) 12 m (b) 20 m
   (c) 8 m (d) 48 m

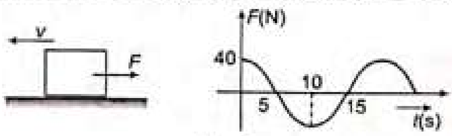
14. A particle moves in the xy-plane under the action of a force F such that the components of its linear momentum p at any time t are $p_x = 2\cos t$, $p_y = 2\sin t$. The angle between F and p at time t is
   (a) 90° (b) 0°
   (c) 180° (d) 30°

15. A body A of mass m_1 exerts a force on another body B of mass m_2. If the acceleration of B be a_2, then the acceleration (in magnitude) of A is
   (a) $\dfrac{m_2}{m_1}a_2$ (b) $\dfrac{m_1}{(m_1+m_2)}$
   (c) $\dfrac{m_1}{m_2}a_2$ (d) $\dfrac{(m_1+m_2)}{m_1}$

16. Five forces $\vec{F}_1, \vec{F}_2, \vec{F}_3, \vec{F}_4$ and $\vec{F}_5$ are acting on a particle of mass 2.0 kg so that it is moving with 4 m/s^2 in east direction. If $\vec{F}_1$ force is removed, then the acceleration becomes 7 m/s^2 in north, then the acceleration of the block if only $\vec{F}_1$ is acting will be
   (a) 16 m/s^2 (b) $\sqrt{65}$ m/s
   (c) $\sqrt{260}$ m/s^2 (d) $\sqrt{33}$ m/s^2

17. Five persons A, B, C, D and E are pulling a cart of mass 100 kg on a smooth surface and cart is moving with acceleration 3 m/s^2 in east direction. When person A stops pulling, it moves with acceleration 1 m/s^2 in the west direction. When person B stops pulling, it moves with acceleration 24 m/s^2 in the north direction. The magnitude of acceleration of the cart when only A and B pull the cart keeping their directions same as the old directions, is
   (a) 26 m/s^2 (b) $3\sqrt{71}$ m/s^2
   (c) 25 m/s^2 (d) 30 m/s^2

18. A 15 kg block is initially moving along a smooth horizontal surface with a speed of $v = 4$ m/s to the left. It is acted by a force F, which varies in the manner shown. Determine the velocity of the block at $t = 15$ seconds.



Given that, $F = 40\cos\left(\dfrac{\pi}{10}\right)t$
   (a) 12.5 m/s (b) 8.5 m/s
   (c) 20 m/s (d) 9.5 m/s

Application of Newton's Laws of Motion in Base Situations

19. In order to raise a mass of 100 kg, a man of mass 60 kg fastens a rope to it and passes the rope over a smooth pulley. He climbs the rope with acceleration $5g/4$ relative to the rope. The tension in the rope is (take $g = 10\ \text{m s}^{-2}$)

   (a) $\dfrac{4875}{8}$ N (b) $\dfrac{4875}{2}$ N
   (c) $\dfrac{4875}{4}$ N (d) $\dfrac{4875}{6}$ N

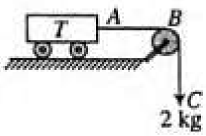
20. A plumb bob is hung from the ceiling of a train compartment. The train moves on an inclined track of inclination 30° with horizontal. The acceleration of train up the plane is $a = g/2$. The angle which the string supporting the bob makes with normal to the ceiling in equilibrium is

(a) 30° (b) $\tan^{-1}(2/\sqrt{3})$
(c) $\tan^{-1}(\sqrt{3}/2)$ (d) $\tan^{-1}(2)$

21. A balloon of mass M is descending at a constant acceleration a. When a mass m is released from the balloon, it starts rising with the same acceleration a. Assuming that its volume does not change, what is the value of m?

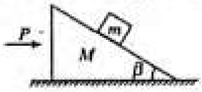
(a) $\dfrac{a}{a+g}M$ (b) $\dfrac{2a}{a+g}M$
(c) $\dfrac{a+g}{a}M$ (d) $\dfrac{a+g}{2a}M$

22. A trolley T of mass 5 kg on a horizontal smooth surface is pulled by a load of 2 kg through a uniform rope ABC of length 2 m and mass 1 kg. As the load falls from $BC = 0$ to $BC = 2$ m, its acceleration (in $m s^{-2}$) changes from



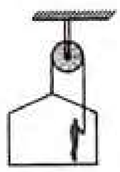
(a) $\dfrac{20}{6}$ to $\dfrac{30}{6}$ (b) $\dfrac{20}{8}$ to $\dfrac{30}{8}$
(c) $\dfrac{20}{5}$ to $\dfrac{30}{6}$ (d) None of these

23. Two wooden blocks are moving on a smooth horizontal surface such that the mass m remains stationary with respect to the block of mass M as shown in the figure. The magnitude of force P is



(a) $(M+m)g \tan\beta$ (b) $g \tan\beta$
(c) $mg \cos\beta$ (d) $(M+m)g \operatorname{cosec}\beta$

24. A man is raising himself and the crate on which he stands with an acceleration of $5\ m s^{-2}$ by a massless rope-and-pulley arrangement. Mass of the man is 100 kg and that of the crate is 50 kg. If $g = 10\ m s^{-2}$, then the tension in the rope is

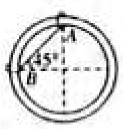


(a) 2250 N (b) 1125 N (c) 750 N (d) 375 N

25. In the above problem, the contact force between the man and the crate is

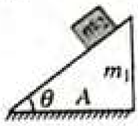
(a) 2250 N (b) 1125 N (c) 750 N (d) 375 N

26. Two objects A and B, each of mass m, are connected by a light inextensible string. They are restricted to move on a frictionless ring of radius R in a vertical plane (as shown in the figure). The objects are released from rest at the position shown. Then the tension in the cord just after release is



(a) Zero (b) mg (c) $\sqrt{2}\,mg$ (d) $mg/\sqrt{2}$

27. In the figure, the mass m_2 starts with velocity v_0 and moves with constant velocity on the surface. During motion, the normal reaction between the horizontal surface and fixed triangle block m_1 is N. Then during motion

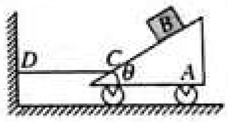


(a) $N = (m_1 + m_2)g$ (b) $N = m_1 g$
(c) $N < (m_1 + m_2)g$ (d) $N > (m_1 + m_2)g$

28. A lift is moving down with an acceleration a. A man in the lift drops a ball inside the lift. The acceleration of the ball as observed by the man in the lift, and a man standing stationary on the ground are, respectively,

(a) a, g (b) $(g-a), g$ (c) a, a (d) g, g

29. Block B has mass m and is released from rest when it is on top of wedge A, which has a mass $3m$. Determine the tension in cord CD needed to hold the wedge from moving while B is sliding down A. Neglect friction.



(a) $2\,mg\cos\theta$ (b) $\dfrac{mg}{2}\cos\theta$
(c) $\dfrac{mg}{2}\sin 2\theta$ (d) $mg\sin 2\theta$

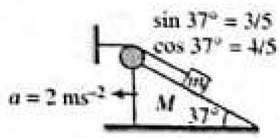
30. Three blocks A, B, and C are suspended as shown in the figure. Mass of each of blocks A and B is m. If the system is in equilibrium, and mass of C is M, then

(a) $M > 2m$ (b) $M = 2m$
(c) $M < 2m$ (d) None of these

31. An object is suspended from a spring balance in a lift. The reading is 240 N when the lift is at rest. If the spring balance reading now changes to 220 N, then the lift is moving

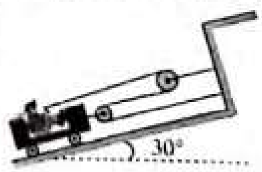
(a) Downward with constant speed
(b) Downward with decreasing speed
(c) Downward with increasing speed
(d) Upward with increasing speed

32. As shown in the figure, if acceleration of M with respect to ground is $2\ m s^{-2}$, then



(a) Acceleration of m with respect to M is $5\ m s^{-2}$.
(b) Acceleration of m with respect to ground is $5\ m s^{-2}$
(c) Acceleration of m with respect M is $2\ m s^{-2}$
(d) Acceleration of m with respect to ground is $10\ m s^{-2}$.

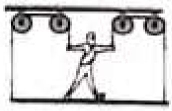
33. A man pulls himself up the 30° incline by the method shown in the figure. If the combined mass of the man and cart is 100 kg, determine the acceleration of



the cart if the man exerts a pull of 250 N on the rope. Neglect all friction and the mass of the rope, pulleys, and wheels.

(a) $4.5\ ms^{-2}$ (b) $2.5\ ms^{-2}$ (c) $3.5\ ms^{-2}$ (d) $1.5\ ms^{-2}$

34. A painter of mass M stands on a platform of mass m and pulls himself up by two ropes which hang over pulley as shown in the figure. He pulls each rope with force F and moves upward with a uniform acceleration a. Find a, neglecting the fact that no one could do this for long time.



(a) $\dfrac{4F+(2M+m)g}{M+2m}$ (b) $\dfrac{4F+(M+m)g}{M+2m}$

(c) $\dfrac{4F-(M+m)g}{M+m}$ (d) $\dfrac{4F-(M+m)g}{2M+m}$

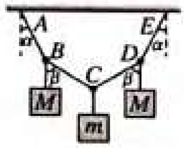
35. A block is lying on the horizontal frictionless surface. One end of a uniform rope is fixed to the block which is pulled in the horizontal direction by applying a force F at the other end. If the mass of the rope is half the mass of the block, the tension in the middle of the rope will be

(a) F (b) $2\ F/3$ (c) $3\ F/5$ (d) $5\ F/6$

36. A 60-kg man stands on a spring scale in a lift. At some instant, he finds that the scale reading has changed from 60 kg to 50 kg for a while and then comes back to original mark. What should be concluded?

(a) The lift was in constant motion upward.
(b) The lift was in constant motion downward.
(c) The lift while in motion downward suddenly stopped.
(d) The lift while in motion upward suddenly stopped.

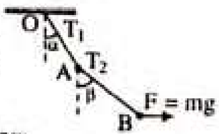
37. Figure represents a light inextensible string $ABCDE$ in which $AB = BC = CD = DE$ and to which are attached masses M, m, and M at the points B, C, and D, respectively.



The system hangs freely in equilibrium with ends A and E of the string fixed in the same horizontal line. It is given that $\tan\alpha = 3/4$ and $\tan\beta = 12/5$. Then the tension in the string BC is

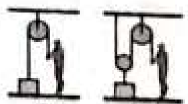
(a) $2\ mg$ (b) $(13/10)\ mg$
(c) $(3/10)\ mg$ (d) $(20/11)\ mg$

38. Two particles A and B, each of mass m, are kept stationary by applying a horizontal force $F = mg$ on particle B as shown in the figure. Then



(a) $2\tan\beta = \tan\alpha$ (b) $2T_1 = 5T_2$
(c) $T_1\sqrt{2} = T_2\sqrt{5}$ (d) None of these

39. In the figure, a person wants to rise a block lying on the ground to a height h. In both the cases, if the time required is same, then in which case he has to exert more force? Assume pulleys and strings light.

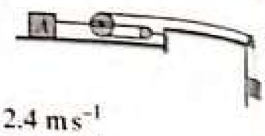


(i) (ii)

(a) (i) (b) (ii)
(c) Same in both (d) Cannot be determined

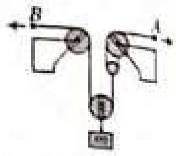
Problems Based on Constraint Relation

40. A block A has a velocity of $0.6\ ms^{-1}$ to the right. Determine the velocity of cylinder B.



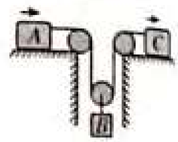
(a) $1.2\ ms^{-1}$ (b) $2.4\ ms^{-1}$
(c) $1.8\ ms^{-1}$ (d) $3.6\ ms^{-1}$

41. For the pulley system shown in the figure, each of the cables at A and B is given a velocity of $2\ ms^{-1}$ in the direction of the arrow. Determine the upward velocity v of the load m.



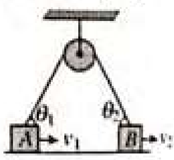
(a) $1.5\ ms^{-1}$ (b) $3\ ms^{-1}$ (c) $6\ ms^{-1}$ (d) $4.5\ ms^{-1}$

42. Blocks A and C start from rest and move to the right with acceleration $a_A = 12t\ ms^{-2}$ and $a_C = 3\ ms^{-2}$. Here t is in seconds. The time when block B again comes to rest is



(a) 2 s (b) 1 s (c) 3/2 s (d) 1/2 s

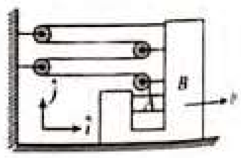
43. In the figure, blocks A and B move with velocities v_1 and v_2 along horizontal direction. Find the ratio of v_1/v_2.



(a) $\dfrac{\sin\theta_1}{\sin\theta_2}$ (b) $\dfrac{\sin\theta_2}{\sin\theta_1}$

(c) $\dfrac{\cos\theta_2}{\cos\theta_1}$ (d) $\dfrac{\cos\theta_1}{\cos\theta_2}$

44. If block B moves towards right with acceleration b, find the net acceleration of block A.



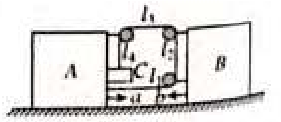
(a) $b\hat{i} + 4b\hat{j}$

(b) $b\hat{i} + b\hat{j}$

(c) $b\hat{i} + 2b\hat{j}$

(d) None of these

45. If the blocks A and B are moving towards each other with accelerations a and b as shown in the figure, find the net acceleration of block C.



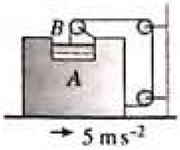
(a) $a\hat{i} - 2(a+b)\hat{j}$ (b) $-(a+b)\hat{j}$

(c) $a\hat{i} - (a+b)\hat{j}$ (d) None of these

46. In the following arrangement, the system is initially at rest. The 5-kg block is now released. Assuming the pulleys and string to be massless and smooth, the acceleration of block C will be

(a) Zero (b) 2.5 ms^{-2}
(c) $10/7 \text{ ms}^{-2}$ (d) $5/7 \text{ ms}^{-2}$

47. If block A is moving with an acceleration of 5 ms^{-2}, the acceleration of B w.r.t ground is

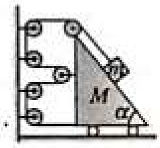


(a) 5 ms^{-2}
(b) $5\sqrt{2} \text{ ms}^{-2}$
(c) $5\sqrt{5} \text{ ms}^{-2}$
(d) 10 ms^{-2}

48. In the arrangement shown in the figure, if the acceleration of B is $\vec{a}$, then find the acceleration of A.

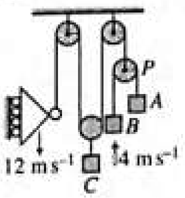
(a) $a \sin \alpha$
(b) $a \cot \theta$
(c) $a \tan \theta$
(d) $a(\sin \alpha \cot \theta + \cos \alpha)$

49. If the acceleration of wedge in the shown arrangement is $a \text{ ms}^{-2}$ towards left, then at this instant, acceleration of the block (magnitude only) would be



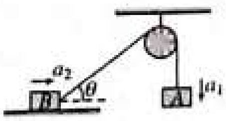
(a) $4a \text{ ms}^{-2}$
(b) $a\sqrt{17 - 8\cos\alpha} \text{ ms}^{-2}$
(c) $(\sqrt{17})a \text{ ms}^{-2}$
(d) $\sqrt{17} \cos\frac{\alpha}{2} \times a \text{ ms}^{-2}$

50. In the arrangement shown in the figure at a particular instant, the roller is coming down with a speed of 12 ms^{-1} and C is moving up with 4 ms^{-1}. At the same instant, it is also known that w.r.t. pulley P, block A is moving down with speed 3 ms^{-1}. Determine the motion of block B (velocity) w.r.t. ground.



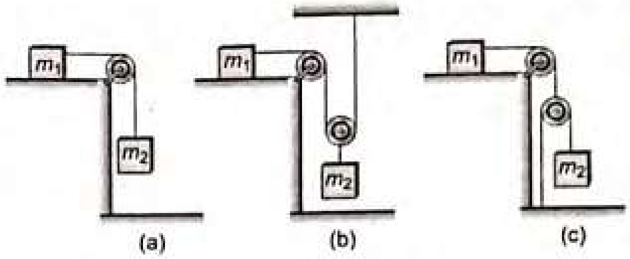
(a) 4 ms^{-1} in downward direction
(b) 3 ms^{-1} in upward direction
(c) 7 ms^{-1} in downward direction
(d) 7 ms^{-1} in upward direction

51. Figure shows two blocks, each of mass m. The system is released from rest. If accelerations of blocks A and B at any instant (not initially) are a_1 and a_2, respectively, then



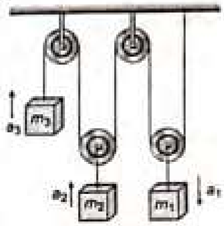
(a) $a_1 = a_2 \cos\theta$ (b) $a_2 = a_1 \cos\theta$
(c) $a_1 = a_2$ (d) None of these

52. In each of the three arrangements, the block of mass m_1 is being pulled left with constant velocity. There is no friction anywhere. The strings are light and inextensible and pulleys are massless. The ratio of the speed of the block of mass m_2 in the three cases respectively is:



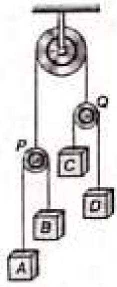
(a) $2:1:4$ (b) $2:4:1$
(c) $4:2:1$ (d) Cannot be calculated

53. If the blocks are moving as shown in the figure the relation between a_1, a_2 and a_3 will be



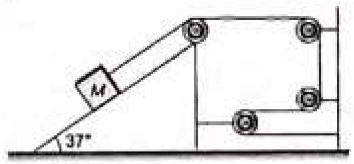
(a) $2a_1 + 2a_2 + a_3 = 0$
(b) $2a_1 - 2a_2 + a_3 = 0$
(c) $2a_1 - 2a_2 - a_3 = 0$
(d) $2a_2 - 2a_1 + a_3 = 0$

54. In the figure acceleration of A is 1 m/s^2 upwards, acceleration of B is 7 m/s^2 upwards and acceleration of C is 2 m/s^2 upwards. The acceleration of D will be



(a) 7 m/s^2 downwards
(b) 2 m/s^2 downwards
(c) 10 m/s^2 downwards
(d) 8 m/s^2 downwards

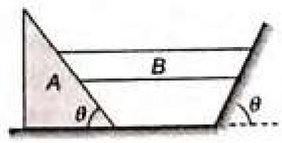
55. A block of mass m and wedge M is arranged as shown in the figure.



Initially the system is kept stationary, certain time system is released from rest. If acceleration of M is found to be $A = \sqrt{5} \text{ m/s}^2$ towards right, then find net acceleration of m with respect to ground

(a) $2\sqrt{5} \text{ m/s}^2$ (b) 3 m/s^2
(c) $3\sqrt{5} \text{ m/s}^2$ (d) none of these

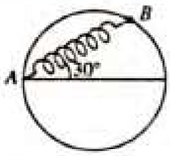
56. In the situation as shown in figure if acceleration of B is a then find the acceleration of A (B always remains horizontal)



(a) $a \sin\theta$ (b) $a \cot\theta$
(c) $2a \tan\theta$ (d) $2a \cos\theta$

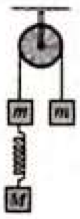
Kinematics of Circular Motion

57. A bead of mass m is attached to one end of a spring of natural length R and spring constant $k = \frac{(\sqrt{3}+1)mg}{R}$. The other end of the spring is fixed at a point A on a smooth vertical ring of radius R as shown in the figure. The normal reaction at B just after it is released to move is



(a) $mg/2$ (b) $\sqrt{3}\,mg$ (c) $3\sqrt{3}\,mg$ (d) $\frac{3\sqrt{3}\,mg}{2}$

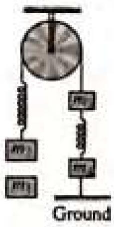
58. The system shown in the figure is released from rest. The spring gets elongated



(a) If $M > m$ (b) If $M > 2m$
(c) If $M > m/2$ (d) For any value of M

(Neglect the friction and masses of pulley, string, and spring.)

59. For the system shown in the figure, $m_1 > m_2 > m_3 > m_4$. Initially, the system is at rest in equilibrium condition. If the string joining m_4 and ground is cut, then just after the string is cut.



Statement I: m_1, m_2, m_3 remain stationary.
Statement II: The value of acceleration of all the four blocks can be determined.
Statement III: Only m_4 remains stationary.
Statement IV: Only m_4 accelerates.
Now, choose the correct options.
(a) All the statements are correct.
(b) Only I, II, and IV are correct.
(c) Only I and II are correct.
(d) Only II and IV are correct.

60. The tension in the spring is

(a) Zero (b) 2.5 N (c) 5 N (d) 10 N

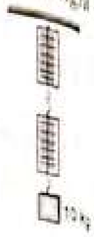
61. The masses of 10 kg and 20 kg respectively are connected by a massless spring as shown in figure. A force of 200 N acts on the 20 kg mass. At the instant shown, the 10 kg mass has acceleration 12 m/s^2. What is the acceleration of 20 kg mass?

(a) 12 m/s^2 (b) 4 m/s^2 (c) 10 m/s^2 (d) Zero

62. Figure shows a 5 kg ladder hanging from a string that is connected with a ceiling and is having a spring balance connected in between. A boy of mass 25 kg is climbing up the ladder at acceleration 1 m/s^2. Assuming the spring balance and the string to be massless and the spring to show a constant reading, the reading of the spring balance is (Take g = 10 m/s^2)

(a) 30 kg (b) 32.5 kg (c) 35 kg (d) 37.5 kg

63. A block of mass 10 kg is suspended through two light spring balances as shown in figure.

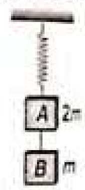


(a) Both the scales will read 10 kg
(b) Both the scales will read 5 kg
(c) The upper scale will read 10 kg and the lower zero
(d) The readings may be anything but their sum will be 10 kg

64. Initially the spring is undeformed. Now the force F is applied to B as shown in the figure. When the displacement of B w.r.t. A is x towards right in some time then the relative acceleration of B w.r.t. A at that moment is

(a) $\frac{F}{2m}$ (b) $\frac{F-kx}{m}$
(c) $\frac{F-2kx}{m}$ (d) none of these

65. Two blocks A and B of masses $2m$ and m, respectively, are connected by a massless and inextensible string. The whole system is suspended by a massless spring as shown in the figure. The magnitudes of acceleration of A and B immediately after the string is cut, are respectively



(a) $g, \frac{g}{2}$ (b) $\frac{g}{2}, g$
(c) g, g (d) $\frac{g}{2}, \frac{g}{2}$

66. Two blocks of mass 2 kg are connected by a massless ideal spring of spring constant k = 10 N/m. The upper block is suspended from roof by a light string A. The system shown is in equilibrium. The string A is now cut, the acceleration of upper block just after the string A is cut will be (g = 10 m/s^2)

(a) 0 m/s^2 (b) 10 m/s^2
(c) 15 m/s^2 (d) 20 m/s^2

Problems Based on Mixed Concepts

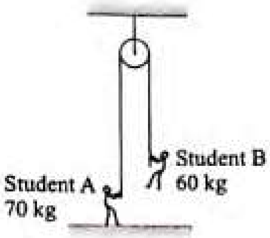
67. A rope of negligible mass passes over a pulley of negligible mass attached to the ceiling, as shown in figure. One end of the rope is held by Student A of mass 70 kg, who is at rest on the floor. The opposite end of the rope is held by Student B of mass 60 kg, who is suspended at rest above the floor. The minimum acceleration a_0 with which the Student B should climb up the rope to lift the Student A upward off the floor.

(a) $\frac{1}{3}$m/s^2

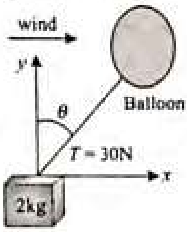
(b) $\frac{2}{3}$m/s^2

(c) $\frac{4}{3}$m/s^2

(d) $\frac{5}{3}$m/s^2



68. A balloon is tied to a block. The mass of the block is 2 kg. The tension of the string between the balloon and the block is 30 N. Due to the wind, the string has an angle θ relative to the vertical direction, $\cos\theta = 4/5$ and $\sin\theta = 3/5$. Assume the acceleration of gravity is $g = 10$ m/s^2. Also assume the block is small so the force on the block from the wind can be ignored. Then the x-component and the y-component of the acceleration a of the block.



(a) 9 m/s^2, 2 m/s^2 (b) 9 m/s^2, 12 m/s^2

(c) 18 m/s^2, 2 m/s^2 (d) 18 m/s^2, 12 m/s^2

69. A lift of total mass M is raised by cables from rest through a height h. The greatest tension which the cables can safely bear is nMg. The maximum speed of lift during its journey if the ascent is to made in shortest time is

(a) $\sqrt{2gh\left(\frac{n+1}{n}\right)}$ (b) $\sqrt{2gh}$

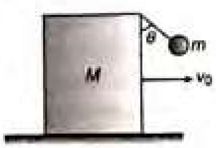
(c) $\sqrt{2gh\left(\frac{n}{n+1}\right)}$ (d) $\sqrt{2gh\left(\frac{n-1}{n}\right)}$

70. A bullet of mass m moving with velocity v_0 hits a wooden plank A of mass M placed on a smooth horizontal surface. The length of the plank is ℓ. The bullet experiences a constant resistive force F inside the block. The minimum value of v_0 such that it is able to come out of the plank is

(a) $\sqrt{\frac{F\ell/m}{M^2}}$ (b) $\sqrt{\frac{2F\ell(M+m)}{Mm}}$

(c) $\sqrt{\frac{2F\ell m}{M^2}}$ (d) $\sqrt{\frac{F\ell(M+m)}{Mm}}$

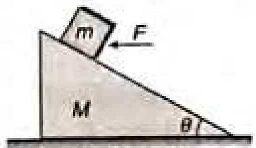
71. A wedge of mass m is pushed with a speed v_0 on a rough horizontal plane. The angle of friction between the wedge and horizontal plane is ϕ. The angle of inclination θ of the pendulum is



(a) ϕ (b) $90° - \phi$

(c) $\tan^{-1}\left(\frac{m}{M}\tan\phi\right)$ (d) None of these

72. A block of mass m lies on wedge of mass M, which lies on fixed horizontal surface. The wedge is free to move on the horizontal surface. A horizontal force of magnitude F is applied on block as shown, neglecting friction at all surfaces, the value of force F such that block has no relative motion w.r.t. wedge will be: (where g is acceleration due to gravity)



(a) $(M+m)\,g\tan\theta$ (b) $(M+m)\,g\cot\theta$

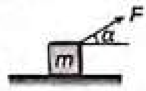
(c) $\frac{m}{M}(M+m)\,g\tan\theta$ (d) $\frac{m}{M}(M+m)\,g\cot\theta$

73. A particle of mass m is placed on the smooth face of an inclined plane of mass M and slope θ which is free to slide on a smooth horizontal plane in a direction perpendicular to the edge. If the particle slides with an accelerating a, the acceleration of the inclined plane towards right A will be

(a) $\frac{ma\cos\theta}{(M+m)}$ (b) $\frac{Mm\cos\theta}{(M+m)}$

(c) $\frac{Ma\cos\theta}{(M+m)}$ (d) $\frac{M\cos\theta}{(M+m)}$

74. A force $F = bt$ (where b is a constant) is applied at an angle to a mass m kept on a smooth horizontal plane. The velocity of mass m at the moment of its breaking off the plane is



(a) $\frac{mg^2\cos\alpha}{2b\sin^2\alpha}$ (b) $\frac{g^2\cos\alpha}{2mb\sin^2\alpha}$

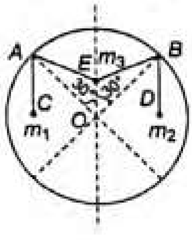
(c) $\frac{mg^2\sin^2\alpha}{2b\cos\alpha}$ (d) $\frac{bg^2\cos\alpha}{2m\sin\alpha}$

75. A flat plate moves normally with a speed v_1 towards a horizontal jet of water of uniform area of cross-section. The jet discharges water at the rate of volume V per second at a speed of v_2. The density of water is ρ. Assume that water splashes along the surface of the plate at right angles to the original motion. The magnitude of the force acting on the plate due to the jet of water is

(a) $\rho V v_1$ (b) $\rho V(v_1+v_2)$

(c) $\frac{\rho V}{v_1+v_2}v_1^2$ (d) $\rho\left[\frac{V}{v_2}\right](v_1+v_2)^2$

76. Two massless rings slide on a smooth circular loop of the wire whose axis lies in a horizontal plane. A smooth massless inextensible string passes through the rings, which carries masses m_1 and m_2 at the two ends and mass m_3 between the rings. If there is equilibrium when the line connecting

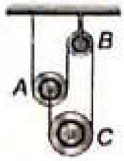


each ring with centre subtends an angle 30° with vertical as shown in figure. Then the ratio of masses are

(a) $m_1 = 2m_2 = m_3$ (b) $2m_1 = m_2 = 2m_3$

(c) $m_1 = m_2 = m_3$ (d) None of these

77. In the arrangement shown in the figure pulleys A and B are massless and the thread is inextensible. Mass of pulley C is equal to m. If friction in all the pulleys is negligible, then



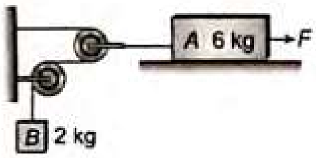
(a) tension in thread is equal to (1/2) mg

(b) acceleration of pulley C is equal to $g/2$ (downward)

(c) acceleration of pulley A is equal to g (upward)

(d) acceleration of pulley A is equal to $2g$ (upward)

78. The system starts from rest and A attains a velocity of 5 m/s after it has moved 5 m towards right. Assuming the arrangement to be frictionless everywhere and pulley and strings to be light, the value of the constant force F applied on A is



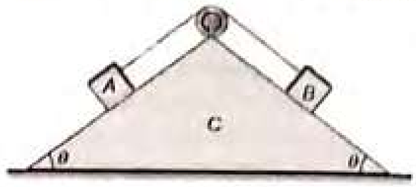
(a) 50 N (b) 75 N (c) 100 N (d) 96 N

79. In the following arrangement the system is initially at rest. The 5 kg block is now released. Assuming the pulleys and string to be massless and smooth, the acceleration of block C will be

(a) Zero (b) 2.5 m/s^2

(c) $\frac{10}{7}$ m/s^2 (d) $\frac{5}{7}$ m/s^2

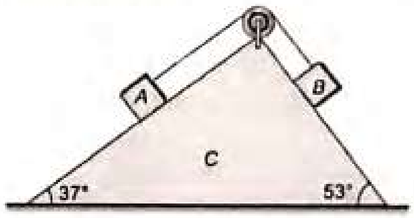
80. In the figure shown C is a fixed wedge on horizontal surface. Blocks A and B are of masses m and $2m$ respectively are kept as shown in figure. They can slide along the inclined plane smoothly. The pulley and string are massless. Take $\theta = 30°$ and $g = 10$ m/s^2. The inclined planes are very long. A and B are released from rest. 2 seconds after the release, B is caught for a moment and released again. Find out the speed of A just before the instant when the string becomes tight again.



(a) Zero (b) $\frac{9}{5}$ m/s

(c) $\frac{12}{5}$ m/s (d) $\frac{12}{7}$ m/s

81. In the figure shown blocks A and B are kept on a wedge C. A, B and C each have mass m. All surfaces are smooth. Find the acceleration of C.



(a) Zero (b) 2.0 m/s^2

(c) $\frac{12}{5}$ m/s^2 (d) 3.5 m/s^2

ARCHIVES

1. One end of a massless rope, which passes over a massless and frictionless pulley P, is tied to a hook C, while the other end is free. The maximum tension that the rope can bear is 360 N. With what value of maximum safe acceleration (in m/s^2) can a man of 60 kg climb on the rope?

(a) 16 (b) 6

(c) 4 (d) 8 **(AIEEE 2002)**

2. When forces F_1, F_2, and F_3 are acting on a particle of mass m such that F_2 and F_3 are mutually perpendicular, then the particle remains stationary. If the force F_1 is now removed, then the acceleration of the particle is

(a) F_1/m (b) F_2F_3/mF_1

(c) $(F_2 - F_3)/m$ (d) F_2/m **(AIEEE 2002)**

3. A lift is moving down with acceleration a. A man in the lift drops a ball inside the lift. The acceleration of the ball as observed by the man in the lift and a man standing stationary on the ground are, respectively,

(a) g, g (b) $g - a$, $g - a$

(c) $g - a$, g (d) a, g **(AIEEE 2002)**

4. A light string passing over a smooth light pulley connects two blocks of masses m_1 and m_2 (vertically). If the acceleration of the system is $g/8$, then the ratio of the masses is

(a) 8 : 1 (b) 9 : 7

(c) 4 : 3 (d) 5 : 3 **(AIEEE 2002)**

5. Two forces are such that the sum of their magnitudes is 18 N and their resultant, of magnitude 12 N, is perpendicular to the smaller force. Then the magnitudes of the forces are

(c) 10 N, 8 N (d) 16 N, 2 N **(AIEEE 2002)**

6. A light spring balance hangs from the hook of the other light spring balance and a block of mass M kilogram hangs from the former one. Which of the following statements about the scale reading is true?
(a) Both the scales read $M/2$ kilogram each.
(b) Both the scales read M kilogram each.
(c) The scale of the lower one reads M kilogram and of the upper one zero.
(d) The reading of the two scales can be anything but the sum of the reading will be M kilogram.
(AIEEE 2003)

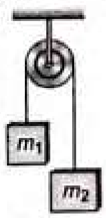
7. A block of mass M is pulled along a horizontal frictionless surface by a rope of mass m. If a force P is applied at the free end of the rope, the force exerted by the rope on the block is
(a) $\frac{PM}{M+m}$ (b) $\frac{Pm}{M+m}$
(c) $\frac{PM}{M-m}$ (d) P **(AIEEE 2003)**

8. A spring balance is attached to the ceiling of a lift. A man hangs his bag on the spring and the spring reads 49 N, when the lift is stationary. If the lift moves downward with an acceleration of 5 m/s^2, the reading of the spring balance will be
(a) 49 N (b) 24 N
(c) 74 N (d) 15 N **(AIEEE 2003)**

9. A rocket with a lift-off mass 3.5×10^4 kg is blasted upward with an initial acceleration of 10 m/s^2. Then the initial thrust of the blast is
(a) 1.75×10^5 N (b) 3.5×10^5 N
(c) 7.0×10^5 N (d) 1.40×10^5 N
(AIEEE 2003)

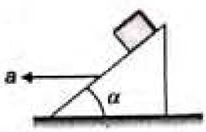
10. A machine gun fires a bullet of mass 40 g with a velocity of 1200 m/s. The man holding it can exert a maximum force of 144 N on the gun. How many bullets can he fire per second at the most?
(a) two (b) four
(c) one (d) three **(AIEEE 2004)**

11. Two masses $m_1 = 5$ kg and $m_2 = 4.8$ kg tied to a string are hanging over a light frictionless pulley. What is the acceleration of the masses when the system is left free to move? ($g = 9.8$ m/s^2)



(a) 5 m/s^2 (b) 9.8 m/s^2
(c) 0.2 m/s^2 (d) 4.8 m/s^2
(AIEEE 2004)

12. A block is kept on a frictionless inclined surface with angle of inclination α. The incline is given an acceleration a to keep the block stationary. Then a is equal to



(a) $g \tan \alpha$ (b) g
(c) $g \operatorname{cosec} \alpha$ (d) $g/\tan \alpha$ **(AIEEE 2005)**

13. A particle of mass 0.3 kg is subjected to a force $F = -kx$ with $k = 15$ N/m. What will be its initial acceleration if it is released from a point 20 cm away from the origin?
(a) 5 m/s^2 (b) 10 m/s^2
(c) 3 m/s^2 (d) 15 m/s^2 **(AIEEE 2005)**

14. A player caught a cricket ball of mass 150 g moving at a rate of 20 m/s. If the catching process is completed in 0.1 s, the force of the blow exerted by the ball on the hand of the player is
(a) 30 N (b) 300 N
(c) 150 N (d) 3 N **(AIEEE 2006)**

15. A ball of mass 0.2 kg is thrown vertically upward by applying a force by hand. If the hand moves 0.2 m while applying the force and the ball goes up to 2 m height further, find the magnitude of the force. Consider g = 10 m/s^2.

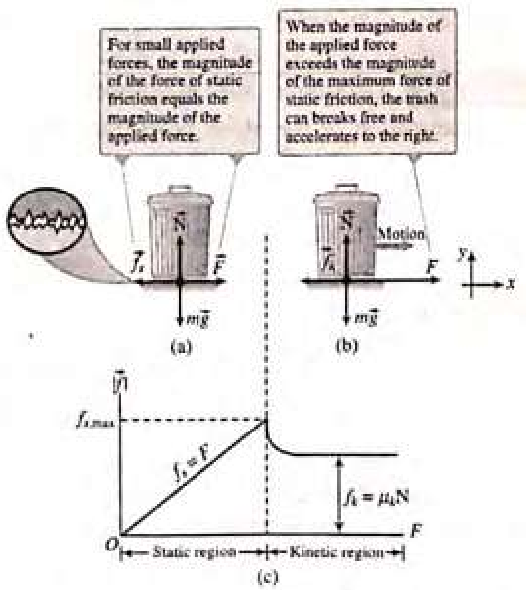
Chapter 6

Newton's Laws of Motion (With Friction) and Dynamics of Circular Motion

STATIC FRICTION AND KINETIC FRICTION

Imagine you are trying to slide a heavy box on horizontal concrete surface by applying a force $\vec{F}$. You try to drag the box across the surface of your concrete floor. The concrete surface is a real, not an ideal, frictionless surface in a simplification model. If we apply an external horizontal force $\vec{F}$ to the box acting to the right, the box remains stationary if $\vec{F}$ is small. The force that counteracts $\vec{F}$ and keeps the box from moving acts to the left and is called the force of *static friction*, $\vec{f}_s$. As long as the box is not moving, it is modelled as a particle in equilibrium and $f_s = F$. Therefore, if $\vec{F}$ decreases, $\vec{f}_s$ also decreases. Experiments show that the friction force arises from the nature of two surfaces; because of their roughness, contact is made only at a few points, as shown in the magnified surface view in Fig. (a).



If we increase the magnitude of $\vec{F}$, the box eventually slips. When the box is on the verge of slipping, f_s is maximum. If F is excess $f_{s,\max}$, the box moves and accelerates to the right. While the box is in motion, the friction force is less than f_s, max. We call the friction force for an object in motion the force of *kinetic friction*. The net force $(F - f_k)$ in the x direction produces an acceleration to the right, according to Newton's second law. If we reduce the magnitude of $\vec{F}$ so that $F = f_k$, the acceleration becomes zero and the box moves to the right with constant speed. If the applied force is removed, the friction force acting to the left provides an acceleration of the box in the $-x$ direction and eventually brings it to rest.

- The magnitude of the force of static friction between any two surfaces in contact can have the values
  $$f_s \le \mu_s N \tag{i}$$
  where the dimensionless constant μ_s is called the coefficient of static friction and N is the magnitude of the normal force. The equality in Eq. (i) holds when the surfaces are on the verge of slipping, that is, when $f = f_{s,\max} \equiv \mu_s N$. This situation is called *impending motion*. The inequality holds when the component of the applied force parallel to the surfaces is less than this value.
- We define the static friction as tangential contact force which prevents relative sliding between the points of contact.
- Static friction can have any value between zero and its maximum (limiting) value $\mu_s N$. We can write $0 \le f_s \le \mu_s N$
- *Static friction is of self-adjusting nature and can change its magnitude and direction as per requirement.*
- The magnitude of the force of kinetic friction acting between two surfaces is $f_k = \mu_k N$
  μ_k is the coefficient of kinetic friction. In our simplification model, this coefficient is independent of the relative speed of the surfaces.
- The values of μ_k and μ_s depend on the nature of the surfaces, but μ_k is generally less than μ_s.
- The direction of the friction force on an object is opposite to the actual motion (kinetic friction) or the impending motion (static friction) of the object relative to the surface with which it is in contact.

LAWS OF LIMITING FRICTION

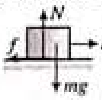
The force of friction always acts along such a direction so as to oppose the motion of the body relative to the other. The force of friction depends upon the nature and roughness of the two surfaces in contact. The rougher the surface, more will be the frictional forces.

- Limiting frictional force is independent of the apparent area of contact till the value of the normal reaction remains same.
- The direction of limiting frictional force is opposite to the direction in which one body is on the verge of starting its motion.
- The limiting frictional force depends upon the nature of surfaces in contact.

ILLUSTRATION 6.1 A block of mass $m = 1$ kg is at rest on a rough horizontal surface having coefficient of static friction $\mu_s = 0.2$ and kinetic force $\mu_k = 0.15$. Discuss the frictional forces if a horizontal force F is applied on the block.

S.No.	Value of F	
1.	1 N	
2.	2 N	
3.	2.5 N	

Solution. Assume no friction, the motion of the block will be in the direction of applied force. The friction opposes relative motion between two surfaces. The direction of friction will be opposite to relative motion, i.e., in leftward direction.



Now let us find the maximum friction force.

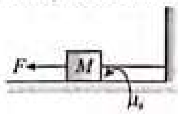
$$f_{max} = f_{lim} = \mu_s N = 0.2 \times 1 \times 10 = 2\text{ N}$$

(a) If $F = 1.0$ N
If the block is at rest friction acting on the block, $f = F = 1.0$ N.
As $f < f_{lim}$, hence, friction will be of static nature and acceleration of the block will be zero.

(b) If $F = 2.0$ N
Here the applied force equals limiting friction. The block is on the verge of slipping.
or $f = f_{lim} = 2.0$ N

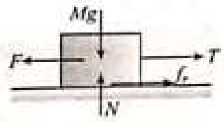
(c) If $F = 2.5$ N
Here the applied force is greater than the magnitude of the maximum nature of static friction. The nature of friction between the block and ground is of kinetic nature.
or $f = f_k = \mu_k N = 0.15 \times 1 \times 10 = 1.5$ N

ILLUSTRATION 6.2 In the figure, force F is gradually increased from zero. Draw the graph between applied force F and tension T in the string. The coefficient of static friction between the block and the ground is μ_S.



Solution. As the external force F is gradually increased from zero, it is compensated by the friction and the string bears no tension. When the limiting friction is achieved by increasing force F to a value till $\mu_S mg$, the further increase in F is transferred to the string.

$$\text{When} \begin{cases} F < \mu_s mg; \text{ the friction is static and } T = 0 \\ F \geq \mu_s mg; T = F - \mu_s mg \end{cases}$$



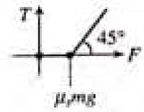


ILLUSTRATION 6.3 In the figure, an object of mass $M = 10$ kg is kept on a rough table as seen from above. Forces are applied on it as shown.

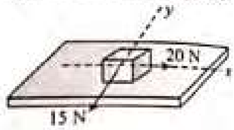
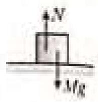
Find the direction of static friction if the object does not move. (Take μ = 0.4)



Solution. Here limiting value of friction force

$$f_{lim} = \mu_s N = 0.4 \times 10 \times 10 = 40\text{ N}$$

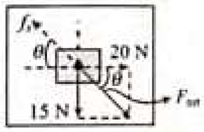


The resultant of external forces acting on the block (see figure).

$$F_{net} = \sqrt{(15)^2 + (20)^2} = 25\text{ N}$$

If the block is at rest, $f = F_{net} = 25$ N

As $f < f_{lim}$.



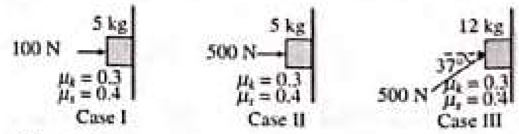
Here actual friction force acting on the block is less than f_{lim}. The friction in this case is of static nature.

For the direction of friction force, we draw the free body diagram of find the resultant force.

The direction of static friction is opposite to the direction of the resultant force FR. Its magnitude is equal to 25 N at angle,

$$\tan\theta = \frac{15}{20} = \frac{3}{4} \text{ or } \theta = 37° \text{ as shown in the figure.}$$

ILLUSTRATION 6.4 Determine the magnitude of frictional force and acceleration of the block in each of the following cases:

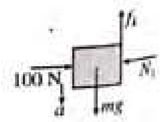


Solution. **Case I**

$$N_1 = 100\text{ N}, mg = 50\text{ N}$$

$$f_l = \mu_s N_1 = 0.4 \times 100 = 40\text{ N},$$

$$f_k = \mu_k N_1 = 0.3 \times 100 = 30\text{ N}$$



Here mg (driving force) is greater than maximum friction $f_l = 40$ N. Hence, the block will not be able to stay at rest. It will accelerate downwards. But when it starts slipping, then kinetic friction will come into play. Now

$$a = \frac{mg - f_k}{m} = \frac{50 - 30}{5} = 4\text{ m s}^{-2}$$

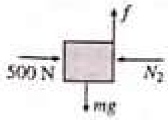
So, in this case, $f = f_k = 30$ N and $a = 4$ m s^{-2} (downwards)

Case II

$N_2 = 500$ N, $mg = 50$ N

$f_l = \mu_s N_2 = 200$ N,

$f_k = \mu_k N_2 = 150$ N



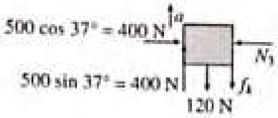
Here f_l is greater than mg (driving force). Hence, block will not move. So, in this case, $a = 0$, $f = mg = 50$ N.

Case III

$N_3 = 400$ N,

$f_l = \mu_s N_3 = 160$ N,

$f_k = \mu_k N_3 = 120$ N



Here driving force = 300 − 120 = 180 N in upward direction; hence, friction will act downwards. Driving force is more than f_l. So the block will accelerate upwards.

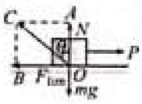
$$a = \frac{180 - f_k}{m} = \frac{180 - 120}{12} = 5 \text{ m s}^{-2} \text{(upwards)}$$

So, in this case, $f = f_k = 120$ N and $a = 5$ m s^{-2} (upwards)

ANGLE OF FRICTION

The angle of friction between any two surfaces in contact is defined as the angle which the resultant of the force of limiting friction F and normal reaction R makes with the direction of normal reaction R. It is represented by θ.

In the figure, OA represents the normal reaction R which balances the weight mg of the body. OB represents F, the limiting force of sliding friction, when the body tends to move to the right. Complete the parallelogram $OACB$. Join OC. This represents the resultant of R and F. By definition, $\angle AOC = \theta$ is the angle of friction between the two bodies in contact.



The value of angle of friction depends on the material and nature of the surfaces in contact.

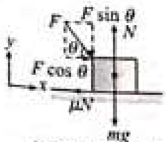
Relation between μ and θ

$$\text{In } \Delta AOC, \ \tan\theta = \frac{AC}{OA} = \frac{OB}{OA} = \frac{f_{\text{lim}}}{N} = \mu$$

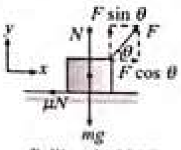
Hence, $\mu = \tan\theta$, i.e., coefficient of limiting friction between any two surfaces in contact is equal to tangent of the angle of friction between them.

Pull is Easier than Push

Push: Consider a block of mass m placed on a rough horizontal surface. The coefficient of static friction between the block and surface is μ. Let a push force F is applied at an angle θ with the horizontal.



Pushing the block



Pulling the block

As the block is in equilibrium along y-axis, thus, we have

$\Sigma f_y = 0$ or $N = mg + F \sin\theta$

To just move the block along x-axis, we have

$F \cos\theta = \mu N = \mu(mg + F \sin\theta)$

$$\text{or} \quad F = \frac{\mu mg}{\cos\theta - \mu \sin\theta} \qquad \text{(i)}$$

Pull: Along y-axis, we have

$\Sigma f_y = 0$ or $N = mg - F\sin\theta$

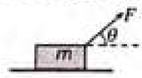
To just move the block along x-axis, we have

$F\cos\theta = \mu N = \mu(mg - F \sin\theta)$

$$\text{or} \quad F = \left(\frac{\mu mg}{\cos\theta + \mu\sin\theta}\right) \qquad \text{(ii)}$$

It is clear from above discussion that pull force is smaller than push force.

ILLUSTRATION 6.5 A block of mass m lying on a horizontal surface (coefficient of static friction = μ_s) is to be brought into motion by a pulling force F. At what angle θ with the horizontal should the force F be applied so that its magnitude is minimum? Also find this minimum magnitude.

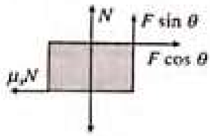


Solution. Let us first calculate the force F required to bring m into motion in terms of angle θ. Equation using laws of motion are as follows:

$N = mg - F \sin\theta$

and $F\cos\theta = \mu_s N$

$F\cos\theta = \mu_s(mg - F\sin\theta)$



$$\Rightarrow \quad F = \frac{\mu_s mg}{\cos\theta + \mu_s \sin\theta}$$

We have to find the angle θ for which this force F is minimum. Substituting $\mu_s = \tan\phi$ (for simplification), we get

$$F = \frac{mg\tan\phi}{\cos\theta + \tan\phi\sin\theta} = \frac{mg\sin\phi}{\cos(\theta - \phi)}$$

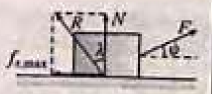
F is minimum if $\cos(\theta - \phi)$ is maximum. Hence, F is minimum for $\theta = \phi = \tan^{-1}\mu_S$ and $F_{\min} = mg \sin\phi$

To bring m into motion with least effort, force should be applied at an angle $\tan^{-1}\mu_S$ and should have a magnitude equal to

$$F_{\min} = mg\sin\phi = \frac{\mu_s mg}{\sqrt{1+\mu_s^2}}$$

Important Results

- The block can be moved with least effort on a rough surface (μ) if the force is applied at the angle of friction (λ). That is, $\phi = \tan^{-1}\mu_s = \lambda$



- The minimum magnitude of force is given by $F_{\min} = mg \sin\lambda$

ILLUSTRATION 6.6 A block of mass $m = 10$ kg is to be pulled on a horizontal rough surface with the minimum force.

(a) At what angle θ with horizontal the block should be pulled?

(b) What is the magnitude of the force F?

Solution.

(a) The block can be moved with least effort on a rough surface (μ) if the force is applied at the angle of friction (λ). That is, $\lambda = \theta = \tan^{-1}\mu_s$

The block should be pulled at the angle of friction, i.e.,

$$\theta = \tan^{-1}(0.75) = 37°$$

(b) The magnitude of external force is

$$F_{min} = mg \sin\theta$$

$$= (10)(10)\sin 37° = (100)\left(\frac{3}{5}\right) = 60 \text{ N}$$

ANGLE OF REPOSE OR ANGLE OF SLIDING

The angle of repose or angle of sliding is defined as the minimum angle of inclination of a plane with the horizontal such that a body placed on the plane just begins to slide down. Its value depends on the material and nature of the surfaces in contact.

In the figure, AB is an inclined plane such that a body placed on it just begins to slide down. $\angle BAC = \alpha =$ angle of repose. The various forces involved are:

1. Weight, mg, of the body acting vertically downwards
2. normal reaction, N, acting perpendicular to AB
3. Force of friction, f, acting upon the plane AB

Now, mg can be resolved into two rectangular components: $mg\cos\alpha$ opposite to R and $mg\sin\alpha$ opposite to F. In equilibrium,

$$f = mg\sin\alpha \quad \text{(i)}$$

$$N = mg\cos\alpha \quad \text{(ii)}$$

Dividing (i) by (ii), we get $\dfrac{f}{N} = \dfrac{mg\sin\alpha}{mg\cos\alpha} = \mu_s$

i.e., $\mu = \tan\alpha$ (iii)

Hence, the coefficient of limiting friction between any two surfaces in contact is equal to the tangent of the angle of repose between them.

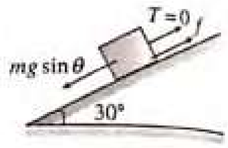
NOTE: Minimum angle for which a block starts sliding down an inclined plane is known as angle of repose. Angle of repose is independent of mass of the object.

ILLUSTRATION 6.7 A block of mass 1 kg is place on a rough inclined plane at angle $\theta = 30°$ will horizontal. The block is connected with a straight as shown in the figure. If $\mu_s = 3/4$, find the tension in string.

Solution. Let us first find the angle of repose, i.e., the angle of inclination of inclined plane with horizontal such that when a body placed on it just begins to slide down.

As we know the angle of repose,

$$\alpha = \tan^{-1}(\mu_s) = \tan^{-1}\left(\frac{3}{4}\right) = 37°$$

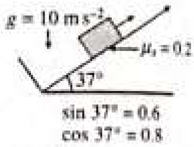


Here the angle of inclination of plane is less than the angle of repose. Here the block does not have tendency to slide. The friction force between the block and incline is static nature.

$$f = mg\sin\theta = 1 \times 10 \times \sin 30° = 5 \text{ N}$$

Hence, tension in string will be zero.

ILLUSTRATION 6.8 An object of mass 10 kg is to be kept at rest on an inclined plane making an angle of 37° to the horizontal by applying a force F along the plane upwards as shown in the figure. The coefficient of static fiction between the object and the plane is 0.2. Find the magnitude of force F. [Take $g = 10 \text{ m s}^{-2}$.]



Solution. mg sin 37° = 10 × 10 × 3/5 = 60 N

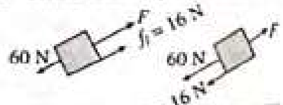
$$f_l = \mu N = 0.2\, mg\cos 37°$$

$$= 0.2 \times 10 \times 10 \times 4/5$$

$$= 16 \text{ N}$$

Friction force alone is unable to balance $mg\sin 37°$. Hence, F is required for balancing. Here two cases arise.

Case I: if the block has tendency to slide down, friction on block will act upwards.



Case (i) Case (ii)

$$F + 16 = 60$$

$$\Rightarrow \quad F = 44 \text{ N}$$

This is the minimum force required for balancing.

Case II: If the block has tendency to slide up, friction on block will act downwards.

$$F = 60 + 16 \quad \Rightarrow \quad F = 76 \text{ N}$$

This is the maximum force required for balancing.

Therefore, for balancing $44 \text{ N} \le F \le 76 \text{ N}$

ILLUSTRATION 6.9 A 5-kg block slides down a plane inclined at 30° to the horizontal. Find

(a) The acceleration of the block if the plane is frictionless.

(b) The acceleration if the coefficient of kinetic friction is $1/2\sqrt{3}$.

Solution.

(a) $mg\sin 30° = ma$

$a = g\sin 30° = 5 \text{ m s}^{-2}$, down the plane if plane is smooth.

(a) (b)

(b) $mg \sin 30° - \mu_k N = ma$

$a = g \sin 30° - \mu_k g \cos 30° = 5/2 \text{ m s}^{-2}$

Concept Application Exercise 6.1

1. What is the value of friction f for the following value of applied force F?

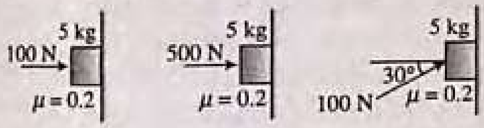
(a) 1 N (b) 2 N (c) 3 N
(d) 4 N (e) 20 N

Assume the coefficient of friction to be $\mu_s = 0.3$; $\mu_k = 0.25$. Mass of the body is $m = 1$ kg. (Assume $g = 10 \text{ m s}^{-2}$)

2. A block of mass 5 kg rests on a rough horizontal surface. It is found that a force of 10 N is required to make the block just move. However, once the motion begins, a force of only 8 N is enough to maintain the motion. Find the coefficients of kinetic and static friction between the block and the horizontal surface.

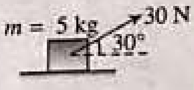
3. A body of mass m is kept on a rough horizontal surface of friction coefficient m. A force P is applied horizontally, but the body is not moving. Find the net force F exerted by the surface on the body.

4. Determine the magnitude of frictional force f in each of the following cases:



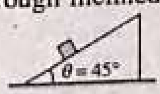
(a) (b) (c)

5. A 5-kg box is moving straight across the floor at a constant speed by a force of 30 N, as shown in the figure.



(a) How large a friction force impedes the motion of the box?
(b) Find μ_k between the box and the floor.

6. A block of mass $m = 3$ kg slides on a rough inclined plane of coefficient of friction 0.2. Find the resultant force offered by the plane on the block.

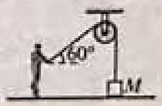


7. A block slides down an inclined plane (angle of inclination 60°) with an acceleration $g/2$. Find the coefficient of kinetic (dynamic) friction.

8. An insect crawls up a hemispherical surface very slowly. The coefficient of friction between the insect and the surface is 1/3. If the line joining the center of the hemispherical surface to the insect makes an angle α with the vertical, find the maximum possible value of α.

9. A box of bananas weighing 40.0 N rests on a horizontal surface. The coefficient of static friction between the box and the surface is 0.40 and the coefficient of kinetic friction is 0.20.
   (a) If no horizontal force is applied to the box and the box is at rest, how large is the friction force exerted on the box?
   (b) What is the magnitude of the friction force if a monkey applies a horizontal force of 6.0 N to the box and the box is initially at rest?
   (c) What minimum horizontal force must the monkey apply to start the box in motion?
   (d) What minimum horizontal force must the monkey apply to keep the box moving at constant velocity once it has been started?
   (e) If the monkey applies a horizontal force of 18.0 N, what is the magnitude of the friction force and what is the box's acceleration?

10. A man of mass 60 kg is pulling a mass M by an inextensible light rope passing through a smooth and massless pulley as shown in figure. The coefficient of friction between the man and the ground is $\mu = 1/2$. Find the maximum value of M that can be pulled by the man without slipping on the ground.



ANALYSIS OF FRICTION FORCE BETWEEN TWO OBJECTS IN CONTACT: CONDITION OF EXISTENCE OF STATIC FRICTION

In many situations, we need to analyze whether friction is present between the surface, and, if present what the nature of friction, kinetic or static is? Following are some important points to analyze this situation.

When two surfaces tend to slide (but do not slide) relative to each other, static friction comes into play.

Then, how do we confirm the tendency of relative sliding between any two surfaces in contact? Let us find a process for it.

First of all, mentally eliminate the friction between the contact points of the surfaces where we want to detect the presence of friction. Then, considering all other forces, we find the accelerations a_1 and a_2 of these points. If the relative acceleration $a_{rel}(=|\vec{a}_1 - \vec{a}_2|)$ between the surfaces is not zero, then surfaces tend to slide relative to each other.

In general, when two bodies are in contact, if the net forces acting on them (ignoring the frictional forces between the contacting surface under consideration) are $\vec{F}_1$ and $\vec{F}_2$, respectively, their accelerations are given as

$$\vec{a}_1 = \frac{\vec{F}_1}{m_1} \text{ and } \vec{a}_2 = \frac{\vec{F}_2}{m_2}$$

If $|\vec{a}_1 - \vec{a}_2| \neq 0$, static friction exists between the surface. If $\vec{a}_1 = \vec{a}_2$, we can say that there is no tendency of relative sliding. Hence, no friction exists; ($f_s = 0$) when $\vec{a}_1 = \vec{a}_2$.

ILLUSTRATION 6.10 Two blocks of masses M and m are arranged as shown in the figure. There is no friction between ground and block M.

The coefficients of static and kinetic friction between M and m are μ_s and μ_k, respectively.

(a) Calculate the maximum possible value of F so that both the bodies move together.

(b) Find the accelerations of the blocks if F is greater than that found in part (a).

Solution.

(a) If both blocks move together, i.e., no sliding between M and m, the friction between m and M will be static nature. Static friction force is a self-adjusting force $0 \le f \le \mu_s N$

Acceleration of system in this case, $a = \dfrac{F}{(M+m)}$ (i)

FBD of m and M:

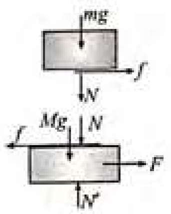
Equation of motion of m:

$$f = ma = m\frac{F}{(M+m)} \qquad \text{(ii)}$$

If there is no sliding between M and m, then $f \le f_{s\text{-max}}$

$$\Rightarrow \quad \frac{mF}{(M+m)} \le \mu_s(mg)$$

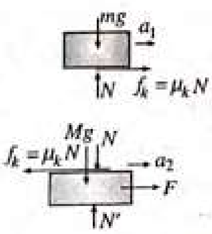
$$\Rightarrow \quad F \le \mu_s (M+m)g$$



(a)

(b) If $F > \mu_s (M+m)g$, then there will be relative sliding between M and m. When relative sliding between M and m starts.

The friction force reaches limiting value the friction force becomes $f_k = \mu_k N$



(b)

FBD of m and M:

Equation of motion of m: $\mu_k(mg) = ma_1$

Acceleration of m, $a_1 = \mu_k g$

Equation of motion of M: $F - \mu_k mg = Ma_2$

Acceleration of M, $a_2 = \dfrac{F - \mu_k mg}{M}$

ILLUSTRATION 6.11 Let us consider the next case in the previous illustration when there is no friction between ground and M. The coefficients of static and kinetic friction are μ_s and μ_k, respectively, and force F acts on upper block as shown in the figure.

(a) What is the maximum possible value of F so that the system moves together?

(b) If there is relative sliding between M and m, then calculate acceleration of M and m.

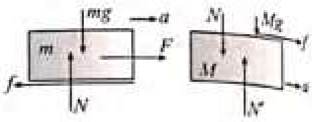
Solution. Let the systems move together, then $a = \dfrac{F}{(M+m)}$.

FBD of m and M

From FBD of M: $f = ma = M\left(\dfrac{F}{M+m}\right)$ (i)

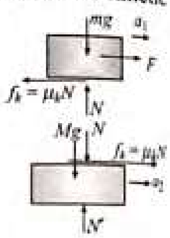
As there is no sliding between M and m,

$$M\left(\frac{F}{M+m}\right) \le \mu_s mg$$



$$\Rightarrow \quad F \le \mu_s \frac{m}{M}(M+m)g$$

If $F > \mu_s \dfrac{m}{M}(M+m)g$, the relative sliding between the blocks starts. The friction force between the blocks will be of kinetic nature and both blocks will move with different accelerations.

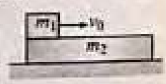


Acceleration of m, $a_1 = \dfrac{F - \mu_k mg}{m}$

Acceleration of M, $a_2 = \dfrac{\mu_k mg}{M}$

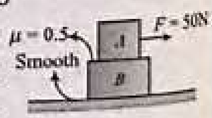
CONCEPT APPLICATION EXERCISE 6.2

1. A block of mass 1 kg is horizontally thrown with a velocity of 10 m s^{-1} on a stationary long plank of mass 2 kg whose surface has a $\mu = 0.5$. Plank rests on frictionless surface. Find the time when m_1 comes to rest w.r.t. plank.

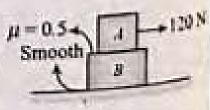


2. In the figure, initially the system is at rest. Find out minimum value of F for which sliding starts between the two blocks. Given $m_A = 10$ kg and $m_B = 20$ kg.

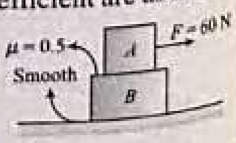
3. Find the acceleration of the two blocks. The system is initially at rest and the friction coefficient are as shown in the figure. Given $m_A = m_B = 10$ kg.



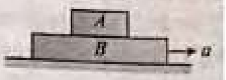
4. Find the acceleration of the two blocks. The system is initially at rest and the friction coefficient are as shown in the figure. Given $m_A = m_B = 10$ kg.



5. Find the acceleration of the two blocks. The system is initially at rest and the friction coefficient are as shown in the figure. Also find maximum F for which two blocks will move together. Given $m_A = 10$ kg and $m_B = 20$ kg.

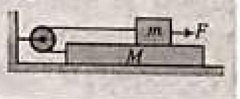


6. The block A is kept over a plank B. The maximum horizontal acceleration of the system in order to prevent slipping of A over B is $a = 2\,\text{m s}^{-2}$. Find the coefficient of friction between A and B.



7. A small block of mass m kept at the left end of a larger block of mass M and length l. The system can slide on a horizontal road. The system is started towards right with an initial velocity v. The friction coefficient between the road and the bigger block is μ and that between the blocks is $\mu/2$. Find the time elapsed before the smaller block separates from the bigger block.

8. A small block of mass m is placed on a plank of mass M. The block is connected to plank with the help of a light string passing over a light smooth pulley, shown in the figure. The co-efficient of static friction between the block and plank is μ. The co-efficient of friction between the plank and the horizontal surface is zero. What maximum horizontal force F applied on the block of mass m can make the block and plank not to slide relatively?



DYNAMICS OF CIRCULAR MOTION

Centripetal Force

Newton's second law tells us that when a particle accelerates, there must be a net force acting on the particle in the direction of its acceleration. Following this law, as the particle in uniform circular motion accelerates radially inwards, the particle must experience a net force directed radially inwards (centripetal). Hence, we call this *centripetal force*.

Centripetal force is not a special force. It can be any field force such as gravitational, electrostatics, magnetic, and others. This can be also be any constant force (reaction force), i.e., friction and normal reaction, etc. The string force and spring force can take the credit of pulling or pushing a particle in a circular track as described in this topic. Hence, any force or component of any force along the radial direction or sum (resultant) of two or many forces acting on a particle directed towards the center of a circle may be called centripetal force.

As $F = ma$, centripetal force = mass × centripetal acceleration, i.e.,

$$F = \frac{mv^2}{r} = m\omega^2 r$$

Centrifugal Force

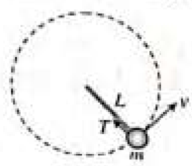
When you are sitting by the side of a window of a car while it negotiates a curve, you feel as if you are pushed away from the center of the curve. This is what we call centrifugal forces as it gives a physical sensation of being centrifuged (pushed radially away). Since you are sitting in an accelerating frame you think that you are not accelerating towards the center of the circle, rather you are centrifuged. But the actual situation can be viewed from ground frame. The actual thing is that "you are moving in a circular path for some time" by the inward reaction force (pressing) offered by the inner wall of the car. You may feel as if you are pressed against the walls of the vehicle. According to Newton's third law, the wall is pushing your muscles in contact, towards the center of the circular path. In fact, the reaction force given by the wall of the car is the centripetal force and in the rotating frames "$\vec{F}_{\text{pseudo}} = -m\vec{a}_{\text{CP}}$" is the centrifugal force which never exists in inertial frame.

Important Results

- As centrifugal force exists in rotating (accelerating) frames, it is a pseudo force. Hence, centripetal force has no action-reaction pair.
- The centrifugal force arises from the relative rotational motion of the observer (reference frame). In other words, F_{CF} arises from the kinematics of the rotating frame (but not from any interactions).
- Centripetal forces are real forces (arising from interaction) whereas centrifugal forces are imaginary or pseudo force (arising from the rotation of the reference frames). The centrifugal force acting on a particle depends only on "mass m," angular velocity $\vec{\omega}$ of the rotating frame (but not the angular velocity of the particle), and the perpendicular distance of the particle from the axis of rotation of the reference frame. In this way, the particle need not move in a circle to experience a centrifugal force.
- When a real force pushes a particle radially outward, we cannot call it centrifugal force of the first kind.
- The centrifugal force is directed "radially" outwards from the axis of rotation of the reference frame (or observer) along the line drawn from the particle perpendicular to the axis of rotation.
- The centrifugal force is a pseudo force, which is equal to $-m\vec{a}_{\text{CP}}$ and centripetal force is a real force. The centrifugal force is adopted to solve the problems in the rotating frame.

ILLUSTRATION 6.12 A block of mass 1 kg is tied to a string of length 1 m, the other end of which is fixed. The block is moved on a smooth horizontal table with constant speed $10\,\text{m s}^{-1}$. Find the tension in the string.

Solution. The ball in the figure does not accelerate vertically. Therefore, we model it as a particle in equilibrium in the vertical direction. It experiences a centripetal acceleration in the horizontal direction. In this case, centripetal force is provided by tension.



$$\Sigma F_y = N - mg = 0$$
$$N = mg \qquad \text{(i)}$$
$$\Sigma Fx = T = ma_c = \frac{mv^2}{r} \qquad \text{(ii)}$$
$$T = \frac{mv^2}{r} = \frac{1\times 10^2}{1} = 100\,\text{N}$$

ILLUSTRATION 6.13 A ball of mass m moves with speed v against a smooth, fixed vertical circular groove of radius R kept on smooth horizontal surface. Find the

(a) normal reaction of the floor on the ball.

(b) normal reaction of the vertical wall on the ball.

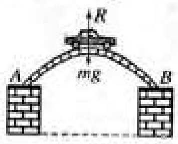
Solution. The ball in the figure does not accelerate vertically. Here centripetal force is provided by normal reaction of vertical wall. It experiences a centripetal acceleration in the horizontal direction (radial). In this case, centripetal force is provided by tension.

$$\Sigma F_y = N_{\text{Floor}} - mg = 0$$
$$N_{\text{Floor}} = mg \qquad \text{(i)}$$
$$\Sigma F_x = N_{\text{wall}} = ma_c = \frac{mv^2}{R} \qquad \text{(ii)}$$

ILLUSTRATION 6.14 A car of mass m moving over a convex bridge of radius r. Find the normal reaction acting on car when it is at the highest point of the bridge.

Solution. The motion of the motor car over a convex bridge AB is the motion along the segment of a circle AB (see figure).

The centripetal force is provided by the difference of weight mg of the car and the normal reaction R of the bridge.



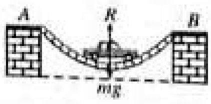
$$\therefore \quad mg - R = \frac{mv^2}{r} \quad \text{or} \quad R = mg - \frac{mv^2}{r}$$

Clearly $R < mg$, i.e., the weight of the moving car is less than the weight of the stationary car.

ILLUSTRATION 6.15 A car of mass m moving over a concave bridge of radius r. Find the normal reaction acting on car when it is at the lowest point of the bridge.

Solution. The motion of the motor car over a concave bridge AB is the motion along the segment of a circle AB (see figure). The centripetal force is provided by the difference of normal reaction R of the bridge and weight mg of the car.

$$\therefore \quad R - mg = \frac{mv^2}{r}$$



$$\text{or} \quad R = mg + \frac{mv^2}{r}$$

Clearly $R > mg$, i.e., the weight of the moving car is greater than the weight of the stationary car.

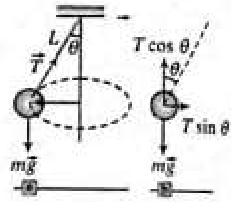
CONICAL PENDULUM

A small ball of mass m is suspended from a string of length L. The ball revolves with constant speed v in a horizontal circle of radius r as shown in the figure. Because the string sweeps out the surface of a cone, the system is known as a *conical pendulum.*

The string sweeps out a cone and that the ball moves in a horizontal circle. Let us find an expression for v.

The ball in the figure does not accelerate vertically. Therefore, we model it as a particle in equilibrium in the vertical direction. It experiences acentripetal acceleration in the horizontal direction, so it is modeled as a particle in uniform circular motion in this direction.

Let θ represent the angle between the string and the vertical. In the diagram of forces acting on the ball in the figure, the force $\vec{T}$ exerted by the string on the ball is resolved into a vertical component T cos θ and a horizontal component T sin θ acting toward the center of the circular path. Apply the particle in equilibrium model in the vertical direction:



$$\Sigma F_y = T\cos\theta - mg = 0$$
$$\text{or} \quad T\cos\theta = mg \qquad \text{(i)}$$
$$\Sigma F_x = T\sin\theta = ma_c = \frac{mv^2}{r} \qquad \text{(ii)}$$

Divide equation (ii) by (i) and use $\tan\theta = \dfrac{v^2}{rg}$

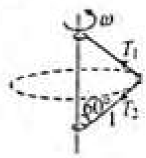
Solve for v: $v = \sqrt{rg\tan\theta}$

Incorporate $r = L \sin u$ from the geometry in figure:

$$v = \sqrt{Lg\sin\theta\tan\theta}$$

Notice that the speed is independent of the mass of the ball.

ILLUSTRATION 6.16 A small block is connected to one end of two identical massless strings of length $16\dfrac{2}{3}$ cm each with their other ends fixed to a vertical rod. If the ratio of tensions T_1/T_2 is 4 : 1, then what will be the angular velocity of the block? Take $g = 9.8\ \text{m s}^{-2}$.

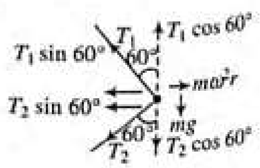


Solution. For horizontal,

$$T_1 \sin 60° + T_2 \sin 60° = m\omega^2 r = m\omega^2 l \sin 60°$$
$$\Rightarrow \quad T_1 + T_2 = m\omega^2 l \qquad \text{(i)}$$

For vertical equilibrium of the block,

$$T_1 \cos 60° = T_2 \cos 60° + mg$$
$$\Rightarrow \quad T_1 - T_2 = \frac{mg}{\cos 60°} = 2\,mg \qquad \text{(ii)}$$



Dividing (i) by (ii), $\dfrac{T_1 + T_2}{T_1 - T_2} = \dfrac{\omega^2 l}{2g}$

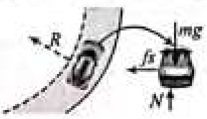
$$\Rightarrow \quad \frac{\frac{T_1}{T_2}+1}{\frac{T_1}{T_2}-1}=\frac{\omega^2 l}{2g} \quad \Rightarrow \quad \frac{4+1}{4-1}=\frac{\omega^2 l}{2g}$$

or $\quad \omega^2=\dfrac{10g}{3l}=\dfrac{10\times 9.8\times 3}{3\times 50\times 10^{-2}}=196$

or $\quad \omega = 14 \text{ rad s}^{-1}$

TURNING OF A VEHICLE ON HORIZONTAL CIRCULAR ROAD

A car moving on a flat, horizontal road negotiates a curve as shown in the figure. If the radius of the curve is R and the coefficient of static friction between the tires and dry pavement is μ_s, let us consider maximum speed the car can have and still it makes the turn successfully.



The force that enables the car to remain in its circular path is the force of static friction. (It is *static* because no slipping occurs at the point of contact between road and tires. The maximum speed, v_{max}, the car can have around the curve is the speed at which it is on the verge of skidding outward. At this point, the friction force has its maximum value $f_{s,max}=\mu_s N$. Apply equation in the radial direction for the maximum speed condition:

$$f_{s,max}=\mu_s N=\frac{mv_{max}^2}{r} \qquad \text{(i)}$$

The car is in equilibrium the vertical direction:

$$\sum F_y = 0 \Rightarrow N - mg = 0 \Rightarrow N = mg \qquad \text{(ii)}$$

From equations (i) and (ii), we get

$$v_{max}=\sqrt{\frac{\mu_s NR}{m}}=\sqrt{\frac{\mu_s (mg)R}{m}}=\sqrt{\mu_s gR}$$

Notice that the maximum speed does not depend on the mass of the car, which is why curved highways do not need multiple speed limits to cover the various masses of vehicles using the road.

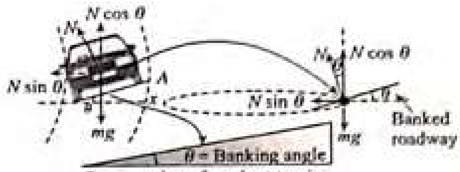
Banking of Roads

The curved roadways are designed in such a way that a vehicle will not have to rely on friction to round the curve without skidding. In other words, a car moving at the designated speed can negotiate the curve even when the road is covered with ice. For achieving this, such roads are usually *banked,* which means that the roadway is tilted toward the inside of the curve as seen in the figure.

Banking of curved road provides following purposes:

- To contribute in providing necessary centripetal force
- To reduce frictional wear and tear of tyres
- To avoid skidding
- To avoid overturning of vehicles

Suppose the designated speed for the curved road ramp is to be v and the radius of the curve is R. Let us find at what angle should the curve be banked.



Cross section of roads at turning

The car is modeled as a particle in equilibrium in the vertical direction and a particle in uniform circular motion in the horizontal direction.

Write Newton's second law for the car in the radial direction, which is the x direction:

$$\sum F_r = N\sin\theta = \frac{mv^2}{R} \qquad \text{(i)}$$

Apply the particle in equilibrium model to the car in the vertical direction:

$$\sum F_y = N\cos\theta - mg = 0$$

$$N\cos\theta = mg \qquad \text{(ii)}$$

Divide Eq. (i) by Eq. (ii): $\tan\theta = \dfrac{v^2}{rg}$ (iii)

ILLUSTRATION 6.17 A turn of radius 20 m is banked for the vehicles going at a speed of 36 km h^{-1}. If the coefficient of static friction between the road and the tyre is 0.4, what are the possible speeds of a vehicle so that it neither slips down nor skids up?

Solution. Angle of banking for designed speed,

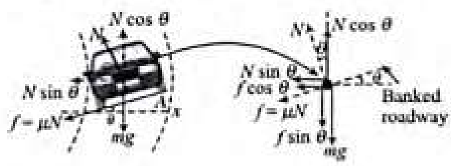
$$\tan\theta = \frac{v_0^2}{Rg} \qquad \text{(i)}$$

$$v_0 = 36 \text{ km h}^{-1} = 10 \text{ m s}^{-1}$$

$$\Rightarrow \quad \tan\theta = \frac{v_0^2}{Rg}=\frac{10^2}{20\times 10}=\frac{1}{2}$$

The vehicle may have the tendency to slide up or down depending on the speed of the vehicle. If speed of the vehicle is more it has tendency to side up and visa-versa.

For speed greater than designed speed: The vehicle has the tendency to slide. Friction will act downward.



In vertical direction $\sum F_y = 0$, $N\cos\theta - \mu N\sin\theta = mg$

In horizontal direction $\sum F_r = \dfrac{mv_{max}^2}{R}$

$$N\sin\theta + \mu N\cos\theta = \frac{mv_{max}^2}{R} \qquad \text{(ii)}$$

$$N\cos\theta - \mu N\sin\theta = mg \qquad \text{(iii)}$$

From (ii) and (iii)

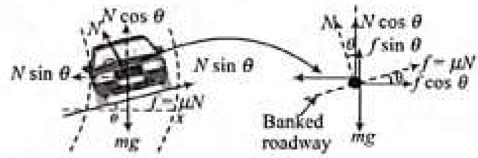
$$\frac{N(\sin\theta+\mu\cos\theta)}{N(\cos\theta-\mu\sin\theta)}=\frac{\frac{mv_{max}^2}{R}}{mg}\Rightarrow\frac{(\sin\theta+\mu\cos\theta)}{\cos\theta-\mu\sin\theta}=\frac{v_{max}^2}{Rg}$$

$$\Rightarrow\quad\left(\frac{\tan\theta+\mu}{1-\mu\tan\theta}\right)=\frac{v_{max}^2}{Rg}\qquad\text{(iv)}$$

$$\Rightarrow\quad\left(\frac{\tan\theta+\mu}{1-\mu\tan\theta}\right)=\left(\frac{0.5+0.4}{1-0.4\times0.5}\right)=\frac{v_{max}^2}{20\times10}$$

$$\Rightarrow\quad v_{max}=15\ \mathrm{m\,s^{-1}}$$

For speed less than designed speed: The vehicle has tendency to slide down friction will act upward.



In vertical direction $\sum F_y=0$, $N'\cos\theta+\mu N'\sin\theta=mg$ (v)

In horizontal direction $\sum F_r=\dfrac{mv_{max}^2}{R}$

$$N'\sin\theta-\mu N'\cos\theta=\frac{mv'^2}{R}\qquad\text{(vi)}$$

From (v) and (vi), we get $\dfrac{(\sin\theta-\mu\cos\theta)}{\cos\theta+\mu\sin\theta}=\dfrac{v'^2}{Rg}$

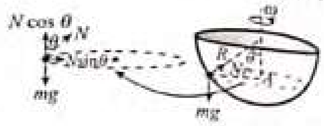
$$\left(\frac{\tan\theta-\mu}{1+\mu\tan\theta}\right)=\frac{v'^2}{Rg}\quad\Rightarrow\quad v_{min}=10\sqrt{\frac{1}{6}}\ \mathrm{m\,s^{-1}}$$

OTHER APPLICATIONS OF NEWTON'S LAWS OF MOTION IN CIRCULAR MOTION

- Remember $\dfrac{mv^2}{r}$ is not a force itself. It is just the value of the net force acting along the inside normal which is responsible for circular motion.
- This force may be friction, normal, tension, spring force, gravitational force or a combination of them. So to solve any problem in uniform circular motion, we identify all the forces acting along the normal (toward's center). Calculate their resultant and equate it to mv^2/r.
- If the circular motion is non-uniform, then in addition to above step we also identify all the forces acting along the tangent to the circular path, calculate their resultant and equate it to mdv/dt or $md|\vec{v}|/dt$.

ILLUSTRATION 6.18 A hemispherical bowl of radius R is rotating about its axis of symmetry which is kept vertical. A small ball kept in the bowl rotates with the bowl without slipping on its surface. If the surface of the bowl is smooth and the angle made by the radius through the ball with the vertical is θ, find the angular speed at which the bowl is rotating.

Solution. Let ω be the angular speed of the rotation of the bowl. Two forces are (*a*) normal reaction, N and (*b*) weight, mg.



The ball is rotating in a circle of radius r (= $R\sin\theta$) with center at A at an angular speed ω. Thus,

$$N\sin\theta=mr\omega^2=mR\omega^2\sin\theta$$

$$N=mR\omega^2\qquad\text{(i)}$$

and $\quad N\cos\theta=mg\qquad$ (ii)

Dividing Eqs. (i) by (ii), we get

$$\frac{1}{\cos\theta}=\frac{\omega^2R}{g}$$

$$\omega=\sqrt{\frac{g}{R\cos\theta}}$$

CONCEPT APPLICATION EXERCISE 6.3

1. An amusement park ride consist of a large vertical cylinder that spins about its axis fast enough that any person inside is held up against the wall when the floor drop away. The coefficient of static friction between person and wall is μ_s, and the radius of the cylinder is R.

   (a) Show that the maximum period of revolution necessary to keep the person from falling is $T=(4\pi^2R\mu_s/g)^{1/2}$.
   (b) Obtain a numerical value for T, taking $R=4.00$ m and $\mu_s=0.400$. How many revolutions per minute does the cylinder make?
   (c) If the rate of revolution of the cylinder is made to be somewhat larger, what happens to the magnitude of each one of the forces acting on the person? What happens to the motion of the person?
   (d) If instead the cylinder's rate of revolution is made to be somewhat smaller, what happens to the magnitude of each one of the forces acting on the person. What happens to the motion of the person?

2. A roller-coaster car has a mass of 500 kg when fully loaded with passengers.

   (a) If the vehicle has a speed of $20.0\ \mathrm{m\,s^{-1}}$ at point A, what is the force exerted by the track on the car at this point?
   (b) What is the maximum speed the vehicle can have at point B and still remain on the track?

3. An air puck of mass m_1 is tied to a string and allowed to revolve in a circle of radius R on a frictionless horizontal table. The other end of the string passes through a small hole in the center of the table, and a load of mass m_2 is tied to the string? The suspended load remains in equilibrium while the puck on the tabletop revolves.

   (a) Find the tension in the string.
   (b) Find the radial force acting on the puck.
   (c) Find the speed of the puck.
   (d) Qualitatively describe what will happen in the motion of the puck if the value of m_2 is somewhat increased by placing an additional load on it.
   (e) Qualitatively describe what will happen in the motion of the puck if the value of m_2 is instead decreased by removing a part from the hanging load.
4. A simple pendulum is oscillating with angular displacement 90°. For what angle with vertical the acceleration of bob directed horizontally?
5. A ceiling fan has a diameter (of the circle through the outer edges of the three blades) of 120 cm and rpm 1500 at full speed. Consider a particle of mass 1 g sticking at the outer end of a blade.
   (a) How much force does it experience when the fan runs at full speed?
   (b) Who exerts this force on the particle?
   (c) How much force does the particle exert on the blade along its surface?
6. A simple pendulum is constructed by attaching a bob of mass m to a string of length L fixed at its upper end. The bob oscillates in a vertical circle. It is found that the speed of the bob is v when the string makes an angle α with the vertical. Find the tension in the string and the magnitude of net force on the bob at the instant.
7. A car is moving with uniform speed over a circular bridge of radius R which subtends an angle of 90° at its center. Find the minimum possible speed so that the car can cross the bridge without losing the contact any where.

SOLVED EXAMPLES

1. A block of mass 2 kg is kept on the floor. The coefficient of static friction is 0.4. If a force F of 2.5 N is applied on the block as shown in the figure, the frictional force between the block and the floor will be

   (a) 2.5 N (b) 5 N
   (c) 7.84 N (d) 10 N

Sol. (a) Applied force = 2.5 N

Limiting friction $\mu mg = 0.4 \times 2 \times 9.8 = 7.84$ N

For the given condition applied force is very smaller than limiting friction.

$\therefore$ Static friction on a body = Applied force = 2.5 N

2. A body of mass 10 kg slides along a rough horizontal surface. The coefficient of friction is $1/\sqrt{3}$. Taking $g = 10\,\text{m/s}^2$, the least force which acts at an angle of 30° to the horizontal is
   (a) 25 N (b) 100 N
   (c) 50 N (d) $\dfrac{50}{\sqrt{3}}$ N

Sol. (c) Let P force is acting at an angle 30° with the horizontal.

For the condition of motion $F = \mu R$

$$P\cos 30° = \mu(mg - P\sin 30°)$$

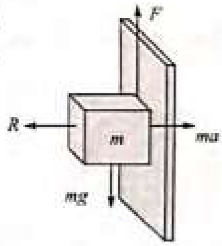
$$\Rightarrow \quad P\frac{\sqrt{3}}{2} = \frac{1}{\sqrt{3}}\left(100 - P\frac{1}{2}\right) \Rightarrow \frac{3P}{2} = \left(100 - \frac{P}{2}\right)$$

$$\Rightarrow \quad 2P = 100 \Rightarrow P = 50 \text{ N}$$

3. A rough vertical board has an acceleration a so that a 2-kg block pressing against it does not fall. The coefficient of friction between the block and the board should be

   (a) $>g/a$ (b) $<g/a$
   (c) $=g/a$ (d) $>a/g$

Sol. (a) For the limiting condition, upward friction force between board and block will balance the weight of the block.



i.e. $F > mg$

$\Rightarrow \quad \mu(R) > mg$

$\Rightarrow \quad \mu(ma) > mg$

$\Rightarrow \quad \mu > \dfrac{g}{a}$

4. Block A weighing 100 kg rests on a block B and is tied with a horizontal string to the wall at C. Block B weighs 200 kg. The coefficient of friction between A and B is 0.25 and between B and the surface is 1/3. The horizontal force P necessary to move the block B should be ($g = 10\text{ m/s}^2$)

   (a) 1150 N (b) 1250 N
   (c) 1300 N (d) 1420 N

Sol. (b) Friction between block A and block B and between block B and surface will oppose the P

$$\therefore \quad P = F_{AB} + F_{BS}$$
$$= \mu_{AB} m_A g + \mu_{BS}(m_A + m_B)g$$

$$= 0.25 \times 100 \times 10 + \frac{1}{3}(100+200)\times 10 = 1250 \text{ N}$$

5. A body B lies on a smooth horizontal table and another body A is placed on B. The coefficient of friction between A and B is μ. What acceleration given to B will cause slipping to occur between A and B?

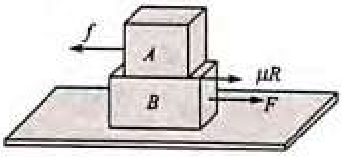
(a) μg (b) g/μ

(c) μ/g (d) $\sqrt{\mu g}$

Sol. (a) There is no friction between the body B and surface of the table. If the body B is pulled with force F, then

$F = (m_A + m_B)a$

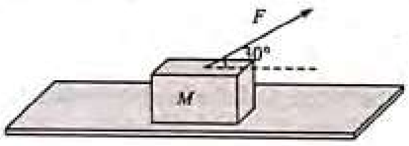
Due to this force, upper body A will feel the pseudo force in a backward direction.



$f = m_A \times a$

But due to friction between A and B, the body will not move. Body A will start moving when pseudo force is more than friction force, i.e., for slipping, $m_A a = \mu m_A g \Rightarrow a = \mu g$

6. A block of mass $M = 5$ kg is resting on a rough horizontal surface for which the coefficient of friction is 0.2. When a force $F = 40$ N is applied, the acceleration of the block will be ($g = 10$ m/s^2)

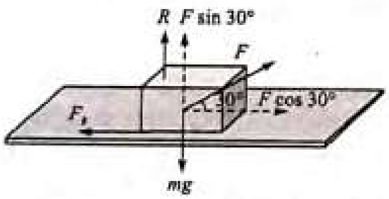


(a) 5.73 m/s^2 (b) 8.0 m/s^2

(c) 3.17 m/s^2 (d) 10.0 m/s^2

Sol. (a) Kinetic friction $= \mu_k R = 0.2(mg - F\sin 30°)$

$$= 0.2\left(5\times 10 \times 40 \times \frac{1}{2}\right) = 0.2(50-20) = 6 \text{ N}$$



$$\text{Acceleration of the block} = \frac{F\cos 30° - \text{Kinetic friction}}{\text{Mass}}$$

$$= \frac{40 \times \frac{\sqrt{3}}{2} - 6}{5} = 5.73 \text{ m/s}^2$$

7. A body of mass M is kept on a rough horizontal surface (friction coefficient μ). A person is trying to pull the body by applying a horizontal force but the body is not moving. The force by the surface on the body is F, where

(a) $F = Mg$ (b) $F = \mu Mgf$

(c) $Mg \le F \le Mg\sqrt{1+\mu^2}$ (d) $Mg \ge F \ge Mg\sqrt{1+\mu^2}$

Sol. (c) Maximum force by surface when friction works

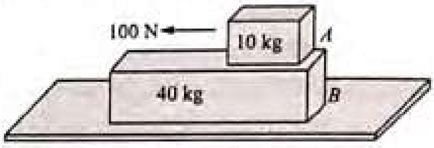
$$\sqrt{f^2 + R^2} = \sqrt{(\mu R)^2 + R^2} = R\sqrt{\mu^2+1}$$

Minimum force $= R$ when there is no friction

Hence, ranging from R to $R\sqrt{\mu^2+1}$ we get,

$$Mg \le F \le Mg\sqrt{\mu^2+1}$$

8. A 40 kg slab rests on a frictionless floor as shown in the figure. A 10 kg block rests on the top of the slab. The static coefficient of friction between the block and slab is 0.60 while the kinetic friction is 0.40. The 10 kg block is acted upon by a horizontal force 100 N. If $g = 9.8$ m/s^2, the resulting acceleration of the slab will be



(a) 1 m/s^2 (b) 1.5 m/s^2

(c) 2 m/s^2 (d) 6 m/s^2

Sol. (a) Limiting friction between block and slab

$= \mu_s m_A g = 0.6 \times 10 \times 10 = 60$ N

But applied force on block A is 100 N. So, the block will slip over a slab.

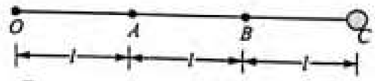
Now kinetic friction works between block and slab

$F_k = \mu_k m_A g = 0.4 \times 10 \times 10 = 40$ N

This kinetic friction helps to move the slab

$\therefore$ Acceleration of slab $\dfrac{40}{m_g} = \dfrac{40}{40} = 1$ m/s^2

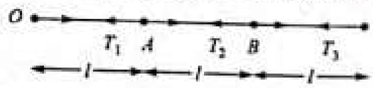
9. Three identical particles are joined together by a thread as shown in figure. All the three particles are moving in a horizontal plane. If the velocity of the outermost particle is v_0, then the ratio of tensions in the three sections of the string is



(a) 3 : 5 : 7 (b) 3 : 4 : 5

(c) 7 : 11 : 6 (d) 3 : 5 : 6

Sol. (d) Let ω is the angular speed of revolution



$T_3 = m\omega^2 3l$

$T_2 - T_3 = m\omega^2 2l \Rightarrow T_2 = m\omega^2 5l$

$T_1 - T_2 = m\omega^2 l \Rightarrow T_1 = m\omega^2 6l$

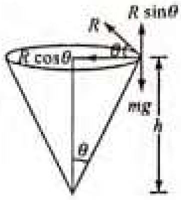
$T_3 : T_2 : T_1 = 3 : 5 : 6$

10. A particle describes a horizontal circle in a conical funnel whose inner surface is smooth with speed of 0.5 m/s. What is the height of the plane of circle from vertex of the funnel?

(a) 0.25 cm (b) 2 cm

(c) 4 cm (d) 2.5 cm

Sol. (d) The particle is moving in circular path



From the figure, $mg = R\sin\theta$ ...(i)

$$\frac{mv^2}{r} = R\cos\theta \quad \text{...(ii)}$$

From equation (i) and (ii) we get

$$\tan\theta = \frac{rg}{v^2} \text{ but } \tan\theta = \frac{r}{h}$$

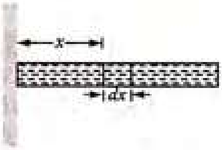
$$\therefore \quad h = \frac{v^2}{g} = \frac{(0.5)^2}{10} = 0.025\text{ m} = 2.5\text{cm}$$

11. A tube of length L is filled completely with an incompressible liquid of mass M and closed at both the ends. The tube is then rotated in a horizontal plane about one of its ends with a uniform angular velocity ω. The force exerted by the liquid at the other end is

(a) $\dfrac{ML\omega^2}{2}$ (b) $ML\omega^2$

(c) $\dfrac{ML\omega^2}{4}$ (d) $\dfrac{ML^2\omega^2}{2}$

Sol. (a) $dM = \left(\dfrac{M}{L}\right)dx$



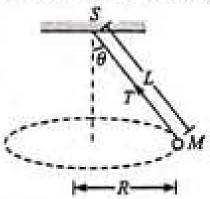
Force on dM mass is

$$dF = (dM)\,\omega^2 x$$

By integration, we can get the force exerted by whole liquid

$$\Rightarrow \quad F = \int_0^L \frac{M}{L}\omega^2 x\,dx = \frac{1}{2}M\omega^2 L$$

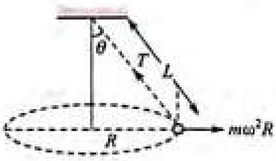
12. A string of length L is fixed at one end and carries a mass M at the other end. The string makes $2/\pi$ revolutions per second around the vertical axis through the fixed end as shown in the figure. Then tension in the string is



(a) ML (b) $2ML$

(c) $4ML$ (d) $16ML$

Sol. (d)



$$T\sin\theta = M\omega^2 R \quad \text{...(i)}$$

$$T\sin\theta = M\omega^2 L\sin\theta \quad \text{...(ii)}$$

From (i) and (ii)

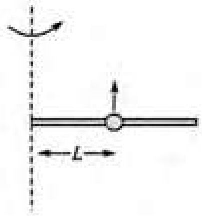
$$T = M\omega^2 L = M4\pi^2 n^2 L = M\,4\pi^2\left(\frac{2}{\pi}\right)^2 L = 16ML$$

13. A long horizontal rod has a bead which can slide along its length, and initially placed at a distance L from one end A of the rod. The rod is set in angular motion about A with constant angular acceleration α. If the coefficient of friction between the rod and the bead is μ, and gravity is neglected, then the time after which the bead starts slipping is

(a) $\sqrt{\dfrac{\mu}{\alpha}}$ (b) $\dfrac{\mu}{\sqrt{\alpha}}$

(c) $\dfrac{1}{\sqrt{\mu\alpha}}$ (d) Infinitesimal

Sol. (a) Let the bead starts slipping after time t.



For critical condition

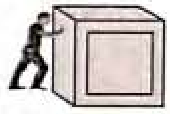
Frictional force provides the centripetal force

$$m\omega^2 L = \mu R = \mu m \times a_t = \mu L m\alpha$$

$$\Rightarrow \quad m\omega^2 L = \mu R = \mu m \times a_t = \mu L m\alpha$$

$$\Rightarrow \quad m(\alpha t)^2 L = \mu m L\alpha \quad t = \sqrt{\frac{\mu}{\alpha}} \qquad (\text{As } \omega = \alpha t)$$

14. A man of mass 75 kg is pushing a heavy box on a flat floor. The coefficient of kinetic and static friction between the floor and the box is 0.20, and the coefficient of static friction between the man's shoes and the floor is 0.80. If the man pushes horizontally (see figure), what is the maximum mass (in kg) of the box he can move?



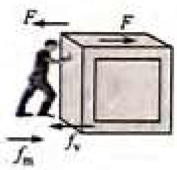
(a) 300 kg (b) 600 kg

(c) 900 kg (d) None of these

Sol. (a) From FBD of box, the box will move if

$$F \le f_b$$

$$\Rightarrow \quad F \ge 0.2mg \quad \text{(i)}$$



where m is the mass of box.

If man is moving the box, then there is no slipping of shoes of man on floor. So friction on man f_m will be static.

From FBD of man $\quad f_m = F$

but $\quad f_m \le \mu_s 75g$

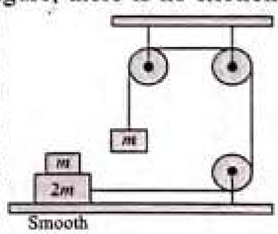
$$\Rightarrow \quad F \le \mu_s 75g \quad \text{(ii)}$$

From (i) and (ii)

$$0.2mg \le F \le \mu_s 75g \quad \Rightarrow \quad 0.2mg \le \mu_s 75g$$

$$\Rightarrow \quad m \le \frac{0.8}{0.2}75 \quad \Rightarrow \quad m \le 300\text{ kg}$$

15. In the arrangement shown in figure, there is no friction between the block of mass $2m$ and ground but there is friction between the blocks of masses m and $2m$. The block of mass m is stationary with respect to block of mass $2m$. The least value of coefficient of friction between m and $2m$ is



(a) $\frac{1}{2}$ (b) $\frac{1}{\sqrt{2}}$ (c) $\frac{1}{4}$ (d) $\frac{1}{3}$

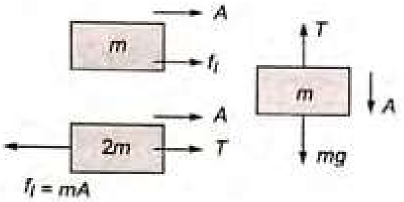
Sol. (c) For least value of coefficient of friction, limiting friction will exist between m and $2m$.

$mg - T = mA$

$T - f_l = 2\,mA$

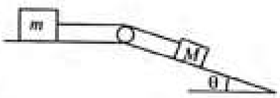
$f_l = mA$

Solving. $f_l = \dfrac{mg}{4}$



$$\mu mg = \frac{mg}{4} \;\Rightarrow\; \mu = \frac{1}{4}$$

16. Find the maximum value of (M/m) in the situation shown in figure so that the system remains at rest. Friction coefficient of both the contacts is μ, string is massless and pulley is friction less.



(a) $\dfrac{\cos\theta}{\sin\theta - \mu\cos\theta}$ (b) $\dfrac{\sin\theta}{\sin\theta - \mu\cos\theta}$

(c) $\dfrac{\mu\cos\theta}{\sin\theta - \mu\cos\theta}$ (d) $\dfrac{\mu}{\sin\theta - \mu\cos\theta}$

Sol. (d) The system is at rest ($F_{net} = 0$)

For maximum M/m ; Limiting friction will be acting on both blocks (at contact surfaces).

$\mu g + \mu Mg\cos\theta$ = Net pulling force on the whole system

$\mu mg + \mu Mg\cos\theta = Mg\sin\theta$

$Mg(\sin\theta - \mu\cos\theta) = \mu mg.$

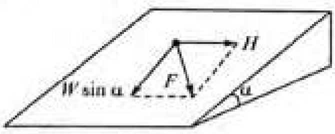
$$\frac{M}{m} = \frac{\mu}{(\sin\theta - \mu\cos\theta)}$$

17. A particle of weight W rests on a rough inclined plane which makes an angle α with the horizontal. If the coefficient of static friction $\mu = 2\tan\alpha$, find the horizontal force H acting transverse to the slope of the plane when the particle is about to slip.

(a) $2W\sin\alpha$ (b) $W\sin\alpha$

(c) $\dfrac{\sqrt{3}}{2}W\sin\alpha$ (d) $W\sqrt{3}\sin\alpha$

Sol. (d) Net force: $F = \sqrt{(W\sin\alpha)^2 + H^2}$



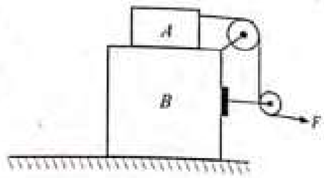
When the particle is about to slip:

$F = \mu N$

$\Rightarrow \sqrt{(W\sin\alpha)^2 + H^2} = (2\tan\alpha)\,W\cos\alpha$

$\Rightarrow H = \sqrt{3}\,W\sin\alpha$

18. In the arrangement shown in figure, $m_A = m_B = 2$ kg. String is massless and pulley is frictionless. Block B is resting on a smooth horizontal surface, while friction coefficient between blocks A and B is $\mu = 0.5$. The maximum horizontal force F that can be applied so that block A does not slip over the block B is



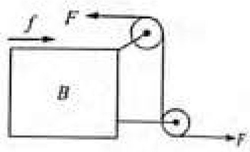
(a) 25 N (b) 40 N

(c) 30 N (d) 20 N

Sol. (d) Maximum value of friction on A,

$$f_{max} = \mu mg = 0.5 \times 2 \times 10 = 10\text{ N}$$

Hence, the block B is subjected to this frictional force in the forward direction. Since block A does not slip on B, both of them move with a common acceleration. The acceleration of B is the same as the acceleration of A.

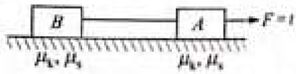


To determine acceleration of a, we find that $m_B a_{max} = f_{max}$

$$a_{max} = \frac{10}{2} = 5\text{m/s}^2$$

$$F_{max} = (m_A + m_B)a_{max} = 4 \times 5 = 20\text{ N}$$

19. A force $F = t$ is applied to a block A as shown in figure, where t is time in seconds. The force is applied at $t = 0$ seconds when the system was at rest. Which of the following graph correctly gives the frictional force between A and horizontal surface as a function of time t. [Assume that at $t = 0$, tension in the string connecting the two blocks is zero].



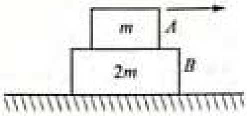
(a) 
(b) 
(c) 
(d) 
Sol. (c) Let m_A and m_B be the mass of blocks A and B, respectively.

As the force F increases from 0 to $\mu_s m_A g$, the frictional force on block A is such that $f = F$. When $F = \mu_s m_A g$, the frictional force f attains maximum value $f = \mu_s m_A g$.

As F is further increased to $\mu_s (m_A + m_B)g$, the block A does not move. In this duration frictional force on block A remains constant at $\mu_s m_A g$. After this blocks start moving and friction decrease.

Hence, (c) is correct choice.

20. In the figure block A of mass m is placed on block B of mass $2m$. B rests on floor. The coefficient of friction between A and B is μ and that between B and floor is $\mu/2$. Both blocks are given same initial velocity to the right. What is the acceleration of A with respect to B?



(a) $\frac{\mu g}{2}$ towards right

(b) μg towards left

(c) $\frac{\mu g}{4}$ towards left

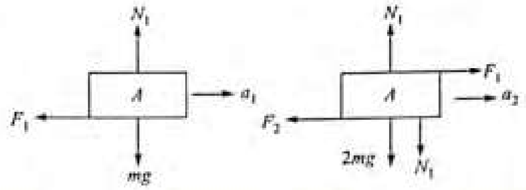
(d) $\frac{3\mu g}{4}$ towards left

Sol. (d) $F_1 = +\mu N_1$

$ma_1 = -\mu N_1$

$a_1 = -\mu g$

$F_1 - F_2 = (2m)\, a_2$



$$\mu mg - \frac{\mu}{2}(3mg) = 2ma_2$$

$$a_2 = -\frac{\mu g}{4}$$

Acceleration of A with respect to B

$$-\mu g - \left(-\frac{\mu g}{4}\right) = -\frac{3\mu g}{4}$$

$\Rightarrow$ $\frac{3\mu g}{4}$ towards left.

EXERCISES

Basic Concept of Static and Kinetic Friction

1. A box of mass 8 kg is placed on a rough inclined plane of inclination θ. Its downward motion can be prevented by applying an upward pull F and it can be made to slide upwards by applying a force $2F$. The coefficient of friction between the box and the inclined plane is

(a) $(\tan\theta)/3$ (b) $3\tan\theta$
(c) $(\tan\theta)/2$ (d) $2\tan\theta$

2. A horizontal force just sufficient to move a body of mass 4 kg lying on a rough horizontal surface is applied on it. The coefficient of static and kinetic friction between the body and the surface are 0.8 and 0.6, respectively. If the force continues to act even after the block has started moving, the acceleration of the block in $m\,s^{-2}$ is ($g = 10\ m\,s^{-2}$)

(a) 1/4 (b) 1/2 (c) 2 (d) 4

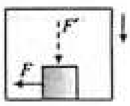
3. A passenger is travelling a train moving at 40 $m\,s^{-1}$. His suitcase is kept on the berth. The driver of train applies breaks such that the speed of the train decreases at a constant rate to 20 $m\,s^{-1}$ in 5 s. What should be the minimum coefficient of friction between the suitcase and the berth if the suitcase is not to slide during retardation of the train?

(a) 0.3 (b) 0.5 (c) 0.1 (d) 0.2

4. A rectangular wooden box 10 cm × 20 cm × 40 cm in size is kept on a horizontal surface with its face of largest area on the surface. A minimum force of 10 N applied parallel to the surface sets the box in sliding motion along the surface. If the box is now kept with its face of smaller area in contact with the surface, the minimum force applied parallel to the surface, to set the box in motion, is

(a) less than 10 N
(b) may be greater or less than 10 N
(c) greater than 10 N
(d) equal to 10 N

5. A block of mass m is kept on the floor of a freely falling lift. During the free fall of the lift, the block is pulled horizontally with a force of $F = 5$ N. $\mu_s = 0.1$. The frictional force on the block will be



(a) 5 N (b) 2 N (c) zero (d) 10 N

6. If in previous problem, an additional force $F' = 100$ N is applied in vertical direction as shown in figure. The friction force acting on the block is

(a) zero (b) 10 N (c) 20 N (d) 5 N

7. Figure shows a wooden block at rest in equilibrium on a rough horizontal plane being acted upon by forces $F_1 = 10$ N, $F_2 = 2$ N as shown.

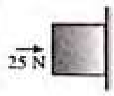
If F_1 is removed, the resultant force acting on the block will be

(a) 2 N towards left (b) 2 N towards right
(c) zero (d) cannot be determined

8. A lift is moving upwards with a uniform velocity v in which a block of mass m is lying. The frictional force offered by the block, when coefficient of friction is $\mu = 0.5$, will be

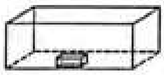
(a) zero (b) $mg/2$ (c) mg (d) $2mg$

9. A horizontal force of 25 N is necessary to just hold a block stationary against a wall. The coefficient of friction between the block and the wall is 0.4. The weight of the block is



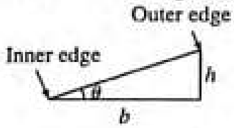
(a) 2.5 N (b) 20 N (c) 10 N (d) 5 N

10. A solid block of mass 2 kg is resting inside a cube as shown in the figure. The cube is moving with a velocity $\vec{v} = 5\hat{i} + 2\hat{j}$ m s^{-1}. If the coefficient of friction between the surface of cube and block is 0.2, then the force of friction between the block and cube is



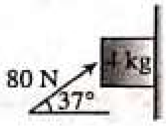
(a) 10 N (b) 4 N (c) 14 N (d) Zero

11. A vehicle is moving with a velocity v on a curved road of width b and radius of curvature R. For counteracting the centrifugal force on the vehicle, the difference in elevation required in between the outer and inner edges of the rod is



(a) v^2b/Rg (b) vb/Rg (c) vb^2/Rg (d) vb/R^2g

12. A block of mass 4 kg is pressed against the wall by a force of 80 N as shown in the figure. Determine the value of friction force and block's acceleration (take $\mu_s = 0.2$, $\mu_k = 0.15$).



(a) 8 N, 0 m s^{-2} (b) 32 N, 6 m s^{-2}
(c) 8 N, 6 m s^{-2} (d) 32 N, 2 m s^{-2}

13. A block of mass m, lying on a horizontal plane, is acted upon by a horizontal force P and another force Q, inclined at an angle θ to the vertical. The block will remain in equilibrium if the coefficient of friction between it and the surface is (assume $P > Q$)

(a) $(P \sin\theta - Q)/(mg - \cos\theta)$
(b) $(P - Q\sin\theta)/(mg + Q\cos\theta)$
(c) $(P\cos\theta + Q)/(mg - Q\cos\theta)$
(d) $(P + Q\sin\theta)/(mg + Q\cos\theta)$

14. A given object takes n times more time to slide down 45° rough inclined plane as it takes to slide down a perfectly smooth 45° incline. The coefficient of kinetic friction between the object and the incline is

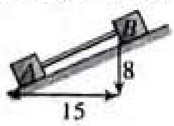
(a) $\sqrt{\dfrac{1}{1-n^2}}$ (b) $\sqrt{1-\dfrac{1}{n^2}}$

(c) $1-\dfrac{1}{n^2}$ (d) $\dfrac{1}{2-n^2}$

15. The upper half of an inclined plane with inclination ϕ is perfectly smooth while the lower half is rough. A body starting from rest at the top will again come to rest at the bottom if the coefficient of friction for the lower half is given by

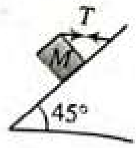
(a) $2\tan\phi$ (b) $\tan\phi$ (c) $2\sin\phi$ (d) $2\cos\phi$

16. Blocks A and B in the figure are connected by a bar of negligible weight. Mass of each block is 170 kg and $\mu_A = 0.2$ and $\mu_B = 0.4$, where μ_A and μ_B are the coefficients of limiting friction between blocks and plane, calculate the force developed in the bar ($g = 10\ \text{m s}^{-2}$)



(a) 150 N (b) 75 N (c) 200 N (d) 250 N

17. A block of mass 15 kg is resting on a rough inclined plane as shown in the figure. The block is tied by a horizontal string which has a tension of 50 N. The coefficient of friction between the surfaces of contact is



(a) 1/2 (b) 2/3 (c) 3/4 (d) 1/4

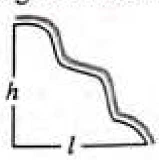
18. In the figure, the tension in the rope (rope is light) is

(a) $(M + m)g\sin\theta$
(b) $(M + m)g\sin\theta - \mu mg\cos\theta$
(c) Zero
(d) $(M + m)g\cos\theta$

19. A house is built on the top of a hill with 45° slope. Due to the sliding of material and sand from top to the bottom of hill, the slope angle has been reduced. If the coefficient of static friction between sand particles is 0.75, what is the final angle attained by hill? ($\tan^{-1} 0.75 \simeq 37°$)

(a) 8° (b) 45° (c) 37° (d) 30°

20. A uniform chain is placed at rest on a rough surface of base length l and height h on an irregular surface as shown in the figure. Then, the minimum coefficient of friction between the chain and the surface must be equal to

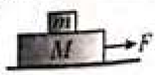


(a) $\mu = \dfrac{h}{2l}$ (b) $\mu = \dfrac{h}{l}$

(c) $\mu = \dfrac{3h}{2l}$ (d) $\mu = \dfrac{2h}{3l}$

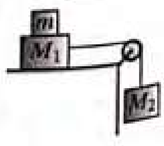
Application of Newton's Laws of Motion with Friction

21. A block of mass m is placed on another block of mass M, which itself is lying on a horizontal surface. The coefficient of friction between two blocks is μ_1 and that between the block of mass M and horizontal surface is μ_2. What maximum horizontal force can be applied to the lower block so that the two blocks move without separation?



(a) $(M + m)(\mu_2 - \mu_1)g$ (b) $(M - m)(\mu_2 - \mu_1)g$
(c) $(M - m)(\mu_2 + \mu_1)g$ (d) $(M + m)(\mu_2 + \mu_1)g$

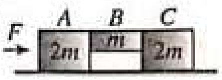
22. Two blocks of masses M_1 and M_2 are connected with a string passing over a pulley as shown in the figure. The block M_1 lies on a horizontal surface. The coefficient of friction between the block M_1 and the horizontal surface is μ. The system accelerates. What additional mass m should be placed on the block M_1 so that the system does not accelerate?



(a) $\dfrac{M_2 - M_1}{\mu}$ (b) $\dfrac{M_2}{\mu} - M_1$

(c) $M_2 - \dfrac{M_1}{\mu}$ (d) $(M_2 - M_1)\mu$

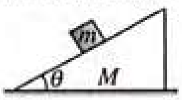
23. A system is pushed by a force F as shown in the figure. All surfaces are smooth except between B and C. Friction coefficient between B and C is μ. Minimum value of F to prevent block B from down ward slipping is



(a) $\left(\dfrac{3}{2\mu}\right)mg$ (b) $\left(\dfrac{5}{2\mu}\right)mg$

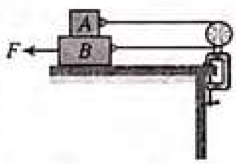
(c) $\left(\dfrac{5}{2}\right)\mu mg$ (d) $\left(\dfrac{3}{2}\right)\mu mg$

24. In the figure shown, the block of mass m is at rest relative to the wedge of mass M and the wedge is at rest with respect to ground. This implies that



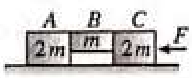
(a) Net force applied by m on M is mg.
(b) Normal force applied by m on M is mg.
(c) Force of friction applied by m on M is mg.
(d) None of the above.

25. Block A, as shown in the figure weighs 2.0 N and block B weighs 6.0 N. The coefficient of kinetic friction between all surfaces is 0.25. Find the magnitude of the horizontal force necessary to drag block B to the left at constant speed if A and B are connected by a light, flexible cord passing around a fixed, frictionless pulley.



(a) 2 N (b) 3 N (c) 5 N (d) 6 N

26. The system is pushed by a force F as shown in figure. All surfaces are smooth except between B and C. Friction coefficient between B and C is μ. Minimum value of F to prevent block B from downward slipping is



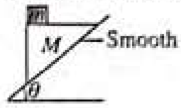
(a) $\left(\dfrac{5}{2\mu}\right)mg$ (b) $\left(\dfrac{5}{3\mu}\right)mg$

(c) $\left(\dfrac{5}{2}\right)\mu mg$ (d) $\left(\dfrac{3}{2}\right)\mu mg$

27. A block of mass M is being pulled along rough horizontal surface. The coefficient of friction between the block and the surface is μ. If another block of mass $M/2$ is placed on the block and it is again pulled on the surface, the coefficient of friction between the block and the surface will be

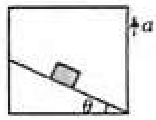
(a) μ (b) $\dfrac{3\mu}{2}$ (c) 2μ (d) $\dfrac{5\mu}{2}$

28. A triangular prism of mass M with a block of mass m placed on it is released from rest on a smooth inclined plane of inclination θ. The block does not slip on the prism. Then



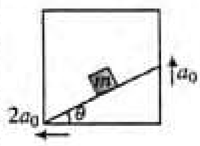
(a) The acceleration of the prism is $g \cos \theta$.
(b) The acceleration of the prism is $g \tan \theta$.
(c) The minimum coefficient of friction between the block and the prism is $\mu_{\min} = \cot \theta$.
(d) The minimum coefficient of friction between the block and the prism is $\mu_{\min} = \tan \theta$.

29. A block of mass m is at rest with respect to a rough incline kept in elevator moving up with acceleration a. Which of following statements is correct?



(a) The contact force between block and incline is parallel to the incline.
(b) The contact force between block and incline is of the magnitude $m(g + a)$.
(c) The contact force between block and incline is perpendicular to the incline.
(d) The contact force is of the magnitude $mg \cos \theta$

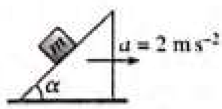
30. For the situation shown in the figure, the block is stationary w.r.t. incline fixed in an elevator. The elevator is having an acceleration of $\sqrt{5}\,a_0$ whose components are shown in the figure. The surface is rough and coefficient of static friction between the incline and block is μ_s. Determine the magnitude of force exerted by incline on the block. (Take $a_0 = g/2$ and $\theta = 37°$, $\mu_s = 0.2$.)



(a) $\dfrac{mg}{10}$ (b) $\dfrac{9mg}{25}$

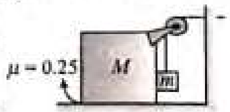
(c) $\dfrac{3mg}{25} \times \sqrt{41}$ (d) $\dfrac{\sqrt{13}\,mg}{2}$

31. A block of mass m is lying on a wedge having inclination angle $\alpha = \tan^{-1}\left(\dfrac{1}{5}\right)$. Wedge is moving with a constant acceleration $a = 2\text{ m s}^{-2}$. The minimum value of coefficient of friction μ so that m remains stationary w.r.t.wedge is



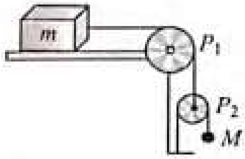
(a) 2/9 (b) 5/12 (c) 1/5 (d) 2/5

32. Two blocks (m and M) are arranged as in the figure. There is friction between ground and M only and other surfaces are frictionless. The coefficient of friction between ground and M is μ = 0.25. The maximum ratio of m and M (m/M) so that the system remains is at rest



(a) $\frac{1}{3}$ (b) $\frac{2}{5}$ (c) 3 (d) $\frac{5}{2}$

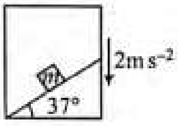
33. In the pulley arrangement shown in the figure, the pulley P_2 is movable. Assuming the coefficient of friction between m and surface to be μ, the minimum value of M for which m is at rest is



(a) $M = \frac{\mu m}{2}$ (b) $m = \frac{\mu M}{2}$

(c) $M = \frac{m}{2\mu}$ (d) $m = \frac{M}{2\mu}$

34. A block of mass m is kept on an inclined plane of a lift moving down with acceleration of $2\ \text{m s}^{-2}$. What should be the minimum coefficient of friction to let the block move down with constant velocity?



(a) $\mu = \frac{1}{\sqrt{3}}$ (b) $\mu = 0.4$

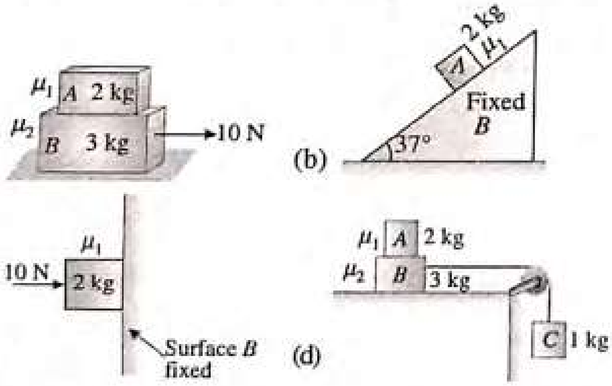
(c) $\mu = 0.8$ (d) $\mu =$ not defined

35. A body of mass M is resting on a rough horizontal plane surface, the coefficient of friction being equal to μ. At $t = 0$, a horizontal force $F = F_0 t$ starts acting on it, where F_0 is a constant. Find the time T at which the motion starts?

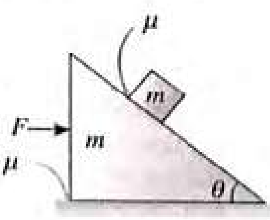
(a) $\mu Mg/F_0$ (b) $Mg/\mu F_0$

(c) $\mu F_0/Mg$ (d) None of these

36. In which of the following cases the friction force between 'A' and 'B' is maximum. In all cases $\mu_1 = 0.5$, $\mu_2 = 0$.



37. In the situation shown in figure a wedge of mass m is placed on a rough surface, on which a block of equal mass is placed on the inclined plane of wedge. Friction coefficient between plane and the block and the ground and the wedge (μ). An external force F is applied horizontally on the wedge. Given that m does not slide on incline due to its weight.



The value of F at which wedge will start slipping is:

(a) $= \mu\, mg$ (b) $= (3/2)\, \mu\, mg$

(c) $> 2\mu\, mg$ (d) $< \mu\, mg$

38. If in question no. 37, the wedge and block moves together. Then the value of F at which no friction will act on block on inclined plane, is

(a) $2\mu\, mg$ (b) $2\mu\, mg + 2\, mg \tan\theta$

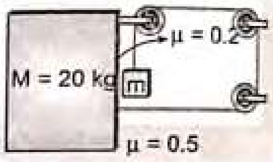
(c) $2\mu\, mg + mg \tan\theta$ (d) $2\mu\, mg + mg \sin\theta$

39. The minimum value of acceleration of wedge for which the block starts sliding on the wedge, is:

(a) $g\left(\frac{\cos\theta + \mu \sin\theta}{\sin\theta - \mu\cos\theta}\right)$ (b) $g\left(\frac{\sin\theta + \mu\cos\theta}{\cos\theta - \mu\sin\theta}\right)$

(c) $g\left(\frac{\sin\theta - \mu\cos\theta}{\sin\theta + \mu\cos\theta}\right)$ (d) $g\left(\frac{\cos\theta - \mu\sin\theta}{\sin\theta + \mu\cos\theta}\right)$

40. In the arrangement shown in the figure, A block of mass $M = 20$ kg is placed on rough horizontal surface with $\mu = 0.5$. A block of mass m is arranged as shown. The maximum value of 'm' in order that system remains an equilibrium:



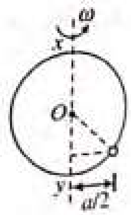
(a) $\frac{10}{3}$ kg (b) 10 kg (c) $\frac{40}{3}$ kg (d) $\frac{20}{3}$ kg

Dynamics of Circular Motion

41. A coin is placed at the edge of a horizontal disc rotating about a vertical axis through its axis with a uniform angular speed 2 rad s^{-1}. The radius of the disc is 50 cm. Find the minimum coefficient of friction between disc and coin so that the coin does not slip ($g = 10\ \text{m s}^{-2}$).

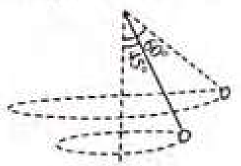
(a) 0.1 (b) 0.2 (c) 0.3 (d) 0.4

42. A small ring P is threaded on a smooth wire bent in the form of a circle of radius a and center O. The wire is rotating with constant angular speed ω about a vertical diameter XY, while the ring remains at rest relative to the wire at a distance $a/2$ from XY. Then ω^2 is equal to



(a) $\frac{2g}{a}$ (b) $\frac{g}{2a}$ (c) $\frac{2g}{a\sqrt{3}}$ (d) $\frac{g\sqrt{3}}{2a}$

43. When the string of a conical pendulum makes an angle of 45° with the vertical, its time period is T_1. When the string makes an angle of 60° with the vertical, its time period is T_2. Then T_1^2/T_2^2 is



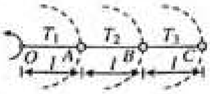
(a) 2

(b) $\sqrt{2}$

(c) 0.5

(d) none of these

44. Three identical particles are joined together by a thread as shown in the figure. All the three particles are moving in a horizontal plane. If the velocity of the outermost particle is v_0, then the ratio of tensions in the three sections of the string (T_1: T_2: T_3 = ?) is

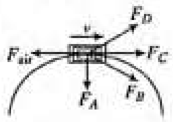


(a) 6 : 5 : 3 (b) 3 : 5 : 6
(c) 3 : 4 : 5 (d) none of these

45. A particle is projected with a speed $v_0 = \sqrt{gR}$. The coefficient of friction between the particle and the hemi-spherical plane is $\mu = 0.5$. Then, the acceleration of the particle is

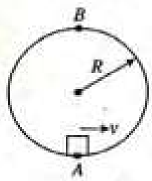
(a) $\sqrt{2}\,g \searrow$ (b) $\frac{\sqrt{5}\,g}{2} \nwarrow$
(c) $\sqrt{2}\,g \nwarrow$ (d) none of these

46. A car travels with constant speed on a circular road on level ground. In the figure, F_{air} is the force of air resistance on the car. Air resistance acts opposite to the motion of car. Which of the other forces shown best represents the horizontal force of the road on the car's tires?



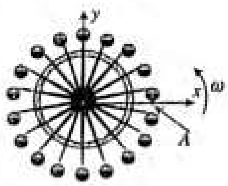
(a) F_C (b) F_D (c) F_A (d) F_B

47. A block of mass m is projected on a smooth horizontal circular track with velocity v. What is the average normal force exerted by the circular walls on the block during its motion from A to B?



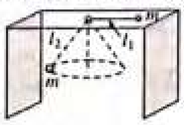
(a) $\frac{mv^2}{R}$ (b) $\frac{mv^2}{\pi R}$ (c) $\frac{2mv^2}{R}$ (d) $\frac{2mv^2}{\pi R}$

48. Consider the setup of a Ferris wheel in an amusement park. The wheel is turning in a counterclockwise manner. Contrary to the illustration, not all seats are aligned horizontally, i.e., parallel to the x-axis. Determine the orientation of the normal to seat as it passes point A.



(a) parallel to the x-axis
(b) in the first/third quadrants
(c) parallel to the y-axis
(d) in the second/fourth quadrants

49. Two identical particles are attached at the ends of a light string which passes through a hole at the center of a table. One of the particles is made to move in a circle on the table with angular velocity ω_1 and the other is made to move in a horizontal circle as a contact pendulum with angular velocity ω_2. If l_1 and l_2 are the length of the string over and under the table, then in order that particle under the table neither moves down nor moves up, the ratio l_1/l_2 is

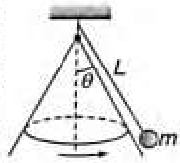


(a) $\frac{\omega_1}{\omega_2}$ (b) $\frac{\omega_2}{\omega_1}$ (c) $\frac{\omega_1^2}{\omega_2^2}$ (d) $\frac{\omega_2^2}{\omega_1^2}$

50. A circular road of radius 1000 m has banking angle 45°. The maximum safe speed (in m s^{-1}) of a car having a mass 2000 kg will be (if the coefficient of friction between tyre and road is 0.5)
(a) 172 (b) 124 (c) 99 (d) 86

51. A circular table of radius 0.5 m has a smooth diametrical groove. A ball of mass 90 g is placed inside the groove along with a spring of spring constant 10^2 N cm^{-1}. One end of the spring is tied to the edge of the table and the other end to the ball. The ball is at a distance of 0.1 m from the center when the table is at rest. On rotating the table with a constant angular frequency of 10^2 rad s^{-1}, the ball moves away from the center by a distance nearly equal to
(a) 10^{-1} m (b) 10^{-2} m (c) 10^{-3} m (d) 2×10^{-1} m

52. A small sized mass m is attached by a massless string (of length L) to the top of a fixed frictionless solid cone whose axis is vertical. The half angle at the vertex of the cone is θ. If the mass m moves around in a horizontal circle at speed v, what is the maximum value of v for which mass stays in contact with the cone? (g is acceleration due to gravity)



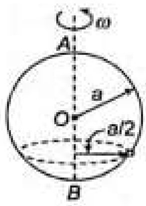
(a) $\sqrt{gL\cos\theta}$ (b) $\sqrt{gL\sin\theta}$
(c) $\sqrt{gL\sin\theta\tan\theta}$ (d) $\sqrt{gL\tan\theta}$

53. A circular road of radius R is banked for a speed v = 40 km/hr. A car of mass m attempts to go on the circular road, the friction co-efficient between the tyre and road is negligible:
(a) the car cannot make a turn without skidding
(b) if the car runs at a speed less than 40 km/hr, it will slip up the slope
(c) if the car runs at the correct speed of 40 km/hr, the force by the road on the car is equal to mv^2/r
(d) if the car runs at the correct speed of 40 km/hr, the force by the road on the car is greater than mg as well as greater than mv^2/r

54. An automobile enters a turn of radius R. If the road is banked at an angle of 45° and the coefficient of friction is 1, the minimum and maximum speed with which the automobile can negotiate the turn without skidding is
(a) $\sqrt{\frac{rg}{2}}$ and $\sqrt{rg}$ (b) $\frac{\sqrt{rg}}{2}$ and $\sqrt{rg}$
(c) $\frac{\sqrt{rg}}{2}$ and $2\sqrt{rg}$ (d) 0 and infinite

Problems Based on Mixed Concepts

55. A smooth wire is bent into a vertical circle of radius a. A bead P can slide smoothly on the wire. The circle is rotated about vertical diameter AB as axis with a speed ω as shown in figure. The bead P is at rest w.r.t. the circular ring in the position shown. Then ω^2 is equal to:



(a) $\frac{2g}{a}$ (b) $\frac{2g}{a\sqrt{3}}$ (c) $\frac{g\sqrt{3}}{a}$ (d) $\frac{2a}{g\sqrt{3}}$

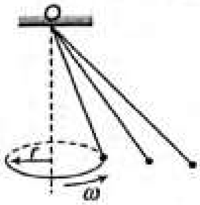
56. A particle is attached to an end of a rigid rod. The other end of the rod is hinged and the rod rotates always remaining horizontal. Its angular speed is increasing at constant rate. The mass of the particle is 'm'. The force exerted by the rod on the particle is $\vec{F}$, then:

(a) $F \geq mg$ (b) F is constant

(c) The angle between $\vec{F}$ and horizontal plane decreases

(d) The angle between $\vec{F}$ and the rod decreases

57. Three masses of small size are attached by light inextensible strings of various lengths to a point O on the ceiling. All of the masses swing round in horizontal circles of various radii with the same angular frequency ω (one such circle is drawn in the shown figure). Then pick up the correct statement.



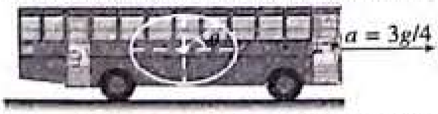
(a) The vertical depth of each mass below point of suspension from ceiling is different.

(b) The radius of horizontal circular path of each mass is same.

(c) All masses revolve in the same horizontal plane.

(d) All the particles must have same mass.

58. A bus is moving with a constant acceleration $a = 3g/4$ towards right. In the bus, a ball is tied with a rope and is rotated in vertical circle as shown. The tension in the rope will be minimum, when the rope makes an angle θ equal to.



(a) 53° (b) 37° (c) 180 − 53° (d) 180 + 37°

59. The force required just to move a body up an inclined plane is double the force required just to prevent the body sliding down. If the coefficient of friction is 0.25, the angle of inclination of the plane is

(a) 37° (b) 45° (c) 30° (d) 53°

60. Two blocks of masses m_1 and m_2 connected by a string are placed gently over a fixed inclined plane, such that the tension in the connecting string is initially zero. The coefficient of friction between m_1 and inclined plane is μ_1; between μ_2 and the inclined plane is μ_2. The tension in the string shall continue to remain zero if

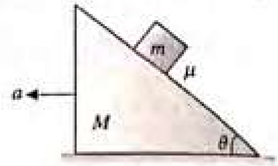
(a) $\mu_1 > \tan\alpha$ and $\mu_2 < \tan\beta$

(b) $\mu_1 < \tan\alpha$ and $\mu_2 > \tan\beta$

(c) $\mu_1 > \tan\alpha$ and $\mu_2 > \tan\beta$

(d) $\mu_1 > \tan\alpha$ and $\mu_2 > \tan\beta$

61. A block of mass m is at rest relative to the stationary wedge of mass M. The coefficient of friction between block and wedge is μ. The wedge is now pulled horizontally with acceleration 'a' as shown in figure. Then the minimum magnitude of 'a' for the friction between block and wedge to be zero is



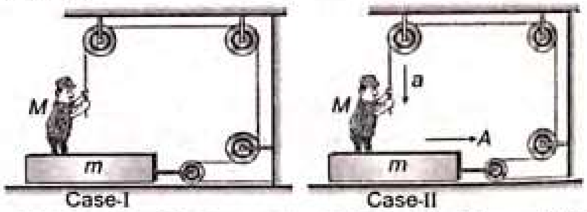
(a) $g\tan\theta$

(b) $\mu g\tan\theta$

(c) $g\cot\theta$

(d) $\mu g\cot\theta$

62. A board of mass $m = 11$ kg is placed on the floor and a man of mass $M = 70$ kg is standing on the board as shown (Case-I). The coefficient of friction between the board and the floor is $\mu = 0.25$. The maximum force that the man can exert on the rope so that the board does not slip on the floor is



(a) 125 N (b) 90 N (c) 162 N (d) None of these

63. If in case-II all surfaces are frictionless and the man hang on the rope without touching the board. The ratio of a/A is

(a) 2 (b) 1/2 (c) 1 (d) None of these

64. If in Case-II (all surfaces are frictionless) the acceleration of man will be

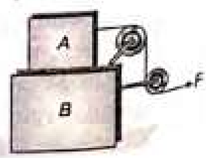
(a) $\frac{2800}{291}$ m/s^2 (b) $\frac{2218}{291}$ m/s^2

(c) 65 m/s^2 (d) None of these

65. A flat car is given an acceleration $a_0 = 2$ m/s^2 starting from rest. A cable is connected to a crate of weight 50 kg as shown whose other end is attached to a fixed support on ground. Neglect friction between the floor and the car wheels and also the mass of the pulley. Calculate corresponding tension in the cable if $\mu = 0.30$ between the crate and the floor of the car.

(a) 350 N (b) 250 N (c) 300 N (d) None of these

66. In the arrangement shown in figure, $m_A = m_B = 2$ kg. String is massless and pulley is frictionless. Block B is resting on a smooth



horizontal surface, while friction coefficient between blocks A and B is $\mu = 0.5$. The maximum horizontal force F that can be applied so that block A does not slip over the block B is

(a) 25 N (b) 40 N (c) 30 N (d) 20 N

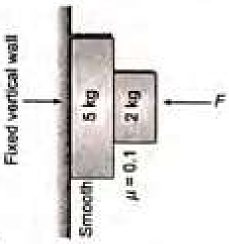
67. A block is placed at the bottom of an inclined plane and projected upwards with some initial speed. It slides up the plane and stops after time t_1. It begins to slide back down to the bottom in a further time t_2. The angle of inclination of plane is θ and the coefficient of friction between body and the surface is μ. Then

(a) $t_1 = t_2$ (b) $t_1 > t_2$ (c) $t_2 > t_1$ (d) $t_1 = 2t_2$

68. A block of mass 1 kg starts moving at $t = 0$ with velocity $\vec{v} = 3\hat{i}$ on a rough horizontal platform (with coefficient of friction $\mu = 0.3$) moving with velocity $4\hat{j}$. At $t = t_0$ block comes to rest with respect to platform. Then displacement of block with respect to ground in this time interval. (x-y plane is a horizontal plane)

(a) $\frac{7}{6}$ m (b) 2 m (c) 1 m (d) $\frac{3}{25}$ m

69. In the arrangement shown in figure the wall is smooth and friction coefficient between the blocks is $\mu = 0.1$. A horizontal force $F = 1000$ N is applied on the 2 kg block. Study following statements regarding this situation:



(i) The normal interaction force between the blocks is 1000 N
(ii) The friction force between the blocks is zero
(iii) Both the blocks accelerate downward with acceleration g m/s^2
(iv) Both the blocks remain at rest

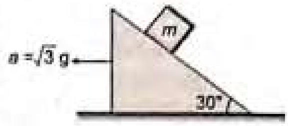
The correct statements are:

(a) only (ii) and (iv) (b) only (i), (ii) and (iii)
(c) only (ii) and (iii) (d) only (i) and (iv)

70. A plank of mass $3m$ is placed on a rough inclined plane and a man of mass m walks down the board. If the coefficient of friction between the board and inclined plane is $\mu = 0.5$, the minimum acceleration of does not slide is:

(a) 8 m/s^2 (b) 4 m/s^2 (c) 6 m/s^2 (d) 3 m/s^2

71. If the acceleration is towards right the frictional force exerted by wedge on the block will be (coefficient of friction between wedge and block is $\sqrt{3}/2$)

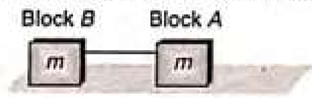


(a) mg (b) $\frac{3mg}{2}$ (c) $2mg$ (d) $\frac{mg}{2}$

72. A particle of mass m attached to a string of length l is describing circular motion on a smooth plane inclined at an angle α with the horizontal. For the particle to reach the highest point its velocity at the lowest point should exceed.

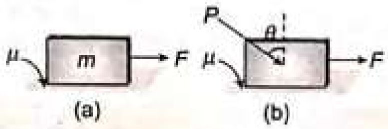
(a) $\sqrt{gl}$ (b) $\sqrt{5gl(\cos\alpha \tan+1)}$
(c) $\sqrt{5gl \tan\alpha}$ (d) $\sqrt{5gl \sin\alpha}$

73. Two blocks each of mass m are placed on a rough horizontal surface and connected by a massless inelastic string as shown. The coefficient of friction between each block and horizontal surface is μ. The string connecting both the blocks has zero tension. The minimum force to be applied on block A to just move the two block system horizontally (without the string getting slack) is:



(a) $2\mu mg$ (b) $\frac{2\mu mg}{\sqrt{\mu^2+1}}$ (c) $\frac{2\mu mg}{\sqrt{4\mu^2+1}}$ (d) $\frac{\mu mg}{\sqrt{\mu^2+1}}$

74. The coefficient of friction between the block and the horizontal surface is μ. The block moves towards right under action of horizontal force F [Fig. (a)]. Sometime later another force P is applied to the block making an angle θ (such that $\tan\theta = \mu$) with vertical as shown in [Fig. (b)]. After application of force P, the acceleration of block shall



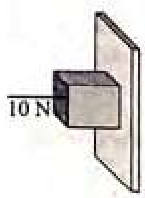
(a) increase (b) decrease
(c) remains same
(d) information insufficient for drawing inference

ARCHIVES

1. The minimum velocity (in m/s) with which a car driver must traverse a flat curve of radius 150 m and coefficient of friction 0.6 to avoid skidding is

(a) 60 (b) 30
(c) 15 (d) 25 **(AIEEE 2002)**

2. A horizontal force of 10 N is necessary to just hold a block stationary against a wall. The coefficient of friction between the block and the wall is 0.2. The weight of the block is



(a) 2 N (b) 20 N
(c) 50 N (d) 100 N **(AIEEE 2003)**

3. A marble block of mass 2 kg lying on ice when given a velocity of 6 m/s is stopped by friction in 10 s. Then the coefficient of friction is
(a) 0.01 (b) 0.02
(c) 0.03 (d) 0.06 **(AIEEE 2003)**

4. A car is moving in a circular path of radius 500 m with a speed of 30 m/s. If the speed is increased at the rate of 2 m/s^2, the resultant acceleration will be
(a) 2 m/s^2 (b) 2.5 m/s^2
(c) 2.7 m/s^2 (d) 4 m/s^2 **(AIEEE 2003)**

5. A block rests on a rough inclined plane making an angle of 30° with the horizontal. The coefficient of static friction between the block and the plane is 0.8. If the frictional force on the block is 10 N, the mass of the block (in kg) is (take $g = 10$ m/s^2)
(a) 1.6 (b) 4.0
(c) 2.0 (d) 2.5 **(AIEEE 2004)**

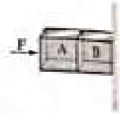
6. A smooth block is released at rest on a 45° incline and then slides a distance d. The time taken to slide is n times as much to slide on a rough incline than on a smooth incline. The coefficient of friction is
(a) $\mu_s = \sqrt{1-\frac{1}{n^2}}$ (b) $\mu_s = 1-\frac{1}{n^2}$
(c) $\mu_k = \sqrt{1-\frac{1}{n^2}}$ (d) $\mu_k = 1-\frac{1}{n^2}$ **(AIEEE 2005)**

7. Consider a car moving on a straight road with a speed of 100 m/s. The distance at which the car can be stopped is $[\mu_k = 0.5]$
(a) 400 m (b) 100 m (c) 1000 m (d) 800 m
(Note: It should be minimum distance in which the car can be stopped.)
(AIEEE 2005)

8. The upper half of an inclined plane of inclination θ is perfectly smooth while the lower half is rough. A body starting from the rest at top comes back to rest at the bottom if the coefficient of friction for the lower half is given by
(a) $\mu = \sin\theta$ (b) $\mu = \cot\theta$
(c) $\mu = 2\cos\theta$ (d) $\mu = 2\tan\theta$ **(AIEEE 2005)**

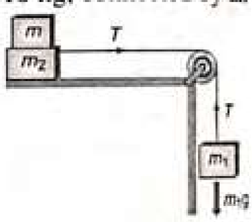
9. A block of mass m is placed on a surface with a vertical cross section given by $y = x^3/6$. If the coefficient of friction is 0.5, the maximum height above the ground at which the block can be placed without slipping is
(a) $\frac{1}{3}$m (b) $\frac{1}{2}$m (c) $\frac{1}{6}$m (d) $\frac{2}{3}$m
(JEE Main 2014)

10. Given in the figure are two blocks A and B of weight 20 N and 100 N, respectively. These are being pressed against a wall by a force F as shown. If the coefficient of friction between the blocks is 0.1 and between block B and the wall is 0.15, the frictional force applied by the wall on block B is



(a) 100 N (b) 80 N
(c) 120 N (d) 150 N **(JEE Main 2015)**

11. Two masses $m_1 = 5$ kg and $m_2 = 10$ kg, connected by an inextensible string over a frictionless pulley, are moving as shown in the figure. The coefficient of friction of horizontal surface is 0.15. The minimum weight m that should be put on top of m_2 to stop the motion is:



(a) 10.3 kg (b) 18.3 kg
(c) 27.3 kg (d) 43.3 kg **(JEE Main 2018)**

12. A particle is moving with a uniform speed in a circular orbit of radius R in a central force inversely proportional to the nth power of R. If the period of rotation of the particle is T, then
(a) $T \propto R^{n/2}$ (b) $T \propto R^{3/2}$ for any n
(c) $T \propto R^{\frac{n}{2}+1}$ (d) $T \propto R^{(n+1)/2}$
(JEE Main 2018)

Chapter 7

Work, Energy and Power

WORK DONE BY A FORCE

When a constant force $\vec{F}$ acts on a particle while the particle moves through a displacement $\vec{s}$ (for a rigid body, $\vec{s}$ is the displacement of point of application of force on body w.r.t. the frame, in which we have to find the work), the force is said to do work W on the particle given by

$$W = \vec{F}.\vec{s}$$

$\vec{F}.\vec{s}$, the scalar (dot) product of $\vec{F}$ and $\vec{s}$ can be evaluated as:

$$W = \vec{F}.\vec{s} = Fs\cos\theta \quad \text{(i)}$$

$W = Fs\cos\theta = F(s\cos\theta) = fs_{\parallel}$

= Magnitude of the force × Component of the displacement in the direction of the force

$W = (F\cos\theta)s = F_{\parallel}s$

= Component of force in the direction of displacement × Magnitude of the displacement

Notice also that the displacement in Eq. (i) is that of *the point of application of the force.* If the force is applied to a particle or a rigid object that can be modeled as a particle, this displacement is same as that of the particle. For a deformable system, however, these displacements are not the same. For example, imagine pressing in on the sides of a balloon with both hands.

NOTE: If a number of forces $\vec{F}_1, \vec{F}_2, \vec{F}_3, \ldots, \vec{F}_n$ are acting on a body and they shift from position vector $\vec{r}_1$ to position vector $\vec{r}_2$, then

$$W = (\vec{F}_1 + \vec{F}_2 + \vec{F}_3 + \cdots \times \vec{F}_n).(\vec{r}_2 - \vec{r}_1) = (\Sigma\vec{F})\cdot(\Delta\vec{r})$$

In terms of rectangular components, the force and displacement vectors can be written as: $\vec{F} = F_x\hat{i} + F_y\hat{j} + F_z\hat{k}$ and $\vec{s} = x\hat{i} + y\hat{j} + z\hat{k}$. Therefore,

Work done, $W = \vec{F}\cdot\vec{s}$

$$= (F_x\hat{i} + F_y\hat{j} + F_z\hat{k})\cdot(x\hat{i} + y\hat{j} + z\hat{k})$$

$$= F_x x + F_y y + F_z z$$

Important Points

- We can calculate the work done by a force on an object, but that force is *not* necessarily the cause of the object's displacement. For example, if you lift an object (negative), work is done on the object by the gravitational force, although gravity is not the cause of the object moving upward.
- Work is defined for an interval or displacement. There is no term such as instantaneous work similar to instantaneous velocity.
- For a particular displacement, the work done by a force is independent of the type of motion, i.e.m whether it moves with constant velocity, constant acceleration or retardation, etc.
- For a particular displacement as work is independent of time. Work will be same for same displacement whether the time taken is small or large.
- When several forces act, the work done by a force for a particular displacement is independent of other forces.

ILLUSTRATION 7.1 A constant force $\vec{F} = (3\hat{i} + 2\hat{j} + 2\hat{k})$ N acts on a particle displacing it from a position $\vec{r}_1 = (-\hat{i} + \hat{j} - 2\hat{k})$ m to a new position $\vec{r}_2 = (\hat{i} - \hat{j} + 3\hat{k})$ m. Find the work done by the force.

Solution. The displacement vector, $\vec{s} = \vec{r}_2 - \vec{r}_1$

$$\vec{s} = (1+1)\hat{i} + (-1-1)\hat{j} + (3+2)\hat{k} = 2\hat{i} - 2\hat{j} + 5\hat{k}$$

From $W = \vec{F}\cdot\vec{s}$, we have

$$W = (3\hat{i} + 2\hat{j} + 2\hat{k})\cdot(2\hat{i} - 2\hat{j} + 5\hat{k}) = 6 - 4 + 10 = 12 \text{ J}$$

ILLUSTRATION 7.2 Three constant forces $\vec{F}_1 = 2\hat{i} - 3\hat{j} + 2\hat{k}$, $\vec{F}_2 = \hat{i} + \hat{j} - \hat{k}$, and $\vec{F}_3 = 3\hat{i} + \hat{j} - 2\hat{k}$ in newtons displace a particle from (1, –1, 2) to (–1, –1, 3) and then to (2, 2, 0) (displacement being measured in metres). Find the total work done by the forces.

Solution.

Net (resultant) force, $\vec{F} = \vec{F}_1 + \vec{F}_2 + \vec{F}_3 = 6\hat{i} - \hat{j} - \hat{k}$ dyn

and net displacement, $\vec{s} = (2-1)\hat{i} + (2+1)\hat{j} + (0-2)\hat{k}$

$$= \hat{i} + 3\hat{j} - 2\hat{k} \text{ m}$$

Therefore, work done,

$$W = \vec{F}\cdot\vec{s} = (6\hat{i} - \hat{j} - \hat{k})\cdot(\hat{i} + 3\hat{j} - 2\hat{k}) \text{ Nm}$$

$$= (6 - 3 + 2) \times 10^{-5} \text{ J} = 5 \times 10^{-5} \text{ J}$$

Work Done By a Variable Force

Force is a vector quantity. When either its magnitude of direction or both magnitude and direction change, we say that the force is varying. For work done by a variable force, the work done for an infinitesimal displacement $\overrightarrow{ds}$ is given by

$$dW = \vec{F}.\overrightarrow{ds}$$

The total work done in going from A to B as shown in the figure is

$$W_{AB} = \int_A^B \vec{F}.\overrightarrow{ds} = \int_A^B F\,ds\cos\theta$$

In terms of rectangular components,

$$\overrightarrow{ds} = dx\hat{i} + dy\hat{j} + dz\hat{k}$$

Work done by a variable force between points A and B,

$$W = \int \vec{F}.\overrightarrow{ds}$$

$$W_{AB} = \int (F_x\hat{i} + F_y\hat{j} + F_z\hat{k}).(dx\hat{i} + dy\hat{j} + dz\hat{k})$$

$$= \int_{x_A}^{x_B} F_x\,dx + \int_{y_A}^{y_B} F_y\,dy + \int_{z_A}^{z_B} F_z\,dz$$

ILLUSTRATION 7.3 A force $\vec{F} = 6x\hat{i} + 2y\hat{j}$ displaces a body from $\vec{r}_1 = 3\hat{i} + 8\hat{j}$ *to* $\vec{r}_2 = 5\hat{i} - 4\hat{j}$. Find the work done by the force.

Solution. Given force $\vec{F} = 6x\hat{i} + 2y\hat{j}$

Initial position $\vec{r}_1 = 3\hat{i} + 8\hat{j}$ and final position $\vec{r}_2 = 5\hat{i} - 4\hat{j}$

We know work done, $W = \int_{s_1}^{s_2} \vec{F}\cdot d\vec{s} = \int_{s_1}^{s_2} \vec{F}\cdot(dx\hat{i} + dy\hat{j})$

$$W = \int_{s_1}^{s_2} (6x\hat{i} + 2y\hat{j})\cdot(dx\hat{i} + dy\hat{j}) = \int_3^5 6x\,dx + \int_8^{-4} 2y\,dy$$

$$= \left[3x^2\right]_3^5 + \left[y^2\right]_8^{-4} = [75 - 27] + [16 - 64] = 0 \text{ J}$$

ILLUSTRATION 7.4 A chain of length L and mass M is held on a frictionless table with $(1/n)$th of its length hanging over the edge (see figure). Calculate the work done in pulling the chain slowly on the table against gravity.

Solution. Let $\lambda = M/L$ = mass per unit length of the chain and y is the length of the chain hanging over the edge. So the mass of the chain of length y will be λy and the force acting on it due to gravity will be mgy.

The work done in pulling the dy length of the chain on the table.

$$dW = F(-dy) \qquad [dy \text{ is negative as } y \text{ is decreasing}]$$

As the chain is pulled slowly,

$$F = \text{Weight of the hanging chain} = \lambda yg$$

i.e., $\quad dW = (\lambda yg)(-dy)$

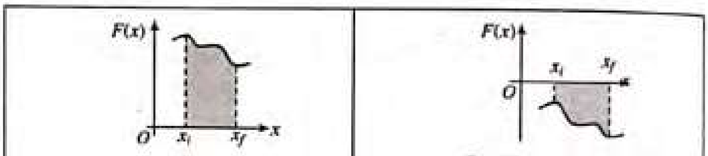
So the work done in pulling the hanging portion on the table,

$$W = -\int_{L/n}^{0} \lambda gy\,dy = -\lambda g\left[\frac{y^2}{2}\right]_{L/n}^{0} = \frac{\lambda g L^2}{2n^2} = \frac{MgL}{2n^2}$$

$$[\text{as } \lambda = M/L]$$

Graphical Interpretation of Work Done

Generally, the work done by a variable force $F(x)$ from an initial position x_i to final position x_f is interpreted as the area under the force-displacement curve.



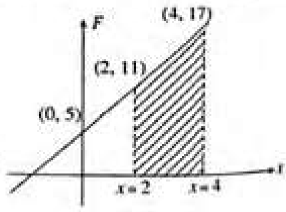
(a) Positive work (b) Negative work

ILLUSTRATION 7.5 Consider a variable force $F = (3x + 5)$ N acting on a body and if it is displaced from $x = 2$ m to $x = 4$ m, calculate the work done by this force.

Solution. If we plot the force in the function of displacement, the work done can be given by the shaded area shown in the figure. Thus, work done by this force is

W = Area of shaded trapezium

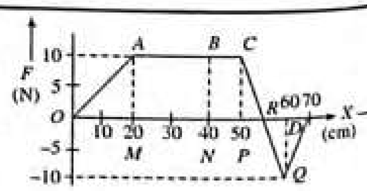
$$= \frac{1}{2} \times 2 \times (11 + 17) = 28$$



If we find the same using integration, we have

$$W = \int_2^4 (3x + 5)dx = \left(\frac{3x^2}{2} + 5x\right)_2^4 = 28 \text{ J}$$

ILLUSTRATION 7.6 From the figure, find the work done at the end of displacements: (a) 20 cm, (b) 40 cm, and (c) 60 cm.



Solution.

(a) Work done at the end of displacement 20 cm,

$$= \text{Area of triangle } OAM$$

$$= \frac{1}{2} \times (20 \times 10^{-2}) \times 10 = 1 \text{ J}$$

(b) Work done at the end of displacement 40 cm,

= Area of $OABN$

= Area of OAM + Area of rectangle $ABMN$

$= 1 + 20 \times 10^{-2} \times 10 = 3$ J

(c) Work done at the end of displacement 60 cm,

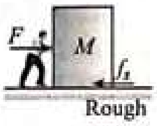
= Area of triangle OAM + Area of rectangle $ACMP$

$= 1 + 30 \times 10^{-2} \times 10 = 4.0$ J

Net area from 50 cm to 60 cm will be zero.

Work Done by Static Friction

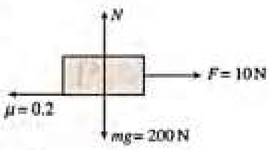
We have learnt about two types of frictional forces, i.e. static friction and kinetic friction. Let us discuss the work done by static friction.



If you push a box by applying a force F, say, let us assume that the box does not move (relative to fixed surface on which it is placed) as shown in the figure. Then the static friction f_s does not perform any work as the displacement of the box (displacement of point of application of friction force) is zero ($W_{f_s} = 0$).

ILLUSTRATION 7.7 A force of 10 N is acting on a block of 20 kg on a horizontal surface with coefficient of friction $\mu = 0.2$. Calculate the work done by the force.

Solution. $f_{max} = \mu N = 40$ N

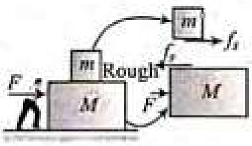


Driving force, $F < f_{max}$, therefore, $s = 0$.

Hence, $W = 0$.

The block does not displace ($s = 0$) because the applied force is less than the limiting friction.

Now take another example. A block of mass m is placed on the block of mass M as shown in the figure. The horizontal force $\vec{F}$ acts on M. The horizontal surface is smooth, assuming no relative sliding between the blocks. If the lower block moves through a distance x, the upper blocks m will also move through the same distance x. The direction of static friction on the upper block is in forward direction while the direction of static friction on lower block will be in backward direction. Work done by the friction can be given as:



On lower block: $(W_f)_M = -f_s x$

On upper block: $(W_f)_m = f_s x$

The total work done by static friction at the box–surface system (interface) is

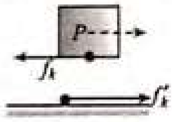
$$W_f = (W_f)_M + (W_f)_m = -f_s x + f_s x$$

Hence, the total "static frictional work," $W = 0$.

From the above discussion, we conclude the following points: the work done by static friction can be positive, negative, or zero. When we consider the net work done by the static friction at the contacting surfaces, since there is no relative displacement between the surfaces, the total work done by the static friction is zero.

Work Done by Kinetic Friction

Object is sliding over a fixed surface: As you know, kinetic friction acts on a particle when it slides on a surface. If the surface is fixed, the displacement of the particle is non-zero. That means, kinetic friction f_k will perform certain work. Since $\vec{f}_k$ points opposite to the displacement $\vec{s}$, the work done by kinetic friction is negative.



or $\quad W_{f_k} = \vec{f}_k \cdot \vec{s} = f_k s \cos 180° \Rightarrow W_{f_k} = -f_k s$

As the surface is assumed to be fixed ($s = 0$), the work done by the kinetic friction f_k' on the surface is zero. In this way, the total work done by kinetic friction on both the surfaces is negative.

ILLUSTRATION 7.8 A block of mass 2.0 kg is pushed down an inclined plane of inclination 37° with a force of $F = 20$ N acting parallel to the incline. It is found that the block moves down the incline with an acceleration of 10 m s^{-2}. If the block started from rest, find the work done

(a) by the applied force in the first second

(b) by the weight of the block in the first second

(c) by the frictional force acting on the block in the first second

Solution. Displacement of block in 1 s

$$s = \frac{1}{2} \times 10 \times 1^2 = 5 \text{ m}$$

The work done by the applied force in the first second,

$$W_F = \vec{F} \cdot \vec{s} = F \cdot s \cos\theta = 20 \times 5 = 100 \text{ J}$$

The work done by the weight of the block in the first second = Component of weight in the direction of displacement × Displacement

$$W_{\text{weight}} = (mg \sin\theta) \times d = \left(2 \times 10 \times \frac{3}{5}\right) \times 5 = 60 \text{ J}$$

Now we need to calculate friction force acting on block. For this, we need to write

Equation of motion of block, $mg \sin\theta + F - f = ma$

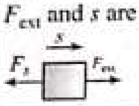
$$2 \times 10 \times \frac{3}{5} + 20 - f = 2 \times 10 \Rightarrow f = 12 \text{ N}$$

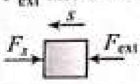
The work done by the frictional force acting on the block in the first second,

$$W_{\text{friction}} = \vec{f} \cdot \vec{d} = f \cdot d \cos 180° = -f \times d = -60 \text{ J}$$

Work Done by Spring Force

Whenever a spring is stretched or compressed, the spring force always tends to restore it to the relaxed position.

A spring stretched from its equilibrium position.	A spring is compressed from its equilibrium position.
	F_s and s are antiparallel.	F_s and s are antiparallel.
F_{ext} and s are parallel.	F_{ext} and s are parallel.
	




If x be the displacement of the free end of the spring from its equilibrium position, then the magnitude of the spring force is

$$F_s = -kx$$

The negative sign indicates that the force is restoring.

The work done by the spring force for a displacement from x_i to x_f is given by

$$W_s = \int \vec{F}_s d\vec{x} = -\int_{x_i}^{x_f} kx\,dx = -\frac{1}{2}k(x_f^2 - x_i^2)$$

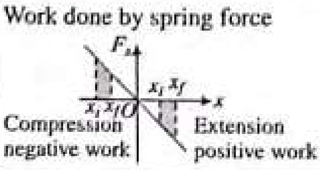
where x_i and x_f are the initial and final deformations of the spring. Hence, when a spring is deformed from $x = x_i$ to $x = x_f$,

- If $x_f > x_i$, W_{sp} is negative.
- If $x_f = x_i$, $W_{sp} = 0$. If $x_f < x_i$, W_{sp} is positive. That means a spring can perform positive, negative and zero work depending upon the initial and final deformations.
- When the spring is undeformed, we calculate the displacement of the free end P of the spring from the relaxed position of the spring. Substituting $x = 0$ and $x = x$, we have

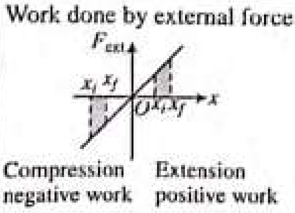
$$W_{sp} = -\frac{1}{2}kx^2$$

The above expression tells us that a spring always performs negative work when deformed (compressed or elongated) from its relaxed (undeformed) position.

- The graph plotted between a spring force and the displacement from the equilibrium position is a straight line with negative slope.

Work done by spring force	The work done by spring force is negative both in compression and extension.
	


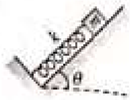
Work done by external force	The work done by external force is positive both in compressing or stretching the spring.
	



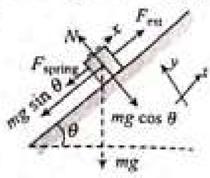
NOTE:

- Like gravity, the work done by spring force only depends on the initial and final positions.
- Also, the net work done by the spring force is zero for any path that returns to the initial position.

ILLUSTRATION 7.9 A block of mass m welded with a light spring of stiffness k is in equilibrium on an smooth inclined plane with angle of inclination θ. If a variable external force is applied slowly till the spring comes to its relaxed position, find the work done by spring force.



Solution. Referring to the FBD as shown in the figure, we have four forces (N, mg, F_{spring} and F_{ext}) acting on the particle.

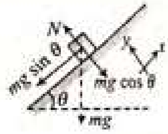


Initially, the block is at equilibrium.

$$kx_i = mg\sin\theta \Rightarrow x_i = \frac{mg\sin\theta}{k}$$

When the block is pulled up by an external force to bring the spring to relaxed length $x_f = 0$

Hence, work done by spring force,



$$W_{sp} = -\frac{1}{2}k(x_f^2 - x_i^2)$$

$$= -\frac{1}{2}\left[0 - \left(\frac{mg\sin\theta}{k}\right)^2\right]$$

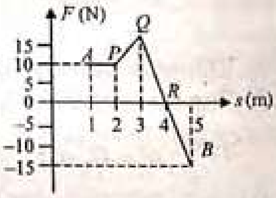
$$= \frac{1}{2}\frac{(mg\sin\theta)^2}{2k}$$

CONCEPT APPLICATION EXERCISE 7.1

1. A cyclist comes to a skidding stop in 10 m. During this process, the force on the cycle due to the road is 200 N and is directly opposite to the motion.
   (a) How much work does the road do on the cycle?
   (b) How much work does the cycle do on the road?
2. A gardener moves a lawn roller through a distance of 100 m with a force of 50 N. Calculate his wages if he is to be paid 10 paise for doing 25 J of work. It is given that the applied force is inclined at 60° to the direction of motion.
3. A body constrained to move along the z-axis of a coordinate system is subjected to a constant force given by $\vec{F} = -\hat{i} + 2\hat{j} + 3\hat{k}$ N, where $\hat{i}, \hat{j}, \hat{k}$ are unit vectors along the x-, y-, and z-axes of the system, respectively. What is the work done by this force in moving the body through a distance of 4 m along the z-axis?
4. An object is displaced from point A (2 m, 3 m, 4 m) to a point B (1 m, 2 m, 3 m) under a constant force $\vec{F} = (2\hat{i} + 3\hat{j} + 4\hat{k})$. Find the work done by this force in this process.

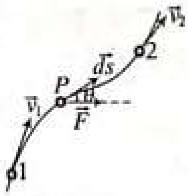
5. An object is displaced from position vector $\vec{r}_1 = (2\hat{i} + 3\hat{j})$ m to $\vec{r}_2 = (4\hat{j} + 6\hat{k})$ m under a force $\vec{F} = (3x^2\hat{i} + 2y\hat{j})$ N. Find the work done by the force.

6. A body moves from point A to B under the action of a force, varying in magnitude as shown in the figure. Obtain the work done. Force is expressed in newton and displacement in meter.



WORK–ENERGY THEOREM

One force on particle: For the sake of simplicity, let us assume a single force F acting on a particle P of mass m. If the particle moves in any arbitrary path, the work done by the force in an elementary displacement $d\vec{s}$ of the particle is



$$dW = \vec{F}.d\vec{s}$$

Substituting $\vec{F} = m\vec{a}$, we have

$$dW = m\vec{a}.d\vec{s}$$

Then the total work done is

$$W = \int dW = m\int \vec{a}.d\vec{s}$$

Substituting $\vec{a}\cdot d\vec{s} = v\,dv$, we have

$$W = m\int_{v_1}^{v_2} v\,dv$$

This gives $W = \frac{1}{2}mv_2^2 - \frac{1}{2}mv_1^2$

where $\frac{1}{2}mv_1^2 = \text{KE}_1$ and $\frac{1}{2}mv_2^2 = \text{KE}_2$

Then, we have $W = \text{KE}_2 - \text{KE}_1 = \Delta\text{KE}$

When only a single force acts on a particle, *work done by the force is equal to the change in the kinetic energy of the particle.*

Many forces on one particle: If more than one forces act on a particle, we know that the sum of work done by all forces is equal to the work done by the resultant force acting on the particle. Since the resultant force $\vec{F}_{net}$ (say) decides the acceleration $\vec{a}$ of the particle, the total work done can be given as:

$$W_{total} = \sum W_{F_i} = W_F, \text{ where } W_F = \vec{F}_{net}.d\vec{s}$$

Then, $W_{total} = \int \vec{F}_{net}.d\vec{s}$

Substituting $\vec{F}_{net} = m\vec{a}$ and $\vec{a}.d\vec{s} = v\,dv$, we have

$$W_{total} = m\int_{v_1}^{v_2} v\,dv$$

which gives the same expression.

$$W_{total} = \frac{1}{2}mv_2^2 - \frac{1}{2}mv_1^2 = \Delta\text{KE}$$

$$\sum W_{F_i} = \Delta K$$

The sum of work done by all forces acting on each particle of a system of particles is equal to the sum of change in the KE of each particle of the system. This is what we call work–energy theorem which signifies the "work" as "energy transfer."

NOTE:
For a system of particles (or system of rigid bodies),

$$\sum W_{ext} + \sum W_{int} = \Delta K$$

where $\sum W_{ext}$ is the work done by the external forces on the system. and $\sum W_{int}$ is the work done by the internal forces on the system.

Newton's third law of motion gives you that $\sum \vec{F}_{int} = 0$. But the work done by the internal force may or may not be equal to zero. Now it is more useful to write the work-energy theorem in non-inertial frame as

$$W_{external} + W_{internal} + W_{pseudo} + W_{other} = \Delta\text{KE}$$

- Positive work increases the kinetic energy and negative work decreases the kinetic energy.
- Work can be converted into kinetic energy and kinetic energy can be converted into work.

ILLUSTRATION 7.10 A particle slides along a track with elevated ends and a flat central part as shown in the figure. The flat part has a length $l = 3$ m. The curved portions of the track are frictionless. For the flat part, the coefficient of kinetic friction is $\mu_K = 0.2$. The particle is released at point A which is at height $h = 1.5$ m above the flat part of the track. Where does the particle finally come to rest?

Solution. The particle will finally come to rest on the flat part. Hence, displacement of the particle along vertical is h. If W_g be the work done on the particle by the gravity, then

$$W_g = mgh \quad \text{(i)}$$

where m is the mass of the particle.

If distance travelled by the particle on the flat part is x, the work done on the particle by the friction is

$$W_f = -\mu mgx \quad \text{(ii)}$$

Since, initially, particle was at rest and finally it comes to rest again. Hence, change in its KE is zero.

From work–energy theorem, $W_g + W_f = \Delta\text{KE}$

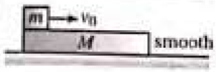
$$\Rightarrow \quad mgh - \mu mgx = 0$$

$$\Rightarrow \quad x = \frac{h}{\mu} = \frac{1.5}{0.2}\text{m} \Rightarrow x = 7.5 \text{ m}$$

Since $x > l$, the particle will reach C and then will rise up till the remaining KE at C is converted into potential energy. It will then again descend to C and will have the same kinetic energy as it had when ascending but now will move from C to B. At B, same thing will be repeated (because $7.5 > 2l$), and finally, the particle will stop at E such that

$$BC + CB + BE = 7.5$$
$$BE = 7.5 - 6 = 1.5 \text{ m}$$

ILLUSTRATION 7.11 A plank of mass M and length L is placed at rest on a smooth horizontal surface. A small block of mass m is projected with a velocity v_0 from the left end of it as shown in the figure.



The coefficient of friction between the block and the plank is m, and its value is such that the block becomes stationary with respect to the plank before it reaches the other end.

(a) Find the time and common velocity when relative sliding between the block and the plank stops.

(b) Find the work done by the friction force on the block during the period it slides on the plank. Is the work positive or negative?

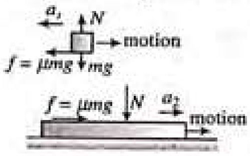
(c) Calculate the work done on the plank during the same period. Is the work positive or negative?

(d) Also, determine the net work done by friction. Is it positive or negative?

Solution.

(a) Initially, the block will slide on plank. The friction will be of kinetic nature. The friction will decrease the speed of the block and starts motion of the plank.

The free body diagrams of the block and the plank are shown in the figure.



Equation of motion

For block: $a_1 = \dfrac{f}{m} = \mu g$

Instantaneous velocity,

$v_1 = v_0 - \mu g t$

For plank: $a_2 = \dfrac{f}{M} = \dfrac{\mu mg}{M}$

Instantaneous velocity, $v_2 = \dfrac{\mu mgt}{M}$

Finally, both the block and the plank start moving together, i.e., $v_1 = v_2$, then

$$v_0 - \mu g t = \frac{\mu mgt}{M} \text{ or } t = \frac{Mv_0}{(M+m)\mu g}$$

and the final common velocity is $V = \dfrac{mv_0}{M+m}$.

If we take the block as system, friction is the only force which do work.

(b) The work done by friction on the block is equal to its change in kinetic energy, i.e.,

$$W_1 = K_f - K_i = \frac{1}{2}mV^2 - \frac{1}{2}mv_0^2$$

$$W_1 = \frac{1}{2}m\left(\frac{mv_0}{m+M}\right)^2 - \frac{1}{2}mv_0^2$$

$$= -\frac{1}{2}\frac{mM(M+2m)v_0^2}{(M+m)^2}$$

The work done by friction on the block is negative.

If we take plank as system only friction is only force which do work on plank.

(c) The work done by friction on the plank is given by

$$W_2 = K_f - K_i = \frac{1}{2}MV^2 - 0$$

$$W_2 = \frac{1}{2}M\left(\frac{mv_0}{m+M}\right)^2 = \frac{1}{2}\frac{m^2M}{(m+M)^2}v_0^2$$

The work done by friction on the block is positive.

(d) The net work done by friction is

$$W = W_1 + W_2 = -\frac{1}{2}\frac{mM}{M+m}v_0^2$$

The net work done by friction is negative.

The work done by tension $W_T = 0$

At the position of maximum deflection, the velocity of the bob is zero, $\Delta K = 0$.

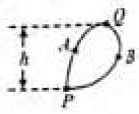
CONSERVATIVE AND NON-CONSERVATIVE FORCES

Consider an object moving downward near the surface of the earth. The work done by the gravitational force on the object does not depend on whether it falls vertically or slides down a sloping incline. All that matters is the change in the object's elevation. In other words, the path makes no difference when we consider the work done by the gravitational force, but it does make a difference when we consider energy transformation due to friction forces. We can use this varying dependence on path to classify forces as either conservative or non-conservative.

Conservative Force

Conservative forces have the following two equivalent properties:

1. The work done by a conservative force on a particle moving between any two points is independent of the path taken by the particle.
2. The work done by a conservative force on a particle moving through any closed path is zero. (A closed path is one for which the beginning point and the endpoint are same)



A particle is taken from point P to point Q via the path PAQ and then placed back to point P via the path QBP in the vertical plane. Let us calculate the work done by gravity on the body over this closed path. Here, displacement of the particle is $\overline{PQ}$; gravity is acting vertically downward. The vertical component of $\overline{PQ}$ is h upward. Hence,

$$W_{(PAQ)} = -mgh \qquad (1)$$

For the path QBP, component of the displacement along vertical is h (downward).

In this case, $W_{QBP} = mgh$

Therefore, total work done $= W_{PAQ} + W_{QBP} = 0$

For the case of the object–spring system, the work W_s done by the spring force is given by $W_s = \dfrac{1}{2}kx_i^2 - \dfrac{1}{2}kx_f^2$. We see

that the spring force is conservative because W_s depends only on the initial and final x coordinates of the object and is zero for any closed path.

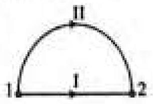
Non-Conservative Force

The work done by a non-conservative force not only depends on the initial and final positions but also on the path followed.

The common examples of such forces are frictional force and drag force in fluids.

The work done by a non-conservative force along a closed path is not equal to zero.

Let us choose two points 1 and 2 on a rough horizontal floor and drag an object slowly and horizontally between these points along paths I and II can observe that, in shifting the object along two paths. We feel more exhausted when we drag a body through more distance. In other words, work done by friction is more for a longer path. The work done due to friction for the paths I and II can be given as $W_1 = -fl_1$ and $W_2 = -fl_2$, respectively.

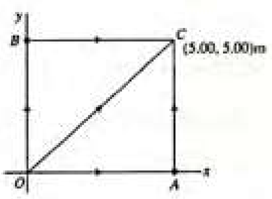


Since the work done by kinetic friction is path-dependent, for a round trip (when we drag the object from position 1 to 2 along the path I and we bring it back slowly to its initial position 1 from the path II), the total work done by friction is

$$W = W_1 + W_2 = -fl_1 + (-fl_2) = -f(l_1 + l_2) = -fl$$

where l is the length of the closed path.

ILLUSTRATION 7.12 A 4.00-kg particle moves from the origin to position C, having coordinate x = 5.00 m and y = 5 m. One force on the particle is the gravitational force acting in the negative y direction. Using equation $W = F\Delta r \cos\theta = \vec{F}\cdot\Delta\vec{r}$, calculate the work done by the gravitational force on the particle as it goes from O to C along (a) OAC, (b) OBC, and (c) OC. Your results should all be identical. Why?



Solution. $F_g = mg = (4.00\text{ kg})(10.0\text{ m s}^{-2}) = 40.0\text{ N}$

(a) Work done along OAC = Work along OA + Work along AC

$$= F_g(OA)\cos 90.0^\circ + F_g(AC)\cos 180^\circ$$
$$= (40.0\text{ N})(5.00\text{ m})\cos 90^\circ + (40.0\text{ N})(5.00\text{ m})\cos 180^\circ$$
$$= -200\text{ J}$$

(b) Work done along OBC = W along OB + W along BC

$$= (40.0)(5.00\text{ m})\cos 180^\circ + (40.0\text{ N})(5.00\text{ m})\cos 90.0^\circ$$
$$= -200\text{ J}$$

(c) Work done along $OC = F_g(OC)\cos 135^\circ$

$$= (40.0\text{ N})\ (5.00\times\sqrt{2}\text{ m})\left(-\frac{1}{\sqrt{2}}\right) = -200\text{ J}$$

Work done is same in all cases because gravitational force is a conservative force.

POTENTIAL ENERGY

Potential energy is defined as the ability of doing work by a conservative force. It arises from the configuration of the system or position of the particles in the system (conservative force fields like spring, gravity, etc.)

Work-potential energy theorem: The conservative force always does positive work at the expense of its potential energy sored in its field. For instance, when the compression or elongation of the spring decreases, the spring force decreases. Consequently the spring becomes more inactive. It means, the stability of work done by the spring decreases. In this way we can logically interpret that:

Work done by the spring is equal to the loss of its potential energy, $W_{sp} = -\Delta U_{sp}$; negative sign is used for the loss of potential energy.

Same logic is also valid for gravitational field. When the body moves down, its kinetic energy increases and the gravity does a positive work. It means, the gravitational potential energy decreases by an amount which is equal to the gravitational work done on the falling body, $W_{gr} = -\Delta U_{gr}$.

In general, we can state that: any conservative force field performs a work at the expense of its potential energy.

$$W_{\text{conc.}} = -\Delta U$$

The loss in potential energy is equal to the total work done by the conservative forces.

Elastic Potential Energy Stored in a Spring

As the spring deformation changes from x_1 to x_2, the work done by spring is

$$W_{sp} = -\frac{k}{2}(x_2^2 - x_1^2)$$

In this process, the spring potential energy changes from U_1 to U_2. Substituting the above value of W_{spring} in

$$W_{sp} = -\Delta U = -(U_2 - U_1)$$

we have $U_2 - U_1 = \dfrac{kx^2}{2} - \dfrac{1}{2}kx_1^2$

If $x_1 = 0$ and $x_2 = x$, we have $U_1 = 0$ and $U_2 = U = kx^2/2$. Then the potential energy U as the function of deformation x can be given as $U = kx^2/2$.

Change in Potential Energy

Change in potential energy between any two points is defined in the terms of the work done by the associated conservative force in displacing the particle between these two points without any change in kinetic energy.

$$U_2 - U_1 = -\int_{r_1}^{r_2}\vec{F}.d\vec{r} = -W \qquad \text{(i)}$$

We can define a unique value of potential energy only by assigning some arbitrary value to a fixed point called the reference point. Whenever and wherever possible, we take the reference point at infinity and assume potential energy to be zero there, i.e., if we take $r_1 = \infty$ and $r_2 = r$, then from eqn. (i),

$$U = -\int_{\infty}^{r} \vec{F}.d\vec{r} = -W$$

In case of conservative force (field) potential energy is equal to negative of work done by conservative force in shifting the body from reference position to given position.

ILLUSTRATION 7.13 A conservative force held function is given by $F = k/r^2$, where k is a constant.

(a) Determine the potential energy function $U(r)$ assuming zero potential energy at $r = r_0$.

(b) Also, determine the potential energy at $r = \infty$.

Solution.

(a) Using the definition of potential energy function,

$$U(r) - U(r_0) = -\int_{r_0}^{r} F\,dr$$

$$U(r) - U(r_0) = -k\int_{r_0}^{r} \frac{dr}{r^2} = k\left[\frac{1}{r}\right]_{r_0}^{r} = k\left[\frac{1}{r} - \frac{1}{r_0}\right]$$

Since at $r = r_0$, $U(r_0) = 0$, therefore, $U(r) = \frac{k}{r} - \frac{k}{r_0}$

(b) Potential energy at $r = \infty$ is $U_\infty = -k/r_0$

Relationship between conservative forces and potential energy: If the point of application of the force undergoes an infinitesimal displacement dr, we can express the infinitesimal change in the potential energy of the system dU as

$$dU = -F_r\,dr$$

Therefore, the conservative force is related to the potential energy function through the relationship

$$F_r = -\frac{dU}{dr}$$

That is, the component of a conservative force in the direction of $\vec{r}$ acting on an object within a system equals the negative derivative of the potential energy of the system with respect to r.

Three-Dimensional Formula for Potential Energy

For only conservative fields, $\vec{F}$ equals the negative gradient of the potential energy.

In Cartesian coordinate system, the components of a force F in the axes x, y and z can be given as the negative space derivative (gradient) of the potential energy measured along the corresponding axes.

$$\vec{F}_x = -\frac{\partial U}{\partial x}\hat{i},\ \vec{F}_y = -\frac{\partial U}{\partial y}\hat{j},\text{ and } \vec{F}_z = -\frac{\partial U}{\partial z}\hat{k}$$

Then, the net force $\vec{F}$ can be given as

$$\vec{F} = -\left(\frac{\partial U}{\partial x}\hat{i} + \frac{\partial U}{\partial y}\hat{j} + \frac{\partial U}{\partial z}\hat{k}\right)$$

where $\partial U/\partial x$ is the partial derivative of U w.r.t. x (keeping y and z constant), $\partial U/\partial y$ is the partial derivative of U w.r.t. y (keeping x and z constant), and $\partial U/\partial z$ is the partial derivative of U w.r.t. z (keeping x and y constant).

ILLUSTRATION 7.14 The potential energy of configuration changes in x and y directions as $U = kxy$, where k is a positive constant. Find the force acting on the particle of the system as the function of x and y.

Solution. Substituting $U = kxy$ in the expression

$$F = -\frac{\partial U}{\partial x}\hat{i} - \frac{\partial U}{\partial y}\hat{j} - \frac{\partial U}{\partial z}\hat{k}$$

we have $\vec{F} = -k(y\hat{i} + x\hat{j})$

Potential Energy Curve

A graph plotted between the potential energy of a particle and its displacement from the center of force is called *potential energy curve.*

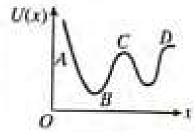


Figure shows a graph of potential energy function $U(x)$ for one dimensional motion.

As we know that negative gradient of the potential energy gives force. Therefore,

$$F_x = -\frac{dU}{dx}$$

Nature of Force

Attractive forc	Repulsive force	Zero force
On increasing x, if U increases, dU/dx is positive, then F is in negative direction, i.e., force is attractive in nature. In graph, this is represented in region BC.	On increasing x, if U decreases, dU/dx is negative, then F is in positive direction, i.e. force is repulsive in nature. In graph, this is represented in region AB.	On increasing x, if U does not change, dU/dx is 0, then F is zero, i.e. no force works on the particle. Point B, C, and D represent the point of zero force or these points can be termed as position of equilibrium.

We can easily check equation $F_r = -dU/dr$ for the two examples already discussed.

In the case of the deformed spring, $U_s = \frac{1}{2}kx^2$. Therefore,

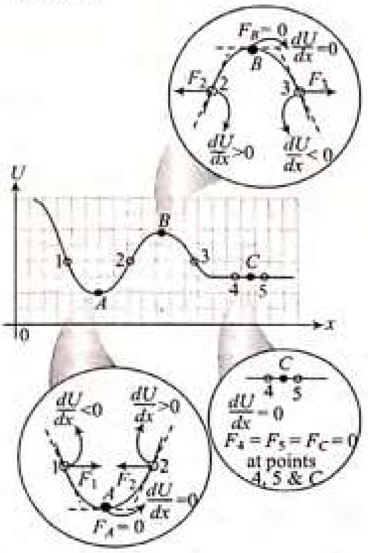
$$F_s = -\frac{dU}{dx} = -\frac{d}{dx}\left(\frac{1}{2}kx^2\right) = -kx$$

which corresponds to the restoring force in the spring (Hooke's law). The gravitational potential energy function is $U_g = mgy$, it follows $F_g = -\frac{dU}{dy} = \frac{-d(mg\,y)}{dy} = -mg$

We now see that U is an important function because a conservative force can be derived from it.

Stability

If the potential energy of a particle changes with a distance along an axis, x and the graph of potential energy U versus x is given, we can tell many important facts of the motion of the particles moving under the influence of the conservative forces by analyzing U–x graph.



We assume an arbitrary U–x graph as shown in the figure. Here we should not confuse x as horizontal—it may be horizontal, vertical. It means we consider the variation of potential energy of a particle in x direction

We can see that, U is minimum at A and maximum at B.

Let $U_{min} = U_A$ and $U_{max} = U_B$.

Hence, the slope of U–x graph, that is dU/dx, must be zero at A and B. Furthermore, $dU/dx = 0$ at C because U remains constant near C. Since $F = -dU/dx = 0$ at the points A, B, and C, the net force acting on the particle (under consideration) at these points is zero. In other words, the particle is in equilibrium at A, B, and C.

Let us now enquire more about the nature of equilibrium by just looking at the U–x graph.

Stable Equilibrium

The particle is in equilibrium at A, we call it "stable equilibrium." This is the sufficient and necessary condition for "oscillations" of an object.

At stable equilibrium, $\dfrac{dU}{dx} = 0$ and $\dfrac{d^2U}{dx^2} > 0$.

Unstable Equilibrium

The particle is in "unstable equilibrium" at B.

At stable equilibrium, $\dfrac{dU}{dx} = 0$ and $\dfrac{d^2U}{dx^2} > 0$

Neutral Equilibrium

Finally, let us come the point C. At C, $F = 0$ as discussed earlier and the particle is in equilibrium at C. Let us displace the particle slowly in either side to (4) and (5). Since at both (4) and (5); $dU/dx = 0$, we can say that the particle experiences no force when it is displaced near C. In other words, the particle will remain at rest (or move with constant velocity) at the points (4) and (5). Then, we can say that the particle is simultaneously neutral and it is in equilibrium because no net force acts on the particle when it undergoes a displacement near C. Hence, at C, the particle is said to be in "neutral equilibrium."

ILLUSTRATION 7.15 The potential energy of a particle in a certain field has the form $U = (a/r^2) - (b/r)$, where a and b are positive constants and r is the distance from the center of the field. Find the value of r_0 corresponding to the equilibrium position of the particle; examine whether this position is stable.

Solution. $U(r) = \dfrac{a}{r^2} - \dfrac{b}{r}$

$$\text{Force} = -\frac{dU}{dr} = -\left(\frac{-2a}{r^3} + \frac{b}{r^2}\right) = -\frac{(br-2a)}{r^3}$$

At equilibrium, $F = -\dfrac{dU}{dr} = 0$

Hence, $br - 2a = 0$, at equilibrium.

$r = r_0 = \dfrac{2a}{b}$ corresponds to equilibrium.

At stable equilibrium, the potential energy is minimum and at unstable equilibrium, it is maximum.

For minimum potential energy,

$dU/dr = 0$ and $d^2U/dr^2 > 0$ at $r = r_0$.

Let us investigate the second derivative.

$$\frac{d^2U}{dr^2} = \frac{d}{dr}\left(\frac{dU}{dr}\right) = \frac{d}{dr}\left(\frac{-2a}{r^3} + \frac{b}{r^2}\right) = \frac{6a}{r^4} - \frac{2b}{r^3}$$

$$\text{At } r = r_0 = \frac{2a}{b} \quad \Rightarrow \quad \frac{d^2U}{dr^2} = \frac{6a - 2br_0}{r_0^4} = \frac{2a}{r_0^4} > 0$$

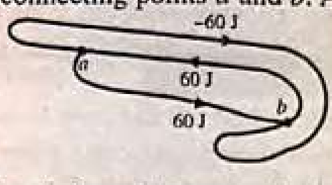
Hence, the potential energy function $U(r)$ has a minimum value at $r_0 = 2a/b$. The system has a stable equilibrium at minimum potential energy state.

NOTE: Conservative force can be defined in three ways as follows:

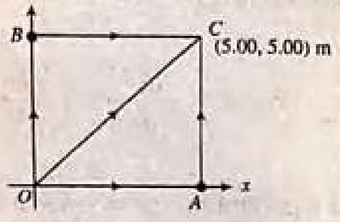
- If the work done by a force on a body depends only upon the initial and final positions of that body, then the force is conservative, e.g., gravitational, electrostatic, $W = K_f - K_i = U(x_i) - U(x_f)$
- A force is conservative if it can be derived from a scalar quantity $U(x)$ by the relation $F(x) = -\Delta U(x)/\Delta x$ or $F = -dU/dx$
- If the work done by a force on a body that has moved in closed path and has come back to its initial position is zero, the force is conservative.

CONCEPT APPLICATION EXERCISE 7.2

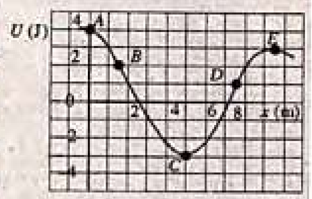
1. The kinetic energy of a body is increased by 21%. What is the percentage increase in the magnitude of linear momentum of the body?
2. Figure shows three paths connecting points a and b. A single force F does the indicated work on a particle moving along each path in the indicated direction. On the basis of this information, is force F conservative?



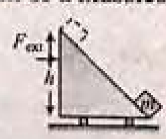
3. A particle moves in the x-y plane in the figure under the influence of a friction force with magnitude 3.00 N and acting in the direction opposite to the particle's displacement. Calculate the work done by the friction force on particle as it moves along the following closed paths: (a) path OA followed by the return path AO, (b) path OA followed by AC and the return path CO, (c) path OC followed by the return path CO, and (d) each of your three answers should be non-zero. What is the significance of this observation?



4. A potential energy function for a two-dimensional force is of the form $U = 3x^2y - 7x$. Find the force that acts at the point (x, y).
5. For the potential energy curve shown in the figure, (a) Determine whether the force F_x is positive, negative, or zero at the five points indicated; (b) Indicate points of stable, unstable, and neutral equilibrium; (c) Sketch the curve for F_x versus x from $x = 0$ to $x = 9.5$ m.



6. A block of mass m is placed at the bottom of a massless smooth wedge which if placed on a horizontal surface. When we push the wedge with a constant force, the block moves up the wedge. Find the work done by the external agent when the block has a speed v and is reaches the top of the wedge.



MECHANICAL ENERGY AND ITS CONSERVATION

Mechanical energy, E, of an object or a system is defined as the sum of kinetic energy K and potential energy U, i.e.,

$$E = K + U$$

We know the work-energy theorem:

$$W_{\text{conservative}} + W_{\text{non-conservative}} + W_{\text{other}} = \Delta K \quad \text{(i)}$$

But we know the definition of the potential energy

$$W_{\text{conservative}} = -\Delta U \quad \text{(ii)}$$

From (i) and (ii),

$$-\Delta U + W_{\text{non-conservative}} + W_{\text{other}} = \Delta K \quad \text{(iii)}$$

$$W_{\text{non-conservative}} + W_{\text{other}} = \Delta K + \Delta U$$

= Change in mechanical energy of the system

If only conservative forces act on the system, then we have $W_{\text{non-conservative}} = 0$ and $W_{\text{other}} = 0$.

Then we have, $\Delta K + \Delta U = 0$ (iv)

or we can say the mechanical energy of the system is constant.

Equation (iv) is a statement of conservation of mechanical energy for an isolated system with no non-conservative forces acting. The mechanical energy in such a system is conserved: the sum of the kinetic and potential energies remains constant.

If there are non-conservative forces acting within the system, mechanical energy is transformed to internal energy. If non-conservative forces act in an isolated system, the total energy of the system is conserved although the mechanical energy is not.

Let us summarize the concepts developed so far in this section:

- Work done on a particle is equal to the change in its kinetic energy.
- Work done on a system by all the (external and internal) forces is equal to the change in its kinetic energy.
- A force is called conservative if the work done by it during a round trip of a system is always zero. The force of gravitation, Coulomb force, force by a spring etc. are conservative. If the work done by it during a round trip is not zero, the force is non-conservative. Friction is an example of non-conservative force.
- The change in the potential energy of a system corresponding to conservative internal forces is equal to negative of the work done by this forces.
- If no external forces act (or the work done by them is zero) and the internal forces are conservative, the mechanical energy of the system remains constant. This is known as the principle of conservation of mechanical energy.
- If some of the internal forces are non-conservative and they do some work, the mechanical energy of the system is not constant.
- If the internal forces are conservative, the work done by the external forces is equal to the change in mechanical energy.

$$W_{\text{external}} = \Delta K + \Delta U$$

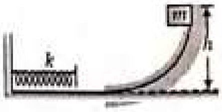
ILLUSTRATION 7.16 A smooth block of mass m is released from rest from a height h. It slides and compresses the spring of stiffness k. Find the maximum compression of the spring.

Solution. Taking block spring a system. No external force is doing work on system and no non-conservative force is present. The mechanical energy should be conserved.

$$\Delta K + \Delta U = 0$$

Let x = maximum compression of the spring.

Here $\Delta U = \Delta U_{sp} + \Delta U_{gr}$



$$\Delta U_{sp} = \frac{k}{2}x^2$$

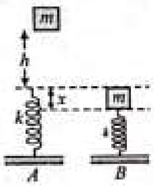
because the spring is deformed from $x = 0$ to $x = x$ and $\Delta U_{gr} = -mgh$ because the block falls down through a vertical distance h. Hence,

$$\Delta U = \frac{k}{2}x^2 - mgh$$

Since, the block will come to rest at the time of maximum compression $\Delta K = 0$. Substituting ΔU and ΔK in the equation $\Delta U + \Delta K = 0$, we have $\frac{k}{2}x^2 - mgh = 0$

Then $x = \sqrt{\frac{2mgh}{k}}$

ILLUSTRATION 7.17 A block of mass m strikes a light pan fitted with a vertical spring after falling through a distance h. If the stiffness of the spring is k, find the maximum compression of the spring.



Solution. Let the maximum compression in the spring be x. The reference level for potential energy is assumed at the position of maximum compression. Applying mechanical energy conservation, $\Delta K + \Delta U = 0$

As block is released from rest and finally comes to rest. Hence, net change in kinetic energy, $\Delta K = 0$.

Net change in potential energy,

$$\Delta U = \Delta U_{gr} + \Delta U_{sp} = [-mg(x+h)] + \left(\frac{1}{2}kx^2\right)$$

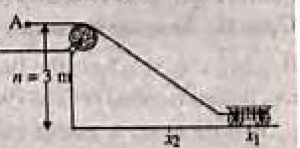
$$0 + [-mg(h+x)] + \left(\frac{1}{2}kx^2 - 0\right) = 0$$

$$x^2 - 2\left(\frac{mg}{k}\right)x - 2\left(\frac{mg}{k}\right)h = 0$$

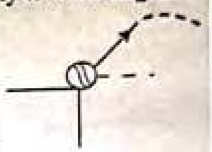
After solving, we get $x = \frac{mg}{k}\left[1 + \sqrt{1 + \frac{2kh}{mg}}\right]$

Concept Application Exercise 7.3

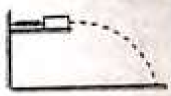
1. Figure shows a light, inextensible string attached to a cart, which can slide along a frictionless horizontal rail aligned along the x axis. The left end of the string is pulled over a pulley of negligible mass and friction and fixed at height $h = 3$ m from the ground level. The cart slides from $x_1 = 3\sqrt{3}$ m to $x_2 = 4$ m and during the move, tension in the string is kept constant at 50 N. Find the change in kinetic energy of the cart in joules. (Use $\sqrt{3} = 1.3$)



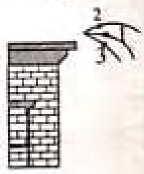
2. A boy throws a ball with initial velocity u at an angle of projection θ from a tower of height H. Neglecting air resistance, find
   (a) How high above the building the ball rises
   (b) Its speed just before it hits the ground.



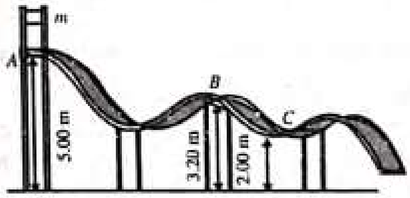
3. A small block of mass 100 g is pressed against a horizontal spring, fixed at one end, to compress the spring through 5.0 cm (see figure). The spring constant is 100 N m^{-1}. When released, the block moves horizontally till it leaves the spring. Where will it hit the ground 2 m below the spring?



4. Three identical balls are thrown from the top of a building, all with the same initial speed. As shown in the figure, the first ball is thrown horizontally, second above horizontal level, and third at an angle below the horizontal. Neglecting air resistance, rank the speeds of the balls at the instant each hits the ground.



5. A particle of mass $m = 5.00$ kg is released from point A and it slides on the frictionless track shown in the figure. Determine (a) the particle's speed at points B and C and (b) the net work done by the gravitational force as the particle moves from A to C.

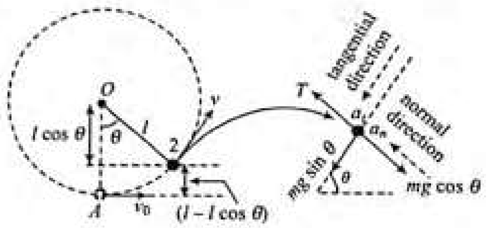


6. A block slides down a curved frictionless track and then up an inclined plane as in the figure. The coefficient of kinetic friction between the block and incline is μ_k. Find the maximum height reached by the block.

7. A block of mass m is released from point (A). The track is frictionless except for the portion between points (B) and (C), which has a length of d_{BC}. The block travels down the track, hits a spring of force constant k, and compresses the spring x from its equilibrium position before coming to rest momentarily. Determine the coefficient of kinetic friction between the block and the rough surface between (B) and (C).

MOTION IN A VERTICAL CIRCLE

Let us consider the motion of a point mass tied to a string of length l and whirled in a vertical circle. If at any time the body is at angular position θ, as shown in the figure.



Let the particle is given velocity v_0 at lowest position. Using conservation of mechanical energy at A and (2).

$$\Delta K + \Delta U = 0$$

$$\left(\frac{1}{2}mv^2 - \frac{1}{2}mv_0^2\right) + mgl(1-\cos\theta) \qquad \text{(i)}$$

$$v^2 = v_0^2 - 2gl(1-\cos\theta)$$

or $$v = \sqrt{v_0^2 - 2gl(1-\cos\theta)} \qquad \text{(ii)}$$

For tangential acceleration at any position on vertical circle,

$$a_t = \frac{mg\sin\theta}{m} = g\sin\theta \qquad \text{(iii)}$$

Normal acceleration, $a_n = \dfrac{v^2}{l}$

$$\Rightarrow \quad a_n = \frac{v^2 - 2gl(1-\cos\theta)}{l} \qquad \text{(iv)}$$

Minimum velocity required at top most position to complete circle is $\sqrt{gR}$, where R is the radius of the circle.

If speed at the lowest point is v_0, then from the conservation of mechanical energy between lowest point and top most point,

$v = v_{top}$ and $v_1 = v_{lowest} = v_0$

$$v_{top} = \sqrt{gl} = \sqrt{v_0^2 - 2gl(1-\cos\theta)} \Rightarrow v_0 \ge \sqrt{5gl}$$

i.e., for looping the loop, minimum velocity at lowest point must be greater than or equal to $\sqrt{5gR}$ where R is the radius of the circle.

If velocity at the lowest point is just enough for looping the loop, the value of various quantities is (True for a point mass attached to a string or a mass moving on a smooth vertical circular track.):	
At A  (a)	Tension at lowest position from (v), $T = \dfrac{m(\sqrt{5gl})^2}{l} + mg\cos 0° = 6mg$ Tangential acceleration, $a_t = g\sin 0° = 0$ Normal acceleration, $a_n = \dfrac{v_0^2}{2} = \dfrac{(\sqrt{5gl})^2}{l} = 5g$

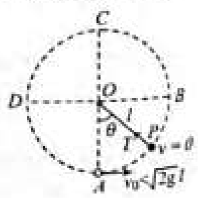
At B and D  (b)	Velocity at B from (i), $v_B = \sqrt{5gl - 2gl(1-\cos 90°)} = \sqrt{3gl}$ Tension at B from (iv), $T_B = \dfrac{mv_B^2}{l} + mg\cos 90°$ $= \dfrac{m(3gl)}{l} + 0 = 3mg$ Tangential acceleration, $\lvert a_t \rvert = g\sin\theta = g\sin 90° = g$ Normal acceleration, $a_n = \dfrac{v_B^2}{l} = 3g$
At C  (c)	Velocity at C from (i) $v_C = \sqrt{5gl - 2gl(1-\cos 180°)} = \sqrt{gl}$ Tension at C from (iv), $T_C = \dfrac{m(\sqrt{gl})^2}{l} + mg\cos 180° = 0$ Tangential acceleration, $\lvert a_t \rvert = g\sin\theta = g\sin 180° = 0$ Normal acceleration, $a_n = \dfrac{v_C^2}{l} = \dfrac{(\sqrt{gl})^2}{l} = g$

CONDITION FOR OSCILLATION OR LEAVING THE CIRCLE

In case of non-uniform circular motion in a vertical plane, if the velocity of body at lowest point is lesser than $\sqrt{5gl}$, the particle will not complete the circle in vertical plane. In this case, the motion of the point mass which depend on whether tension becomes zero before speed becomes zero or vice versa.

Case I: The speed becomes zero before tension

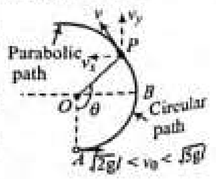
If velocity of the particle at lowest point, $v_0 < \sqrt{2gl}$, the ball never rises above the level of the center O, i.e., the body is confined to move within C and B, ($|\theta| <$ 90°) for this the speed at A.



In this case, tension cannot be zero, since a component of gravity acts radially outwards. Hence, the string will not go slack, and the ball will reverse back as soon as its speed becomes zero. Its motion will be oscillatory motion.

Case II: Tension becomes zero before speed

If $\sqrt{2gl} < v_0 < \sqrt{5gl}$, the ball rises above the level of center O, i.e., it goes beyond point B (90° < θ < 180°).

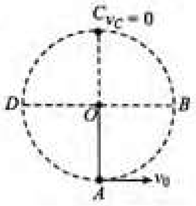


In this case, a component of gravity will always act towards center. Hence, centripetal acceleration or speed will remain non-zero. Hence, tension becomes zero first.

As soon as the tension becomes zero at any point, string will go slack and subsequently, the only force acting on the body is gravity. Hence its subsequent motion will be similar to that of a projectile. In this case, motion is a combination of circular and projectile motion.

Condition for looping the loop in some other cases

- A mass moving on a smooth vertical circular track.
- A particle attached to a light rod rotated in vertical circle.
  Condition for just looping the loop, velocity $v = 0$ at highest point (even if tension is zero, rod would not slack, and a compressive force can appear in the rod).
  By energy conservation,
  velocity at lowest point $= \sqrt{4gl}$
  $v_{min} = \sqrt{4gl}$ (for completing the circle)

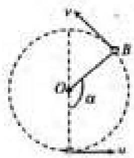


- A bead attached to a ring and rotated.
  Condition for just looping the loop, velocity $v = 0$ at highest point (even if normal is zero, the bead will not lose contact with the track, normal can act radially outward).

  By energy conservation, velocity at lowest point $= \sqrt{4gl}$
  $v_{min} = \sqrt{4gl}$ (for completing the circle)
- A block rotated between smooth surfaces of a pipe.
  Condition for just looping the loop, velocity $v = 0$ at highest point (even if normal is zero, the bead will not lose contact with the track, normal can act radially outward).

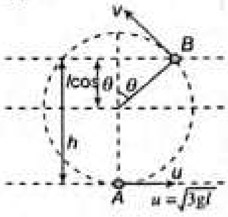
  By energy conservation,
  velocity at lowest point $= \sqrt{4gl}$
  $v_{min} = \sqrt{4gl}$ (for completing the circle)

ILLUSTRATION 7.18 The bob of a pendulum at rest is given a sharp hit to impart a horizontal velocity u where l is the length of the pendulum. Find the angle rotated by the string before it becomes slack.



Solution. Let string slacks at B.

Applying COM, E at A and B, $\Delta U + \Delta K = 0$



$$mgh + \left[\frac{1}{2}mv^2 - \frac{1}{2}mu^2\right] = 0$$

$$\frac{1}{2}mv^2 - \frac{1}{2}mu^2 = -mgh$$

$$v^2 = u^2 - 2g(l + l\cos\theta) \qquad \text{(i)}$$

When string slacks tension in the string becomes zero. The component of the weight in radial direction provide centripetal force at this position. From FBD of bob, we can write

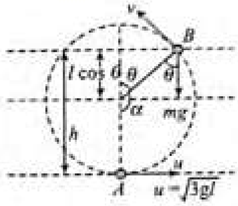
$$\frac{mv^2}{l} = mg\cos\theta$$

$$v^2 = lg\cos\theta \qquad \text{(ii)}$$

From equation (i) and (ii), we get

$$gl\cos\theta = 3gl - 2gl - 2gl\cos\theta$$

$$3\cos\theta = 1 \Rightarrow \theta = \cos^{-1}\left(\frac{1}{3}\right)$$



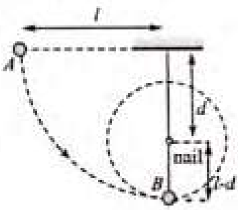
Hence, the angle rotated by the string before it becomes slack is

$$\Rightarrow \quad \alpha = \pi - \theta = \pi - \cos^{-1}\left(\frac{1}{3}\right)$$

ILLUSTRATION 7.19 In the given system, when the ball of mass m is released, it will swing down the dotted arc.

(a) How fast will it reach the lowest point in its swing? A nail is located at a distance d below the point of suspension.

(b) Show that d must at $0.6l$, if the ball is to swing completely around a circle centered along the nail.



(c) If $d = 0.6l$, find the change in tension in the string just after it touches the nail.

Solution.

(a) Radius of the circle centered at nail $= l - d$. To complete the circle centered at nail, the speed at the bottom must be at least $= \sqrt{5g(l-d)}$

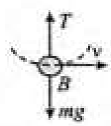
From A to B conserving mechanical energy $\Delta K + \Delta U = 0$:
Loss in GPE = Gain in KE

$$mgl = \frac{1}{2}mv^2 \quad \Rightarrow \quad v = \sqrt{2gl}$$

(b) To complete the circle: $\sqrt{2gl} = \sqrt{5g(l-d)}$

$$\Rightarrow \quad 5l - 5d = 2l \quad \Rightarrow \quad d = \frac{3}{5}l = 0.6l$$

(c) Just before touching the nail, the ball is moving in a circle of radius l.



$$\Rightarrow \quad T_{before} - mg = \frac{mv^2}{l}$$

$$\Rightarrow \quad T_{before} = mg + \frac{mv^2}{l} = mg + 2mg = 3mg$$

Just after touching the nail, the ball is moving in a circle of radius $(l - d)$.

$$T_{after} - mg = \frac{mv^2}{(l-d)}$$

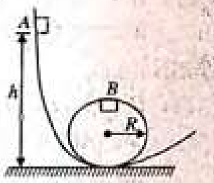
$$\Rightarrow \quad T_{\text{after}} = mg + \frac{mv^2}{l-d} = mg + \frac{m(2gl)}{0.4l}$$

$\Rightarrow$ Tension = $6mg$

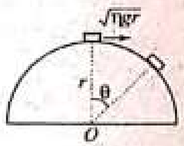
Hence, the tension in the string changes from $3mg$ to $6mg$ as it touches the nail.

Concept Application Exercise 7.4

1. A heavy particle hanging from a fixed point by a light inextensible string of length l is projected horizontally with speed $\sqrt{gl}$. Find the speed of the particle and the inclination of the string to the vertical at the instant when the tension in the string equals the weight of the particle.
2. A ball is attached to a horizontal cord of length l whose other end is fixed. (a) If the ball is released, what will be its speed at the lowest point of its path? (b) A peg is located a distance h directly below the point of attachment of the cord. If $h = 0.75l$, what will be the speed of the ball when it reaches the top of its circular path about the peg?
3. A smooth sphere of radius R is moving in a straight line with an acceleration a. A particle is released from the top of the sphere from rest. Find the speed of the particle when it is at an angular position θ from the initial position relative to the sphere.
4. The block on the loop shown in the figure slides without friction. At what height from A it starts so that it passes against the track at B with a net upward force equal to its own weight? The radius of the loop is R.



5. A particle rests on the top of a smooth hemisphere of radius r. It is imparted a horizontal velocity of $\sqrt{\eta gr}$. Find the angle made by the radius vector joining the particle with the vertical at the instant the particle losses contact with the sphere.



6. A block is released from rest at the top of an inclined plane which later curves into a circular track of radius r as shown in the figure. Find the minimum height h from where it should be released so that it is able to complete the circle.

MECHANICAL POWER

In many cases, it is useful to know not just the total amount of work being done, but how fast the work is done. For example, if you have a machine that can provide only a certain amount of work in a day and you wish to accomplish double of that much work, then you will have to either spend two days for the job or get an additional machine. We define work as the rate at which work is being done. Its defining equation is

$$\text{Power} = \frac{\text{Work done}}{\text{Time taken to do work}}$$

or $\quad P = \dfrac{\Delta W}{\Delta t}$

Power is defined as the line rate of doing work or the time rate at which energy is transferred. Therefore,

$$P = \frac{dW}{dt}$$

where P is the instantaneous power, dW/dt is the rate of doing work.

We can write, $dW = \vec{F}.\,d\vec{r}$

$$\Rightarrow \quad \frac{dW}{dt} = \vec{F}.\frac{d\vec{r}}{dt} \quad \Rightarrow \quad P = \vec{F}\,\vec{v}$$

where $\vec{F}$ is the instantaneous force applied, and $\vec{v}$ is the instantaneous velocity.

Important Points

- Dimension: $[P] = [F]\,[v] = [MLT^{-2}]\,[LT^{-1}]$
  $\therefore \quad [P] = [ML^2T^{-3}]$
- Units: Watt or $J\,s^{-1}$ [SI]
  Erg/s [CGS]
  Practical units: Kilowatt (KW), Megawatt (MW) and Horse power (hp)
  Relations between different units:
  $1 \text{ watt} = 1\,J\,s^{-1} = 10^7 \text{ erg}\,s^{-1}$
  $1 \text{ hp} = 746 \text{ W}$
  $1 \text{ MW} = 10^6 \text{ W}$
  $1 \text{ kW} = 10^3 \text{ W}$
- If work done by the two bodies is same, then
  $$\text{Power} \propto \frac{1}{\text{time}}$$
  i.e., the body which performs the given work in lesser time possesses more power and vice-versa.
- As power = work/time, any unit of power multiplied by a unit of time gives unit of work (or energy) and not power. i.e., kilowatt-hour or watt-day are units of work or energy.
  $$1\,\text{kWh} = 10^3\,\frac{J}{s} \times (60 \times 60\,s) = 3.6 \times 10^6\,J$$
- The slope of work time curve gives the instantaneous power. As $P = dW/dt = \tan\theta$.
- Area under power–time curve gives the work done as

$$P = \frac{dW}{dt}$$

$\therefore \quad W = \int P\,dt$

= Area under P-t curve

ILLUSTRATION 7.20 A car of mass 500 kg moving with a speed 36 kmh in a straight road unidirectionally doubles its speed in 1 min. Find the power delivered by the engine.

Solution. Its initial speed $v_1 = \dfrac{36000}{3600} = 10\,\text{m}\,\text{s}^{-1}$.

If the car doubles its speed, finally its speed becomes $v_2 = 20\ \text{m}\,\text{s}^{-1}$.

Change in KE of the car = $\Delta KE = (1/2)\,mv_2^2 - (1/2)\,mv_1^2$

During $\Delta t = 1$ min = 60 s

the power delivered by the engine,

$$P = \frac{\text{Work done}}{\text{Time taken}} = \frac{|\Delta KE|}{\Delta t}$$

$$= \frac{\frac{1}{2}\times m\left[v_2^2 - v_1^2\right]}{\Delta t}$$

$$= \frac{1/2\times 500\left[20^2 - 10^2\right]}{60} = 1250\ \text{W}$$

ILLUSTRATION 7.21 An automobile of mass m accelerates, starting from rest, while the engine supplies constant power P, its position and instantaneous velocity changes w.r.t. time assuming the automobile starts from rest.

Solution. **Velocity:** As $Fv = P$ = constant, i.e.,

$$m\frac{dv}{dt}v = P \quad \left[\text{as } F = \frac{m\,dv}{dt}\right]$$

or $$\int v\,dv = \int \frac{P}{m}dt$$

By integrating both sides, we get $\dfrac{v^2}{2} = \dfrac{P}{m}t + C_1$

As initially the body is at rest, i.e., $v = 0$ at $t = 0$, so $C_1 = 0$.

$$\therefore \quad v = \left(\frac{2Pt}{m}\right)^{1/2}$$

Position: From the above expression, $v = \left(\dfrac{2Pt}{m}\right)^{1/2}$

or $$\frac{ds}{dt} = \left(\frac{2Pt}{m}\right)^{1/2} \quad \left[\text{As } v = \frac{ds}{dt}\right]$$

i.e., $$\int ds = \int \left(\frac{2Pt}{m}\right)^{1/2} dt$$

By integrating both sides, we get

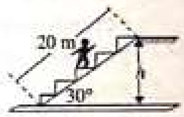
$$s = \left(\frac{2P}{m}\right)^{1/2} \cdot \frac{2}{3}t^{3/2} + C_2$$

Now as at $t = 0$, $s = 0$, so $C_2 = 0$.

$$s = \left(\frac{8P}{9m}\right)^{1/2} t^{3/2}$$

CONCEPT APPLICATION EXERCISE 7.5

1. One coolie takes 1 min to raise a box through a height of 2 m. Another one takes 30 s for the same job and does the same amount of work. Which one of the two has greater power and which one uses greater energy?
2. A large family uses 8 kW of power. Direct solar energy is incident on the horizontal surface at an average rate of 200 W m^{-2}. If 20% of this energy can be converted to useful electrical energy, how large an area is needed to supply 8 kW?
3. An elevator of total mass (elevator + passenger) 1800 kg is moving up with a constant speed of 2 m s^{-1}. A frictional force of 4000 N opposes its motion. Determine the minimum power delivered by the motor to the elevator. Take $g = 10$ m s^{-2}.
4. Two persons of equal weight are running at speeds of 4 m s^{-1} and 5 m s^{-1}, respectively. Both increase their speeds by 1 m s^{-1} in a time span of 10 s. Who does more work? Who develops more power?
5. A 90-kg man runs up an escalator while it is not in operation in 10 s. What is the average power developed by the man. Suppose the escalator is running so that the escalator steps move at a speed of 0.5 m s^{-1}. What is then the power developed by the man as seen by the ground reference if he moves at the same speed relative to the escalator steps as he did when the escalator is not in operation?



6. The electric motor of a model train accelerates the train from rest to 0.620 m s^{-1} in 21.0 ms. The total mass of the train is 875 g. Find the average power delivered to the train during the acceleration.

SOLVED EXAMPLES

1. The potential energy between two atoms in a molecule is given by $U(x) = \dfrac{a}{x^{12}} - \dfrac{b}{x^6}$, where a and b are positive constants and x is the distance between the atoms. The atom is in stable equilibrium when

(a) $x = \sqrt[6]{\dfrac{11a}{5b}}$ (b) $x = \sqrt[6]{\dfrac{a}{2b}}$

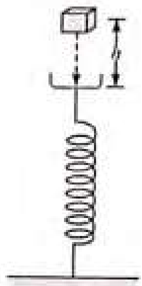
(c) $x = 0$ (d) $x = \sqrt[6]{\dfrac{2a}{b}}$

Sol. (d) Condition for stable equilibrium, $F = -\dfrac{dU}{dx} = 0$

$$\Rightarrow \quad -\frac{d}{dx}\left[\frac{a}{x^{12}}-\frac{b}{x^{6}}\right]=0 \quad \Rightarrow \quad -12ax^{-13}+6bx^{-7}=0$$

$$\Rightarrow \quad \frac{12a}{x^{13}}=\frac{6b}{x^{7}} \Rightarrow \frac{2a}{b}=x^{6} \Rightarrow x=\sqrt[6]{\frac{2a}{b}}$$

2. A block of mass m initially at rest is dropped from a height h on to a spring of force constant k. The maximum compression in the spring is x then



(a) $mgh=\frac{1}{2}kx^2$

(b) $mg(h+x)=\frac{1}{2}kx^2$

(c) $mgh=\frac{1}{2}k(x+h)^2$

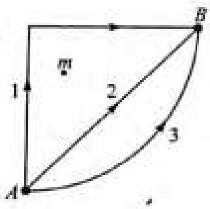
(d) $mg(h+x)=\frac{1}{2}k(x+h)^2$

Sol. (b) Change in gravitational potential energy

= Elastic potential energy stored in compressed spring

$$\Rightarrow \quad mg(h+x)=\frac{1}{2}kx^2$$

3. If W_1, W_2 and W_3 represent the work done in moving a particle from A to B along three different paths 1, 2 and 3, respectively, (as shown) in the gravitational field of a point mass m, find the correct relation between W_1, W_2 and W_3.



(a) $W_1 > W_2 > W_3$

(b) $W_1 = W_2 = W_3$

(c) $W_1 < W_2 < W_3$

(d) $W_2 > W_1 > W_3$

Sol. (b) Gravitational force is a conservative force and work done against it is a point function, i.e., does not depend on the path.

4. A particle of mass m is moving in a horizontal circle of radius r under a centripetal force equal to $-K/r^2$, where K is a constant. The total energy of the particle is

(a) $\frac{K}{2r}$ (b) $-\frac{K}{2r}$

(c) $-\frac{K}{r}$ (d) $\frac{K}{r}$

Sol. (b) Here $\frac{mv^2}{r}=\frac{K}{r^2}$ $\therefore$ K.E. $=\frac{1}{2}mv^2=\frac{K}{2r}$

$$U=-\int_{\infty}^{r}F.dr=-\int_{\infty}^{r}\left(-\frac{K}{r^2}\right)dr=-\frac{K}{r}$$

Total energy $E=\text{K.E.}+\text{P.E.}=\frac{K}{2r}-\frac{K}{r}=-\frac{K}{2r}$

5. A force $F=-K(yi+xj)$ (where K is a positive constant) acts on a particle moving in the xy-plane. Starting from the origin, the particle is taken along the positive x-axis to the point $(a, 0)$ and then parallel to the y-axis to the point (a, a). The total work done by the force F on the particles is

(a) $-2Ka^2$ (b) $2Ka^2$

(c) $-Ka^2$ (d) Ka^2

Sol. (c) While moving from $(0,0)$ to $(a, 0)$

Along positive x-axis, $y=0 \Rightarrow \vec{F}=-kx\hat{j}$

i.e. force is in negative y-direction while displacement is in positive x-direction.

$\therefore \quad W_1=0$

Because force is perpendicular to displacement.

Then particle moves from $(a,0)$ to (a, a) along a line parallel to y-axis $(x=+a)$ during this $\vec{F}=-k(y\hat{i}+a\hat{j})$

The first component of force, $-ky\hat{i}$ will not contribute any work because this component is along negative x-direction $(-\hat{i})$ while displacement is in positive y-direction $(a,0)$ to (a,a).

The second component of force *i.e.* $-ka\hat{j}$ will perform negative work

$\therefore \quad W_2=(-ka\hat{j})(a\hat{j})=(-ka)(a)=-ka^2$

So net work done on the particle

$W=W_1+W_2=0+(-ka^2)=-ka^2$

6. A body is moved along a straight line by a machine delivering constant power. The distance moved by the body in time t is proportional to

(a) $t^{1/2}$ (b) $t^{3/4}$

(c) $t^{3/2}$ (d) t^2

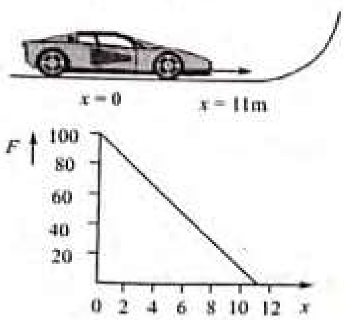
Sol. (c) $P=Fv=mav=m\left(\frac{dv}{dt}\right)v \Rightarrow \frac{P}{m}dt=v\,dv$

$$\Rightarrow \quad \frac{P}{m}\times t=\frac{v^2}{2} \Rightarrow v=\left(\frac{2P}{m}\right)^{1/2}(t)^{1/2}$$

Now $s=\int v\,dt=\int\left(\frac{2P}{m}\right)^{1/2}t^{1/2}dt$

$$\therefore \quad s=\left(\frac{2P}{m}\right)^{1/2}\left[\frac{2t^{3/2}}{3}\right] \Rightarrow s \propto t^{3/2}$$

7. A toy car of mass 5 kg moves up a ramp under the influence of force F plotted against displacement x. The maximum height attained is given by



(a) $y_{max} = 20$ m (b) $y_{max} = 15$ m
(c) $y_{max} = 11$ m (d) $y_{max} = 5$ m

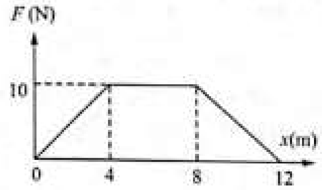
Sol. (c) Work done = Gain in potential energy

Area under curve = mgh

$\Rightarrow \quad \frac{1}{2} \times 11 \times 100 = 5 \times 10 \times h$

$\Rightarrow \quad h = 11$ m

8. A particle of mass 0.1 kg is subjected to a force which varies with distance as shown in the figure. If it starts its journey from rest at $x = 0$, its velocity at $x = 12$ m is



(a) 0 m/s (b) $20\sqrt{2}$ m/s
(c) $20\sqrt{3}$ m/s (d) 40 m/s

Sol. (d) Area between curve and displacement axis

$= \frac{1}{2} \times (12 + 4) \times 10 = 80$ J

In this time, body acquires kinetic energy $= \frac{1}{2}mv^2$

By the law of conservation of energy

$\frac{1}{2}mv^2 = 80$ J

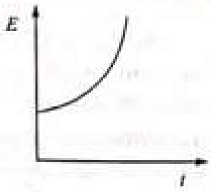
$\Rightarrow \quad \frac{1}{2} \times 0.1 \times v^2 = 80$

$\Rightarrow \quad v^2 = 1600$

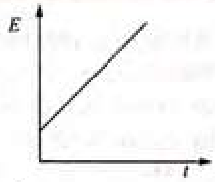
$\Rightarrow \quad v = 40$ m/s

9. A particle is dropped from a height h. A constant horizontal velocity is given to the particle. Taking g to be constant every where, kinetic energy E of the particle w.r.t. time t is correctly shown in

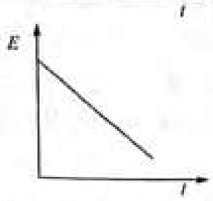
(a)



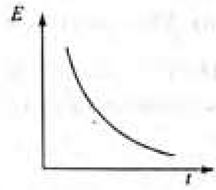
(b)



(c)



(d)



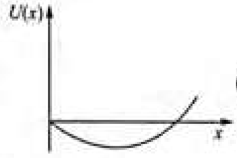
Sol. (a) As particle is projected with some velocity, therefore, its initial kinetic energy will not be zero.

As it moves downward under gravity, then its velocity increases with time K.E. $\propto v^2 \propto t^2$ (As $v \propto t$)

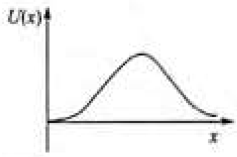
So the graph between kinetic energy and time will be parabolic in nature.

10. A particle which is constrained to move along the x-axis, is subjected to a force in the same direction which varies with the distance x of the particle from the origin as $F(x) = -kx + ax^3$. Here k and a are positive constants. For $x \geq 0$, the functional from of the potential energy $U(x)$ of the particle is

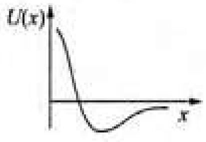
(a)



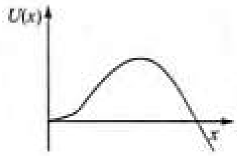
(b)



(c)



(d)



Sol. (d) $F = \frac{-dU}{dx} \Rightarrow dU = -F\,dx$

$\Rightarrow \quad U = -\int_0^x (-Kx + ax^3)dx = \frac{kx^2}{2} - \frac{ax^4}{4}$

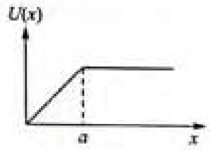
$\therefore$ We get $U = 0$ at $x = 0$ and $x = \sqrt{2k/a}$

and also U = negative for $x > \sqrt{2k/a}$.

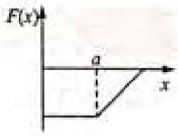
So $F = 0$ at $x = 0$

i.e. slope of $U - x$ graph is zero at $x = 0$.

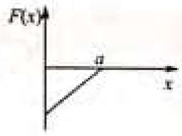
11. The potential energy of a system is represented in the first figure. the force acting on the system will be represented by



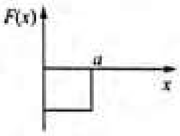
(a)



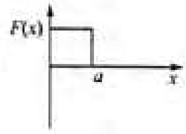
(b)



(c)



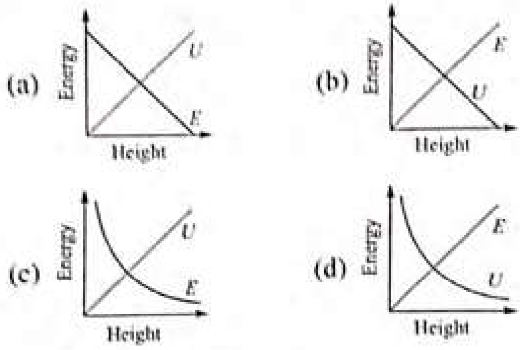
(d)



Sol. (c) As slope of problem graph is positive and constant upto certain distance and then it becomes zero.

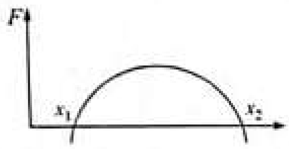
So from $F = \frac{-dU}{dx}$, up to distance a, F = constant (negative) and becomes zero suddenly.

12. Which of the following graphs is correct between kinetic energy (E), potential energy (U) and height (h) from the ground of the particle



***Sol.* (a)** Potential energy increases and kinetic energy decreases when the height of the particle increases it is clear from the graph (*a*).

13. The force acting on a body moving along x-axis varies with the position of the particle as shown in the figure.



The body is in stable equilibrium at

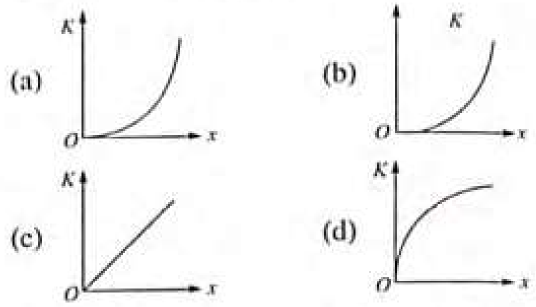
(a) $x = x_1$ (b) $x = ix_2$
(c) both x_1 and x_2 (d) neither x_1 nor x_2

***Sol.* (b)** When particle moves away from the origin, then at position $x = x_1$, force is zero and at $x > x_1$, force is positive (repulsive in nature). So particle moves further and does not return back to original position, i.e., the equilibrium is not stable.

Similarly, at position $x = x_2$, force is zero and at $x > x_2$, force is negative (attractive in nature).

So, particle returns back to original position, i.e., the equilibrium is stable.

14. A body moves from rest with a constant acceleration. Which one of the following graphs represents the variation of its kinetic energy K with the distance travelled x?

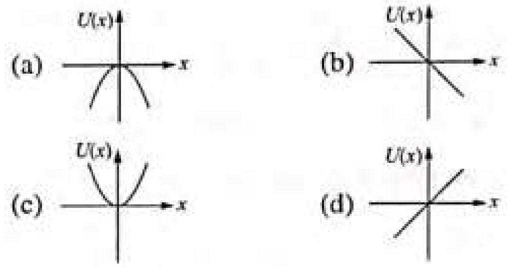


***Sol.* (c)** When body moves under the action of constant force, then kinetic energy acquired by the body K.E. $= F \times S$

$\therefore$ KE $\propto S$ (If F = constant)

So, the graph will be straight line.

15. A particle is placed at the origin and a force $F = kx$ is acting on it (where k is positive constant). If $U(0) = 0$, the graph of $U(x)$ versus x will be (where U is the potential energy function)



***Sol.* (a)** $U = -\int F dx = -\int kx\, dx = -k\dfrac{x^2}{2}$

This is the equation of parabola symmetric to U axis in negative direction.

EXERCISES

Concept of Work and Work Energy Theorem

1. A cart is set rolling across a level table, at the same speed on every trial. If it runs into a patch of sand, the cart exerts on the sand an average horizontal force of 6 N and travels a distance of 6 cm through the sand as it comes to a stop. If instead the cart runs into a patch of gravel on which the cart exerts an average horizontal force of 9 N, how far into the gravel will the cart roll before stopping?

(a) 9 cm (b) 6 cm (c) 4 cm (d) 3 cm

2. If a person is pushing a box with force $\vec{F}$ inside a train moving with constant velocity, the work done in the frame of earth will be:

$\vec{s}_0$ = displacement of the train relative to ground.

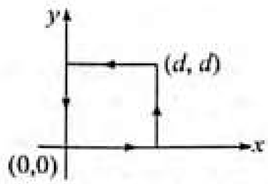
$\vec{s}$ = displacement of the box w.r.t. train.

(a) zero (b) $\vec{F}\cdot(\vec{s}+\vec{s}_0)$ (c) $\vec{F}\cdot\vec{s}$ (d) $\vec{F}\cdot\vec{s}_0$

3. Two springs have their force constant as k_1 and $k_2 (k_1 > k_2)$. When they are stretched by the same force

(a) No work is done in case of both the springs
(b) Equal work is done in case of both the springs
(c) More work is done in case of second spring
(d) More work is done in case of first spring

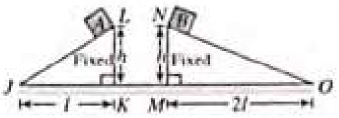
4. The work done by the force $= A(y^2\hat{i} + 2x^2\hat{j})$, where A is a constant and x and y are in meters around the path shown is:



(a) zero (b) $A\,d$ (c) $A\,d^2$ (d) $A\,d^3$

5. If the net work done by external forces on a particle is zero, which of the following statements about the particle must be true?
   (a) Its velocity is zero.
   (b) Its velocity is decreased.
   (c) Its velocity is unchanged.
   (d) Its speed is unchanged.
6. A particle is acted upon by a force of constant magnitude which is always perpendicular to the velocity of the particle, the motion of the particle takes place in a plane. It follows that
   (a) Its velocity is constant
   (b) Its acceleration is constant
   (c) Its kinetic energy is constant
   (d) It moves in a straight line
7. A ball of mass m moves with speed v and strikes a wall having infinite mass and it returns with same speed then the work done by the ball on the wall is
   (a) Zero (b) mv J (c) m/v J (d) v/m J
8. Is the work required to be done by an external force on an object on a frictionless, horizontal surface to accelerate it from a speed v to a speed $2v$
   (a) equal to the work required to accelerate the object from $t = 0$ to v
   (b) twice the work required to accelerate the object from $v = 0$ to v
   (c) three times the work required to accelerate the object from $v = 0$ to v
   (d) four times the work required to accelerate the object from 0 to v
9. A body of mass m is slowly pulled up the hill by a force F which at each point was directed along the tangent of the trajectory as shown in figure. All surfaces are smooth. Find the work performed by this force.

   (a) mgl (b) $-mgl$ (c) mgh (d) zero
10. An engine pumps water continuously through a hole. Speed with which water passes through the hole nozzle is v, and k is the mass per unit length of the water jet as it leaves the nozzle. Find the rate at which kinetic energy is being imparted to the water.
   (a) $\frac{1}{2}kv^2$ (b) $\frac{1}{2}kv^3$ (c) $\frac{v^2}{2k}$ (d) $\frac{v^3}{2k}$
11. A bus can be stopped by applying a retarding force F when it is moving with speed v on a level road. The distance covered by it before coming to rest is s. If the load of the bus increases by 50% because of passengers, for the same speed and same retarding force, the distance covered by the bus to come to rest shall be
   (a) $1.5s$ (b) $2s$ (c) $1s$ (d) $2.5s$
12. Power supplied to a particle of mass 2 kg varies with time as $P = 3t^2/2$ W. Here t is in second. If the velocity of particle at $t = 0$ is $v = 0$, the velocity of particle at time $t = 2$ s will be
   (a) $1\ \text{ms}^{-1}$ (b) $4\ \text{ms}^{-1}$ (c) $2\ \text{ms}^{-1}$ (d) $2\sqrt{2}\ \text{ms}^{-1}$
13. An object of mass m slides down a hill of arbitrary shape and after travelling a certain horizontal path stops because of friction. The total vertical height descended is h. The friction coefficient is different for different segments for the entire path but is independent of the velocity and direction of motion. The work that a tangential force must perform to return the object to its initial position along the same path is
   (a) mgh (b) $-mgh$ (c) $-2mgh$ (d) $2mgh$
14. A spring is compressed between two toy carts of masses m_1 and m_2. When the toy carts are released, the spring exerts on each toy cart equal and opposite forces for the same small time t. If the coefficients of friction μ between the ground and the toy carts are equal, then the magnitude of displacements of the toy carts are in the ratio
   (a) $\frac{S_1}{S_2} = \frac{m_2}{m_1}$ (b) $\frac{S_1}{S_2} = \frac{m_1}{m_2}$
   (c) $\frac{S_1}{S_2} = \left(\frac{m_2}{m_1}\right)^2$ (d) $\frac{S_1}{S_2} = \left(\frac{m_1}{m_2}\right)^2$
15. A particle is released one by one from the top of two inclined rough surfaces of height h each. The angles of inclination of the two planes are 30° and 60°, respectively. All other factors (e.g., coefficient of friction, mass of block, etc.) are same in both the cases. Let K_1 and K_2 be the kinetic energies of the particle at the bottom of the plane in the two cases. Then
   (a) $K_1 = K_2$ (b) $K_1 > K_2$
   (c) $K_1 < K_2$ (d) Data insufficient
16. A person of mass 70 kg jumps from a stationary helicopter with the parachute open. As he falls through 50 m height, he gains a speed of $20\ \text{m s}^{-1}$. The work done by the viscous air drag is
   (a) 21000 J (b) −21000 J
   (c) −14000 J (d) 14000 J
17. A particle of mass m moves with a variable velocity v, which changes with distance covered x along a straight line as $v = k\sqrt{x}$, where k is a positive constant. The work done by all the forces acting on the particle, during the first t seconds is
   (a) $\frac{mk^4}{t^2}$ (b) $\frac{mk^4t^2}{4}$ (c) $\frac{mk^4t^2}{8}$ (d) $\frac{mk^4t^2}{16}$
18. Two identical blocks A and B are placed on two inclined planes as shown in the figure. Neglect resistance and other friction.



Read the following statements and choose options.

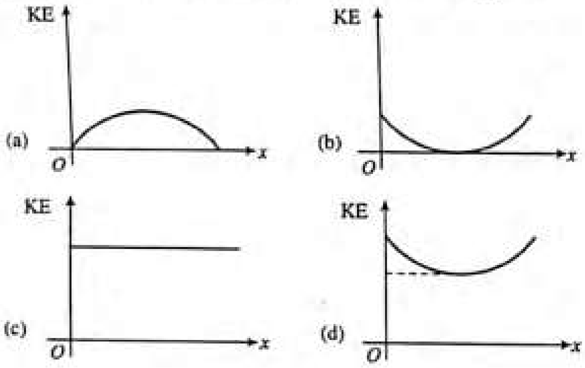
Statement I: The kinetic energy of A on sliding to J will be greater than the kinetic energy of B on sliding to O.

Statement II: The acceleration of A will be greater than acceleration of B when both are released on the inclined plane.

Statement III: The work done by external agent to move the block slowly from position B to O is negative.

(a) Only statement I is true (b) Only statement II is true
(c) Only I and III are true (d) Only II and III are true

19. A projectile is fired with some velocity making certain angle with the horizontal. Which of the following graphs is the best representation for the kinetic energy of a projectile (KE) versus its horizontal displacement (x)?



Concept of Potential Energy and Concept of Conservation of Mechanical Energy

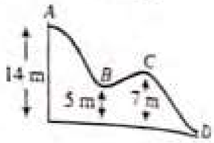
20. In which of the following cases can the work done increases the potential energy?
(a) Both conservative and non-conservative forces
(b) Conservative force only
(c) Non-conservative force only
(d) Neither conservative nor non-conservative forces.

21. Work done by a conservative force on a system is equal to
(a) The change in kinetic energy of the system
(b) The change in potential energy of the system
(c) The change in total mechanical energy of the system
(d) None of the above

22. Which of the following statements is correct?
(a) Kinetic energy of a system can be changed without changing its momentum.
(b) Kinetic energy of a system cannot be changed without changing its momentum.
(c) Momentum of a system cannot be changed without changing its kinetic energy.
(d) A system cannot have energy without having momentum.

23. A heavy weight is suspended from a spring. A person raises the weight till the spring becomes slack. The work done by him is W. The energy stored in the stretched spring was E. What will be the gain in gravitational potential energy?
(a) W (b) E (c) $W+E$ (d) $W-E$

24. Figure shows the vertical section of a frictionless surface. A block of mass 2 kg is released from rest from position A; its KE as it reaches position C is ($g = 10\ \text{m s}^{-2}$)



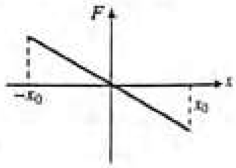
(a) 140 J (b) 180 J (c) 120 J (d) 280 J

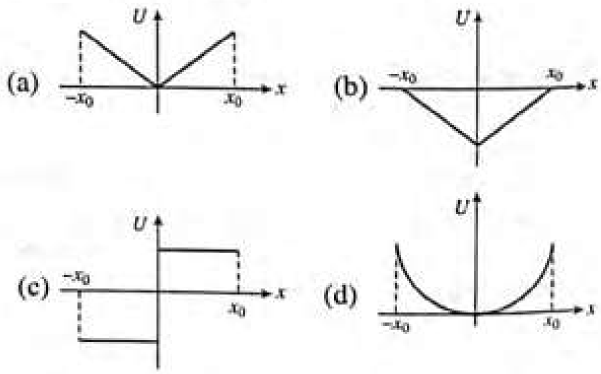
25. A toy gun uses a spring of force constant k. Before being triggered in the upward direction, the spring is compressed by a distance x. If the mass of the shot is m, on being triggered, it will go up to a maximum height of
(a) $\dfrac{kx^2}{mg}$ (b) $\dfrac{x^2}{kmg}$ (c) $\dfrac{kx^2}{2mg}$ (d) $\dfrac{k^2x^2}{mg}$

26. A block of 4 kg mass starts at rest and slides a distance d down a friction less incline (angle 30°) where it runs into a spring of negligible mass. The block slides an additional 25 cm before it is brought to rest momentarily by compressing the spring. The force constant of the spring is 400 N m^{-1}. The value of d is (take $g = 10\ \text{m s}^{-2}$)

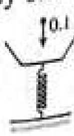
(a) 25 cm (b) 37.5 cm
(c) 62.5 cm (d) None of the above

27. Figure shows a plot of the conservative force F in a unidimensional field. The plot representing the function corresponding to the potential energy (U) in the field is





28. A massless platform is kept on a light elastic spring as shown in the figure. When a particle of mass 0.1 kg is dropped on the pan from a height of 0.24 m, the particle strikes the pan, and the spring is compressed by 0.01 m. From what height should the particle be dropped to cause a compression of 0.04 m?



(a) 0.96 m (b) 2.96 m
(c) 3.96 m (d) 0.48 m

29. The system shown in the figure is released from rest with mass 2 kg in contact with the ground. Pulley and spring are massless, and friction is absent everywhere. The speed of 5 kg block when 2 kg block leaves the contact with the ground is (force constant of the spring $k = 40\ \text{N m}^{-1}$ and $g = 10\ \text{m s}^{-2}$)

(a) $\sqrt{2}\ \text{ms}^{-1}$ (b) $2\sqrt{2}\ \text{ms}^{-1}$
(c) $2\ \text{ms}^{-1}$ (d) $\sqrt{2}\ \text{ms}^{-1}$

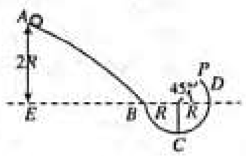
30. When a person stands on a weighing balance, working on the principle of Hooke's law, it shows a reading of 60 kg after a long time and the spring gets compressed by 2.5 cm. If the person jumps on the balance from a height of 10 cm, the maximum reading of the balance will be
(a) 60 kg (b) 120 kg (c) 180 kg (d) 240 kg

31 A particle of mass m is projected at an angle α to the horizontal with an initial velocity u. The work done by gravity during the time it reaches its highest point is
(a) $u^2\sin^2\alpha$ (b) $\frac{mu^2\cos^2\alpha}{2}$
(c) $\frac{mu^2\sin^2\alpha}{2}$ (d) $-\frac{mu^2\sin^2\alpha}{2}$

32. A particle located in a one-dimensional potential field has its potential energy function as $U(x)\ \frac{a}{x^4}-\frac{b}{x^2}$, where a and b are positive constants. The position of equilibrium x corresponds to
(a) $\frac{b}{2a}$ (b) $\sqrt{\frac{2a}{b}}$ (c) $\sqrt{\frac{2b}{a}}$ (d) $\frac{a}{2a}$

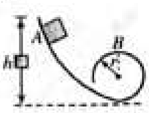
33. A man places a chain (of mass m and length l) on a table slowly. Initially, the lower end of the chain just touches the table. The man brings down the chain by length $l/2$. Work done by the man in this process is
(a) $-mg\frac{l}{2}$ (b) $-\frac{mgl}{4}$ (c) $\frac{-3mgl}{8}$ (d) $-\frac{mgl}{8}$

34. A particle of mass m slides on a frictionless surface $ABCD$, starting from rest as shown in the figure. The part BCD is a circular arc. If it looses contact at point P, the maximum height attained by the particle from point C is



(a) $R\left[2+\frac{1}{2\sqrt{2}}\right]$ (b) $R\left[1+\frac{1}{2\sqrt{2}}\right]R$
(c) $3R$ (d) None of these

35. A mass m starting from A reaches B of a frictionless track. On reaching B, it pushes the track with a force equal to x times its weight, then the applicable relation is



(a) $h = \frac{(x+5)}{2}r$ (b) $h = \frac{x}{2}r$
(c) $h = r$ (d) $h = \left(\frac{x+1}{2}\right)r$

36. A particle of mass m slides along a curved-flat-curved track. The curved portions of the track are smooth. If the particle is released at the top of one of the curved portions, the particle comes to rest at flat portion of length l and of $\mu = \mu_{\text{kinetic}}$ after covering a distance of

(a) $\frac{l}{3\mu}$ (b) $\frac{H}{2\mu_{\text{kinetic}}}$ (c) $\frac{l}{6}$ (d) $\frac{H}{\mu_{\text{kinetic}}}$

Mechanical Power

37. A man M_1 of mass 80 kg runs up a staircase in 15 s. Another man M_2 also of mass 80 kg runs up the same staircase in 20 s. The ratio of the powers developed by them will be
(a) 1 (b) $\frac{4}{3}$ (c) $\frac{16}{9}$ (d) none of these

38. An engine pumps up 100 kg of water through a height of 10 m in 5 s. Given that the efficiency of the engine is 60%, what is the power of the engine? Take $g = 10\ \text{m s}^{-2}$.
(a) 33 kW (b) 3.3 kW (c) 0.33 kW (d) 0.033 kW

39. A pump motor is used to deliver water at a certain rate from a given pipe. To obtain n times water from the same pipe in the same time, by what amount should the power of the motor be increased?
(a) n^2 times (b) n^3 times (c) n times (d) $n^{3/2}$ times

40. The speed v reached by a car of mass m in travelling a distance x, driven with constant power P, is given by
(a) $v = \frac{3xP}{m}$ (b) $v = \left(\frac{3xP}{m}\right)^{1/2}$
(c) $v = \left(\frac{3xP}{m}\right)^{1/3}$ (d) $v = \left(\frac{3xP}{m}\right)^2$

41. A body is moved along a straight line by a machine delivering a constant power. The distance moved by the body in time t is proportional to
(a) $\sqrt{t}$ (b) $t^{3/4}$ (c) $t^{3/2}$ (d) t^2

42. A car drives along a straight level frictionless road by an engine delivering constant power. Then velocity is directly proportional to
(a) t (b) $\frac{1}{\sqrt{t}}$ (c) $\sqrt{t}$ (d) None of these

43. A particle of mass m is moving in a circular path of constant radius r such that its centripetal acceleration a_c is varying with time t as $a_c = k^2rt^2$, where k is a constant. The power delivered to the particle by the forces acting on it is
(a) Zero (b) $mk^2r^2t^2$ (c) mk^2r^2t (d) mk^2rt

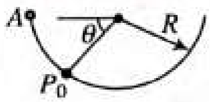
44. In the above question, the average power delivered by gravity is
(a) $-mgu\cos\alpha$ (b) $-mgu\sin\alpha$
(c) $-\dfrac{mgu\cos\alpha}{2}$ (d) $-\dfrac{mgu\sin\alpha}{2}$

45. A particle of mass m moves along a circular path of radius r with a centripetal acceleration a_n changing with time t as $a_n = kt^2$, where k is a positive constant. The average power developed by all the forces acting on the particle during the first t_0 seconds is
(a) $mkrt_0$ (b) $\dfrac{mkrt_0^2}{2}$ (c) $\dfrac{mkrt_0}{2}$ (d) $\dfrac{mkrt_0}{4}$

46. A 500-kg car, moving with a velocity of 36 $\mathrm{km\,h^{-1}}$ on a straight road unidirectionally, doubles its velocity in 1 min. The average power delivered by the engine for doubling the velocity is
(a) 750 W (b) 1050 W (c) 1150 W (d) 1250 W

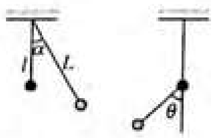
Circular Motion in Vertical Plane

47. A bead of mass m is released from rest at A to move along the fixed smooth circular track as shown in the figure. The ratio of magnitudes of centripetal force and normal reaction by the track on the bead at any point P_0 described by the angle $\theta (\neq 0)$ would



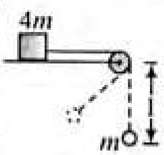
(a) Increase with θ
(b) Decrease with θ
(c) Remain constant
(d) First increase with θ and then decrease

48. A simple pendulum consisting of a mass M attached to a string of length L is released from rest at an angle α. A pin is located at a distance l below the pivot point. When the pendulum swings down, the string hits the pin as shown in the figure. The maximum angle θ which the string makes with the vertical after hitting the pin is



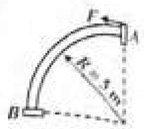
(a) $\cos^{-1}\left[\dfrac{L\cos\alpha + l}{L+l}\right]$ (b) $\cos^{-1}\left[\dfrac{L\cos\alpha + l}{L-l}\right]$
(c) $\cos^{-1}\left[\dfrac{L\cos\alpha - l}{L-l}\right]$ (d) $\cos^{-1}\left[\dfrac{L\cos\alpha - l}{L+l}\right]$

49. Two bodies of masses m and $4m$ are attached to a light string as shown in the figure. A body of mass m hanging from string is executing oscillations with angular amplitude 60°, while other body is at rest on a horizontal surface. The minimum coefficient of friction between mass $4m$ and the horizontal surface is (here pulley is light and smooth)



(a) $\dfrac{1}{4}$ (b) $\dfrac{3}{4}$ (c) $\dfrac{1}{2}$ (d) $\dfrac{1}{8}$

50. A bead of mass 1/2 kg starts from rest from A to move in a vertical plane along a smooth fixed quarter ring of radius 5 m, under the action of a constant horizontal force $F = 5$ N as shown in the figure. The speed of bead as it reaches point B is



(a) 14.14 $\mathrm{m\,s^{-1}}$ (b) 7.07 $\mathrm{m\,s^{-1}}$
(c) 5 $\mathrm{m\,s^{-1}}$ (d) 25 $\mathrm{m\,s^{-1}}$

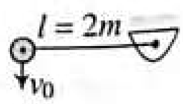
51. A 1-kg stone at the end of 1 m long string is whirled in a vertical circle at a constant speed of 4 $\mathrm{m\,s^{-1}}$. The tension in the string is 6 N when the stone is
(a) At the top of the circle
(b) At the bottom of the circle
(c) Half way down
(d) None of above

52. A stone of mass 1 kg tied to a light inextensible string of length $L = 10/3$ m is whirling in a circular path of radius L in a vertical plane. If the ratio of the maximum tension in the string to the minimum tension is 4 and if g is taken to be 10 $\mathrm{m\,s^{-2}}$, the speed of the stone at the highest point of the circle is
(a) 10 $\mathrm{m\,s^{-1}}$ (b) $5\sqrt{3}$ $\mathrm{m\,s^{-1}}$
(c) $10\sqrt{3}$ $\mathrm{m\,s^{-1}}$ (d) 20 $\mathrm{m\,s^{-1}}$

53. Ball A of mass m, after sliding from an inclined plane, strikes elastically another ball B of same mass at rest. Find the minimum height h so that ball B just completes the circular motion of the surface at C. (All surfaces are smooth.)

(a) $h = \dfrac{5}{2}R$ (b) $h = 2R$
(c) $h = \dfrac{2}{5}R$ (d) $h = 3R$

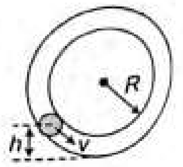
54. A small sphere is given vertical velocity of magnitude $v_0 = 5$ $\mathrm{m\,s^{-1}}$ and it swings in a vertical plane about the end of a massless string. The angle θ with the vertical at which string will break, knowing that it can withstand a maximum tension equal to twice the weight of the sphere, is



(a) $\cos^{-1}\dfrac{2}{3}$ (b) $\cos^{-1}\left(\dfrac{1}{4}\right)$
(c) 60° (d) 30°

55. A heavy particle hanging from a string of length l is projected horizontally with speed $\sqrt{gl}$. The speed of the particle at the point where the tension in the string equals weight of the particle
(a) $\sqrt{2gl}$ (b) $\sqrt{3gl}$ (c) $\sqrt{gl/2}$ (d) $\sqrt{gl/3}$

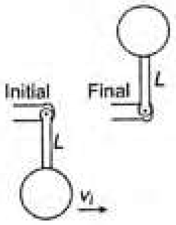
56. With what minimum speed v must a small ball should be pushed inside a smooth vertical tube from a height h so that it may reach the top of the tube? Radius of the tube is R.



(a) $\sqrt{2g(h+2R)}$ (b) $\frac{5}{2}R$

(c) $\sqrt{g(5R-2h)}$ (d) $\sqrt{2g(2R-h)}$

57. A light, rigid rod is 40.0 cm long. Its top end is pivoted on a frictionless, horizontal axle. The rod hangs straight down at rest with a small, massive ball attached to its bottom end. You strike the ball, suddenly giving it a horizontal velocity so that it swings around in a full circle. What minimum speed at the bottom is required to make the ball go over the top of the circle?



(a) 2.5 m/s (b) 4.0 m/s (c) 3.0 m/s (d) 5.0 m/s

58. A particle is moving in the vertical plane. It is attached at one end of a string of length λ whose other end is fixed. The velocity at the lowest point is u. The tension in the string is $\vec{T}$ and velocity of the particle is $\vec{v}$ at any position. Then, which of the following quantity will remain constant.

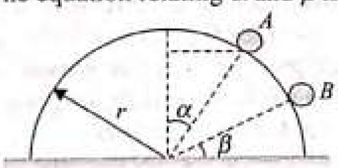
(a) $\vec{T}\cdot\vec{v}$

(b) kinetic energy

(c) Gravitational potential energy

(d) $\vec{T}\times\vec{v}$

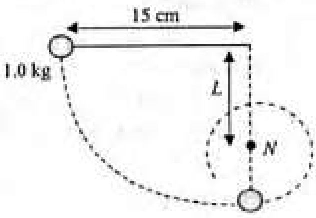
59. A particle moves from rest at A on the surface of a smooth circular cylinder of radius r as shown. At B it leaves the cylinder. The equation relating α and β is



(a) $3\sin\alpha = 2\cos\beta$ (b) $2\sin\alpha = 3\cos\beta$

(c) $3\sin\beta = 2\cos\alpha$ (d) $2\sin\beta = 3\cos\alpha$

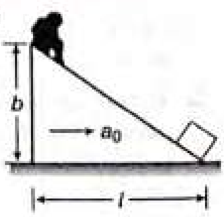
60. A ball weighing 1.0 kg is tied to a string 15 cm long. Initially the ball is held in position such that the string is horizontal. The ball is now released. A nail N is situated vertically below the support at a distance L. The minimum value of L such that the string will be wound round the nail is



(a) 15 cm (b) 4 cm (c) 9 cm (d) None of these

Problems Based on Mixed Concepts

61. A smooth block of mass m moves up from bottom to top of a wedge which is moving with an acceleration a_0. Find the work done by the pseudo force measured by the person sitting at the edge of the wedge.



(a) $ma_0 l$ (b) $ma_0\sqrt{l^2+b^2}$

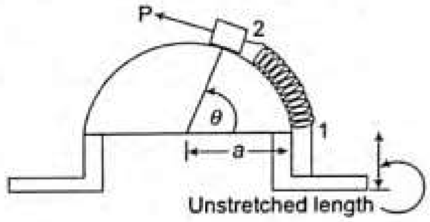
(c) $ma_0\sqrt{l+b}$ (d) $ma_0 l\frac{b}{\sqrt{l^2+b^2}}$

62. A particle is released from the top of two inclined rough surfaces of height 'h' each. The angle of inclination of the two planes are 30° and 60° respectively. All other factors (e.g. coefficient of friction, mass of block etc.) are same in both the cases. Let K_1 and K_2 be the kinetic energies of the particle at the bottom of the plane in two cases. Then

(a) $K_1 = K_2$ (b) $K_1 > K_2$

(c) $K_1 < K_2$ (d) data insufficient

63. A variable force P is maintained tangent to a frictionless cylindrical surface of radius a as shown in figure. By slowly varying this force, a block of weight W is moved and the spring to which it is stretched from position 1 to position 2. The work done by the force P is:



(a) $Wa\sin\theta$ (b) $\frac{1}{2}ka^2\theta^2$

(c) $Wa\sin\theta + ka^2\theta^2$ (d) $Wa\sin\theta + \frac{1}{2}ka^2\theta^2$

64. A ball is thrown from a height of h meter with an initial downward velocity v_0. It hits the ground, loses half of its kinetic energy and bounces back to the same height. The value of v_0 is

(a) $\sqrt{2gh}$ (b) $\sqrt{gh}$ (c) $\sqrt{3gh}$ (d) $\sqrt{2.5gh}$

65. In the situation shown in the adjacent figure, what is the maximum elongation produced in the spring if initially the spring is relaxed (consider all contact surfaces to be smooth)?

(a) $\frac{F}{k}$ (b) $\frac{F}{2k}$ (c) $\frac{2F}{k}$ (d) $\frac{4F}{k}$

66. The kinetic energy of a particle moving along a straight line increases uniformly with respect to the distance travelled by it. The force acting on the particle is (v is the speed of particle at any time)

(a) constant

(b) proportional to v

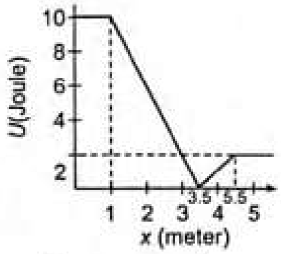
(c) proportional to v^2

(d) inversely proportional to v

67. Two springs A and B are identical except that A is stiffer than B i.e., $k_A > k_B$. If the two springs are stretched by the same force, then

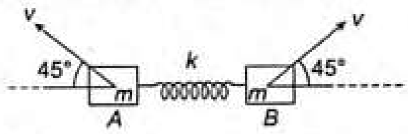
(a) more work is done on B i.e., $W_B > W_A$
(b) more work is done on A, i.e., $W_A > W_B$
(c) work done on A and B are equal
(d) work done depends upon the way in which they are stretched

68. A body with mass 2 kg moves in one direction in the presence of a force which is described by the potential energy graph. If the body is released from rest at $x = 2$ m, then its speed when it crosses $x = 5$ m is



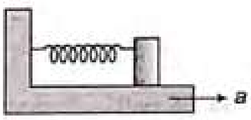
(a) zero (b) 1 ms^{-1} (c) 2 ms^{-1} (d) 3 ms^{-1}

69. Blocks A and B of mass m each are connected with spring of constant k. Both blocks lie on frictionless ground and are imparted horizontal velocity v as shown when spring is unstretched. Find the maximum stretch of spring.



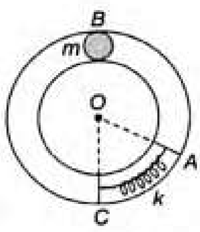
(a) $v\sqrt{\dfrac{m}{k}}$ (b) $v\sqrt{\dfrac{m}{2k}}$ (c) $v\sqrt{\dfrac{2m}{k}}$ (d) None of these

70. Find the maximum compression in the spring, if the lower block is shifted to rightwards with acceleration 'a'. All the surfaces are smooth:



(a) $\dfrac{ma}{2k}$ (b) $\dfrac{2ma}{k}$ (c) $\dfrac{ma}{k}$ (d) $\dfrac{4ma}{k}$

71. In the figure shown, there is a smooth tube of radius 'R', fixed in the vertical plane. A ball 'B' of mass 'm' is released from the top of the tube. B slides down due to gravity and compresses the spring. The end 'C' of the spring is fixed and the end A is free. Initially the line OA makes an angle of 60° with OC and finally it makes an angle of 30° after compression. Find the spring constant of the spring.



Fix smooth tube

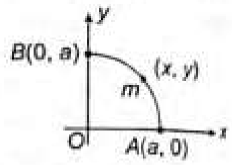
(a) $\dfrac{12mg(2+\sqrt{3})}{\pi^2 R}$ (b) $\dfrac{36mg(2+\sqrt{3})}{\pi^2 R}$

(c) $\dfrac{18mg}{\pi^2 R}$ (d) None of these

72. While running, a person transforms about 0.60 J of chemical energy to mechanical energy per step per kilogram of body mass. If a 60 kg runner transforms energy at a rate of 72 W during a race, how fast is the person running? Assume that a running step is 1.5 m long.

(a) 2.0 m/s (b) 3.0 m/s (c) 2.5 m/s (d) 5.0 m/s

73. A particle of mass 'm' moves along the quarter section of the circular path whose centre is at the origin. The radius of the circular path is 'a'. A force $\vec{F} = y\hat{i} - x\hat{j}$ newton acts on the particle, where x, y denote the coordinates of position of the particle. Calculate the work done by this force in taking the particle from point A $(a, 0)$ to point B $(0, a)$ along the circular path.



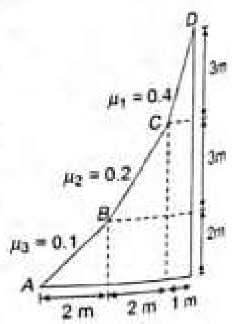
(a) $-\sqrt{2\pi a^2}$ J (b) $-\dfrac{\pi a^2}{2}$J

(c) $-\pi a^2$J (d) $-\dfrac{\sqrt{3}\pi a^2}{2}$J

74. The force exerted by a compression device is given by $F(x) = kx\,(x - l)$ for $0 \le x \le l$, where l is the maximum possible compression, x is the compression and k is a constant. The work required to compress the device by a distance d will be maximum when:

(a) $d = \dfrac{l}{4}$ (b) $d = \dfrac{l}{\sqrt{2}}$ (c) $d = \dfrac{l}{2}$ (d) $d = l$

75. A body of mass 1 kg is shifted from A to D on inclined planes by applying a force slowly such that the block is always in contact with the plane surfaces. Neglecting the jerk experienced at points C and B, total work done by the force is:



(a) 90 J (b) 56 J
(c) 180 J (d) 0 J

ARCHIVES

1. From a building, two balls A and B are thrown such that A is thrown upward and B downward (both vertically). If v_A and v_B are their respective velocities on reaching the ground, then

(a) $v_B > v_A$ (b) $v_A = v_B$
(c) $v_A > v_B$
(d) their velocities depend on their masses. **(AIEEE 2002)**

2. The speeds of two identical cars are u and $4u$ at a specific instant. The ratio of the respective distances in which the two cars are stopped from that instant is

(a) 1 : 1 (b) 1 : 4
(c) 1 : 8 (d) 1 : 16 **(AIEEE 2002)**

3. A spring of force constant 800 N/m has an extension of 5 cm. The work done in extending it from 5 cm to 15 cm is
(a) 16 J (b) 8 J
(c) 32 J (d) 24 J **(AIEEE 2002)**

4. Two masses of 1 kg and 16 kg are moving with equal kinetic energy. The ratio of magnitude of the linear momentum is
(a) 1 : 2 (b) 1 : 4
(c) $1:\sqrt{2}$ (d) $\sqrt{2}:1$ **(AIEEE 2002)**

5. A car moving with a speed of 50 km/h can be stopped by brakes after at least 6 m. If the same car is moving at a speed of 100 km/h, the minimum stopping distance is
(a) 6 m (b) 2 m
(c) 18 m (d) 24 m **(AIEEE 2003)**

6. A body is moved along a straight line by a machine delivering a constant power. The distance moved by the body in time t is proportional to
(a) $t^{1/2}$ (b) $t^{3/4}$
(c) $t^{3/2}$ (d) $t^{1/4}$ **(AIEEE 2003)**

7. A spring of constant 5×10^3 N/m is stretched initially by 5 cm from the unstretched position. Then the work required to stretch it further by another 5 cm is
(a) 6.25 N-m (b) 12.50 N-m
(c) 18.75 N-m (d) 25.00 N-m **(AIEEE 2003)**

8. Consider the following two statements
1. Linear momentum of a system of particles is zero.
2. Kinetic energy of a system of particles is zero.

Then
(a) 1 implies 2 and 2 implies 1
(b) 1 does not imply 2 and 2 does not imply 1
(c) 1 implies 2 but 2 does not imply 1
(d) 1 does not imply 2 but 2 implies 1 **(AIEEE 2003)**

9. A particle moves in a straight line with retardation proportional to its displacement. Its loss of kinetic energy for any displacement x is proportional to
(a) x (b) e^x
(c) x^2 (d) $\log_e x$ **(AIEEE 2004)**

10. A force $\vec{F} = (5\hat{i} + 3\hat{j} + 2\hat{k})$ N is applied over a particle which displaces it from its origin to the point $\vec{r} = (2\hat{i} - \hat{j})$ m. The work done on the particle (in J) is
(a) +10 (b) +7
(c) −7 (d) +13 **(AIEEE 2004)**

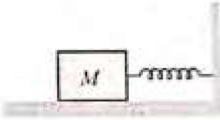
11. A body of mass m accelerates uniformly from rest to v_1 in time t_1. The instantaneous power delivered to the body as a function of time t is

(a) $\dfrac{mv_1t^2}{t_1}$ (b) $\dfrac{mv_1^2t}{t_1^2}$ (c) $\dfrac{mv_1t}{t_1}$ (d) $\dfrac{mv_1^2t}{t_1}$ **(AIEEE 2004)**

12. A particle is acted upon by a force of constant magnitude which is always perpendicular to the velocity of the particle; the motion of the particle takes place in a plane. It follows that
(a) its kinetic energy is constant.
(b) its acceleration is constant.
(c) its velocity is constant.
(d) it moves in a straight line. **(AIEEE 2004)**

13. A uniform chain of length 2 m is kept on a table such that a length of 60 cm hangs freely from the edge of the table. The total mass of the chain is 4 kg. What is the work done in pulling the entire chain on the table?
(a) 7.2 J (b) 3.6 J
(c) 120 J (d) 1200 J **(AIEEE 2004)**

14. The block of mass M moving on a frictionless horizontal surface collides with a spring of spring constant k and compresses it by length L. The maximum momentum of the block after collision is



(a) $\dfrac{ML^2}{k}$ (b) zero (c) $\dfrac{kL^2}{2M}$ (d) $\sqrt{MkL}$ **(AIEEE 2005)**

15. A particle of mass 0.3 kg is subjected to a force $F = -kx$ with $k = 15$ N/m. What will be its initial acceleration if it is released from a point 20 cm away from the origin?
(a) 10 m/s^2 (b) 5 m/s^2
(c) 15 m/s^2 (d) 3 m/s^2 **(AIEEE 2005)**

16. A spherical ball of mass 20 kg is stationary at the top of a hill of height 100 m. It rolls down a smooth surface to the ground, then climbs up another hill of height 30 m and finally rolls down to a horizontal base at a height of 20 m above the ground. The velocity attained by the ball is
(a) $10\sqrt{30}$ m/s (b) 10 m/s
(c) 20 m/s (d) 40 m/s **(AIEEE 2005)**

17. A body of mass m is accelerated uniformly from rest to a speed v in a time T. The instantaneous power delivered to the body as a function of time is given by

(a) $\dfrac{1}{2}\dfrac{mv^2}{T^2}t^2$ (b) $\dfrac{1}{2}\dfrac{mv^2}{T^2}t$

(c) $\dfrac{mv^2}{T^2}t^2$ (d) $\dfrac{mv^2}{T^2}t$ **(AIEEE 2005)**

18. A particle of mass 100 g is thrown vertically upward with a speed of 5 m/s. The work done by the force of gravity during the time the particle goes up is
(a) 1.25 J (b) 0.5 J
(c) −0.5 J (d) −1.25 J **(AIEEE 2006)**

19. The potential energy of a 1 kg particle free to move along the x-axis is given by $V(x) = [(x^4/4) - (x^2/2)]$ J. The total mechanical energy of the particle is 2 J. Then the maximum speed (in m/s) is

(a) $\frac{1}{\sqrt{2}}$ (b) 2 (c) $\frac{3}{\sqrt{2}}$ (d) $\sqrt{2}$ **(AIEEE 2006)**

20. A mass of M kg is suspended by a weightless string. The horizontal force required to displace it until the string makes an angle of 45° with the initial vertical direction is

(a) $\frac{Mg}{\sqrt{2}}$ (b) $Mg(\sqrt{2}-1)$

(c) $Mg(\sqrt{2}+1)$ (d) $Mg\sqrt{2}$ **(AIEEE 2006)**

21. A ball of mass 0.2 kg is thrown vertically upwards by applying a force by hand. If the hand moves 0.2 m while applying the force and the ball goes upto 2 m height further, find the magnitude of the force. Consider $g = 10$ m/s^2

(a) 20 N (b) 22 N

(c) 4 N (d) 16 N **(AIEEE 2006)**

22. A 2 kg block slides on a horizontal floor with a speed of 4 m/s. It strikes an uncompressed spring, and compresses it till the block is motionless. The kinetic friction force is 15 N and spring constant is 10000 N/m. The spring compresses by (in cm)

(a) 2.5 (b) 11.0

(c) 8.5 (d) 5.5 **(AIEEE 2007)**

23. A particle is projected at 60° to the horizontal with a kinetic energy K. The kinetic energy at the highest point is

(a) zero (b) $\frac{K}{4}$ (c) $\frac{K}{2}$ (d) K **(AIEEE 2007)**

24. An athlete in the olympic games covers a distance of 100 m in 10 s. His kinetic energy can be estimated to be in the range

(a) 200–500 J (b) 2×10^5–3×10^5 J

(c) 20000–50000 J (d) 2000–5000 J

(AIEEE 2008)

25. The potential energy function for the force between two atoms in a diatomic molecule is approximately given by $U(x) = \frac{a}{x^{12}} - \frac{b}{x^6}$, where a and b are constants and x is the distance between the atoms. If the dissociation energy of the molecule is $D = [U_{(x=\infty)} - U_{\text{at equilibrium}}]$, D is

(a) $\frac{b^2}{2a}$ (b) $\frac{b^2}{12a}$ (c) $\frac{b^2}{4a}$ (d) $\frac{b^2}{6a}$

(AIEEE 2010)

26. This question has Statement I and Statement II. Of the four choices given after the statements, choose the one that best describes the two statements.

If two springs S_1 and S_2 of force constants k_1 and k_2, respectively, are stretched by the same force, it is found that more work is done on spring S_1 than on spring S_2.

Statement I: If stretched by the same amount, work done on S_1, will be more than that on S_2

Statement II: $k_1 < k_2$

(a) Statement I is false, Statement II is true.

(b) Statement I is true, Statement II is false.

(c) Statement I is true, Statement II is true, Statement II is the correct explanation for statement I.

(d) Statement I is true, Statement II is true, Statement II is not the correct explanation of Statement I.

(AIEEE 2012)

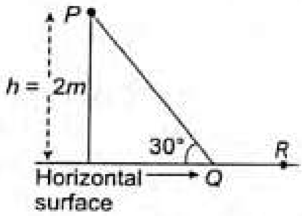
27. When a rubber-band is stretched by a distance x, it exerts a restoring force of magnitude $F = ax + bx^2$, where a and b are constants. The work done in stretching the unstretched rubber band by L is,

(a) $\frac{aL^2}{2} + \frac{bL^3}{3}$ (b) $\frac{1}{2}\left(\frac{aL^2}{2} + \frac{bL^3}{3}\right)$

(c) $aL^2 + bL^3$ (d) $\frac{1}{2}(aL^2 + bL^3)$

(JEE Main 2014)

28. A point particle of mass m, moves along the uniformly rough track PQR as shown in the figure. The coefficient of friction, between the particle and the rough track equals μ. The particle is released, from rest, from the point P and it comes to rest at a point R.



The energies, lost by the ball, over the parts, PQ and QR, of the track, are equal to each other, and no energy is lost when particle changes direction from PQ to QR.

The values of the coefficient of friction μ and the distance $x(= QR)$, are, respectively close to:

(a) 0.2 and 6.5 m (b) 0.2 and 3.5 m

(c) 0.29 and 3.5 m (d) 0.29 and 6.5 m

(JEE Main 2016)

29. A person trying to lose weight by burning fat lifts a mass of 10 kg up to a height of 1 m 1000 times. Assume that the potential energy lost each time he lowers the mass is dissipated. How much fat will he use up considering the work done only when the weight is lifted up? Fat supplies 3.8×10^7 J of energy per kg which is converted to mechanical energy with a 20% efficiency rate. Take $g = 9.8$ m s^{-2}.

(a) 2.45×10^{-3} kg (b) 6.45×10^{-3} kg

(c) 9.89×10^{-3} kg (d) 12.89×10^{-3} kg

(JEE Main 2016)

30. A body of mass $m = 10^{-2}$ kg is moving in a medium and experiences a frictional force $F = -kv^2$. Its initial speed is $v_0 = 10$ ms^{-1}. If, after 10 s, its energy is $\frac{1}{8}mv_0^2$, the value of k will be

(a) 10^{-4} kg m^{-1} (b) 10^{-1} kg m^{-1}s^{-1}

(c) 10^{-3} kg m^{-1} (d) 10^{-3} kg s^{-1}

(JEE Main 2017)

31. A time dependent force $F = 6t$ acts on a particle of mass 1 kg. If the particle starts from rest, the work done by the force during the first 1 sec. will be

(a) 9 J (b) 18 J
(c) 4.5 J (d) 22 J **(JEE Main 2017)**

32. A particle is moving is moving in a circular path of radius a under the action of an attractive potential $U = -k/2r^2$. Its total energy is:

(a) $-\frac{3}{2}\frac{k}{a^2}$ (b) $-\frac{k}{4a^2}$ (c) $\frac{k}{2a^2}$ (d) Zero

(JEE Main 2018)

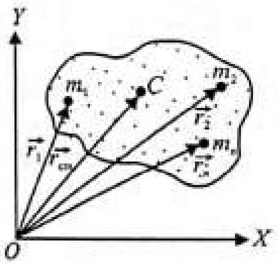
Chapter 8

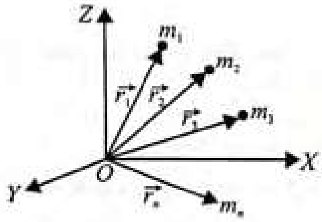
Centre of Mass, Conservation of Linear Momentum and Collision

CENTRE OF MASS OF A SYSTEM OF N DISCRETE PARTICLES

Consider a system of N point masses $m_1, m_2, m_3, \ldots, m_n$ whose position vectors from origin O are given by $\vec{r}_1, \vec{r}_2, \vec{r}_3, \ldots, \vec{r}_n$, respectively.

Then, the position vector of the centre of mass C of the system is given by



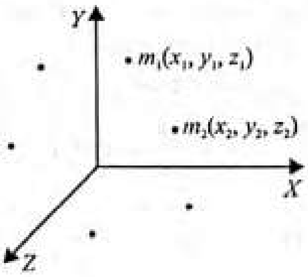


$$\vec{r}_{CM} = \frac{m_1\vec{r}_1 + m_2\vec{r}_2 + \cdots + m_n\vec{r}_n}{m_1 + m_2 + \cdots + m_n}$$

$$= \frac{\Sigma_{i=1}^{n} m_i\vec{r}_i}{\Sigma_{i=1}^{n} m_i} = \frac{1}{M}\Sigma_{i=1}^{n} m_i\vec{r}_i$$

where $M(=\Sigma_{i=1}^{n} m_i)$ is the total mass of the system.

Consider a system of point masses $m_1, m_2, m_3, \ldots$, located at the coordinates $(x_1, y_1, z_1), (x_2, y_2, z_2), \ldots$, respectively. The centre of mass of this system of masses is a point whose coordinates are (x_{cm}, y_{cm}, z_{cm}), which are given by



$$x_{cm} = \frac{m_1x_1 + m_2x_2 + \cdots}{m_1 + m_2 + \cdots}$$

$$y_{cm} = \frac{m_1y_1 + m_2y_2 + \cdots}{m_1 + m_2 + \cdots}$$

$$z_{cm} = \frac{m_1z_1 + m_2z_2 + \cdots}{m_1 + m_2 + \cdots}$$

NOTE:

- The centre of mass of two particles lies on the line joining them.
- The centre of mass divides the distance between two particles in the inverse ratio of masses.

  As shown in the previous section

  $$m_1\vec{r}_1' + m_2\vec{r}_2' = 0 \Rightarrow \frac{|\vec{r}_1'|}{|\vec{r}_2'|} = \frac{m_2}{m_1} \quad \text{[taking modulus]}$$

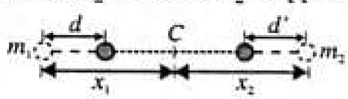
  Thus, the centre of mass is dividing the distance in inverse ratio. Thus, $r' \propto \frac{1}{m}$. Thus, the centre of mass less closer to more massive particle is

  $$m_1r'_1 = m_2(l - r'_1)$$

  $$r_1' = \left(\frac{m_2}{m_1 + m_2}\right)l$$

ILLUSTRATION 8.1 Consider a two-particle system with the particles having masses m_1 and m_2. If the first particle is pushed towards the centre of mass through a distance d, by what distance should the second particle be moved so as to keep the centre of mass at the same position?

Solution. Consider the figure. Suppose the distance of m_1 from the centre of mass C is x_1 and that of m_2 from C is x_2. Suppose mass m_2 is moved through a distance d' towards C so as to keep the centre of mass at C.



Then, $m_1x_1 = m_2x_2$ (i)

and $m_1(x_1 - d) = m_2(x_2 - d')$ (ii)

Subtracting Eq. (ii) from Eq. (i), we get

$m_1d = m_2d'$ or $d' = (m_1/m_2)\,d$.

CENTRE OF MASS OF A CONTINUOUS MASS DISTRIBUTION

For a continuous mass distribution, the centre of mass can be located by replacing summation sign with an integral sign. Proper limits for the integral are chosen according to the situation.

$$x_{CM} = \frac{\int x\,dm}{\int dm},\ y_{CM} = \frac{\int y\,dm}{\int dm},\ z_{CM} = \frac{\int z\,dm}{\int dm}$$

$\int dm = M$ (mass of the body)

$$\vec{r}_{CM} = \frac{1}{M}\int \vec{r}\,dm$$

NOTE: If an object has symmetric uniform mass distribution about x-axis, then y-coordinate of CM is zero and vice versa.

The following points regarding centre of mass can be noted.

- For a lamina type (two-dimensional) body with uniform negligible thickness, the formulae for finding the position of centre of mass are as follows:

$$\vec{r}_{CM} = \frac{m_1\vec{r}_1 + m_2\vec{r}_2 + \cdots}{m_1 + m_2 + \cdots}$$
$$= \frac{\rho A_1 t\vec{r}_1 + \rho A_2 t\vec{r}_2 + \cdots}{\rho A_1 t + \rho A_2 t + \cdots}, (m = \rho A t)$$
$$= \frac{A_1\vec{r}_1 + A_2\vec{r}_2 + \cdots}{A_1 + A_2 + \cdots}$$

  Here, A stands for area and ρ for density.

- If some mass is removed from a rigid body, then the position of centre of mass of the remaining portion is obtained from the following formulae:

  (a) $\vec{r}_{CM} = \dfrac{m_1\vec{r}_1 - m_2\vec{r}_2}{m_1 - m_2}$ or $\vec{r}_{CM} = \dfrac{A_1\vec{r}_1 - A_2\vec{r}_2}{A_1 - A_2}$

  (b) $x_{CM} = \dfrac{m_1x_1 - m_2x_2}{m_1 - m_2}$ or $x_{CM} = \dfrac{A_1x_1 - A_2x_2}{A_1 - A_2}$

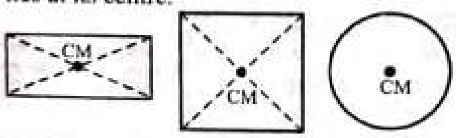
  (c) $y_{CM} = \dfrac{m_1y_1 - m_2y_2}{m_1 - m_2}$ or $y_{CM} = \dfrac{A_1y_1 - A_2y_2}{A_1 - A_2}$

  (d) $z_{CM} = \dfrac{m_1z_1 - m_2z_2}{m_1 - m_2}$ or $z_{CM} = \dfrac{A_1z_1 - A_2z_2}{A_1 - A_2}$

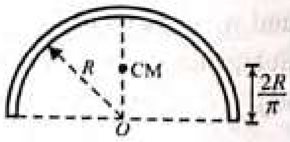
Here, $m_1, A_1, \vec{r}_1, x_1, y_1$ and z_1 are the values for the whole mass while $m_2, A_2, \vec{r}_2, x_2, y_2$ and z_2 are the values for the mass which has been removed.

NOTE: Centre of mass of some well known rigid bodies

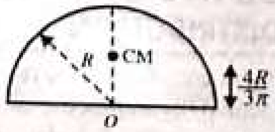
- Centre of mass of a uniform rectangular, square or circular plate lies at its centre.



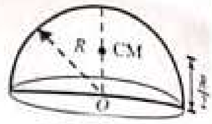
- Centre of mass of a uniform semicircular ring lies at a distance of $h = 2R/\pi$ from its centre, on the axis of symmetry where R is the radius of the ring.



- Centre of mass of a uniform semicircular disc of radius R lies at a distance of $h = 4R/3\pi$ from the centre on the axis of symmetry as shown in the figure.



- Centre of mass of a hemispherical shell of radius R lies at a distance of $h = R/2$ from its centre on the axis of symmetry as shown in the figure.



- Centre of mass of a solid hemisphere of radius R lies at a distance of $3R/8$ from its centre on the axis of symmetry.

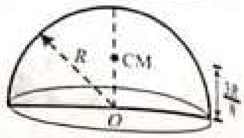


ILLUSTRATION 8.2 Find the centre of mass of a uniform L-shaped lamina (a thin flat plate) with dimensions as shown in the figure. The mass of lamina is 3 kg.

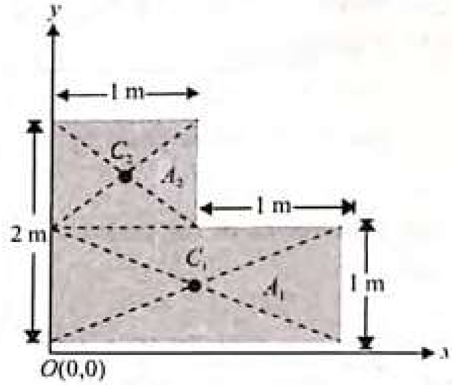


Solution. The plate has uniform density and same thickness everywhere. So its *CM* will coincide with the centroid. Divide the given plate into two parts of area A_1 and A_2 as shown in the figure. We have

$A_1 = 2 \times 1\ \text{m}^2$ with its centroid C_1 (1, 1/2) and

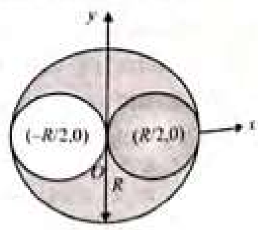
$A_2 = 1 \times 1\ \text{m}^2$ with its centroid C_2 (1/2, 3/2)

The centroid of the whole plate can be defined as

$$\bar{x} = \frac{A_1x_1 + A_2x_2}{A_1 + A_2} = \frac{2\times 1 + 1\times\frac{1}{2}}{2+1} = \frac{5}{6}\ \text{m}$$

$$\bar{y} = \frac{A_1y_1 + A_2y_2}{A_1 + A_2} = \frac{2\times\frac{1}{2} + 1\times\frac{3}{2}}{2+1} = \frac{5}{6}\ \text{m}$$

ILLUSTRATION 8.3 Figure shows a uniform disc of radius R, from which a hole of radius $R/2$ has been cut out from left of the centre and is placed on the right of the centre of the disc. Find the CM of the resulting disc.



Solution. Mass of the cut-out disc is

$$m = \frac{M}{\pi R^2} \times \pi\left(\frac{R}{2}\right)^2 = \frac{M}{4}$$

Let centre of the disc is at the origin of the coordinates. Then we can write the CM of the system as

$$x_{CM} = \frac{M\vec{R} - m\vec{r} + m\vec{r}}{M - m + m} = \frac{M\times 0 - \frac{M}{4}\left(\frac{-R}{2}\right) + \frac{M}{4}\left(\frac{R}{2}\right)}{M - \frac{M}{4} + \frac{M}{4}} = \frac{R}{4}$$

$y_{CM} = 0$

MOTION OF THE CENTRE OF MASS

Motion of Centre of Mass and Conservation of Momentum: Velocity of Centre of Mass of System

$$\vec{v}_{CM} = \frac{m_1\frac{d\vec{r}_1}{dt} + m_2\frac{d\vec{r}_2}{dt} + m_3\frac{d\vec{r}_3}{dt} + \cdots + m_n\frac{d\vec{r}_n}{dt}}{M}$$

$$= \frac{m_1\vec{v}_1 + m_2\vec{v}_2 + \cdots}{m_1 + m_2 + \cdots} \Rightarrow \vec{v}_{CM} = \frac{\vec{p}_{total}}{M_{total}}$$

Here, the numerator of the right-hand-side term is the total momentum of the system, i.e., summation of momentum of the individual components (particles) of the system.

Hence, velocity of centre of mass of the system is the ratio of momentum of the system per unit mass of the system.

Acceleration of Centre of Mass of System

$$\vec{a}_{CM} = \frac{m_1\frac{d\vec{v}_1}{dt} + m_2\frac{d\vec{v}_2}{dt} + m_3\frac{d\vec{v}_3}{dt} + \cdots + m_n\frac{d\vec{v}_n}{dt}}{M}$$

$$= \frac{m_1\vec{a}_1 + m_2\vec{a}_2 + m_3\vec{a}_3 + \cdots + m_n\vec{a}_n}{M}$$

$$= \frac{\vec{F}_{ext}}{M} = \frac{\text{Net external force}}{M}$$

(Both the action and reaction of an internal force must be within the system. Vector summation will cancel all internal forces and hence net internal force on system is zero.)

$$\therefore \quad \vec{F}_{ext} = M\vec{a}_{CM}$$

where $\vec{F}_{ext}$ is the sum of the 'external' forces acting on the system. The internal forces which the particles exert on one another play absolutely no role in the motion of the centre of mass.

If no external force is acting on a system of particles, the acceleration of centre of mass of the system will be zero. If $\vec{a}_{CM} = 0$, it implies that $\vec{v}_{CM}$ must be a constant and if $\vec{v}_{CM}$ is a constant, it implies that the total momentum of the system must remain constant. It leads to the principle that the total momentum of the system must remain constant. It leads to the principle of conservation of momentum in the absence of external forces.

If $\vec{F}_{ext} = 0$, then $\vec{p}_{total} =$ constant.

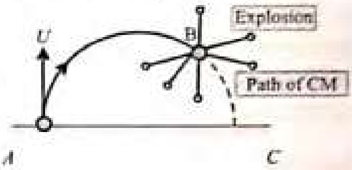
If no external force is acting on the system, net momentum of the system must remain constant.

Centre of Mass at Rest

If $\vec{F}_{ext} = 0$ and $\vec{v}_{cm} = 0$, then centre of mass remains at rest. Individual components of a system may move and have non-zero momentum due to mutual forces (internal), but the net momentum of the system remains zero.

NOTE:

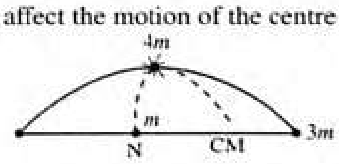
- Net force on a system of particles is equal to net external force.
- Sum of internal forces on particles of a system is zero.
- Centre of mass cannot be accelerated by internal forces.
- External forces equal mass multiplied by acceleration of centre of mass .
- Action point of external force is immaterial in producing acceleration in centre of mass.
- If a projectile explodes in air in different parts, the path of the centre of mass remains unchanged. This is because during explosion no external force (except gravity) acts on the centre of mass. The situation is as shown in the figure.



- Path of centre of mass is ABC, even though the different parts travel in different directions after explosion.
- Suppose a system consists of more than one particle (or bodies). Net external force on the system in a particular direction is zero. If initially the centre of mass of the system is at rest, then obviously the centre of mass will not move along that particular direction even though some particles (or bodies) of the system may move along that direction. The following example will illustrate the above theory.
- For a two particle system, the ratio of velocities, displacements and accelerations of the particles is equal to the inverse ratio of their masses.
- If $\vec{F}_{ext} = 0$, the CM moves with constant velocity. Hence, the CM (but not necessarily other points of the system which may be accelerating) can be treated as an inertial frame (point).
- The net effect of internal forces is zero on the CM whereas it is not zero (in general) for other points of the system. Inconsequence, the CM moves with a constant velocity whereas other points may move with same accelerations when $\vec{F}_{ext} = 0$.

ILLUSTRATION 8.4 A projectile is fired at a speed of 100 m/s at an angle of 37° above the horizontal. At the highest point, the projectile breaks into two parts of mass ratio 1:3, the smaller coming to rest. Find the distance from the launching point to the point where the heavier piece lands.

Solution. Internal forces do not affect the motion of the centre of mass, the centre of mass hits the ground at a position where the original projectile would have landed. The range of the original projectile is



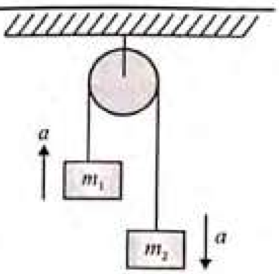
$$x_{CM} = \frac{2u^2 \sin\theta\cos\theta}{g} = \frac{2 \times 10^4 \times \frac{3}{5} \times \frac{4}{5}}{10} \text{ m} = 960 \text{ m}$$

The centre of mass will hit the ground at this position. As the smaller block comes to rest after breaking, it falls down vertically and hits the ground at half of the range, i.e., at $x = 480$ m. If the heavier block hits the ground at x_2, then

$$x_{CM} = \frac{m_1x_1 + m_2x_2}{m_1 + m_2} \Rightarrow 960 = \frac{(m)(480) + (3m)(x_2)}{(m + 3m)}$$

$\therefore \quad x_2 = 1120$ m

ILLUSTRATION 8.5 A pulley fixed to the ceiling carried a thread with bodies of masses m_1 and m_2 attached to its ends. The masses of the pulley and the thread are negligible and friction is absent. Find the acceleration of the centre of mass of this system.



Solution. Let us assume that $m_2 > m_1$. We can see that the masses have equal and opposite acceleration of the same magnitude.

$$a = \frac{m_2 - m_1}{m_2 + m_1} g \text{ and tension in string is } T = \frac{2m_1m_2g}{m_2 + m_1}$$

Taking downward direction as positive, $a_1 = -a$; $a_2 = +a$

$$\vec{a}_{CM} = \frac{m_1\vec{a}_1 + m_2\vec{a}_2}{m_1 + m_2} = \frac{(m_2 - m_1)}{m_2 + m_1}$$

Substituting for the value of a, we have

$$a_{CM} = \left(\frac{m_2 - m_1}{m_2 + m_1}\right)^2 g$$

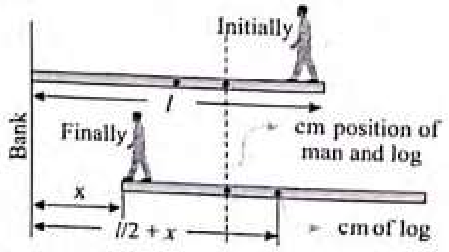
Alternative method:

$$a_{CM} = \frac{F_{ext}}{m_1 + m_2} = \frac{(m_1g + m_2g) - 2T}{m_1 + m_2} = g - \frac{2T}{m_1 + m_2}$$

$$= g - \frac{4m_1m_2g}{(m_2 + m_1)^2} = \left(\frac{m_2 - m_1}{m_2 + m_1}\right)^2 g \text{ (downwards)}$$

ILLUSTRATION 8.6 A log of wood of length l and mass M is floating on the surface of a river perpendicular to the banks. One end of the log touches the banks. A man of mass m standing at the other end walks towards the bank. Calculate the displacement of the log when he reaches the nearer end of the log.

Solution. Let PQ be the log of wood. As there is no external force, the centre of mass of man and the log system remains at rest. Let the bank of the river be the origin A. Initially, the man is at point Q.



Let $\quad m$ = mass of man

$\quad M$ = mass of log

x = displacement of log w.r.t. ground (here water)

$$X_{CM} \text{ (initial)} = \frac{m(l) + M\left(\frac{l}{2}\right)}{m + M}$$

$$X_{CM} \text{ (final)} = \frac{m(x) + M\left(\frac{l}{2} + x\right)}{m + M}$$

Now, X_{CM} (initial) = X_{CM} (final)

$$\Rightarrow \quad ml + \frac{Ml}{2} = mx + \frac{Ml}{2} + Mx$$

$$\Rightarrow \quad x = \frac{ml}{m + M}.$$

Hence, the log moves away from the bank through a distance of $\dfrac{ml}{(m+M)}$.

Alternative method: Displacement of the log = $\Delta x_1 = x$

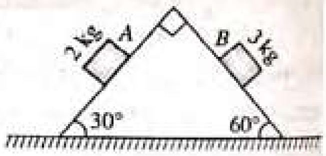
Displacement of the man = $\Delta x_2 = l - x$

Apply $m_1x_1 = m_2x_2 \Rightarrow$ (if the centre of mass remains at the same place)

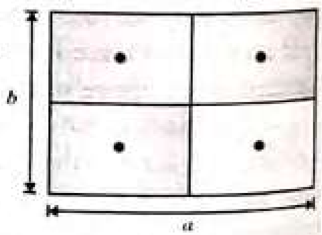
$$\Rightarrow Mx = m(l - x) \Rightarrow x = \frac{ml}{(m + M)}$$

CONCEPT APPLICATION EXERCISE 8.1

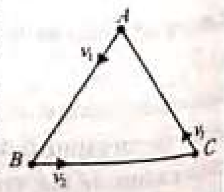
1. Figure shows a fixed wedge on which two blocks of masses 2 kg and 3 kg are placed on its smooth inclined surfaces. When the two blocks are released from rest, find the acceleration of centre of mass of the two blocks.



2. Consider a rectangular plate of dimensions $a \times b$. If the plate is considered to be made up of four rectangles of dimensions $\frac{a}{2} \times \frac{b}{2}$ and we now remove one (the lower right) out of the four rectangles, find the position where the centre of mass of the remaining system lie.



3. There are two masses m_1 and m_2 placed at a distance l apart, let the centre of mass of this system is at a point named C. If m_1 is displaced by l_1 towards C and m_2 is displaced by l_2 away from C, find the distance from C where the new centre of mass will be located.
4. Let there are three equal masses situated at the vertices of an equilateral triangle, as shown in the figure. Now particle A starts with a velocity v_1 towards line AB, particle B starts with the velocity v_2 towards line BC and particle C starts with velocity v_3 towards line CA. Find the displacement of the



centre of mass of the three particles A, B and C after time t. What would it be if $v_1 = v_2 = v_3$?

5. A 30 kg projectile moving horizontally with a velocity $\vec{v}_0 = (120 \text{ m/s})\ \hat{i}$ explodes into two fragments A and B of masses 12 kg and 18 kg, respectively. Taking point of explosion as origin and knowing that 3 s later the position of fragment A is (300 m, 24 m, –48 m), determine the position of fragment B at the same instant.

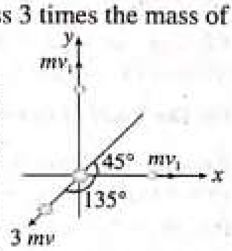
CONSERVATION OF LINEAR MOMENTUM

The total momentum of an isolated system remains constant.

This law is universal, i.e., it applies to both macroscopic and microscopic systems. It holds good even in atomic and nuclear physics where classical mechanics fails. Further it is more generally applicable than the law of 'conservation of mechanical energy' because 'internal forces' are often non-conservative and so mechanical energy is not conserved but momentum is (if $F_{ext} = 0$). Principal applications of conservation of linear momentum are in the field of collisions.

NOTE: Remember that the momentum of an isolated system is conserved. The momentum of one particle within an isolated system is not necessarily conserved because other particles in the system may be interacting with it. Always apply conservation of momentum to an isolated system.

ILLUSTRATION 8.7 A body explodes at rest break up into three parts. If two parts having equal masses fly off perpendicularly to each other with a velocity of 18 m/s, then calculate the velocity of the third part which has a mass 3 times the mass of each part.



Solution. Initially the body is at rest. Initial linear momentum of the body is zero. Let due to explosion the body break up into three parts. There is no external force acting on the body. Hence, linear momentum just after collision also be zero.

Let total mass of the body be $5m$, hence the masses of the broken parts will be m, m and $3m$, respectively.

$$\vec{p}_{\text{initial}} = 0$$

Linear momentum just after explosion

$$\vec{p}_{\text{final}} = \vec{p}_1 + \vec{p}_2 + \vec{p}_3 = mv_1\hat{i} + mv_1\hat{j} + \vec{p}_3$$

As $\vec{p}_{\text{initial}} = \vec{p}_{\text{final}} \Rightarrow |\vec{p}_3| = \sqrt{2}mv_1 \Rightarrow 3mv = \sqrt{2}mv_1$

$$v = \frac{\sqrt{2}v_1}{3} = \frac{\sqrt{2}\times 18}{3} = 6\sqrt{2}\ \text{ms}^{-1}$$

$\Rightarrow$ $6\sqrt{2}\ \text{ms}^{-1}$ at an angle 135° from the either ball.

NOTE: During explosion, there will not be any change in gravitational potential energy of the body. But kinetic energy of the broken parts of the body will increase due to internal energy provided during explosion. This increase in kinetic energy will be equal to energy released during explosion.

ILLUSTRATION 8.8 A shell is fired from a cannon with a speed of 100 m/s at an angle 60° with the horizontal (positive x-direction). At the highest point of its trajectory, the shell explodes into two equal fragments. One of the fragments moves along the negative x-direction with a speed of 50 m/s. What is the speed of the other fragment at the time of explosion.

Solution. The velocity of the shell at the highest point of trajectory is

$v_M = u \cos\theta = 100 \cos 60° = 50$ m/s

Let v_1 be the speed of the fragment which moves along the negative x-direction and the other fragment has speed v_2, which must be along the positive x-direction. Now from momentum conservation, we have

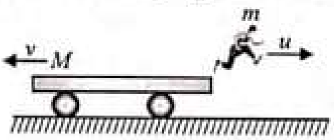
$$mv = \frac{-m}{2}v_1 + \frac{m}{2}v_2 \text{ or } 2v = v_2 - v_1$$

or $v_2 = 2v + v_1 = (2 \times 50) + 50 = 150$ m/s

ILLUSTRATION 8.9 A flat car of mass M is at rest on a frictionless floor with a child of mass m standing at its edge. If the child jumps off from the car towards right with an initial velocity u, with respect to the car, find the velocity of the car after its jump.

Solution. Let the car attain a velocity v. The net velocity of the child with respect to the earth will be $u - v$, as u is its velocity with respect to the car.

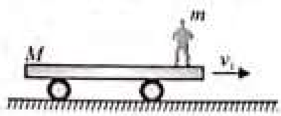
Initially, the system was at rest, thus according to momentum conservation, momentum after jump must be zero. Hence,

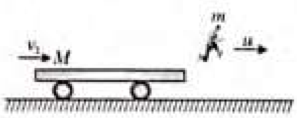


$$m(u - v) = Mv \Rightarrow v = \frac{mu}{m + M}$$

ILLUSTRATION 8.10 A flat car of mass M with a child of mass m is moving with a velocity v_1. The child jumps in the direction of motion of car with a velocity u with respect to the car. Find the final velocities of the child and that of the car after jump.

Solution. This case is similar to the previous example, except now the car is moving before jump. Here, also no external force is acting on the system in horizontal direction, hence momentum remains conserved in this direction. After the jump, car attains a velocity v_2 in the same direction, which is less than v_1, due to backward push of the child for jumping. After the jump, child attains a velocity $u + v_2$ in the direction of motion of car with respect to ground.





According to momentum conservation,

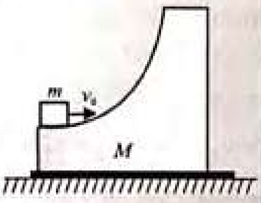
$(M + m)v_1 = Mv_2 + m(u + v_2)$

Velocity of car after jump is $v_2 = \dfrac{(M + m)v_1 - mu}{M + m}$

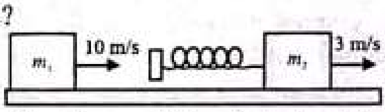
Velocity of child after jump is $u + v_2 = \dfrac{(M+m)v_1 + Mu}{M+m}$

CONCEPT APPLICATION EXERCISE 8.2

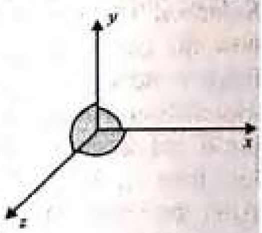
1. A shell is fired from a cannon with a speed of 100 m/s at an angle 30° with the vertical (y-direction). At the highest point of its trajectory, the shell explodes into two fragments of masses in the ratio 1:2. The lighter fragment moves vertically upwards with an initial speed of 200 m/s. What is the speed of the heavier fragment at the time of explosion?
2. A smooth wedge of mass M rests on a smooth horizontal surface. A block of mass m is projected from its lowermost point with velocity v_0. What is the maximum height reached by the block?



3. Two blocks of masses $m_1 = 2$ kg and $m_2 = 5$ kg are moving in the same direction along a frictionless surface with speeds 10 m/s and 3 m/s, respectively, m_2 being ahead of m_1. An ideal spring with $k = 1120$ N/m is attached to the back side of m_2. Find the maximum compression of the spring when the blocks collide. What are the final velocities of the blocks when they separate?



4. A projectile of mass 50 kg is shot vertically upwards with an initial velocity of 100 m/s. After 5 s, it explodes into two fragments, one of which having a mass of 20 kg travels vertically up with a velocity of 150 m/s.
   (a) What is the velocity of the other fragment at that instant?
   (b) Calculate the sum of momenta of fragments 3 s after the explosion. What would have been the momentum of the projectile at this instant if there had been no explosion?
5. A shell of mass 2 kg moving at a rate of 4 m/s suddenly explodes into two equal fragments. The fragments go in directions inclined with the original line of motion with equal velocities. If the explosion imparts 48 J of translational kinetic energy to the fragments, find the velocity and direction of each fragment.



6. A mud ball at rest explodes into three fragments of masses in the ratio 1:2:1. The two equal masses move with velocities $2\hat{i} + 5\hat{j} - 6\hat{k}$ and $-4\hat{i} + 3\hat{j} + 2\hat{k}$. Find the velocity of the third mass.

COLLISION OR IMPACT

Collision is an isolated event in which a strong force acts between two or more bodies for a short time, which results in change in their velocities. In a collision, a relatively large force acts on each colliding particle for a relatively short time. The basic idea of a 'collision' is that the motion of the colliding particles (or of at least one of them) changes rather abruptly and that we can make a relatively clean separation of times that are 'before the collision' and those that are 'after the collision'.

NOTE:

- In a collision, particles may or may not come in physical contact.
- The duration of collision Δt is negligible as compared to the usual time intervals of observation of motion.
- In a collision, the effects of external non-impulsive forces such as gravity are not taken into account as due to small duration of collision (Δt). Average impulsive force responsible for collision is much larger than external forces acting on the system.

The collision is, in fact, a redistribution of total momentum of the particles. Thus, law of conservation of linear momentum is indispensable in dealing with the phenomenon of collision between particles.

Classification of Collisions

On the Basis of Line of Impact

Head-on collision: The velocities of the particles are along the same line before and after the collision.

Oblique collision: The velocities of the particles are along different lines before and after the collision.

On the Basis of Energy

Elastic collision: In an elastic collision, the particles regain their shape and size completely after collision. That is, no fraction of mechanical energy remains stored as deformation potential energy in the bodies. Thus, kinetic energy of a system after collision is equal to kinetic energy of a system before collision. Thus, in addition to the linear momentum, kinetic energy also remains conserved before and after collision.

Inelastic collision: In an inelastic collision, the particles do not regain their shape and size completely after collision. Some fraction of mechanical energy is retained by the colliding particles in the form of deformation potential energy. Thus, the kinetic energy of the particles no longer remains conserved. However, in the absence of external forces, law of conservation of linear momentum still holds good.

Perfectly inelastic collision: If velocity of separation just after collision becomes zero, then the collision is perfectly inelastic. Collision is said to be perfectly inelastic if both the particles stick together after collision and move with the same velocity.

NOTE: Actually collision between all real objects is neither perfectly elastic nor perfectly inelastic, its inelastic in nature.

Coefficient of Restitution (e)

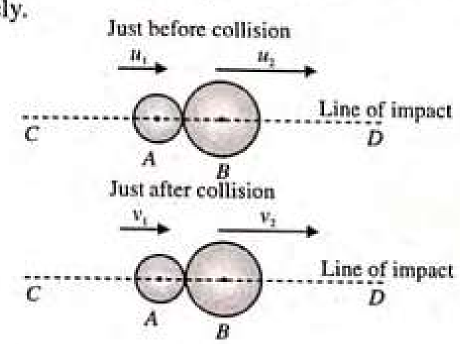
The coefficient of restitution is defined as the ratio of the impulses of recovery and deformation of either body.

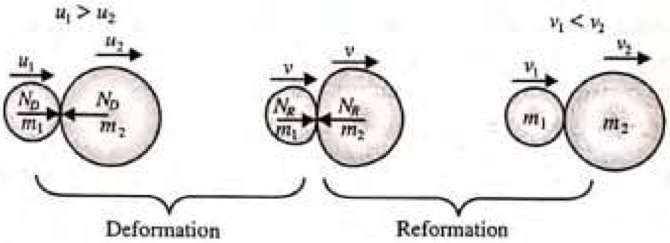
The most general expression for coefficient of restitution is

$$e = \frac{\text{Velocity of separation of points of contact along line of impact}}{\text{Velocity of approach of points of contact along line of impact}}$$

Illustration for Calculation of e

Two smooth balls A and B approach each other such that their centres are moving along the line CD in the absence of external impulsive force. Let the velocities of A and B just before collision be u_1 and u_2, respectively, and the velocities of A and B just after collision be v_1 and v_2, respectively.





Since, momentum is conserved for the system.

$\therefore \quad F_{ext} = 0$

$\Rightarrow \quad m_1u_1 + m_2u_2 = (m_1 + m_2)v = m_1v_1 + m_2v_2$

$$\Rightarrow \quad v = \frac{m_1u_1 + m_2u_2}{m_1 + m_2} = \frac{m_1v_1 + m_2v_2}{m_1 + m_2} \qquad \text{(i)}$$

Impulse of Deformation

J_D = change in momentum of any one body during deformation

$= m_2(v - u_2)$ for m_2

$= m_1(-v + u_1)$ for m_1

Impulse of Reformation

J_R = change in momentum of any one body during reformation

$= m_2(v_2 - v)$ for m_2

$= m_1(v - v_1)$ for m_1

$$e = \frac{\text{Impulse of reformation } (J_R)}{\text{Impulse of deformation } (J_D)} = \frac{v_2 - v}{v - u_2} = \frac{v_2 - v_1}{u_1 - u_2}$$

[Substituting v from Eq. (i)]

$$e = \frac{\text{Velocity of separation along line of impact}}{\text{Velocity of approach along line of impact}}$$

This is also known as Newton's experimental law.

NOTE: e is independent of shape and mass of the object but depends on the material.

The coefficient of restitution is constant for two particular objects.

(1) For $e = 1$

$\Rightarrow$ Impulse of reformation = Impulse of deformation

$\Rightarrow$ Velocity of separation = Velocity of approach

$\Rightarrow$ Kinetic energy is conserved

$\Rightarrow$ Elastic collision

(2) For $e = 0$

$\Rightarrow$ Impulse of reformation = 0

$\Rightarrow$ Velocity of separation = 0

$\Rightarrow$ Kinetic energy is not conserved

$\Rightarrow$ Perfectly inelastic collision

(3) For $0 < e < 1$

$\Rightarrow$ Impulse of reformation < Impulse of deformation

$\Rightarrow$ Velocity of separation < Velocity of approach

$\Rightarrow$ Kinetic energy is not conserved

$\Rightarrow$ Inelastic collision

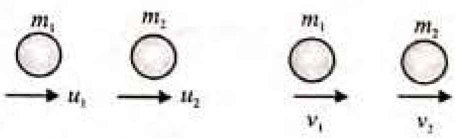
NOTE:

- In case of contact collisions, e is always less than unity.
- u_1, u_2, v_1 and v_2 can be positive, negative or zero.

General Equation for Direct Impact

If u_1, u_2 are the velocities before the impact of the masses m_1, m_2 and v_1, v_2 are the velocities after the impact, then applying conservation of momentum, we get

$m_1u_1 + m_2u_2 = m_1v_1 + m_2v_2$ and $v_1 - v_2 = -e(u_1 - u_2)$



Combining these equations, we get

$$v_1 = \frac{m_1 - em_2}{m_1 + m_2}u_1 + \frac{(1+e)m_2}{m_1 + m_2}u_2;$$

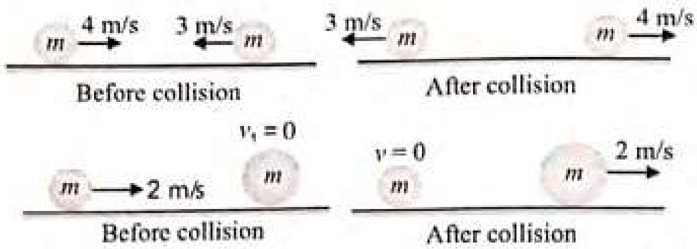
$$v_2 = \frac{(1+e)m_1}{m_2 + m_1}u_1 + \frac{m_2 - em_1}{m_2 + m_1}u_2$$

For a perfectly elastic collision, we can substitute $e = 1$.

Special case: For $e = 1$ and $m_1 = m_2 = m$, we get

$v_1 = u_2$ and $v_2 = u_1$

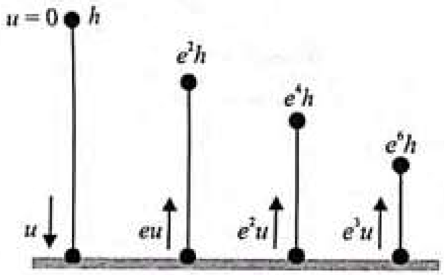
i.e., when two particles of equal mass collide elastically and the collision is head-on, they exchange their velocities, e.g.,



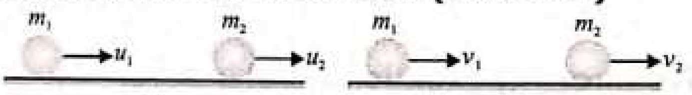
If a body of mass m with initial velocity u strikes on another identical body but at rest and e is the coefficient of restitution, then their velocities v_1 and v_2 after collision will be

$$v_1 = \frac{1-e}{2}u;\ v_2 = \frac{1+e}{2}u$$

If a ball of mass m falls on ground from a vertical height h and rebounds with e as coefficient of restitution between them (see figure), then the upward velocity of the ball after nth collision will be $(e^n u)$ and the maximum height attained by the ball after nth collision will be $(e^{2n}h)$.



Collision in One Dimension (Head-on)



(a) Before collision (b) After collision

$u_1 > u_2,\ v_2 > v_1$

$$e = \frac{v_2 - v_1}{u_1 - u_2} \Rightarrow (u_1 - u_2)e = (v_2 - v_1)$$

By momentum conservation, we get

$$m_1u_1 + m_2u_2 = m_1v_1 + m_2v_2$$

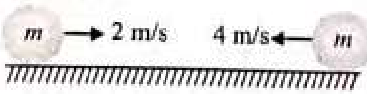
Now, $v_2 = v_1 + e(u_1 - u_2)$

Hence,

$$v_1 = \frac{m_1u_1 + m_2u_2 - m_2e(u_1 - u_2)}{m_1 + m_2}$$

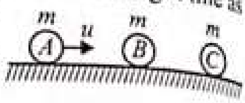
$$v_2 = \frac{m_1u_1 + m_2u_2 + m_1e(u_1 - u_2)}{m_1 + m_2}$$

ILLUSTRATION 8.11 Two identical balls are approaching towards each other on a straight line with velocity 2 m/s and 4 m/s, respectively. Find the final velocities, after elastic collision between them.

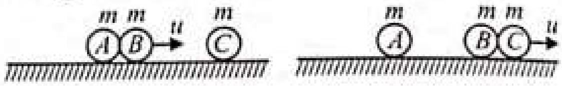


Solution. The two velocities will be exchanged and the final motion is the reverse of the initial motion for both.

ILLUSTRATION 8.12 Three balls A, B and C of same mass 'm' are placed on a frictionless horizontal plane in a straight line as shown. Ball A is moved with velocity u towards the middle ball B. If all the collisions are elastic, find the final velocities of all the balls.



Solution. A collides elastically with B and comes to rest but B starts moving with velocity u.



After a while B collides elastically with C and comes to rest but C starts moving with velocity u.

Therefore, final velocities, $v_A = 0$, $v_B = 0$ and $v_C = u$.

ILLUSTRATION 8.13 Two particles of masses m and $2m$ moving in opposite directions collide elastically with velocity $2v$ and v, respectively. Find their velocities after collision.

Solution. Let the final velocities of m and $2m$ be v_1 and v_2, respectively, as shown in the figure.

By conservation of momentum, we get

$$m(2v) + 2m(-v) = m(v_1) + 2m(v_2)$$

or $\quad 0 = mv_1 + 2mv_2$

or $\quad v_1 + 2v_2 = 0 \qquad$ (i)

and since the collision is elastic,

$$v_2 - v_1 = 2v - (-v)$$

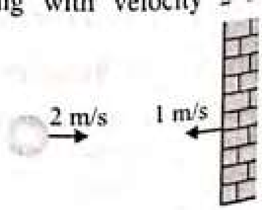
or $\quad v_2 - v_1 = 3v \qquad$ (ii)

Solving the above two equations, we get

$$v_2 = v \text{ and } v_1 = -2v$$

That is, mass $2m$ returns with velocity v while mass m returns with velocity $2v$ in the direction shown in the figure.

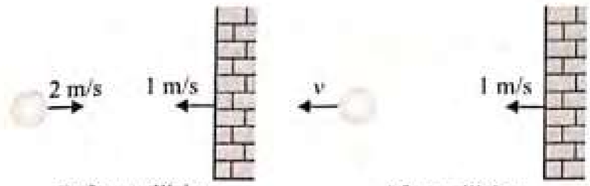
ILLUSTRATION 8.14 A ball is moving with velocity 2 m/s towards a heavy wall moving towards the ball with speed 1 m/s as shown in the figure. Assuming collision to be elastic, find the velocity of the ball immediately after the collision.



Solution. The speed of the wall will not change after the collision. Let v be the velocity of the ball after collision in the direction shown in the figure. Since collision is elastic ($e = 1$).

Speed of separation speed = Speed of approach

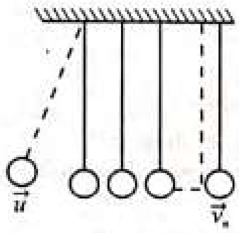
or $\quad v - 1 = 2 + 1$ or $v = 4$ m/s



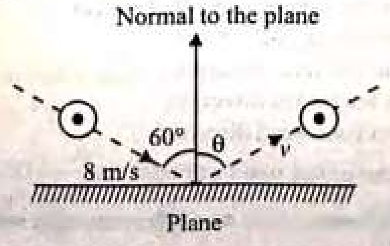
Before collision After collision

Concept Application Exercise 8.3

1. In the figure, there are n identical spheres of mass m suspended with wires of equal length. The spheres are almost in contact with each other. Sphere 1 is pulled aside and released. If sphere 1 strikes sphere 2 with velocity u, find an expression for velocity v_n of the nth sphere immediately after being struck by the one adjacent to it. The coefficient of restitution for all the impacts is e.



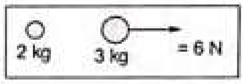
2. A block m_1 strikes a stationary block m_3 inelasticlly. Another block m_2 is kept on m_3. Neglecting the friction between all contacting surfaces, calculate the fractional decrease in KE of the system in collision.
3. A mass m_1 moves with a great velocity. It strikes another mass m_2 at rest in head-on collision. It comes back along its path with low speed after collision. Then find out whether $m_1 < m_2$ or $m_1 > m_2$.
4. A ball of mass 4 kg moving with a velocity of 12 m/s impinges directly on another ball of mass 8 kg moving with velocity of 4 m/s in the same direction. Find their velocities after impact and calculate the loss of KE due to impact if $e = 0.5$.
5. A bullet of mass 2 g travelling at a speed of 500 m/s is fired into a ballistic pendulum of mass 1.0 kg suspended from a cord 1.0 m long. The bullet penetrates the pendulum and emerges with a velocity of 100 m/s. Through what vertical height will the pendulum rise?
6. A spherical imperfectly elastic ball strikes a plane with velocity 8 m/s at an angle of 30° with the plane. Determine the magnitude and direction of the velocity after impact if $e = 0.5$ (neglect gravity).



7. Three balls of masses m_1, m_2 and m_3 are lying in a straight line. The first ball is moved with a certain velocity so that it strikes the second ball directly and itself comes to rest. The second ball collides with the third and is itself reduced to rest. If e is the coefficient of restitution for each ball, write down the relation of m_3 in terms of m_1 and m_2.

Solved Examples

1. A square of side a and uniform thickness is divided into four equal parts. If the upper right part is removed, then find the coordinates of centre of mass of remaining part.



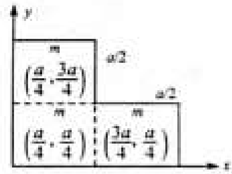
(a) $\left(\frac{5}{12}a, \frac{5}{12}a\right)$ (b) $\left(\frac{7}{12}a, \frac{7}{12}a\right)$

(c) $\left(\frac{1}{4}a, \frac{1}{4}a\right)$ (d) $\left(\frac{1}{3}a, \frac{1}{3}a\right)$

Sol. (a) Let the mass of each part is m. Coordinates of their respective centre of masses are shown in the figure.

$$x_{CM} = \frac{m\frac{a}{4} + m\frac{3a}{4} + m\frac{a}{4}}{m+m+m} = \frac{5a}{12}$$

$$y_{CM} = \frac{m\frac{a}{4} + m\frac{a}{4} + m\frac{3a}{4}}{m+m+m} = \frac{5a}{12}$$



2. A free body of mass 8 kg is travelling at 2 meter per second in a straight line. At a certain instant, the body splits into two equal parts due to internal explosion which releases 16 joules of energy. Neither part leaves the original line of motion finally
   (a) Both parts continue to move in the same direction as that of the original body
   (b) One part comes to rest and the other moves in the same direction as that of the original body
   (c) One part comes to rest and the other moves in the direction opposite to that of the original body
   (d) One part moves in the same direction and the other in the direction opposite to that of the original body

Sol. (b) As the body splits into two equal parts due to internal explosion therefore momentum of system remains conserved, i.e. $8 \times 2 = 4v_1 + 4v_2 \Rightarrow v_1 + v_2 = 4$ ...(i)

By the law of conservation of energy
Initial kinetic energy + Energy released due to explosion = Final kinetic energy of the system

$$\Rightarrow \frac{1}{2}\times 8\times(2)^2 + 16 = \frac{1}{2}4v_1^2 + \frac{1}{2}4v_2^2$$

$$\Rightarrow v_1^2 + v_2^2 = 16 \quad \text{...(ii)}$$

By solving eq. (i) and (ii) we get $v_1 = 4$ and $v_2 = 0$ i.e. one part comes to rest and other moves in the same direction as that of original body.

3. A sphere of mass m, moving with velocity v, enters a hanging bag of sand and stops. If the mass of the bag is M and it is raised by height h, then the velocity of the sphere was

(a) $\frac{M+m}{m}\sqrt{2gh}$ (b) $\frac{M}{m}\sqrt{2gh}$

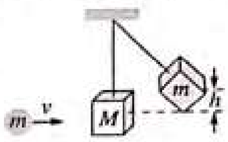
(c) $\frac{m}{M+m}\sqrt{2gh}$ (d) $\frac{m}{M}\sqrt{2gh}$

Sol. (a) By the conservation of linear momentum

Initial momentum of sphere = Final momentum of system

$$mv = (m+M)v_{sys} \quad \text{...(i)}$$

If the system rises up to height h then by the conservation of energy



$$\frac{1}{2}(m+M)v_{sys.}^2 = (m+M)gh \quad \text{...(ii)}$$

$$\Rightarrow v_{sys.} = \sqrt{2gh}$$

Substituting this value in equation (i)

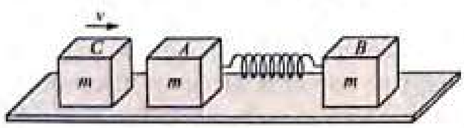
$$v = \left(\frac{m+M}{m}\right)\sqrt{2gh}$$

4. Two identical blocks A and B, each of mass m resting on smooth floor are connected by a light spring of natural length L and spring constant k, with the spring at its natural length. A third identical block 'C' (mass m) moving with a speed v along the line joining A and B collides with A. the maximum compression in the spring is

(a) $v\sqrt{\frac{m}{2k}}$ (b) $m\sqrt{\frac{v}{2k}}$

(c) $\sqrt{\frac{mv}{k}}$ (d) $\frac{mv}{2k}$

Sol. (a) Initial momentum of the system (block C) = mv



After striking with A, the block C comes to rest and now both block A and B moves with velocity V, when compression in spring is maximum.

By the law of conservation of linear momentum

$$mv = (m+m)V \Rightarrow V = \frac{v}{2}$$

By the law of conservation of energy

K.E. of block C = K.E. of system + P.E. of system

$$\frac{1}{2}mv^2 = \frac{1}{2}(2m)V^2 + \frac{1}{2}kx^2$$

$$\Rightarrow \frac{1}{2}mv^2 = \frac{1}{2}(2m)\left(\frac{v}{2}\right)^2 + \frac{1}{2}kx^2$$

$$\Rightarrow kx^2 = \frac{1}{2}mv^2$$

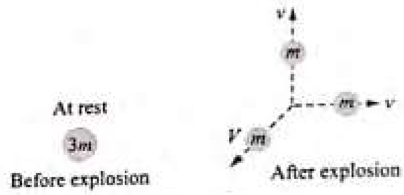
$$\Rightarrow x = v\sqrt{\frac{m}{2k}}$$

5. An object of mass $3m$ splits into three equal fragments. Two fragments have velocities $v\hat{j}$ and $v\hat{i}$. The velocity of the third fragment is

(a) $v(\hat{j}-\hat{i})$ (b) $v(\hat{i}-\hat{j})$

(c) $-v(\hat{i}+\hat{j})$ (d) $\frac{v(\hat{i}+\hat{j})}{\sqrt{2}}$

Sol. (c)



Initial momentum of $3m$ mass = 0 ...(i)

Due to explosion this mass splits into three fragments of equal masses.

Final momentum of system = $m\vec{V} + mv\hat{i} + mv\hat{j}$ ...(ii)

By the law of conservation of linear momentum

$$m\vec{V} + mv\hat{i} + mv\hat{j} = 0 \Rightarrow \vec{V} = -v(\hat{i}+\hat{j})$$

6. A bomb is kept stationary at a point. It suddenly explodes into two fragments of masses 1 g and 3g. The total K.E. of the fragments is 6.4×10^4 J. What is the K.E. of the smaller fragment?

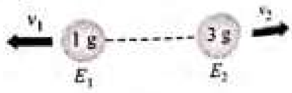
(a) 2.5×10^4 J (b) 3.5×10^4 J

(c) 4.8×10^4 J (d) 5.2×10^4 J

Sol. (c) As the momentum of both fragments are equal therefore $\frac{E_1}{E_2} = \frac{m_2}{m_1} = \frac{3}{1}$ i.e. $E_1 = 3E_2$ ...(i)

According to problem

$E_1 + E_2 = 6.4 \times 10^4$ J ...(ii)



By solving equation (i) and (ii) we get

$E_1 = 4.8 \times 10^4$ J and

$E_2 = 1.6 \times 10^4$ J

7. A body is moving with a velocity v, breaks up into two equal parts. One of the part retraces back with velocity v. Then the velocity of the other part is

(a) v in forward direction

(b) $3v$ in forward direction

(c) v in backward direction

(d) $3v$ in backward direction

Sol. (b) Let the initial mass of body = m

Initial linear momentum $= mv$ ...(i)

When it breaks into equal masses then one of the fragment retrace back with same velocity

$\therefore$ Final linear momentum $= \dfrac{m}{2}(-v) + \dfrac{m}{2}(v_2)$ ...(ii)

By the conservation of linear momentum

$$\Rightarrow mv = \frac{-mv}{2} + \frac{mv_2}{2} \Rightarrow v_2 = 3v$$

i.e. other fragment moves with velocity $3v$ in forward direction.

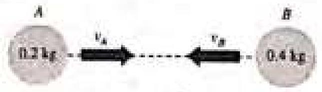
8. Two solid rubber balls A and B having masses 200 and 400 g, respectively, are moving in opposite directions with velocity of A equal to 0.3 m/s. After collision, the two balls come to rest, then the velocity of B is

(a) 0.15 m/s (b) 1.5 m/s

(c) -0.15 m/s (d) None of the above

Sol. (c) Initial linear momentum of system $= m_A\vec{v}_A + m_B\vec{v}_B$

$= 0.2 \times 0.3 + 0.4 \times v_B$



Finally both balls come to rest

$\therefore$ Final linear momentum = 0

By the law of conservation of linear momenum,

$0.2 \times 0.3 + 0.4 \times v_B = 0$

$$\therefore v_B = -\frac{0.2 \times 0.3}{0.4} = -0.15 \text{ m/s}$$

9. A cannon ball is fired with a velocity 200 m/s at an angle of 60° with the horizontal. At the highest point of its flight it explodes into 3 equal fragments, one going vertically upwards with a velocity 100 m/s, the second one falling vertically downwards with a velocity 100 m/s. The third fragment will be moving with a velocity

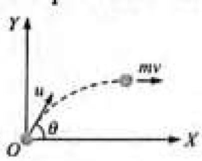
(a) 100 m/s in the horizontal direction

(b) 300 m/s in the horizontal direction

(c) 300 m/s in a direction making an angle of 60° with the horizontal

(d) 200 m/s in a direction making an angle of 60° with the horizontal

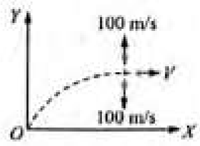
Sol. (b) Momentum of ball (mass m) before explosion at the highest point $= mv\hat{i} = mu\cos 60°\hat{i}$



$= m \times 200 \times \dfrac{1}{2}\hat{i} = 100\, m\hat{i}$ kgms^{-1}

Let the velocity of third part after explosion is V.

After explosion momentum of system



$= \vec{p}_1 + \vec{p}_2 + \vec{p}_3$

$= \dfrac{m}{3} \times 100\hat{j} - \dfrac{m}{3} \times 100\hat{j} + \dfrac{m}{3} \times V\hat{i}$

By comparing momentum of system before and after the explosion

$$\frac{m}{3} \times 100\hat{j} - \frac{m}{3} \times 100\hat{j} + \frac{m}{3}V\hat{i} = 100m\hat{i}$$

$\Rightarrow V = 300$ m/s

10. A lead ball strikes a wall and falls down, a tennis ball having the same mass and velocity strikes the wall and bounces back. Check the correct statement.

(a) The momentum of the lead ball is greater than that of the tennis ball

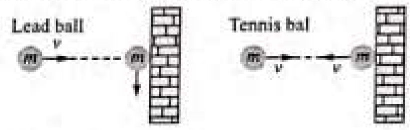
(b) The lead ball suffers a greater change in momentum compared with the tennis ball

(c) The tennis ball suffers a greater change in momentum as compared with the lead ball

(d) Both suffer an equal change in momentum

Sol. (c) Change in the momentum

= Final momentum – initial momentum



For lead ball, $\Delta\vec{p}_{\text{lead}} = 0 - m\vec{v} = -m\vec{v}$

For tennis ball, $\Delta\vec{p}_{\text{tennis}} = -m\vec{v} - m\vec{v} = -2m\vec{v}$

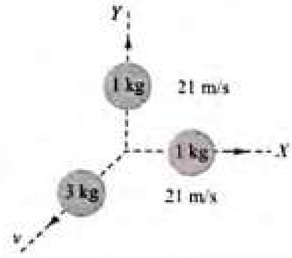
i.e. tennis ball, suffers a greater change in momentum.

11. A body of mass 5 kg explodes at rest into three fragments with masses in the ratio 1 : 1 : 3. The fragments with equal masses fly in mutually perpendicular directions with speeds of 21 m/s. The velocity of the heaviest fragment will be

(a) 11.5 m/s (b) $\dfrac{7}{\sqrt{2}}$ m/s

(c) 7 m/s (d) $7\sqrt{2}$ m/s

Sol. (d)



$p_x = m \times v_x = 1 \times 21$

$= 21$ kg m/s

$p_y = m \times v_y = 1 \times 21$

$= 21$ kg m/s

$\therefore$ Resultant

$= \sqrt{p_x^2 + p_y^2} = 21\sqrt{2}$ kg m/s

The momentum of heavier fragment should be numerically equal to resultant of $\vec{p}_x$ and $\vec{p}_y$.

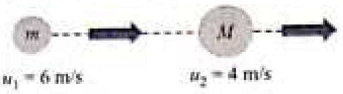
$$3 \times v = \sqrt{p_x^2 + p_y^2} = 21\sqrt{2} \Rightarrow v = 7\sqrt{2} \text{ m/s}$$

12. A particle of mass m moving with horizontal speed 6 m/s as shown in figure. If $m << M$, then for one dimensional elastic collision, the speed of lighter particle after collision will be

(a) 2 m/s in original direction

(b) 2 m/s opposite to the original direction
(c) 4 m/s opposite to the original direction
(d) 4 m/s in original direction

Sol. (a) $v_1 = \left(\frac{m_1 - m_2}{m_1 + m_2}\right)u_1 + \frac{2m_2u_2}{m_1 + m_2}$



Substituting $m_1 = 0$, $v_1 = -u_1 + 2u_2$

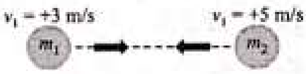
$\Rightarrow v_1 = -6 + 2(4) = 2$ m/s

i.e. the lighter particle will move in original direction with the speed of 2 m/s.

13. Two equal masses m_1 and m_2 moving along the same straight line with velocities +3 m/s and −5 m/s respectively collide elastically. Their velocities after the collision will be respectively

(a) +4 m/s for both (b) −3 m/s and +5 m/s
(c) −4 m/s and +4 m/s (d) −5 m/s and +3 m/s

Sol. (d) As $m_1 = m_2$, therefore after elastic collision velocities of masses get interchanged

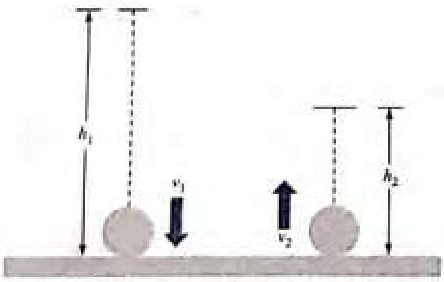


i.e. velocity of mass $m_1 = -5$ m/s
and velocity of mass $m_2 = +3$ m/s

14. A rubber ball is dropped from a height of 5m on a planet where the acceleration due to gravity is not known. On bouncing, it rises to 1.8 m. The ball loses its velocity on bouncing by a factor of

(a) 16/25 (b) 2/5 (c) 3/5 (d) 9/25

Sol. (b) If ball falls from height h_1 and bounces back up to height h_2, then $e = \sqrt{\frac{h_2}{h_1}}$



Similarly, if the velocity of ball before and after collision are v_1 and v_2 respectively, then $e = \frac{v_2}{v_1}$

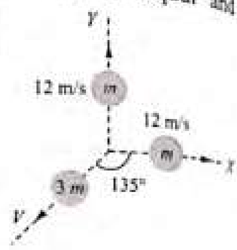
So $\frac{v_2}{v_1} = \sqrt{\frac{h_2}{h_1}} = \sqrt{\frac{1.8}{5}} = \sqrt{\frac{9}{25}} = \frac{3}{5}$

i.e. fractional loss in velocity $= 1 - \frac{v_2}{v_1} = 1 - \frac{3}{5} = \frac{2}{5}$

15. A body at rest breaks up into 3 parts. If 2 parts having equal masses fly off perpendicularly each after with a velocity of 12m/s, then the velocity of the third part which has 3 times mass of each part is

(a) $4\sqrt{2}$ m/s at an angle of 45° from each body
(b) $24\sqrt{2}$ m/s at an angle of 135° from each body
(c) $6\sqrt{2}$ m/s at 135° from each body
(d) $4\sqrt{2}$ m/s at 135° from each body

Sol. (d) The momentum of third part will be equal and opposite to the resultant of momentum of rest two equal parts let v is the velocity of third part.



By the conservation of linear momentum

$$3m \times v = m \times 12\sqrt{2}$$

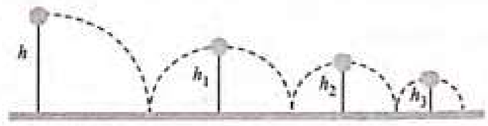
$$\Rightarrow v = 4\sqrt{2} \text{ m/s}$$

16. A particle falls from a height h upon a fixed horizontal plane and rebounds. If e is the coefficient of restitution, the total distance travelled before rebounding has stopped is

(a) $h\left(\frac{1+e^2}{1-e^2}\right)$ (b) $h\left(\frac{1-e^2}{1+e^2}\right)$

(c) $\frac{h}{2}\left(\frac{1-e^2}{1+e^2}\right)$ (d) $\frac{h}{2}\left(\frac{1+e^2}{1-e^2}\right)$

Sol. (a)



Particle falls from height h, then formula for height covered by it in nth rebound is given by

$$h_n = he^{2n}$$

where e = coefficient of restitution, n = no. of rebound.

Total distance travelled by particle before rebounding has stopped.

$$H = h + 2h_1 + 2h_2 + 2h_3 + 2h_n + \ldots$$

$$= h + 2he^2 + 2he^4 + 2he^6 + 2he^8 + \ldots$$

$$= h + 2h(e^2 + e^4 + e^6 + e^8 + \ldots)$$

$$= h + 2h\left[\frac{e^2}{1-e^2}\right] = h\left[1 + \frac{2e^2}{1-e^2}\right] = h\left(\frac{1+e^2}{1-e^2}\right)$$

17. A bag (mass M) hangs by a long thread and a bullet (mass m) comes horizontally with velocity v and gets caught in the bag. Then for the combined (bag + bullet) system

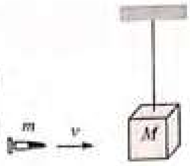
(a) Momentum is $\frac{mvM}{M+m}$

(b) Kinetic energy is $\frac{mv^2}{2}$

(c) Momentum is $\frac{mv(M+m)}{M}$

(d) Kinetic energy is $\frac{m^2v^2}{2(M+m)}$

Sol. (d) Initial momentum $= mv$



Final momentum $= (m+M)V$

By conservation of momentum $mv = (m+M)V$

$\therefore$ Velocity of (bag + bullet) system $V = \dfrac{mv}{M+m}$

$\therefore$ Kinetic energy $= \dfrac{1}{2}(m+M)V^2$

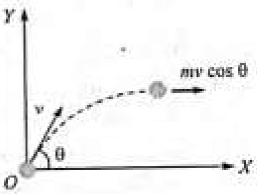
$$= \frac{1}{2}(m+M)\left(\frac{mv}{M+m}\right)^2 = \frac{1}{2}\frac{m^2v^2}{M+m}$$

18. A shell is fired from a cannon with velocity v m/sec at an angle θ with the horizontal direction. At the highest point in its path it explodes into two pieces of equal mass. One of the pieces retraces its path to the cannon and the speed in m/s of the other piece immediately after the explosion is

(a) $3v\cos\theta$ (b) $2v\cos\theta$

(c) $\dfrac{3}{2}v\cos\theta$ (d) $\dfrac{\sqrt{3}}{2}v\cos\theta$

Sol. (a) Shell is fired with velocity v at an angle θ with the horizontal.



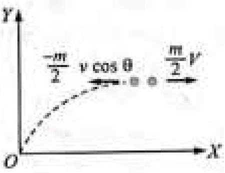
So its velocity at the highest point = horizontal component of velocity $= v\cos\theta$

So momentum of shell before explosion $= mv\cos\theta$

When it breaks into two equal pieces and one piece retrace its path to the canon, then other part moves with velocity V.

So momentum of two pieces after explosion

$$= \frac{m}{2}(-v\cos\theta) + \frac{m}{2}V$$



By the law of conservation of momentum

$$mv\cos\theta = \frac{-m}{2}v\cos\theta + \frac{m}{2}V$$

$\Rightarrow V = 3v\cos\theta$

19. A vessel at rest explodes into three pieces. Two pieces having equal masses fly off perpendicular to one another with the same velocity 30 meter per second. The third piece has three times mass of each of other piece. The magnitude and direction of the velocity of the third piece will be

(a) $10\sqrt{2}$ m/s and 135° from either

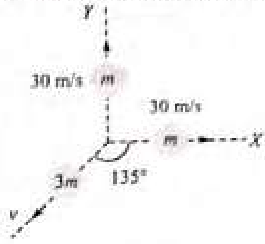
(b) $10\sqrt{2}$ m/s and 45° from either

(c) $\dfrac{10}{\sqrt{2}}$ m/s and 135° from either

(d) $\dfrac{10}{\sqrt{2}}$ m/s and 45° from either

Sol. (a) Let two pieces are having equal mass m and third piece have a mass of $3m$.

According to law of conservation of linear momentum. Since the initial momentum of the system was zero, therefore final momentum of the system must be zero, i.e., the resultant of momentum of two pieces must be equal to the momentum of third piece. We know that if two particle possesses same momentum and angle in between them is 90°, then resultant will be given by $P\sqrt{2} = mv\sqrt{2} = m30\sqrt{2}$



Let the velocity of mass $3m$ is V. So $3mV = 30m\sqrt{2}$

$\therefore V = 10\sqrt{2}$ and angle 135° from either.

(as it is clear from the figure)

20. A set of n identical cubical blocks lies at rest parallel to each other along a line on a smooth horizontal surface. The separation between the near surfaces of any two adjacent blocks is L. The block at one end is given a speed v towards the next one at time $t = 0$. All collisions are completely inelastic. Then

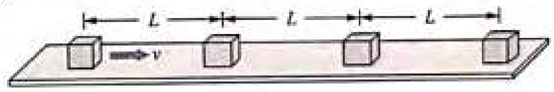
(a) The last block starts moving at $t = \dfrac{(n-1)L}{v}$

(b) The last block starts moving at $t = \dfrac{n(n-1)L}{2v}$

(c) The centre of mass of the system will have a final speed v

(d) The centre of mass of the system will have a final speed $\dfrac{2v}{n}$

Sol. (b)



Since collision is perfectly inelastic so all the blocks will stick together one by one and move in a form of combined mass.

Time required to cover a distance 'L' by first block $= \dfrac{L}{v}$

Now first and second block will stick together and move with $v/2$ velocity (by applying conservation of momentum) and combined system will take time $\dfrac{L}{v/2} = \dfrac{2L}{v}$ to reach up to block third.

Now these three blocks will move with velocity $v/3$ and combined system will take time $\dfrac{L}{v/3} = \dfrac{3L}{v}$ to reach upto the block fourth.

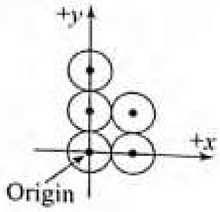
So, total time $= \dfrac{L}{v} + \dfrac{2L}{v} + \dfrac{3L}{v} + \ldots + \dfrac{(n-1)L}{v} = \dfrac{n(n-1)L}{2v}$

and velocity of combined system having n blocks as $\dfrac{v}{n}$.

EXERCISES

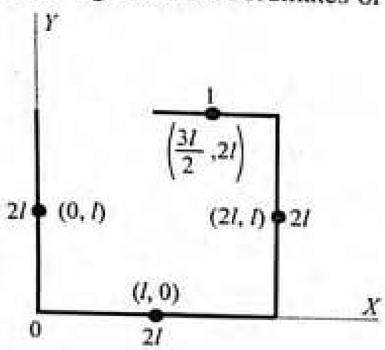
Centre of Mass and Its Motion

1. Five uniform circular plates, each of diameter b and mass m, are laid out in a pattern shown. Using the origin shown, find the y coordinate of the center of mass of the five-plate system.



(a) $b/5$ (b) $b/3$ (c) $4b/5$ (d) $2b/5$

2. A wire of uniform cross-section is bent in the shape shown in the figure. The coordinates of the center of mass of each side are shown in the figure. The coordinates of the center of mass of the system are



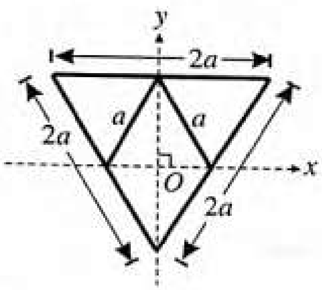
(a) $\left(\frac{15l}{14}, \frac{6l}{7}\right)$

(b) $\left(\frac{15l}{14}, l\right)$

(c) $\left(l, \frac{l}{2}\right)$

(d) (l, l)

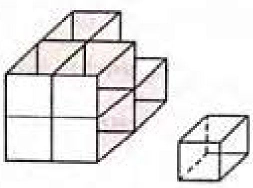
3. The 'y' coordinate of the centre of mass of the system of three rods of length '$2a$' and two rods of length 'a' as shown in the figure is: (Assume all rods to be of uniform density)



(a) $\frac{9a}{8\sqrt{3}}$ (b) $\frac{9a}{16\sqrt{3}}$

(c) zero (d) $\frac{8a}{\sqrt{3}}$

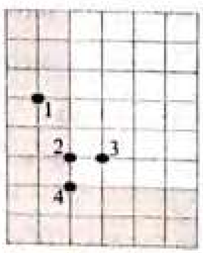
4. Eight solid uniform cubes of edge l are stacked together to form a single cube with center O. One cube is removed from this system. Distance of the centre of mass of remaining 7 cubes from O is



(a) $\frac{7\sqrt{3}l}{16}$ (b) $\frac{\sqrt{3}l}{16}$

(c) $\frac{\sqrt{3}l}{14}$ (d) zero

5. In the figure, the L-shaped shaded piece is cut from a metal plate of uniform thickness. The point that corresponds to the center of mass of the L-shaped piece is



(a) 1 (b) 2 (c) 3 (d) 4

6. A brick of length L is placed on the horizontal floor. The bricks of same length and size are placed on this brick, one above the other by providing a margin of $L/8$ from the edge of the brick placed just below, in the same direction. Find the correct option.

(a) Fifth brick will fall down
(b) Sixth brick alone will fall down
(c) Sixth brick along with fifth brick will fall down
(d) None of these

7. Two semicircular rings of linear mass densities λ and 2λ and of radius 'R' each are joined to form a complete ring. The distance of the center of the mass of complete ring from its centre is

(a) $\frac{3R}{8\pi}$ (b) $\frac{2R}{3\pi}$ (c) $\frac{4R}{21\pi}$ (d) None of these

8. A system of particles is free from any external force. If $\vec{v}$ and $\vec{a}$ be the velocity and acceleration of the centre of mass, then it necessarily follows that

(a) $\vec{v}=0;\ \vec{a}=0$ (b) $\vec{v}\neq 0;\ \vec{a}=0$
(c) $\vec{v}=0;\ \vec{a}\neq 0$ (d) both (a) and (b).

9. The velocity of the CM of a system changes from $\vec{v}_1 = 4\hat{i}$ m/s to $\vec{v}_2 = 3\hat{j}$ m/s during time $\Delta t = 2$ s. If the mass of the system is $m = 10$ kg, the constant force acting on the system is

(a) 25 N (b) 20 N (c) 50 N (d) 5 N

10. A child is sitting at one end of a long trolley moving with a uniform speed v on a smooth horizontal track. If the child starts running towards the other end of the trolley with a speed u (w.r.t. trolley), the speed of the center of mass of the system will

(a) $u+v$ (b) $v-u$ (c) v (d) none of these

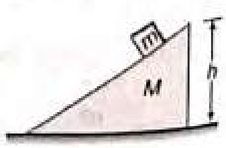
11. A boy of mass m is standing on a block of mass M kept on a rough surface. When the boy walks from left to right on the block, the center of mass (boy + block) of system:

(a) remains stationary (b) shifts towards left
(c) shift towards right
(d) shifts towards right if $M > m$ and towards left if $M < m$.

12. An insulated particle of mass m is moving in a horizontal plane (x-y) along the X-axis. At a certain height above the ground, it suddenly explodes into two fragments of masses $m/4$ and $3m/4$. An instant later, the smaller fragment is at $Y = +15$ cm. The larger fragment at this instant is at:

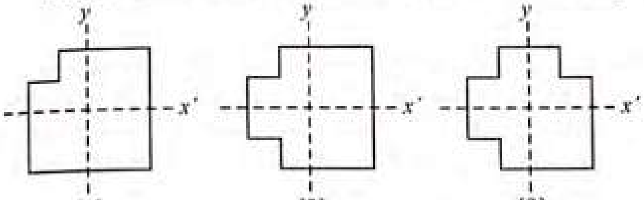
(a) $Y = -5$ cm (b) $Y = +20$ cm
(c) $Y = +5$ cm (d) $Y = -20$ cm

13. A mass m is rest on an inclined plane of mass M which is further resting on a smooth horizontal plane. Now if the mass starts moving the position of C.M. of mass of system will



(a) remains unchanged
(b) change along the horizontal
(c) will move up in the vertical direction
(d) will move down in the vertical direction and changes along the horizontal

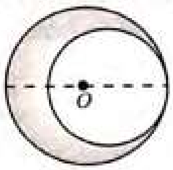
14. A machinist starts with three identical square plates but cuts one corner from one of them, two corners from the second and three corners from the third. Rank the three according to the x-coordinate of their centre of mass, from smallest to largest.



[1] [2] [3]

(a) 3, 1, 2 (b) 1, 3, 2
(c) 3, 2, 1 (d) 1 and 3 tie, then 2

15. A circular plate of uniform thickness has a diameter of 28 cm. A circular portion of diameter 21 cm is removed from the plate as shown. O is the centre of mass of complete plate. The position of centre of mass of remaining portion will shift towards left from O by



(a) 5 cm (b) 9 cm (c) 4.5 cm (d) 5.5 cm

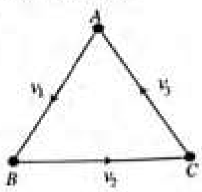
16. A man stands at one end of a boat which is stationary in water. Neglect water resistance. The man now moves to the other end of the boat and again becomes stationary. The centre of mass of the 'man plus boat' system will remain stationary with respect to water
(a) only when the man is stationary initially and finally
(b) only if the man moves without acceleration on the boat
(c) only if the man and the boat have equal masses
(d) in all cases

17. Two particles are shown in the figure. At $t = 0$, a constant force $F = 6$ N starts acting on the 3 kg man.

Find the velocity of the centre of mass of these particles at $t = 5$ s.
(a) 5 m/s (b) 4 m/s (c) 6 m/s (d) 3 m/s

18. A ball kept in a closed box moves in the box making collisions with the walls. The box is kept on a smooth surface. The velocity of the centre of mass
(a) of the box remains constant
(b) of the (box + ball) system remains constant
(c) of the ball remains constant
(d) of the ball relative to the box remains constant

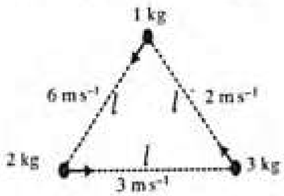
19. Three particles of equal masses are placed at the corners of an equilateral triangle as shown in the figure. Now particle A starts with a velocity v_1 towards line AB, particle B starts with a velocity v_2 towards line BC and particle C starts with velocity v_3 towards line CA. The displacement of CM of three particle A, B and C after time t will be (given if $v_1 = v_2 = v_3$)



(a) zero (b) $\dfrac{v_1 + v_2 + v_3}{3}t$

(c) $\dfrac{v_1 + \dfrac{\sqrt{3}}{2}v_2 + \dfrac{v_3}{2}}{3}t$ (d) $\dfrac{v_1 + v_2 + v_3}{4}t$

20. Three particles of masses 1 kg, 2 kg and 3 kg are situated at the corners of an equilateral triangle move at speed $6\ \text{ms}^{-1}$, $3\ \text{ms}^{-1}$ and $2\ \text{ms}^{-1}$ respectively. Each particle maintains a direction towards the particle at the next corner symmetrically. Find velocity of CM of the system at this instant



(a) $3\ \text{ms}^{-1}$ (b) $5\ \text{ms}^{-1}$ (c) $6\ \text{ms}^{-1}$ (d) zero

Conservation of Linear Momentum

21. An object initially at rest explodes into three fragments A, B and C. The momentum of A is $p\hat{i}$ and that of B is $\sqrt{3}p\,\hat{j}$ where p is a +ve number. The momentum of C will be
(a) $(1+\sqrt{3})p$ in a direction making angle 120° with that of A.
(b) $(1+\sqrt{3})p$ in a direction making angle 150° with that of B.
(c) $2p$ in a direction making angle 150° with that of A.
(d) $2p$ in a direction making angle 150° with that of B.

22. A vessel at rest explodes breaking it into three pieces. Two pieces having equal mass fly off perpendicular to one another with the same speed of 30 m/s. The third piece has three times the mass of each of the other two pieces. What is the direction (w.r.t. the pieces having equal masses) and magnitude of its velocity immediately after the explosion?
(a) $10\sqrt{2}$, 135° (b) $10\sqrt{2}$, 90°
(c) $10\sqrt{2}$, 60° (d) $10\sqrt{2}$, 30°

23. A stationary body of mass 3 kg explodes into three equal pieces. Two of the pieces fly off at right angles to each other. One with a velocity of $2\hat{i}$ m/s and the other with a velocity of $3\hat{j}$ m/s. If the explosion takes place in 10^{-5} s, the average force acting on the third piece in newtons is
(a) $(2\hat{i}+3\hat{j}) \times 10^{-5}$ (b) $-(2\hat{i}+3\hat{j}) \times 10^{5}$
(c) $(3\hat{j}+2\hat{i}) \times 10^{5}$ (d) $-(2\hat{i}+3\hat{j}) \times 10^{-5}$

24. A particle of mass $2m$ is projected at an angle of 45° with the horizontal with a velocity of $20\sqrt{2}$ m/s. After 1 s of explosion, the particle breaks into two equal pieces. As a result of this one part comes to rest. The maximum height from the ground attained by the other part is ($g = 10\ \text{m/s}^2$)
(a) 50 m (b) 25 m (c) 40 m (d) 35 m

25. A bag of mass M hangs by a long massless rope. A bullet of mass m, moving horizontally with velocity u, is caught

in the bag. Then for the combined (bag + bullet) system, just after collision

(a) momentum is $muM/(M + m)$
(b) kinetic energy is $mu^2/2$
(c) momentum is $mu(M + m)/M$
(d) kinetic energy is $m^2u^2/2(M + m)$

26. A stationary body explodes in to four identical fragments such that three of them fly mutually perpendicular to each other, each with same KE(E_0). The energy of explosion will be

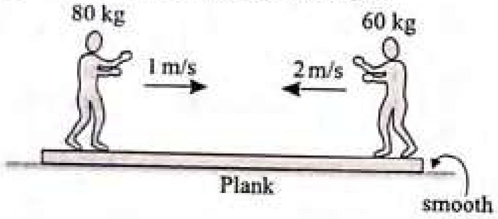
(a) $6E_0$ (b) $3E_0$ (c) $4E_0$ (d) $2E_0$

27. A body of mass 1 kg initially at rest, explodes and breaks into three fragments of masses in the ratio 1 : 1 : 3. The two pieces of equal mass fly off perpendicular to each other with a speed of 15 m s^{-1} each. What is the velocity of the heavier fragment?

(a) $10\sqrt{2}$ m s^{-1} (b) $5\sqrt{3}$ m s^{-1}

(c) $10\sqrt{3}$ m s^{-1} (d) $5\sqrt{2}$ m s^{-1}

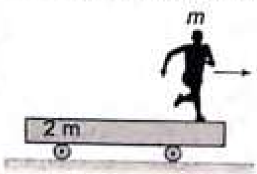
28. Two men of masses 80 kg and 60 kg are standing on a wood plank of mass 100 kg that has been placed over a smooth surface. If both the men start moving toward each other with speeds 1 m/s and 2 m/s respectively. The velocity of the plank by which it starts moving is



(a) $\frac{1}{6}$ m/s towards right (b) $\frac{1}{6}$ m/s towards left

(c) $\frac{2}{5}$ m/s towards right (d) $\frac{2}{5}$ m/s towards left

29. A man is standing on a cart of mass double the mass of the man. Initially cart is at rest on the smooth ground. Now man jumps with relative velocity 'v' horizontally towards right with respect to cart. The work done by man during the process of jumping is

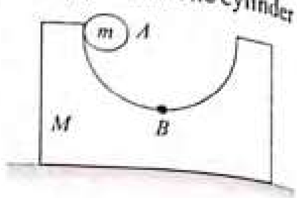


(a) mv^2 (b) $\frac{mv^2}{2}$ (c) $\frac{mv^2}{4}$ (d) $\frac{mv^2}{3}$

30. A gun fires a shell and recoils horizontally. If the shell travels along the barrel with speed v, the ratio of speed with which the gun recoils if (i) the barrel is horizontal (ii) inclined at an angle of 30° with horizontal is

(a) 1 (b) $\frac{2}{\sqrt{3}}$ (c) $\frac{\sqrt{3}}{2}$ (d) $\frac{1}{2}$

31. A block of mass $M = 2$ kg with a semicircular track of radius $R = 1.1$ m rests on a horizontal frictionless surface. A uniform cylinder of radius $r = 10$ cm and mass $m = 1.0$ kg is released from rest from the top point a. The cylinder slips on the semicircular frictionless track. The speed of the block when the cylinder reaches the bottom of the track at B is ($g = 10$ m/s^2)

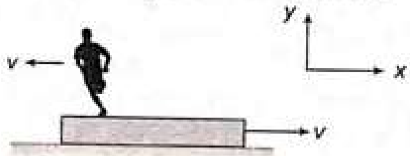


(a) $\sqrt{\frac{10}{3}}$ m/s (b) $\sqrt{\frac{4}{3}}$ m/s (c) $\sqrt{\frac{5}{2}}$ m/s (d) $\sqrt{10}$ m/s

32. A cannon shell moving along a straight line bursts into two parts. Just after the burst one part moves with momentum 40 Ns making an angle 30° with the original line of motion. The minimum momentum of the other part of shell just after the burst is:

(a) 0 N s (b) 10 N s (c) 20 N s (d) 17.32 N s

33. A man and a plank of the same mass are moving with a velocity v along positive x-axis. At the same time man jumps along negative x-axis with a velocity v with respect to ground, then the speed of the plank is:



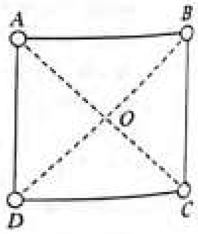
(a) v (b) $2v$ (c) $3v$ (d) none of these

34. Two particles A and B start moving due to their mutual interaction only. If at any time t, $\vec{a}_A$ and $\vec{a}_B$ are their respective accelerations, $\vec{v}_A$ and $\vec{v}_B$ are their respective velocities, and up to that time W_A and W_B are the work done on A and B respectively by the mutual force, m_A and m_B are their masses respectively, then which of the following is always correct?

(a) $\vec{v}_A + \vec{v}_B = 0$ (b) $m_A\vec{v}_A + m_B\vec{v}_B = 0$

(c) $W_A + W_B = 0$ (d) $\vec{a}_A + \vec{a}_B = 0$

35. Four particles A, B, C and D of equal masses are placed at the corners of a square. They move with equal uniform speed v towards the intersection of the diagonals. After collision, A comes to rest, B traces its path back with same speed and C and D move with equal velocities in same direction. What is the velocity of C after collision?



(a) $\frac{2v}{3}$ (b) $2v$ (c) $\frac{v}{2}$ (d) v

36. Two skaters A and B, both of mass 70 kg, are approaching one another over a frictionless fixed surface, each with a speed of 1 m/s with respect to the surface. A carries a bowling ball of mass of 10 kg. Both skaters can throw the ball at 5 m/s relative to themselves. To avoid collision they start throwing the ball back and forth when they are

10 m apart. How many minimum number of throws are required?
(a) 1 (b) 2 (c) 3 (d) 4

37. A man of mass m on an initially stationary boat gets off the boat by jumping to the left in an exactly horizontal direction. Immediately after the jump, the boat of mass M, is observed to be moving to the right at speed v. How much work did the man do during the jump (both on his own body and on the boat)?

(a) $\frac{1}{2}(M+m)v^2$ (b) $\frac{1}{2}\left(M+\frac{M^2}{m}\right)v^2$

(c) $\frac{1}{2}\left(\frac{Mm}{M+m}\right)v^2$ (d) None of these

38. A block of mass $m_1 = 2$ kg slides on a frictionless table with speed of 10 m/s. In front of it, another block of mass $m_2 = 5$ kg is moving with speed 3 m/s in the same direction. A massless spring of spring constant $k = 1120$ N/m is attached on the backside of m_2 as shown. The maximum compression of the spring in cm when the blocks collide is

(a) 25 cm (b) 10 cm (c) 2.5 cm (d) 5 cm

39. A loaded spring gun, initially at rest on a horizontal frictionless surface fires a marble of mass m at an angle of elevation θ. The mass of the gun is M, that of the marble is m and the muzzle velocity of the marble is v_0, then velocity of the gun just after the firing is

(a) $\frac{m v_0}{M}$ (b) $\frac{m v_0 \cos\theta}{M}$

(c) $\frac{m v_0 \cos\theta}{M+m}$ (d) $\frac{m v_0 \cos 2\theta}{M+m}$

40. A particle is projected at an angle of 45°. After 1 second, it breaks into two equal parts. One part stops and other part attains the height of 20 m after the breaking of the particle. Find the velocity of projection ($g = 10$ m/s^2).
(a) 20 m/s (b) $20\sqrt{2}$ m/s (c) $10\sqrt{2}$ m/s (d) 15 m/s

Problems Based on Collision

41. A ball impinges directly on another ball at rest. The first ball is brought to rest by the impact. If half of the kinetic energy is lost by the impact, the value of coefficient of restitution is

(a) $\frac{1}{2}$ (b) $\frac{1}{\sqrt{3}}$ (c) $\frac{1}{\sqrt{2}}$ (d) $\frac{\sqrt{3}}{2}$

42. A particle of mass m travelling with velocity v and kinetic energy E collides elastically to another particle of mass nm, at rest. What is the fraction of total energy retained by the particle of mass m?

(a) $\left(\frac{n+1}{n}\right)^2$ (b) $\left(\frac{n+1}{n-1}\right)^2$

(c) $\left(\frac{n-1}{n+1}\right)^2$ (d) None of these

43. A ball of mass m moving with speed u undergoes a head-on elastic collision with a ball of mass nm initially at rest. The fraction of the incident energy transferred to the second ball is

(a) $\frac{n}{1+n}$ (b) $\frac{n}{(1+n)^2}$ (c) $\frac{2n}{(1+n)^2}$ (d) $\frac{4n}{(1+n)^2}$

44. In the above question, the ratio of the kinetic energies of the first ball to the second ball after collision is

(a) $\frac{(1-n)^2}{2n}$ (b) $\frac{(1-n)^2}{4n}$ (c) $\frac{(1+n)^2}{2n}$ (d) $\frac{(1+n)^2}{4n}$

45. A ball is let fall from a height h_0. There are n collisions with the earth. If the velocity of rebound after n collisions is v_n and the ball rises to a height h_n, then coefficient of restitution e is given by

(a) $e^n = \sqrt{\frac{h_n}{h_0}}$ (b) $e^n = \sqrt{\frac{h_0}{h_n}}$

(c) $ne = \sqrt{\frac{h_n}{h_0}}$ (d) $\sqrt{ne} = \sqrt{\frac{h_n}{h_0}}$

46. A particle of mass m is moving horizontally with a constant velocity v towards a rigid wall that is moving in opposite direction with a constant speed u. Assuming elastic impact between the particle and wall, the work done by the wall in reflecting the particle is equal to
(a) $(1/2)m(u+v)^2$ (b) $(1/2)m(u+v)$
(c) $(1/2)muv$ (d) None of these

47. A ball collides with a fixed inclined plane of inclination θ after falling through a distance h. If it moves horizontally just after the impact, the coefficient of restitution is
(a) $\tan\theta$ (b) $\tan^2\theta$ (c) $\cot\theta$ (d) $\cot^2\theta$

48. A mass m_1 moves with a great velocity. It strikes another mass m_2 at rest in head-on collision. It comes back along its path with low speed after collision. Then
(a) $m_1 > m_2$ (b) $m_1 < m_2$
(c) $m_1 = m_2$
(d) there is no relation between m_1 and m_2

49. A steel ball of mass 0.5 kg is fastened to a cord 20 cm long and fixed at the far end and is released when the cord is horizontal. At the bottom of its path the ball strikes a 2.5 kg steel block initially at rest on a frictionless surface. The collision is elastic. The speed of the block just after the collision will be.

(a) $\frac{10}{3}$ ms^{-1} (b) $\frac{20}{3}$ ms^{-1} (c) 5 ms^{-1} (d) $\frac{5}{3}$ ms^{-1}

50. Two particles of equal masses moving with same speed collide perfectly inelastically. After the collision the combined mass moves with half of the speed of the individual masses. The angle between the initial momenta of individual particle is
(a) 60° (b) 90° (c) 120° (d) 45°

51. A ball is dropped from a height of 45 m from the ground. The coefficient of restitution between the ball and the

ground is 2/3. What is the distance travelled by the ball in 4th second of its motion. Assume negligible time is spent in rebounding. Let $g = 10$ m s^2.
(a) 5 m (b) 20 m (c) 15 m (d) 10 m

52. A ball falls vertically onto a floor with momentum p, and then bounces repeatedly. If the coefficient of restitution is e, then the total momentum imparted by the ball on the floor till the ball comes to rest is
(a) $p(1+e)$ (b) $\frac{p}{1-e}$ (c) $p\left(1+\frac{1}{e}\right)$ (d) $p\left(\frac{1+e}{1-e}\right)$

53. A body of mass 3 kg moving with a velocity of 4 m/s towards left collides head on with a body of mass 4 kg moving in opposite direction with a velocity of 3 m/s. After collision the two bodies stick together and move with a common velocity which is
(a) zero (b) 12 m/s towards left
(c) 12 m/s towards right (d) $\frac{12}{7}$ m/s towards left

54. A particle of mass m_1 moving with velocity v in a positive direction collides elastically with a mass m_2 moving in opposite direction also at velocity v. If $m_2 >> m_1$, then
(a) the velocity of m_1 immediately after collision is nearly $3v$
(b) the change in momentum of m_1 is nearly $4m_1v$
(c) the change in kinetic energy of m_1 is nearly $4m_1v^2$
(d) all of the above

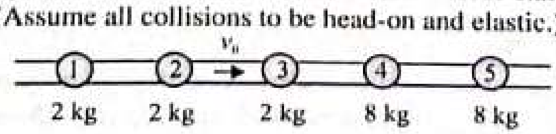
55. A particle of mass m moving with velocity 1 m/s collides perfectly elastically with another stationary particle of mass $2m$. If the incident particle is deflected by 90°, the heavy mass will make an angle θ with the initial direction of m equal to
(a) 60° (b) 45° (c) 15° (d) 30°

56. A smooth sphere is moving on a horizontal surface with velocity vector $2\hat{i}+2\hat{j}$ immediately before it hits a vertical wall. The wall is parallel to $\hat{j}$ vector and the coefficient of restitution between the sphere and the wall is $e = 1/2$. The velocity vector of the sphere after it hits the wall is
(a) $\hat{i}-\hat{j}$ (b) $-\hat{i}+2\hat{j}$ (c) $-\hat{i}-\hat{j}$ (d) $2\hat{i}-\hat{j}$

57. Three balls A, B and C of masses 2 kg, 4 kg and 8 kg, respectively, move along the same straight line and in the same direction, with velocities 4 m/s, 1 m/s and 3/4 m/s. If A collides with B and subsequently B collides with C, find the velocity of ball A and ball B after collision respectively, taking the coefficient of restitution as unity.

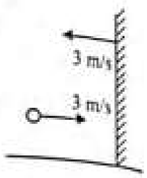
(a) 3 m/s, 9/4 m/s (b) 0 m/s, 3 m/s
(c) 3 m/s, 0 m/s (d) 0 m/s, 0 m/s

58. Five balls are placed one after the other along a straight line as shown in the figure. Initially, all the balls are at rest. Then the second ball has been projected with speed v_0 towards the third ball. Mark the correct statements. (Assume all collisions to be head-on and elastic.)



(a) Total number of collisions in the process is 5.
(b) Velocity of separation between the first and fifth ball after the last possible collision is v_0.
(c) Finally, three balls remain stationary.
(d) All of the above.

59. A highly elastic ball moving at a speed of 3 m/s approaches a wall moving towards it with a speed of 3 m/s. After the collision, the speed of the ball will be

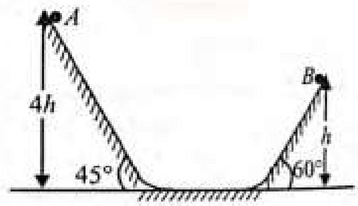


(a) 3 m/s (b) 6 m/s
(c) 9 m/s (d) zero

60. After a totally inelastic collision, two objects of the same mass and same initial speeds are found to move together at half of their initial speeds. The angle between the initial velocities of the objects is
(a) 120° (b) 60° (c) 150° (d) 45°

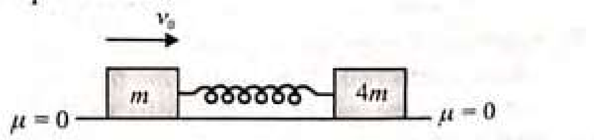
Problems Based on Mixed Concepts

61. Two identical balls A and B are released from the position shown in the figure. They collide elastically with each other on the horizontal portion. The ratio of heights attained by A and B after collision is (neglect friction)



(a) 1:4
(b) 2:1
(c) 4:13
(d) 2:5

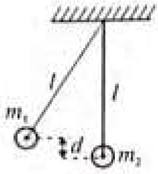
62. Two blocks of masses m and $4m$ lie on a smooth horizontal surface connected with a spring in its natural length. Mass m is given velocity v_0 through an impulse as shown in the figure. Which of the following is not true about subsequent motion?



(a) Kinetic energy is maximum in ground frame and centre of mass (CM) frame simultaneously.
(b) Value of maximum and minimum kinetic energy is same in CM and ground frame.
(c) Minimum kinetic energy is zero in CM frame but non-zero in ground frame.
(d) Maximum and minimum kinetic energy of m in ground frame is, respectively, $\frac{1}{2}mv_0^2$ and zero.

63. A pendulum consists of a wooden bob of mass m and of length l. A bullet of mass m_1 is fired towards the pendulum with a speed v_1. The bullet emerges out of the bob with a speed $v_1/3$ and the bob just completes motion along a vertical circle. Then v_1 is
(a) $\left(\frac{m}{m_1}\right)\sqrt{5gl}$ (b) $\frac{3}{2}\left(\frac{m}{m_1}\right)\sqrt{5gl}$
(c) $\frac{2}{3}\left(\frac{m_1}{m}\right)\sqrt{5gl}$ (d) $\left(\frac{m_1}{m}\right)\sqrt{gl}$

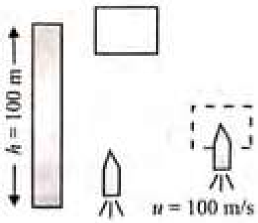
64. Two pendulums each of length l are initially situated as shown in the figure. The first pendulum is released and strikes the second. Assume that the collision is completely inelastic and neglect the mass of the string and any frictional effects. How high does the centre of mass rise after the collision?



(a) $d\left[\frac{m_1}{(m_1+m_2)}\right]^2$ (b) $d\left[\frac{m_1}{(m_1+m_2)}\right]$

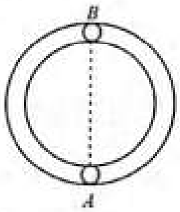
(c) $d\left[\frac{(m_1+m_2)}{m_2}\right]^2$ (d) $d\left[\frac{m_2}{(m_1+m_2)}\right]^2$

65. A wooden block of mass 10 g is dropped from the top of a tower 100 m high. Simultaneously, a bullet of mass 10 g is fired from the foot of the tower vertically upwards with a velocity of 100 m/s. If the bullet is embedded in it, how high will the block rise above the top of tower before it starts falling? ($g = 10$ m/s^2)



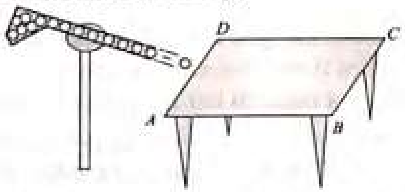
(a) 75 m (b) 85 m (c) 80 m (d) 10 m

66. Two equal spheres A and B lie on a smooth horizontal circular groove at opposite ends of a diameter. At time $t = 0$, A is projected along the groove and it first impinges on B at time $t = T_1$ and again at time $t = T_2$. If e is the coefficient of restitution, the ratio T_2/T_1 is



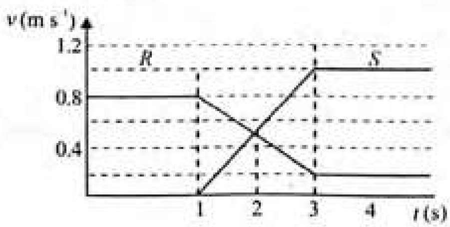
(a) $\frac{2}{e}$ (b) $\frac{(2+e)}{2}$ (c) $\frac{2(e+1)}{e}$ (d) $\frac{(2+e)}{e}$

67. A gun which fires small balls of mass 20 g is firing 20 balls per second on the smooth horizontal table surface $ABCD$. If the collision is perfectly elastic and balls are striking at the centre of table with a speed of 5 m/s at an angle of 60° with the vertical just before collision, then force exerted by one of the legs on ground is (assume total weight of the table is 0.2 kg)



(a) 0.5 N (b) 1 N (c) 0.25 N (d) 0.75 N

68. Figure shows the velocity–time graph for two masses R and S that collided elastically. Which of the following statements is true?



i. R and S moved in the same direction after the collision.
ii. The velocities of R and S were equal at the mid time of the collision.
iii. The mass of R was greater than mass of S.

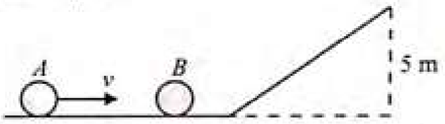
Which of the following is true?

(a) i only (b) ii only
(c) i and ii only (d) i, ii and iii

69. A cracker is thrown into air with a velocity of 10 m/s at an angle of 45° with the vertical. When it is at a height of 0.5 m from the ground, it explodes into a number of pieces which follow different parabolic paths. What is the velocity of centre of mass, when it is at a height of 1 m from the ground? ($g = 10$ m/s^2)

(a) $4\sqrt{5}$ m/s (b) $2\sqrt{5}$ m/s
(c) $5\sqrt{4}$ m/s (d) 10 m/s

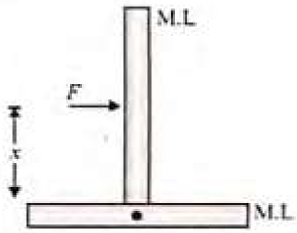
70. Two identical balls, of equal masses A and B, are lying on a smooth surface as shown in the figure. Ball A hits ball B (which is at rest) with a velocity $v = 16$ m/s. What should be the minimum value of coefficient of restitution between A and B so that B just reaches the highest point of inclined plane?



(a) $\frac{2}{3}$ (b) $\frac{1}{4}$ (c) $\frac{1}{2}$ (d) $\frac{1}{3}$

71. An inverted T-shaped object is placed on a smooth horizontal floor as shown in the figure.

A force F is applied on the system as shown in the figure. The value of x so that the system performs pure translational motion is

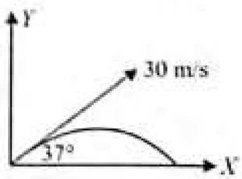


(a) $\frac{L}{4}$ (b) $\frac{3L}{4}$ (c) $\frac{L}{2}$ (d) $\frac{3L}{2}$

72. A particle at rest is constrained to move on a smooth horizontal surface. Another identical particle hits the fractional particle with a velocity v at an angle $\theta = 60°$ with horizontal. If the particles move together, the velocity of the combination just after impact is equal to

(a) v (b) $\frac{v}{2}$ (c) $\frac{\sqrt{3}v}{4}$ (d) $\frac{v}{4}$

73. An object of mass 10 kg is launched from the ground at $t = 0$, at an angle of 37° above the horizontal with a speed of 30 m/s. At some time after its launch, an explosion splits the projectile into two pieces. One piece of mass 4 kg is observed at (105 m, 43 m) at $t = 2$ s. Find the location of second piece at $t = 2$ s.



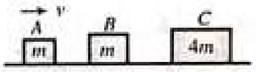
(a) (10, 2) (b) (48, 16)

(c) (10, – 2) (d) Information insufficient

74. A block of mass m starts from rest and slides down a frictionless semi-circular track from a height h as shown. When it reaches the lowest point of the track, it collides with a stationary piece of putty also having mass m. If the block and the putty stick together and continue to slide, the maximum height that the block–putty system could reach is

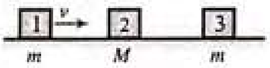
(a) $h/4$ (b) $h/2$
(c) h (d) independent of h

75. Three blocks are initially placed as shown in the figure. Block A has mass m and initial velocity v to the right. Block B with mass m and block C with mass $4m$ are both initially at rest. Neglect friction. All collisions are elastic. The final velocity of blocks A is



(a) $0.6v$ to the left (b) $1.4v$ to the left
(c) v to the left (d) $0.4v$ to the right

76. Three blocks are placed on smooth horizontal surface and lie on same horizontal straight line. Block 1 and block 3 have mass m each and block 2 has mass M ($M > m$). Block 2 and block 3 are initially stationary, while block 1 is initially moving towards block 2 with speed v as shown. Assume that all collisions are head on and perfectly elastic. What value of M/m ensures that block 1 and block 3 have the same final speed?

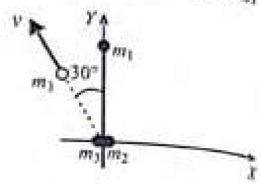


(a) $5+\sqrt{2}$ (b) $5-\sqrt{2}$ (c) $2+\sqrt{5}$ (d) $3+\sqrt{5}$

77. A ball is projected in a direction inclined to the vertical and bounces on a smooth horizontal plane. The range of one rebound is R. If the coefficient of restitution is e, then range of the next rebound is

(a) $R' = eR$ (b) $R' = e^2R$ (c) $R' = \frac{R}{e}$ (d) $R' = R$

78. Three point like equal masses m_1, m_2 and m_3 are connected to the ends of a massless rod of length L which lies at rest on a smooth horizontal plane (see figure). At $t = 0$, an explosion occurs between m_2 and m_3, and as a result, mass m_3 is detached from the rod, and moves with a known velocity v at an angle of 30° with the y-axis. Assume that the masses m_2 and m_3 are unchanged during the explosion.



What is the velocity of the centre of mass of the system consisting of three masses, after the expulsion?

(a) $\frac{v}{4}(\hat{i}-3\hat{j})$ (b) $\frac{v}{4}(-\hat{i}+\sqrt{3}\,\hat{j})$
(c) $-v$ (d) None of these

79. Two objects that are moving along an xy-plane on a frictionless floor collide. Assume that they form a closed, isolated system. The following table gives some of the momentum components (in kilogram meters per second) before and after the collision.

	Before collision		After collision	
Object	P_X	P_Y	P_X	P_Y
A	–4	5	3	a
B	b	–2	4	2

What are the missing values (a, b)?
(a) 10, 11 (b) 1, 11 (c) 5, 7 (d) 6, 4

80. In the arrangements shown in the figure masses of each ball is 1 kg and mass of trolley is 4 kg. In the figure, shell of mass 1 kg moving horizontally with velocity $v = 6\ \text{ms}^{-1}$ collides with the ball and get stuck to it then its maximum deflection of the thread (length 1.5 m) with vertical is

(a) 53° (b) 37° (c) 30° (d) 60°

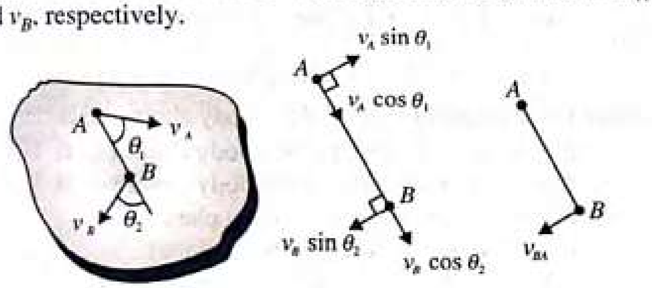
Chapter 9

Rotational Dynamics

RIGID BODY

Rigid body is defined as a system of particles in which distance between each pair of particles remains constant (with respect to time), which means the shape and size do not change during the motion.

For every pair of particles in a rigid body, there is no velocity of separation or approach between the particles. In the figure, velocities of A and B with respect to the ground are v_A and v_B, respectively.



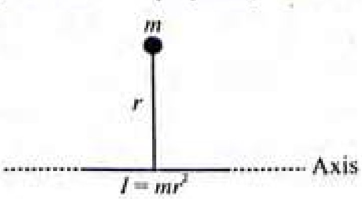
(a) (b) (c)

- If the above body is rigid, $v_A \cos\theta_1 = v_B \cos\theta_2$
- With respect to any particle of the rigid body, the motion of any other particle of that rigid body is circular. v_{BA} = relative velocity of B with respect to A.

MOMENT OF INERTIA

Inertia is a property of a body to resist the change in linear state of motion. It is measured by the mass of the body. The moment of inertia I of a body is a measure of its ability to resist change in its rotational state of motion.

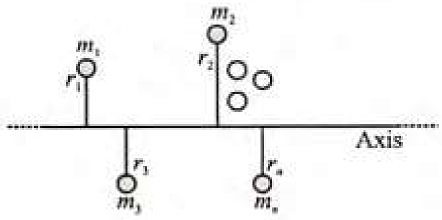
If we compare for rotational motion with corresponding relations for translatory motion, we find that moment of inertia plays the same role in rotatory motion as is played by mass in translatory motion, i.e., if a body has large moment of inertia, it is difficult to start rotation or to stop it if rotating. Large moment of inertia also helps in keeping the motion uniform. This is why stationary engines are provided with fly wheels having large moment of inertia.



Moment of inertia of a particle about an axis is defined as $I = mr^2$ where r is the distance (perpendicular) of the particle from the axis of rotation (see figure).

For a system of particles of masses m_1, m_2, m_3,.... m_n at perpendicular distances $r_1, r_2, r_3, \ldots, r_n$ (see figure), respectively, from the axis of rotation, the moment of inertia is given by

$$I = m_1 r_1^2 + m_2 r_2^2 + \cdots + m_n r_n^2 = \Sigma m_i r_i^2$$



Moment of inertia of a rigid body about an axis is given by $I = \int r^2\, dm$ where r is the perpendicular distance of a particle of mass dm of rigid body from the axis of rotation.

NOTE:

- MI is not constant for a body. It depends on the axis of rotation.
- MI depends on the mass of the body. The higher the mass, the higher is the MI.
- MI depends on the distribution of the mass about an axis. The farther the mass is distributed from the axis, the higher will be the MI.

  Moment of inertia does not change if the mass

  (a) is shifted parallel to the axis of the rotation.

  (b) is rotated with constant radius about axis of rotation.

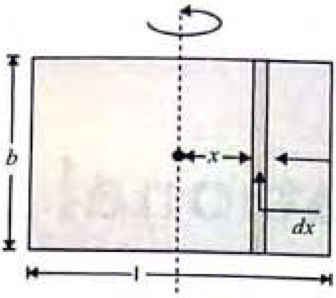
Moment of Inertia of a Uniform Rectangular Lamina

Length, breadth and mass of the lamina are l, b and M, respectively.

(a) Axis in the plane of the lamina passing through its centre and parallel to its breadth

Mass per unit area $= \dfrac{M}{lb}$

Consider a rectangular differential mass element parallel to the breadth at a distance 'x' from the axis of rotation (see figure).



Mass of the strip

$dm = \frac{M}{lb}(bdx) = \frac{M}{l}dx$

Since each particle lying on the differential strip is at the same perpendicular distance 'x' from the axis of rotation, hence the MI of the strip about the given axis is

$$dI = dm\, x^2 = \left(\frac{M}{l}dx\right)x^2$$

Total MI of the entire rectangular lamina can be obtained by integrating the above expression between the limits $-l/2$ to $+l/2$. Thus,

$$I = \int_{-l/2}^{+l/2}\left(\frac{M}{l}x^2\,dx\right) = \frac{M}{l}\left[\frac{x^3}{3}\right]_{-l/2}^{+l/2} = \frac{Ml^2}{12}$$

NOTE: The MI of a square lamina of mass M and side l, about the axes shown in figure are all equal.

$$I_{1,1} = I_{2,2} = I_{3,3} = I_{4,4} = \frac{Ml^2}{12}$$

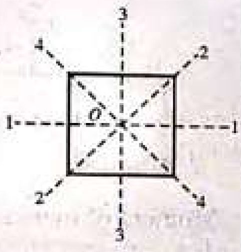


ILLUSTRATION 9.1 Find the moment of inertia of a circular disk or solid cylinder of radius R about the axis through the centre and perpendicular to the flat surface.

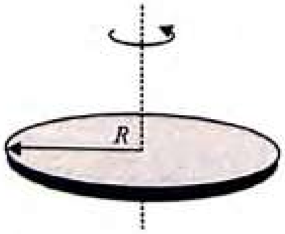
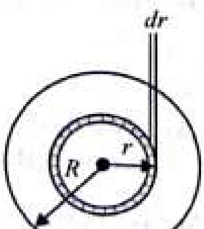


Solution. The figure shows that the appropriate mass element is a circular ring of radius r and width dr.

Its area is $dA = 2\pi r\,dr$ and its mass is $dm = \sigma dA$; where $\sigma = M/A$ is the real mass density.

The moment of inertia of this element is

$dI = dm\,r^2 = 2\pi\sigma r^3 dr$



For the whole body,

$$I = 2\pi\sigma\int_0^R r^3 dr = \frac{1}{2}\pi\sigma R^4$$

The mass of the whole disk or cylinder is

$$M = \sigma A = \sigma\pi R^2, \text{ and so } I = \frac{1}{2}MR^2$$

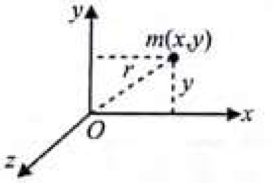
NOTE: The moment of inertia of a cylinder having the same mass and same radius as disc will also be same as MI is independent of the size of the object parallel to its axis of rotation.

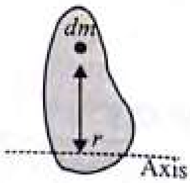
Perpendicular-Axis Theorem

Consider a particle of mass m (see figure) located on the x-y plane at (x, y).

$$I_x = my^2 \text{ and } I_y = mx^2$$

$$\Rightarrow \quad I_x + I_y = my^2 + mx^2 = m(x^2 + y^2) = mr^2 = I_z$$





The distance of the particle from the z-axis $= r$, $I_z = mr^2$.

Now consider a lamina object lying in the x-y plane. Consider a particle of mass dm at (x, y).

$$I_x = y^2\,dm \text{ and } I_y = \int x^2\,dm$$

$$I_x + I_y = \int y^2\,dm + \int x^2\,dm = \int(x^2+y^2)\,dm = \int r^2\,dm = I_z$$

$$I_z = I_x + I_y \qquad \text{(when object is in } x\text{-}y \text{ plane)}$$

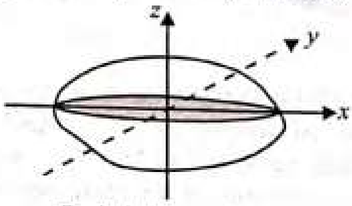
where I_z = moment of inertia of the body about z-axis

I_x = moment of inertia of the body about x-axis

I_y = moment of inertia of the body about y-axis

$I_y = I_x + I_z$ (when object is in x-z plane)

$I_x = I_y + I_z$ (when object is in y-z plane)



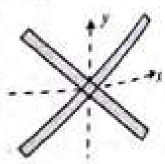
Body is in x-y plane

NOTE: The sum of moments of inertia of a laminar object about two mutually perpendicular axes lying in the plane of lamina is equal to the moment of inertia about an axis normal to the plane of the lamina and passing through the two perpendicular axes.

This theorem is applicable only for a laminar (thin sheet kind of) object.

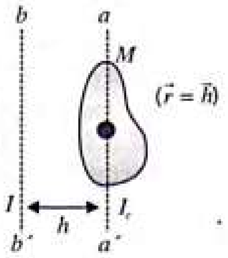
ILLUSTRATION 9.2 Two uniform identical rods each of mass M and length l are joined to form a cross as shown in the figure. Find the moment of inertia of the cross about a bisector shown by dotted lines in the figure.

Solution. Consider the line perpendicular to the plane of the figure through the centre of the cross. The moment of inertia of each rod about this line (say about z-axis) $I_z' = Ml^2/12$. Hence the moments of inertia of the cross $I_z = 2I_z' = Ml^2/6$. The moments of inertia of the cross about the two bisector are equal by symmetry



$I_X = I_Y$ according to the theorem of perpendicular axis, $I_Z = I_X + I_Y$ the moment of inertia of the cross about the bisector is $Ml^2/12$.

Parallel-Axis Theorem



In the figure, bb' is an axis parallel to aa' (an axis passing through centre of mass)

Moment of inertia of the body about centroidal axis (aa'), $I_c = mr^2$

Moment of inertia of the body about an axis parallel to the line bb',

$$I = mr^2 + mh^2$$

ILLUSTRATION 9.3 Find the moment of inertia of a solid cylinder of mass M and radius R about a line parallel to the axis of the cylinder and on the surface of the cylinder.

Solution. The moment of inertia of the cylinder about its axis is $\frac{MR^2}{2}$.

Using parallel axis theorem,

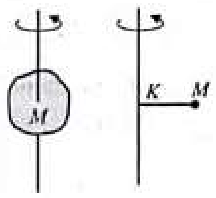
$$I = I_0 + MR^2 = \frac{MR^2}{2} + MR^2 = \frac{3}{2}MR^2$$

Similarly, the moment of inertia of a solid sphere about a tangent is

$$\frac{2}{5}MR^2 + MR^2 = \frac{7}{5}MR^2$$

NOTE:
- Theorem of parallel axes is applicable for any type of rigid body whether it is two dimensional or three dimensional, while the theorem of perpendicular axes is applicable for laminar type or two dimensional bodies only.
- In theorem of perpendicular axes, the point of intersection of the three axes (x, y and z) may be any point on the plane of the body (it may even lie outside the body). This point may or may not be the centre of the mass of the body.

RADIUS OF GYRATION



Radius of gyration (K) of a body about an axis is the effective distance from the axis where the whole mass can be assumed to be concentrated so that the moment of inertia remains the same (see figure). Thus,

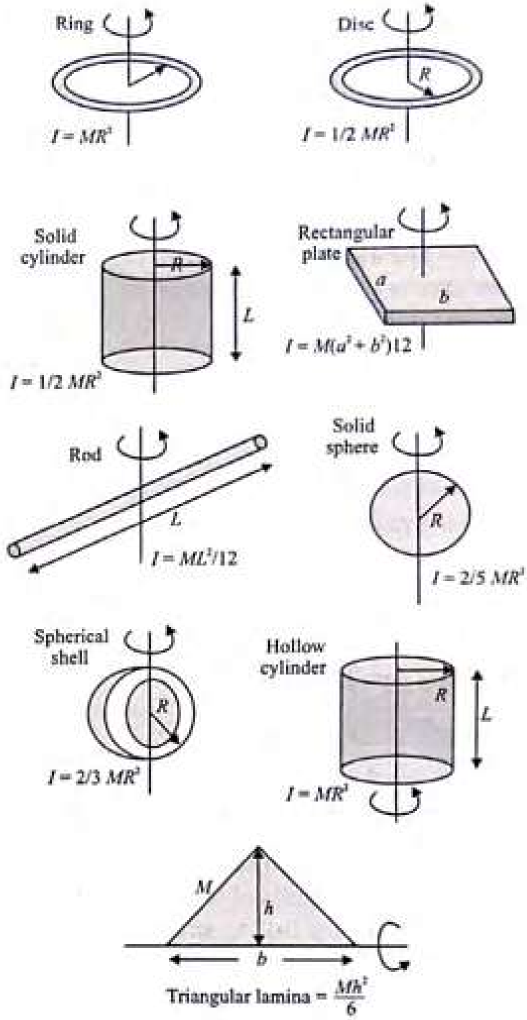
$$I = MK^2 \text{ or } K = \sqrt{\frac{I}{M}}$$

- Radius of gyration of a disc about an axis perpendicular to its plane and passing through its centre of mass is

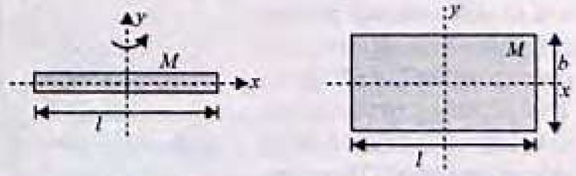
$$K = \sqrt{\frac{\frac{1}{2}MR^2}{M}} = \frac{R}{\sqrt{2}}$$

- Radius of gyration of a solid sphere, $K = \sqrt{\frac{2}{5}}R$
- Radius of gyration of a hollow sphere, $K = \sqrt{\frac{2}{3}}R$

Moment of Inertia of Some Important Cases



NOTE: As moment of inertia of a body having uniform mass distribution is independent of size of the body parallel to axis of rotation. Consider this case:



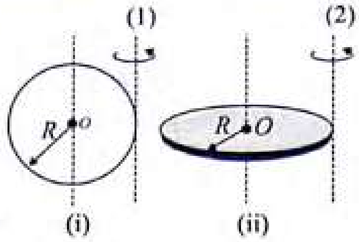
The moment of inertia of a rectangular plate about the y-axis will be same as the moment of inertia of the same mass of the rod about the y-axis. In both the cases $I_y = Ml^2/2$.

We can say directly the moment of inertia of the rectangular plate about x-axis, $Ix = Mb^2/12$.

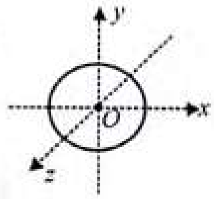
If we are asked to find moment of inertia of the plate about the z-axis, we can use perpendicular axis theorem, i.e.,

$$I_z = I_x + I_y = \frac{Mb^2}{12} + \frac{Ml^2}{12} = \frac{M}{12}(b^2 + l^2)$$

ILLUSTRATION 9.4 Find out the moment of inertia of a ring having uniform mass distribution of mass M and radius R about an axis which is tangent to the ring and (a) in the plane of the ring, (b) perpendicular to the plane of the ring.



Solution. The moment of inertia of a ring about an axis passing through centre and perpendicular to plain of ring is $I_z = MR^2$ because of symmetry we can say $I_x = I_y$ and using perpendicular axis theorem,



$$I_z = I_x + I_y \Rightarrow MR^2 = 2I_x$$

$$\Rightarrow \quad I_x = \frac{MR^2}{2} = I_0 \text{ [in Fig. (i)]}$$

For case (a): Using parallel axis theorem,

$$I_1 = I_o + MR^2 = \frac{MR^2}{2} + MR^2 = \frac{3}{2}MR^2$$

For case (b): Using parallel axis theorem,

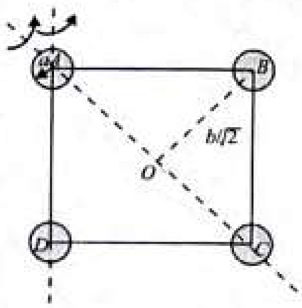
$$I_2 = I_z + MR^2 = MR^2 + MR^2 = 2MR^2$$

ILLUSTRATION 9.5 Four spheres, each of radius a and mass m, are placed with their centres on four corners of a square of side b. Calculate the moment of inertia of the arrangement about any (a) diagonal of the square and (b) any side of the square.

Solution.

(a) Moment of inertia of the arrangement about the diagonal AC:

The moment of inertia of each of spheres A and C about their common diameter $AC = (2/5)ma^2$. The moment of inertia of each of spheres B and D about an axis passing through their centres and parallel to AC is $(2/5)ma^2$. The distance between the axis and AC is $b/\sqrt{2}$, b being side of the square. Therefore, the moment of inertia of each spheres B and D about AC by the theorem of parallel axis is



$$\frac{2}{5}ma^2 + m\left(\frac{b}{\sqrt{2}}\right)^2 = \frac{2}{5}ma^2 + \frac{mb^2}{2}$$

Therefore, the moment of inertia of all the four spheres about diagonal AC is

$$I = 2\left(\frac{2}{5}ma^2\right) + 2\left[\frac{2}{5}ma^2 + \frac{mb^2}{2}\right]$$

(b) The moment of inertia of each of spheres A and D about side AD is $(2/5)\,ma^2$.

The moment of inertia of each of spheres B and C about AD is $(2/5)\,ma^2 + mb^2$.

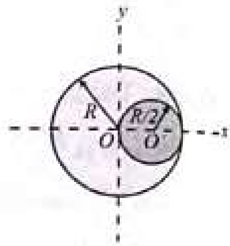
Therefore, the moment of inertia of the whole arrangement about side AD is

$$2\left[\frac{2}{5}ma^2 + \left(\frac{2}{5}ma^2 + mb^2\right)\right] = \frac{2m}{5}\,[4a^2 + 5b^2]$$

ILLUSTRATION 9.6 A circular hole of radius $R/2$ is cut from a circular disc of radius R. The disc lies in the xy-plane and its centre coincides with the origin. If the remaining mass of the disc is M, then

(a) determine the initial mass of the disc, and

(b) determine its moment of inertia about the z-axis.



Solution.

(a) Let σ be the surface mass density of the plate given by

$$\sigma = \frac{M}{\pi R^2 - \pi\left(\frac{R}{2}\right)^2} = \frac{4}{3}\frac{M}{\pi R^2}$$

Now, initial mass of the plate, $m_1 = \sigma\,(\pi R^2) = \frac{4}{3}M$

Mass of the plate removed, $m_2 = \sigma\left(\frac{\pi R^2}{4}\right) = \frac{M}{3}$

The given arrangement may be considered as a combination of a circular plate of mass $(4/3)\,M$ and circular plate of negative mass $(M/3)$.

The moment of inertia of the big disc of radius R and mass m_1 about O and parallel to the z-axis is

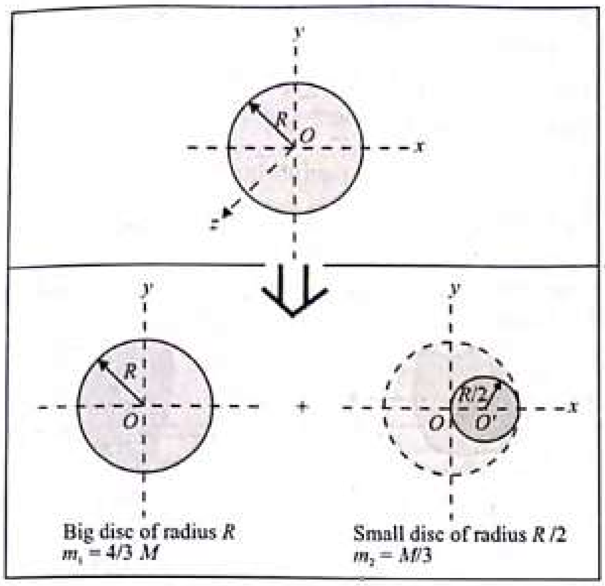
$$I_{O_1} = \frac{m_1R^2}{2}$$

The moment of inertia of the small disc of mass m_2 and radius $R/2$ about O' and parallel to z-axis

$$I_{O_1} = \frac{m_2(R/2)^2}{2} = \frac{m_2R^2}{8}$$

The moment of inertia of the small disc about O (using parallel axis theorem)

$$I_{O_2} = \frac{m_2R^2}{8} + \frac{m_2R^2}{4} = \frac{3m_2R^2}{8}$$



As the part of the disc of mass m_2 is removed from disc m_1, hence the net moment of inertia of structure is

$$I_O = I_{O_1} - I_{O_2}$$

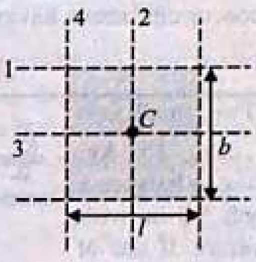
$$I_O = \frac{m_1 R^2}{2} - \frac{3 m_2 R^2}{8}$$

Substituting the values of m_1 and m_2, we get

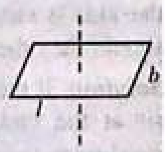
$$I_O = \frac{13}{24} MR^2$$

CONCEPT APPLICATION EXERCISE 9.1

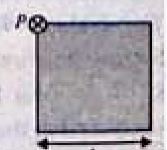
1. In the figure, find moment of inertia of a plate having mass M, length l and width b about axes 1, 2, 3 and 4. Assume that C is the centre and mass is uniformly distributed.



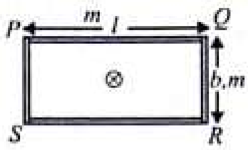
2. Find the moment of inertia of a uniform rectangular plate of mass M and edges of length 'l' and 'b' about its axis passing through the centre and perpendicular to it.



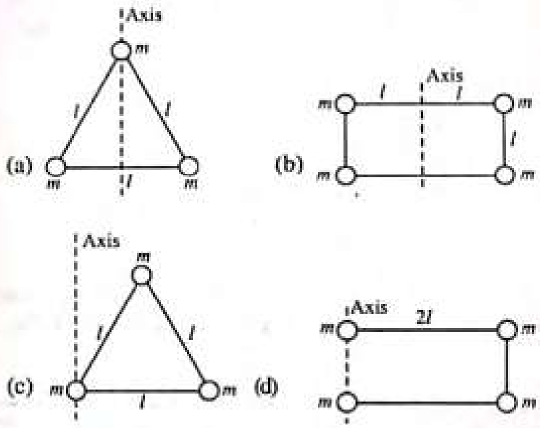
3. Find the moment of inertia of a uniform square plate of mass M and edge of length 'l' about its axis passing through P and perpendicular to it.



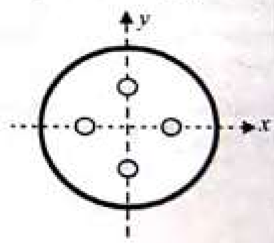
4. Calculate the moment of inertia of a rectangular frame formed by uniform rods having mass m each as shown in the figure about an axis passing through its centre and perpendicular to the plane of frame. Also find moment of inertia about an axis passing through PQ ?



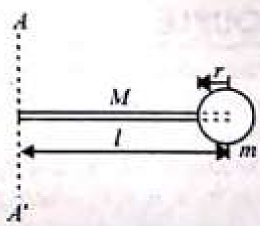
5. Calculate the moment of inertia of each particle in the figure about the indicated axis of rotation.



6. A uniform disc of mass m and radius R has an additional rim of mass m as well as four symmetrically placed masses, each of mass $m/4$, tied at positions $R/2$ from the centre as shown in the figure. What is the total moment of inertia of the disc about an axis perpendicular to the disc through its centre?



7. Find the moment of inertia of a spherical ball of mass m and radius r attached at the end of a straight rod of mass M and length l, if this system is free to rotate about an axis passing through the end of the rod (end of the rod opposite to sphere).



TORQUE

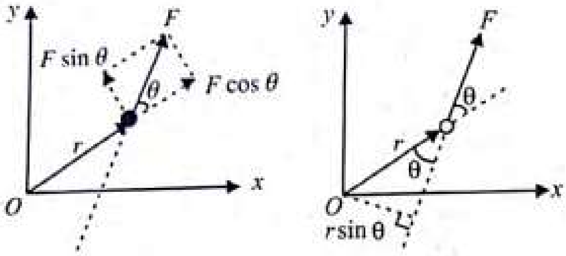
Force causes linear acceleration, whereas torque causes angular acceleration.

It is defined as the moment of force. In other words, the turning ability of a force about an axis is called its torque about that axis.

Consider force $\vec{F}$ which acts through a point whose position vector is r, as shown in the figure.

Its torque about the origin is defined as $\vec{\tau} = \vec{r} \times \vec{F}$.

The direction of the torque can be obtained from the right hand rule and its magnitude is given by $\tau = rF \sin\theta$, where θ is the angle between the vector r and F.



(a) (b)

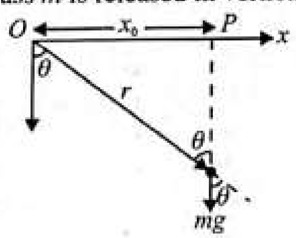
$$\tau = r(F \sin\theta) = rF_\perp$$

where $F_\perp$ is the component of F perpendicular to r.

$$\tau = (r \sin\theta)\,F = r_\perp F$$

where $r_\perp$ is the perpendicular distance from the origin to the line of action of the force. It is also called the lever arm.

ILLUSTRATION 9.7 A particle of mass m is released in vertical plane from a point P at $x = x_0$ on the x-axis. It falls vertically parallel to the y-axis. Find the torque τ acting on the particle at a time t about origin.



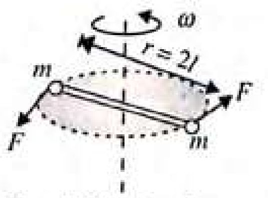
Solution. Torque is produced by the force of gravity.

$$\vec{\tau} = rF \sin\theta \quad \text{or} \quad \tau = r\,mg\,(x_0/r) = mgx_0\,\hat{k}$$

COUPLE

Two equal and opposite forces whose lines of action do not coincide make a couple

Moment of a couple is given by $\tau = r_\perp F$, where $r_\perp$ is the separation of the lines of action of the forces and F is the magnitude of either of the forces.



Two balls each of mass m are fixed at the ends of a rigid body of length $2\,l$.

EQUILIBRIUM OF RIGID BODIES

The conditions of equilibrium for a rigid body are different from that of a particle. Unlike particle such as bodies, rigid bodies have a tendency to rotate, therefore, one has to consider the rotational equilibrium also, in addition to the translational equilibrium.

The equations of equilibrium (in two dimensions) for a rigid body are stated as:

Translational equilibrium: $\sum \vec{F} = 0$

Rotational equilibrium: $\sum \vec{\tau}_c = 0$

Note that for rotational equilibrium of a rigid body, the net torque about its centre of mass must be zero.

Action of two forces on a particle and a rigid body is shown in Figs. (a) and (b).

A particle is in equilibrium under the action of two equal and opposite forces.

Equilibrium
$\Sigma F = 0$
$\Sigma \tau_c = 0$
(a)

No equilibrium
$\Sigma F = 0$
$\Sigma \tau_c \neq 0$
(b)

The body have both translational and rotational equilibria.

A rigid body may or may not be in equilibrium under the action of two equal and opposite forces.

The body is in translational equilibrium but not in rotational equilibrium.

Figures (a) and (b) show equilibrium of a rigid body under the action of three parallel or concurrent forces.

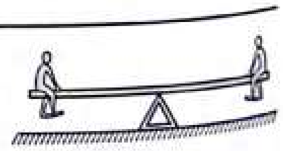
A rigid body may be in equilibrium under the action of three forces if their lines of action are parallel to each other.

Equilibrium
$\Sigma F = 0$
$\Sigma \tau_c = 0$
(a)

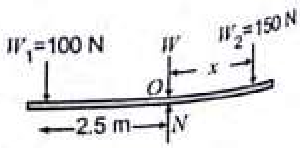
Equilibrium
$\Sigma F = 0$
$\Sigma \tau_c = 0$
(b)

A rigid body may be in equilibrium under the action of three concurrent forces (concurrent means having a common point of application).

ILLUSTRATION 9.8 Two small kids weighing 10 kg and 15 kg, respectively, are trying to balance a seesaw of total length 5.0 m, with the fulcrum at the centre. If one of the kids is sitting at an end, where should the other sit?



Solution. If the kid of mass 15 kg sit at the end, he will produce maximum torque about fulcrum. The sea saw will not be balance for any position of kid of mass 10 kg. It is clear that the 10 kg kid should sit at the end and the 15 kg kid should sit closer to the centre.



Suppose his distance from the centre is x. As the kids are in equilibrium, the normal force between a kid and the seesaw equals the weight of that kid. Considering the rotational equilibrium of the seesaw, the torque of the forces acting on it should add to zero. The forces are as follows:

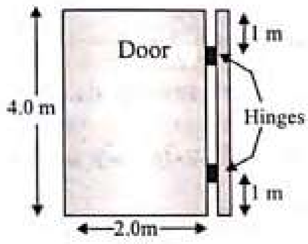
(a) $(15 \text{ kg}) g = 150$ N downwards by the 15 kg kid,
(b) $(10 \text{ kg}) g = 100$ N downwards by the 10 kg kid,
(c) weight of the seesaw, and
(d) the normal force by the fulcrum.

Taking torques about the fulcrum,

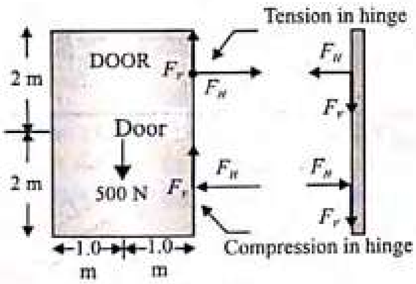
$$150 \times x = 100 \times 2.5 \quad \text{or} \quad x = 1.7 \text{ m}$$

ILLUSTRATION 9.9 The door of an almirah is 4 m high, 1 m wide and weighs 50 kg. The door is supported by two hinges situated at a distance of 1.0 m from the ends. If the magnitude of each forces exerted by the hinges on the door is equal, find this magnitude.

Solution.



(a)



(b) FBD

The free-body diagram of the door is shown in Fig. (b). The forces exerted on the hinges are equal in magnitude. The door is in equilibrium in horizontal as well as in vertical direction, i.e., the horizontal and vertical components of the forces will be equal. For vertical equilibrium of the door, we have

$$\Sigma F_v = 0;\ 2F_v = 500 \Rightarrow F_v = 250 \text{ N}$$

For rotational equilibrium of the door, we have $\Sigma \tau = 0$

Taking moment of all forces acting on the door about lower hinge (may be upper hinge or any other point), we get

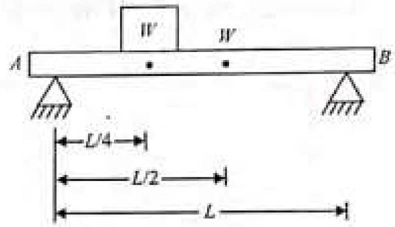
$$500 \times 1.0 - F_H \times 2 = 0 \text{ which gives } F_H = 250 \text{ N}$$

The force on the door exerted by either hinge, in magnitude, is

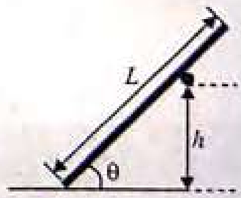
$$F = \sqrt{F_H^2 + F_v^2} = \sqrt{(250)^2 + (250)^2} = 250\sqrt{2} \text{ N}$$

CONCEPT APPLICATION EXERCISE 9.2

1. A uniform cube of side a and mass m rests on a rough horizontal table. A horizontal force F is applied normal to one of the faces at a point directly above the centre of the face, at a height $3a/4$ above the base. What is the minimum value of F for which the cube begins to tip about an edge?
2. A uniform rod is made to lean between a rough vertical wall and the ground. The coefficient of friction between the rod and the ground is μ_1 and between the rod and the wall is μ_2. Find the angle at which the rod can be leaned without slipping.
3. A beam of weight W supports a block of weight W. The length of the beam is L and weight is at a distance $L/4$ from the left end of the beam. The beam rests on two rigid supports at its ends. Find the reactions of the supports.



4. A uniform ladder of mass 10 kg leans against a smooth vertical wall making an angle of 53° with it. The other end rests on a rough horizontal floor. Find the normal force and the friction force that the floor exerts on the ladder.
5. A uniform ladder of length 10.0 m and mass 16.0 kg is resting against a vertical wall making an angle of 37° with it. The vertical wall is frictionless but the ground is rough. An electrician weighing 60.0 kg climbs up the ladder. If he stays on the ladder at a point 8.00 m from the lower end, what will be the normal force and the force of friction on the ladder by the ground? What should be the minimum coefficient of friction for the electrician to work safely?
6. A uniform rod of length L rests against a smooth roller as shown in the figure. Find the friction coefficient between the ground and the lower end if the minimum angle that the rod can make with the horizontal is θ.



ANALOGUE OF NEWTON'S SECOND LAW OF MOTION FOR PURE ROTATION

Equation analogous to force equation $\Sigma \vec{F} = M\vec{a}_{CM}$ for pure rotation is $\tau = I\alpha$, where τ is the torque acting on the body and α is its angular acceleration about the axis of rotation provided moment of inertial (I) of the rigid body about the axis of

rotation remains constant throughout the motion. Such torque is a three-dimensional vector quantity. In the problems we encounter at this level, rotation takes place in two dimensions and τ and α are taken about the axis of rotation in the third dimension (normal to the plane of rotation) and the torque equation is written as

$$\tau_{\text{about the axis of rotation}} = I_{\text{about the axis of rotation}} \times \alpha_{\text{about the axis of rotation in the sense of } \tau}$$

or $\tau = I\alpha$

The above equation is called 'torque equation'.
The torque equation is, however, more complex than the force equation. Why? It is because,

- Force is an absolute value, whereas torque depends on the point about which it is being calculated.
- Mass is an absolute value for a body, whereas MI can have infinite values for a body. MI is defined only for a particular axis of the body.

Remember the following points about the torque equation:

Torque equation can be applied only about two points in a body. These are as follows:

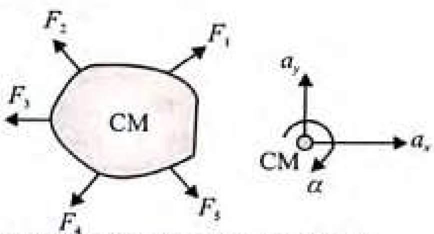
- Centre of mass.
- Point which has zero velocity/acceleration. This point is commonly referred to as the axis of rotation or instantaneous axis of rotation.

Now, remember that the axis of rotation passes through the point and is perpendicular to the surface (valid only for two dimensional bodies).

APPLICATION OF TORQUE EQUATION AND EQUATION OF MOTION COMBINED

If the vector sum of all the forces acting on a rigid body is not equal to zero, then its centre of mass has a linear acceleration. That is

If $\sum F_{\text{net}} \neq 0$, then $a_c \neq 0$



Two dimensional motion of a rigid body

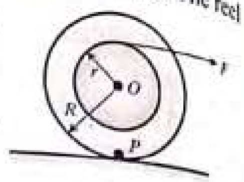
If the vector sum of all the torques about the centre of mass is not equal to zero, then the body rotate about its centre of mass. That is,

If $\sum \tau_c \neq 0$ then $\alpha \neq 0$

According to Newton's second law, for two dimensional motion of a rigid body as shown in the figure, we can state that

- Translational motion: $\sum F_x = ma_x$, $\sum F_y = ma_y$
- Rotational motion: $\sum \tau_c = I_c\alpha$

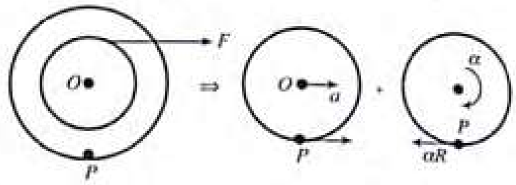
ILLUSTRATION 9.10 A cotton reel of mass m and moment of inertia I is kept at rest on a smooth horizontal surface. The reel has inner and outer radius r and R respectively. A horizontal force F starts acting as shown in figure. Find the



(a) acceleration of the centre of mass of reel.
(b) angular acceleration of the reel
(c) net acceleration of point of contact.

Solution.

(a) From force equation $F = ma \Rightarrow \quad a = \dfrac{F}{m}$ (i)



(b) We can apply torque equation about centre of mass.
From torque equation

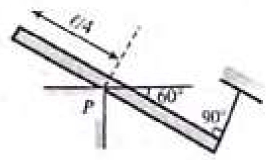
$$Fr = I\alpha \Rightarrow \alpha = \frac{Fr}{I} \quad \text{(ii)}$$

(c) acceleration of 'P' : $\vec{a}_P = \vec{a}_{P,O} + \vec{a}_O$

$$\Rightarrow \quad a_P = (-\alpha R) + a = a - \alpha R = \left(a - \frac{Fr}{I}\right)R$$

Hence acceleration of point of contact will be $a - \left(\dfrac{Fr}{I}\right)R$ in forward direction

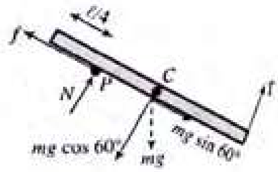
ILLUSTRATION 9.11 A uniform rod of mass m and length l is in equilibrium under the action of constraint forces, gravity and tension in the string. Find the



(a) frictional force acting on the rod.
(b) tension in the string.
(c) normal reaction on the rod.
Now, the string is cut. Find the
(d) angular acceleration of the rod just after the string is cut.
(e) normal reaction on the rod just after the string is cut.

Solution.

(a) Resolving the forces parallel and perpendicular to rod.
Along the length of rod .



$$f = mg\sin 60° = \frac{\sqrt{3}mg}{2}$$

Hence friction force action on rod at support P will be $mg/2$.

(b) for finding tension we can take torque about support P.

$$T\left(\frac{3}{4}l\right) = mg\left(\frac{l}{4}\right) \text{ or } T = \frac{mg}{3}$$

(c) Just before cutting the string the rod is at equilibrium. Considering the forces perpendicular to rod length.

$$N + T = mg\cos 60^\circ \Rightarrow N = \frac{mg}{2} - \frac{mg}{3} = \frac{mg}{6}$$

(d) Just after cutting the string the equilibrium of the rod will disturbed. The rod will have angular acceleration. As the rod does not slip point P will be at rest at the time just after cutting the string.
We can apply torque equation about P: $\tau_P = I_P\alpha$

$$(mg\cos 60^\circ).\frac{l}{4} = \left(\frac{ml^2}{12} + m\left(\frac{l}{4}\right)^2\right)\alpha \Rightarrow \alpha = \frac{6g}{7l}$$

(e) If we apply torque equation about centre of mass

$$N \cdot \frac{l}{4} = \left(\frac{ml^2}{12}\right)\alpha$$

$$N.\frac{l}{4} = \left(\frac{ml^2}{12}\right)\left(\frac{6g}{7l}\right) \Rightarrow N = \frac{2}{7}mg$$

Illustration 9.12 A block of mass m is attached at the end of an inextensible string which is wound over a rough pulley of mass M and radius R [Fig. (a)]. Assume the string does not slide over the pulley. Find the acceleration of the block when released.

Solution. This problem is different from the problems which we have solved in laws of motion where we assumed the string is sliding over the pulley without friction. Here, the pulley is rough and string is not sliding. We will go step by step to analyse the situation.

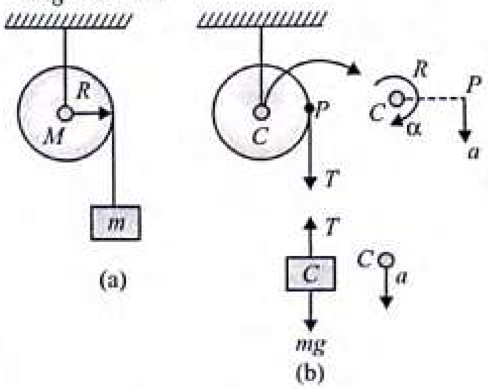
Step I

- We will draw the free-body diagrams of the given situation as in Fig. (b).

Step II

- We should apply Newton's second law for each assumed acceleration.
Equation of motion of the block:

$$mg - T = ma \qquad \text{(i)}$$



Step III

- Formulate the constraint relations, if required.
Constraint relation: $a = \alpha R$ (ii)

Step IV

- Solve the equation to get the desired unknown.
Torque equation for the pulley: $\tau_c = I_c\alpha$

$$TR = \left(\frac{MR^2}{2}\right)\alpha \Rightarrow \alpha = \frac{2T}{MR} \qquad \text{(iii)}$$

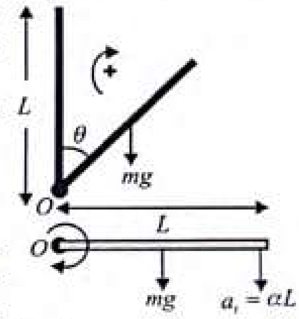
The acceleration of the block is a downwards; hence, acceleration of the point P will also be a downwards.
After solving Eqs. (i), (ii) and (iii), we get

$$a = \frac{2mg}{2m + M}$$

Illustration 9.13 A uniform rod of length L and mass M is pivoted freely at one end and placed in vertical position.
(a) What is the angular acceleration of the rod when it is at an angle θ with the vertical?
(b) What is the tangential linear acceleration of the free end when the rod is horizontal?

Solution. Figure shows the rod at an angle θ to the vertical. If we take torques about the pivot we need not be concerned with the force due to the pivot.
The torque due to the weight about O,

$$\tau_{mg} = \frac{mgL}{2}\sin\theta$$



Using torque equation about O. Here we apply torque equation about fixed axis passing through O.
We can apply torque equation about fixed axis or about centre of mass only.

(a) $\tau = I\alpha \Rightarrow \frac{mgL}{2}\sin\theta = \frac{ML^2}{3}\alpha$

Thus, $\alpha = \frac{3g\sin\theta}{2L}$

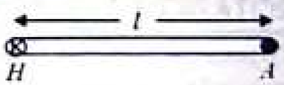
When the rod is horizontal, $\theta = \frac{\pi}{2}$ and $\alpha = \frac{3g}{2L}$

(b) The tangential linear acceleration of the free end is

$$a_t = \alpha L = \frac{3g}{2}$$

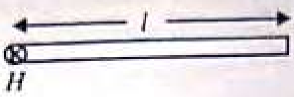
Concept Application Exercise 9.3

1. A uniform rod of mass m and length l can rotate in a vertical plane about a smooth horizontal axis hinged at point H.



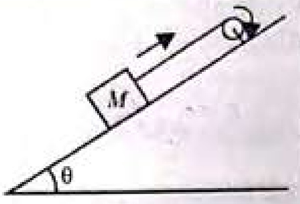
(a) Find angular acceleration α of the rod just after it is released from initial horizontal position from rest?
(b) Calculate the acceleration (tangential and radial) of point A at this moment.

2. A uniform rod of mass m and length l can rotate in a vertical plane about a smooth horizontal axis hinged at point H.

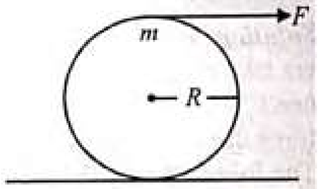


Find the force exerted by the hinge just after the rod is released from rest, from an initial horizontal position?

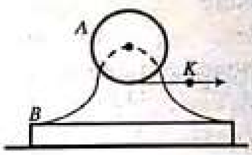
3. A wheel of radius r and moment of inertia I about its axis is fixed at the top of an inclined plane of inclination θ as shown in the figure. A string is wrapped around the wheel and its free end supports a block of mass M which can slide on the plane. Initially, the wheel is rotating at a speed ω in a direction such that the block slides up the plane. How far will the block move before stopping?



4. A cotton reel of mass m, radius R and moment of inertia I is kept on a smooth horizontal surface. If the string is pulled horizontally by a force F, find the (i) acceleration of CM, (ii) angular acceleration of the cotton reel.



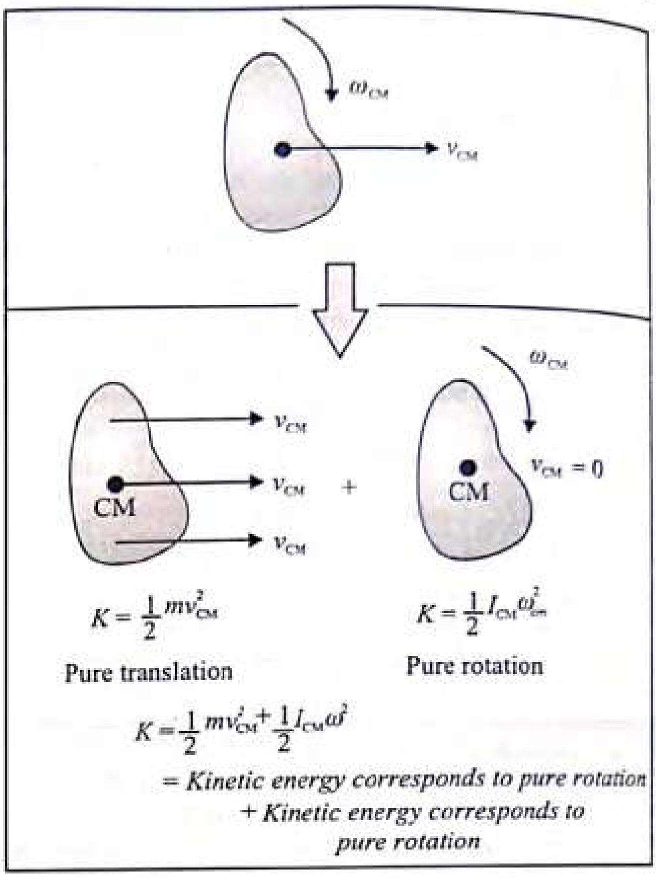
5. A uniform solid cylinder A of mass m_1 can freely rotate about a horizontal axis fixed to a mount of mass m_2. A constant horizontal force F is applied to the end K of a light thread tightly wound on the cylinder. The friction between the mount and the supporting horizontal plane is assumed to be absent. Find the acceleration of the point K.



6. For what value of x, the point P on the rod of length $l = 6$ m has zero acceleration if a force F is applied at the end of rod as shown.

KINETIC ENERGY OF A BODY IN COMBINED ROTATION AND TRANSLATION

Consider a body in combined translational and rotational motion in the lab frame. Suppose in the frame of the centre of mass, the body is making a pure rotation with an angular velocity ω. The centre of mass itself is moving in the lab frame at a velocity $\vec{v}_0$.



NOTE:

- **KE for pure translation:** $K = \dfrac{mv_C^2}{2}$

  As a perfectly translating body has KE formula identical to that of a point mass, we can say that a translating body behaves as a point mass.

- **KE for fixed axis rotation:** $K = \dfrac{1}{2}I_P\omega^2$

  I_P = moment of inertia of body about fixed axis

- **Kinetic energy for combined motion:** $K = \dfrac{m}{2}v_C^2 + \dfrac{1}{2}I_C\omega^2$

  The first term signifies the translational KE of the rigid body which can be understood as the KE of the centre of mass of the body. The second term gives the KE of rotational of the body about the centre of mass. Hence, we can call the term $\frac{1}{2}I_C\omega^2$ as rotational kinetic energy of the rigid body.

  The above formula informs us that, The KE of the centre of mass plus KE about the KE about the CM of a rigid body (or any system of group of particles) gives the total KE of the body:

  $$K_{trans} = \frac{1}{2}Mv_C^2 \text{ and } K_{rot} = \frac{1}{2}I_C\omega^2$$

- If a body is rotating about a fixed axis and spinning (or rotating) about it own axis we write the total kinetic energy of the body as

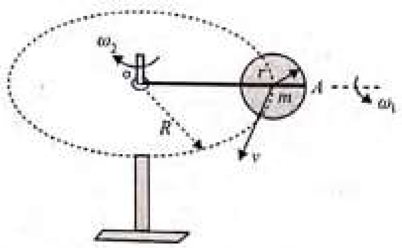
  $$K_{total} = K_{orbital} + K_{spin}$$

ILLUSTRATION 9.14 A uniform sphere of mass m and radius r rolls without sliding over a horizontal plane, rotating about a horizontal axle OA. In the process, the centre of the sphere moves with a velocity v along a circle of radius R. Find the kinetic energy of the sphere.

Solution. Here the motion of the body is orbital and spin combined. The sphere is spining about a horizontal axis and orbiting about a vertical axis.

We write total kinetic energy of the sphere, i.e.,

$$\text{KE} = K_{\text{orbital}} + K_{\text{spin}}$$



The kinetic energy of the sphere due to its rotation about its own axis and its motion along circular path with velocity v.

$$\text{KE} = \frac{1}{2}I_1\omega_1^2 + \frac{1}{2}I_2\omega_2^2$$

where $I_1 = \frac{2}{5}mr^2$ and $I_2 = \left(\frac{2}{5}mr^2 + mR^2\right)$

$$\omega_1 = \frac{v}{r} \text{ and } \omega_2 = \frac{v}{R}$$

Substituting these values in the above equation, we get

$$\text{KE} = \frac{7mv^2}{10}\left[1 + \frac{2r^2}{7R^2}\right]$$

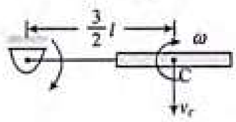
ILLUSTRATION 9.15 A rod of mass m and length l is connected with a light rod of length l. The composite rod is made to rotate with angular velocity ω as shown in the figure. Find the

(a) translational kinetic energy.

(b) rotational kinetic energy.

(c) total kinetic energy of rod.

Solution.



(a) Translational kinetic energy of rod,

$$K_{\text{translational}} = \frac{1}{2}mv_c^2$$

Velocity of centre of mass $v_c = \omega\left(\frac{3}{2}l\right)$

$$\text{Hence } K_{\text{translational}} = \frac{1}{2}m\left[\frac{3\omega l}{2}\right]^2 = \frac{9}{8}m\omega^2 l^2$$

(b) Rotational kinetic energy of rod,

$$K_{\text{rotational}} = \frac{1}{2}I_c\omega^2 = \frac{1}{2}\left[\frac{ml^2}{12}\right]\omega^2 = \frac{1}{24}m\omega^2 l^2$$

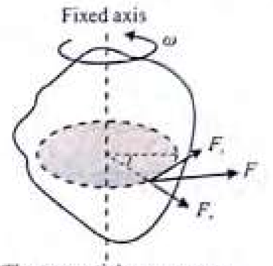
(c) Total kinetic energy

$$K_{\text{total}} = K_{\text{translational}} + K_{\text{rotational}}$$

$$= \frac{9}{8}m\omega^2 l^2 + \frac{1}{24}m\omega^2 l^2 = \frac{7}{6}m\omega^2 l^2$$

ROTATIONAL WORK AND POWER

Figure shows a rigid body rotating about a fixed axis. It is acted on by an external force F that has a radial component F_r and a tangential component F_t. In an infinitesimal time interval dt, the point of application of force moves in a circular arc of length $r = d\theta$. Therefore, the work done is



The tangential component of the force does rotational work

$$dW_{\text{rot}} = F_t\,(rd\theta) = (F_t r)d\theta = \tau d\theta$$

For a finite angular displacement, $W_{\text{rot}} = \int_{\theta_i}^{\theta_f} \tau d\theta$

By definition, the instantaneous power is defined as

$$P = \frac{dW}{dt} = \tau\frac{d\theta}{dt} \Rightarrow P = \tau\omega$$

The rotational analogue of work–kinetic energy theorem may be stated as

$$W_{\text{rot}} = \Delta K_{\text{rot}} = K_f - K_i \quad \text{or} \quad W_{\text{rot}} = \frac{1}{2}I\omega_f^2 - \frac{1}{2}I\omega_i^2$$

NOTE: The work done by a torque on a rigid body rotating about a fixed axis produces a change in its rotational kinetic energy.

$$W_{\text{rot}} = \int \tau\, d\theta;\ W_{\text{trans}} = \int F dx$$

Power imparted by torque in rotation $P_{\text{rot}} = \tau\omega$; which is equivalent to expression for power in translation motion $P_{\text{trans}} = Fv$.

ILLUSTRATION 9.16 Calculate the torque developed by an airplane engine whose output is 2000 HP at an angular velocity of 2400 rev/min.

Solution. $\omega = 2\pi\,(2400/60) = 80\pi$ rad/s

Work done by torque = (Torque) × (Angular displacement)

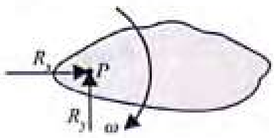
Power = Work done per sec = $\tau\dfrac{\Delta\theta}{\Delta t}$

Power = $\tau\omega \Rightarrow \tau = \dfrac{2000 \times 746}{80\pi} = 5937$ Nm

CONSERVATION OF MECHANICAL ENERGY

When a rigid body moves, the constraint forces are reactions at the pivot. The normal reaction sometimes does not perform work if the point of application of the forces does not move.

For instance, when a rigid body rotates about a fixed axis, the reaction forces R_x and R_y do not perform work.



If a rigid body does not experience any non-conservative force or even though a non-conservative force like force of static friction acts, if it does not perform any work (as described in pure rolling etc), the work–energy equation assumes the form $W_{cons} = \Delta K$.

Since conservative forces perform work at the expense of their potential enegy, we can write $W_{cons} = \Delta U$.

Then, we have $-\Delta U = \Delta K$. This gives $\Delta U + \Delta K = 0$.

WORK–ENERGY THEOREM

In an inertial frame, the work–energy theorem may be stated as

$$W_C + W_{NC} + W_{oth} = \Delta K$$

$$W_{NC} + W_{oth} = \Delta K + \Delta U = \Delta E$$

where W_C is the work done by conservative forces, W_{NC} is the work done by non-conservative forces, W_{oth} is the work done by all other forces which are not included in the above two categories.

NOTE:

- Each term of work includes both the translational and rotational work.
- The kinetic energy also includes both the translational and rotational kinetic energies.

ILLUSTRATION 9.17 The]top in the figure has a moment of inertia equal to 4.00 × 10^{-4} kgm^2 and is initially at rest. It is free to rotate about the stationary axis AA'. A string wrapped around a peg along the axis of the top is pulled in such a manner as to maintain a constant tension of 5.57 N. If the string does not slip while it is unwound from the peg, what is the angular speed of the top after 80.0 cm of string has been pulled off the peg?

Solution. Work done = $F\Delta r$ = (5.57 N) (0.800 m) = 4.46 J

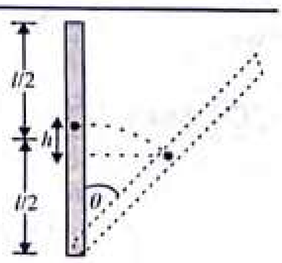
and work = $\Delta K = \frac{1}{2}I\omega_f^2 - \frac{1}{2}I\omega_i^2$

(The last term is zero because the top starts from rest.)

Thus, $4.46\text{ J} = \frac{1}{2}(4.00\times10^{-4}\,kg\times m^2)\omega_f^2$ and from this,

ω_f = 149 rad/s.

ILLUSTRATION 9.18 A rod of length l is pivoted about a horizontal, frictionless pin through one end. The rod is released from rest in a vertical position. Find the velocity of the CM of the rod when the rod is inclined at an angle θ from the vertical.



Solution. The fall in position of the CM of the rod, $h = \frac{l}{2}(1 - \cos\theta)$.

In the process, decrease in PE is equal to increase in rotational KE of the rod, so $mgh = \frac{1}{2}I\omega^2$

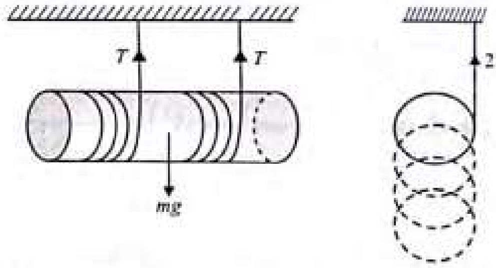
or $\quad mg\frac{l}{2}(1 - \cos\theta) = \frac{1}{2}\left(\frac{ml^2}{3}\right)\omega^2$

$\therefore \quad \omega = \sqrt{\frac{3g}{l}(1 - \cos\theta)}$

The velocity of the CM of the rod, $V_{CM} = \omega r$ is

$$\sqrt{\frac{3g}{l}(1 - \cos\theta)} \times \frac{l}{2} = \sqrt{\frac{3gl(1 - \cos\theta)}{4}}$$

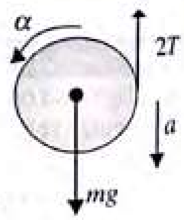
ILLUSTRATION 9.19 A solid cylinder of mass m = 4 kg and radius R = 10 cm has two ropes wrapped around it, one near each end. The cylinder is held horizontally by fixing the two free ends of the cords to the hooks on the ceiling such that both the cords are exactly vertical. The cylinder is released to fall under gravity. Find the linear acceleration of the cylinder.



Solution. **Method 1: Force/Torque Method:**

Let a = linear acceleration and α = angular acceleration of the cylinder.

For the linear motion of the cylinder: $mg - 2T = ma$



For the rotational motion: Net torque = $I\alpha$

$$2TR = (1/2\, mR^2)\alpha$$

Also, the linear acceleration of the cylinder is the same as the tangential acceleration of any point on its surface,

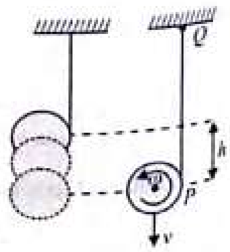
$$a = R\alpha$$

Combining the three equations, we get

$$mg = ma + \frac{m}{2}a \Rightarrow a = \frac{2}{3}g$$

Method 2: Energy Method

The motion of the cylinder is rotational and translational combined. Using conservation of mechanical energy.



$\Delta K + \Delta U = 0$

orLoss in PE = gain in KE

$$mgh = \frac{1}{2}mv^2 + \frac{1}{2}I\omega^2 \qquad \text{(i)}$$

Constraint relation:

Velocity of point P, $v_P = 0 = v - \omega R$

$$\omega = \frac{v}{R} \quad \text{(ii)}$$

From Eqs. (i) and (ii),

$$mgh = \frac{1}{2}mv^2 + \frac{1}{2}\left(\frac{mR}{2}\right)\left(\frac{v}{R}\right)^2 = \frac{m}{2}\left(v^2 + \frac{v^2}{2}\right)$$

$$2gh = \frac{3}{2}v^2 \Rightarrow v^2 = \frac{4}{3}gh \quad \text{(iii)}$$

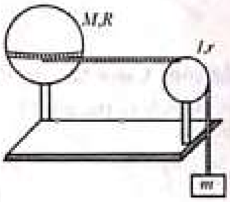
Differentiating Eq. (iii) with respect to time, we get

$$2v\frac{dv}{dt} = \frac{4}{3}g\frac{dh}{dt}$$

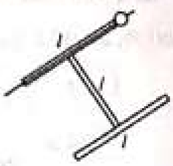
$$2va = \frac{4}{3}gv \Rightarrow a = \frac{2}{3}g$$

CONCEPT APPLICATION EXERCISE 9.4

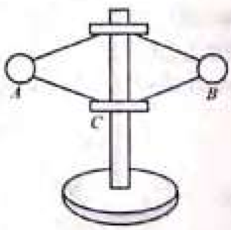
1. A uniform spherical shell of mass M and radius R rotates about a vertical axis on frictionless bearing. A massless cord passes around the equator of the shell, over a pulley of rotational inertia I and radius r and is attached to a small object of mass m that is otherwise free to fall under the influence of gravity. There is no friction of pulley's axle; the cord does not slip on the pulley. What is the speed of the object after it has fallen a distance h from rest? Use work–energy considerations.



2. A uniform rod of mass m and length l is kept vertical with the lower end clamped. It is slightly pushed to let it fall down under gravity. Find its angular speed when the rod is passing through its lowest position. Neglect any friction at the clamp. What will be the linear speed of the free end at this instant?
3. A rigid body is made of three identical thin rods, each with length l, fastened together in the form of letter H. The body is free to rotate about a horizontal axis that runs along the length of one of the arms of H. The body is allowed to fall from rest from a position in which the plane of the H is horizontal. What is the angular speed of the body when the plane of H is vertical?



4. The steel balls A and B have a mass of 500 g each and are rotating about the vertical axis with an angular velocity of 4 rad/s at a distance of 15 CM from the axis. Collar C is now forced down until the balls are at a distance of 5 CM from the axis. How much work must be done to move the collar down?



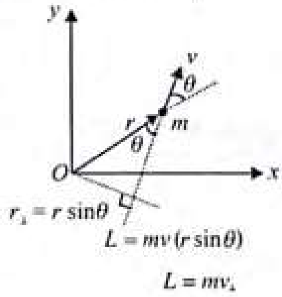
5. A uniform rod smoothly pivoted at one of its ends is released from rest. If it swings in vertical plane, find the maximum speed of the end P of the rod.

ANGULAR MOMENTUM: ROTATIONAL ANALOGUE OF MOMENTUM

The angular momentum of a moving particle about a point is defined as

$$\vec{L} = \vec{r} \times \vec{p} \quad \text{(i)}$$

where $\vec{p}$ is the linear momentum of particle and $\vec{r}$ is its position vector from the point. Regarding angular momentum, it is worth nothing that it is an axial vector (i.e., always perpendicular to the plane of motion) having the dimensions $[ML^2T^{-1}]$.



As torque $(= \vec{r} \times \vec{F})$ is defined as the 'moment of force', angular momentum is also referred sometimes as 'moment of linear momentum'.

For a particle of mass m moving with a velocity $\vec{v}$, the angular momentum $\vec{L}$ about the origin O is defined as

$$\vec{L} = \vec{r} \times m\vec{v}$$

The direction of L vector is given by the right hand rule, and the magnitude is given by

$$L = (mvr\sin\theta) = m(v\sin\theta)r$$
$$= (mv_\perp).\ r \text{ where } v_\perp = v\sin\theta$$

Alternatively, the above expression may be written as

$$L = mv\,(r\sin\theta) = mvr_\perp, \text{ where } r_\perp = r\sin\theta$$

NOTE: If a body is rotating about a fixed axis, we can write angular momentum of the body $L = I\omega$

I = Moment of inertia, about fixed axis

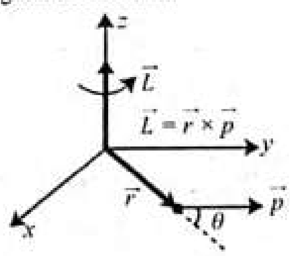
ω = angular velocity of rotation

NOTE: That the above expression is analogous to $p = mv$

$I \Rightarrow m,\ \omega \Rightarrow v,\ L \Rightarrow p$

NOTE:

- Direction of angular momentum.



- We define angular momentum even if the particle is not moving in a circular path. Even a particle moving in a straight line has angular momentum about any axis displaced from the path of the particle.

For rotation about an axis of symmetry, $\vec{\omega}$ and $\vec{L}$ are parallel and along the axis, respectively. The directions of both vectors are given by the right hand rule.

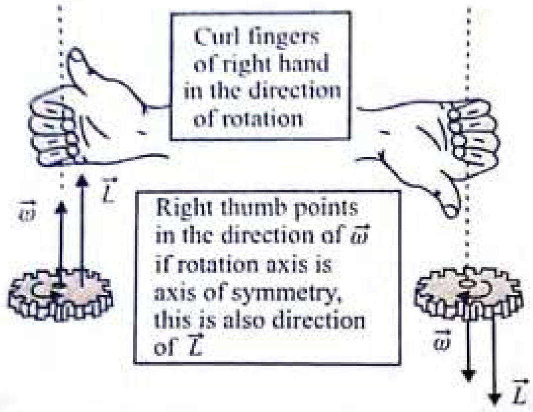


ILLUSTRATION 9.20 A particle of mass m is moving along the line $y = b$, $z = 0$ with constant speed v. Find the angular momentum of the particle about the origin.

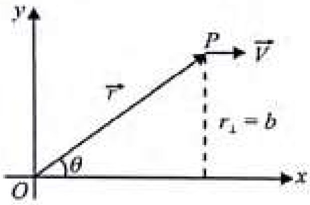
Solution. $|\vec{L}| = mvr \sin\theta = mvr_{\perp}\ mvb$

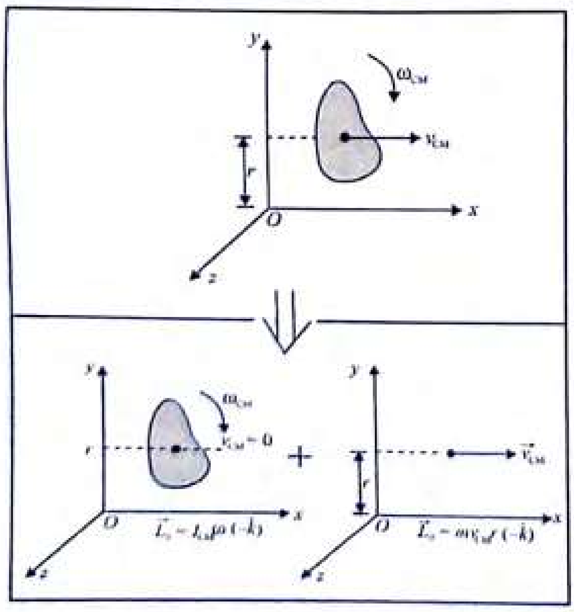
$\therefore \quad |\vec{L}| =$ constant as m, v and b all are constants.

Direction of $\vec{r} \times \vec{v}$ also remains the same. Therefore, angular momentum of the particle about the origin remains constant with due course of time.



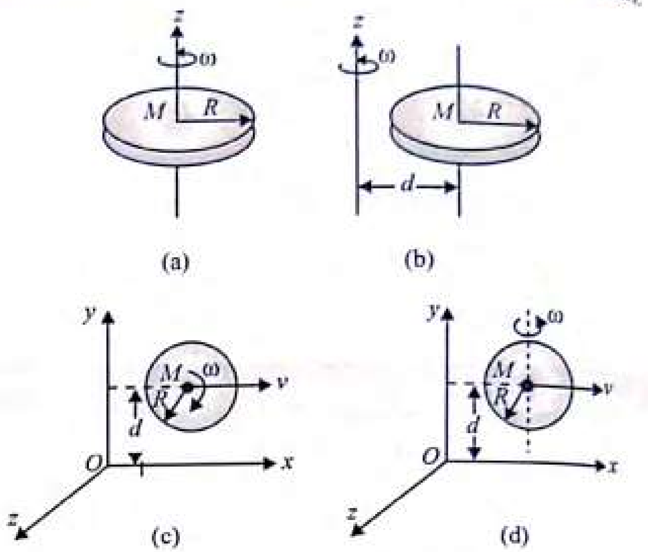
NOTE: In this problem, $|\vec{r}|$ is increasing, θ is decreasing but $r \sin\theta$, i.e., b remains constant. Hence, the angular momentum remains constant.

ANGULAR MOMENTUM OF A RIGID BODY DUE TO TRANSLATION AND ROTATION BOTH



$\vec{L} = I_{CM}\omega(-k) + mv_{CM}r(-k)$

ILLUSTRATION 9.21 Find the angular momentum of a disc about the axis shown in the figure in the following situations.



Solution. **Case (a):** In this case the disc is rotating about fixed axis which is parallel to the z-axis.

Hence, $\vec{L} = I_z(\hat{k}) = \left(\dfrac{MR^2}{2}\right)\omega(\hat{k})$

Direction can be determined using right hand rule.

Case (b): In this case also the disc rotates about fixed axis. We can write angular momentum for this situation.

$$\vec{L} = I_z\omega(\hat{k})$$

Using parallel axis we can find the value of $I_z = \dfrac{MR^2}{2} + Md^2$

Hence, $\vec{L} = \left(\dfrac{MR^2}{2} + Md^2\right)\omega(\hat{k})$

Case (c): In this case the disc is rotating about an axis parallel to the z-axis and centre of mass of disc is also translating.

Hence, angular momentum.

$$\vec{L} = I_{cm}\vec{\omega} + \vec{r} \times m\vec{v}$$

$$= \frac{MR^2}{2}\omega(-\hat{k}) + Mvd(-\hat{k})$$

$$= \left(\frac{MR^2}{2}\omega + Mvd\right)(-\hat{k})$$

Case (d): In this case also the disc is rotating about an axis passing through it centre and parallel to y-axis and centre of mass of disc is translating with velocity v parallel to x-axis.

$$\vec{L} = I_{CM}\omega(\hat{j}) + Mvd(\hat{k})$$

Here $\quad I_{CM} = \dfrac{MR^2}{4}$

Hence, $\quad \vec{L} = \dfrac{MR^2}{4}\omega(\hat{j}) + Mvd(\hat{k})$

LAW OF CONSERVATION OF ANGULAR MOMENTUM

In case of translation motion, we define force as $\vec{F} = \frac{d\vec{p}}{dt}$.

For rotational motion, we define torque.

$$\vec{\tau} = \frac{d\vec{L}}{dt}\left[\equiv \frac{d\vec{p}}{dt} = \vec{F}\right]$$

So if the net torque on a particle (or system) is zero; $\frac{d\vec{L}}{dt} = 0$,

i.e., $\vec{L}$ = constant.

Therefore, angular momentum of a system (may be particle or body) remains constant if the resultant torque acting on it is zero. This principle is called 'law of conservation of angular momentum'.

For a system of particle angular momentum,

$$\vec{L} \Rightarrow \vec{L}_1 + \vec{L}_2 + \cdots$$

Hence, when the total angular momentum is conserved,

$$\vec{L} \Rightarrow \vec{L}_1 + \vec{L}_2 + \cdots = \text{constant}$$

This shows that the angular momentum of an individual particle may change, but their sum remains constant in the absence of an external torque.

ANGULAR IMPULSE

The sum of torques of all external forces acting on a system of particles (or rigid body) about any fixed point is equal to the rate of change in angular momentum about the point.

Since $\vec{\tau} = \frac{d\vec{L}}{dt} \Rightarrow d\vec{L} = \vec{\tau}\, dt$

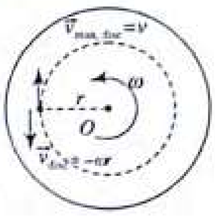
The change in angular momentum of a rigid body during a time interval Δt is given by

$$\int d\vec{L} = \int \vec{\tau}\, dt \Rightarrow \Delta\vec{L} = \int_{t_1}^{t_2} \vec{\tau}\, dt$$

Hence, the angular impulse $\Delta\vec{L} = \int_{t_1}^{t_2} \vec{\tau}\, dt$.

ILLUSTRATION 9.22 A man of mass m stands on a horizontal platform in the shape of a disc of mass M and radius R, pivoted on a vertical axis through its centre about which it can freely rotate. The man starts to move around the centre of the disc in a circle of radius r with a velocity v relative to the disc. Calculate the angular velocity of the disc.

Solution. Since there is no torque acting about the axis of rotation of the disc, so the angular momentum of the system (disc + man) remains constant. Initially it is zero. Suppose ω is the angular velocity of the disc (take positive in the sense of motion of the man). The velocity of the man with respect to the ground observer will be:



$$\vec{v}_{\text{man, disc}} = \vec{v}_{\text{man}} - \vec{v}_{\text{disc}}$$

$$\Rightarrow \quad \vec{v}_{\text{man}} = \vec{v}_{\text{man, disc}} - \vec{v}_{\text{disc}}$$

or $\quad v_{\text{man}} = v - \omega r$

Thus, angular momentum of the man $= m(v - \omega r)r$

And angular momentum of the disc is

$$I_{\text{disc}}\,\omega = \frac{MR^2}{2}\,\omega$$

Initial angular momentum of the system

$$\vec{L}_i = 0$$

Final angular momentum

$$\vec{L}_f = m(v - \omega r) - \frac{MR^2}{2}\omega$$

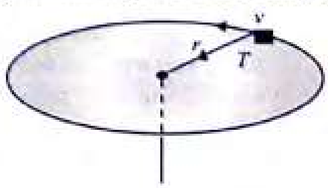
By conservation of angular momentum, we have

$$m(v - \omega r)r = \frac{MR^2}{2}\,\omega$$

After solving, we get $\omega = \dfrac{mvr}{\left(mr^2 + \dfrac{MR^2}{2}\right)}$

ILLUSTRATION 9.23 A small block of mass 4 kg is attached to a cord passing through a hole in a horizontal frictionless surface. The block is originally revolving in a circle of radius 0.5 m about the hole, with a tangential velocity of 4 m/s. The cord is then pulled slowly from below, shortening the radius of the circle in which the block revolves. The breaking strength of the cord is 600 N. What will be the radius of the circle when the cord breaks?

Solution. The tension of the rope is the only net force on the block and it does not exert any torque about the axis of rotation. Hence, the angular momentum of the block about the axis should remain conserved.



$\Rightarrow \quad mvr$ = constant

Let $\quad r_1 = 0.5$ m and $v_1 = 4$ m/s

Let r_2, v_2, T_2 be the radius, velocity and tension, respectively, when the string breaks.

$\Rightarrow \quad T_2 = 600$ N

$mv_1r_1 = mv_2r_2$ and $T_2 = mv_2^2/r_2$

$$\Rightarrow \quad mv_1r_1 = m\sqrt{\frac{r_2T_2}{m}}\, r_2$$

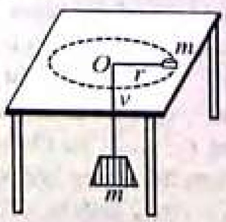
$$r_2 = \left(\frac{mv_1^2 r_1^2}{T_2}\right)^{\frac{1}{3}} = \left(\frac{4\times 16\times 0.25}{600}\right)^{\frac{1}{3}} = \left(\frac{16}{600}\right)^{\frac{1}{3}} = 0.3 \text{ m}$$

NOTE: The tension in the string is inversely proportional to the cube of the radius.

Concept Application Exercise 9.5

1. A circular disc of mass M_1 and radius R, initially moving with a constant angular speed ω_0 is gently placed coaxially on a stationary circular disc of mass M_2 and radius R, as shown in the figure. There is a frictional force between the two discs.

   (a) If disc M_2 is placed on a smooth surface, then determine the final angular speed of each disc.
   (b) Determine the work done by friction.
   (c) Determine the frictional loss in kinetic energy, i.e., $\Delta K/K_i$.
2. A child of mass m is standing on the periphery of a circular platform of radius R, which can rotate about its central axis. The moment of inertia of the platform is I. Child jumps off from the platform with a velocity u tangentially relative to the platform. Find the angular speed of the platform after the child jumps off.
3. Suppose in the previous problem, the child stays at rest on the platform and one of his friend throws a ball of mass m_1 towards him with a velocity of v from a direction tangential to the platform and the child on the platform catches the ball. Find the angular velocity of the platform after he catches the ball.
4. In the previous problem, initially the platform with the child is rotating with an angular speed ω_1. If the child starts walking along its periphery in opposite direction with speed u relative to the platform, what will be the new angular speed of the platform.
5. A thread is passing through a hole at the centre of a frictionless table. At the upper end a block of mass 0.5 kg is tied and a block of mass 8.0 kg is tied at the lower end which is freely hanging. The smaller mass is rotated on the table with a constant angular velocity about the axis passing through the hole so as to balance the heavier mass. If the mass of the hanging block is changed from 8.0 kg to 1.0 kg, what is the fractional change in the radius and the angular velocity of the smaller mass so that it balances the hanging mass again?



6. A girl jumps from a height h on the end of a see-saw. The see-saw consists of a uniform plank of length l pivoted at its centre. The plank is horizontal before the girl jumps. The mass of the see-saw is twice the mass of the girl. Find the angular velocity of the plank just after the girl jumps on the plank.

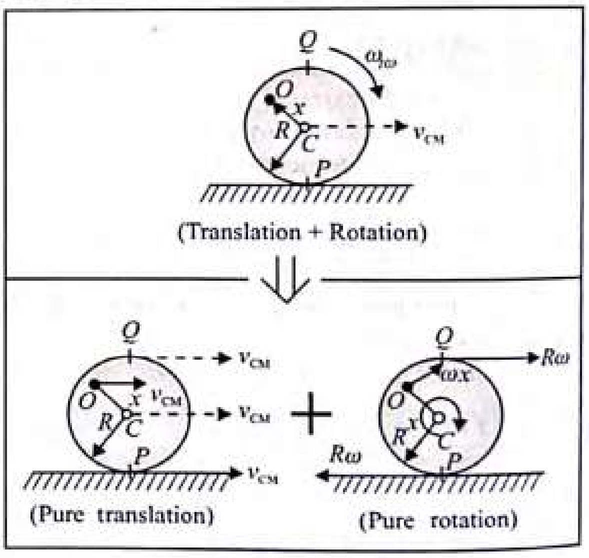
COMBINATION OF TRANSLATION AND ROTATION

When the axis of rotation is not fixed (stationary in space), the motion of a rigid body is considered as combination of motion of centre of mass plus a rotation about centre of mass. The two components of motion are described by

$$\Sigma\vec{F}_{ext} = m\vec{a}_{CM} \text{ and } \Sigma\vec{\tau}_{CM} = I_{CM}\vec{\alpha}$$

Superposition of Translation and Rotation

How the translational motion and rotational motion about the centre of mass are superimposed to get the motion of a rigid body (say a disc of radius R) is illustrated in the following figures.



To get the instantaneous velocity of any point on the rigid body we calculate the instantaneous velocity of that point in pure translation and in pure rotation and add them vectorically.

$$\vec{v}_{net} = \vec{v}_{translation} + \vec{v}_{rotation}$$

Velocity of the Instantaneous Point of Contact P

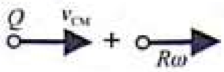
v_P = Velocity of point of contact in pure translation + Velocity of instantaneous point of contact in pure rotation

$v_P = v_{CM}$ (in the forward direction) + $R\omega$ (in the backward direction)

$v_P = v_{CM} - R\omega$, in the forward direction

Velocity of the Instantaneous Topmost Point Q

v_Q = Velocity of the topmost point in pure translation + velocity of point Q in pure rotation



$v_Q = v_{CM}$, in the forward direction + $R\omega$, in the forward direction.

$v_Q = v_{CM} + R\omega$, in the forward direction

Velocity of Point O

v_0 = Velocity of point O in pure translation + instantaneous velocity of point O in pure rotation

ACCELERATION OF DIFFERENT POINTS

Acceleration of Instantaneous Point of Contact P

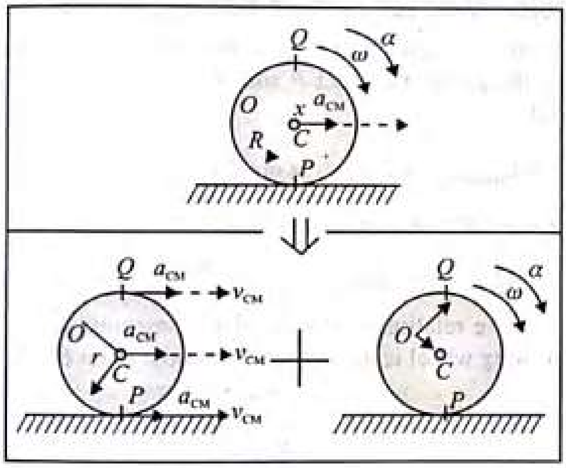


Figure illustrates how the instantaneous accelerations are superimposed. Acceleration of the instantaneous point of contact w.r.t. supporting surface, a_P = acceleration of point of contact in pure translation + acceleration of instantaneous point of contact in pure rotation

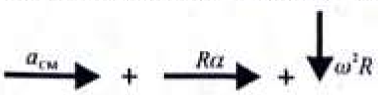
= (a_{CM}, in the forward direction) + ($R\alpha$, in the backward direction + $\omega^2 R$, vertically upward towards the centre of mass)

Acceleration of the Instantaneous Topmost Point

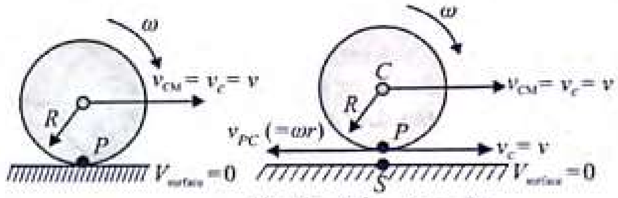
a_Q = Acceleration of the topmost point in pure translation + Acceleration of the instantaneous topmost point in pure rotation



(a_{CM} in the forward direction) + ($R\alpha$, in the forward direction + $\omega^2 R$, vertically downwards towards the centre of mass)

ROLLING

Take a uniform disc of radius R (say), place it vertically on a smooth horizontal surface. Spin the disc and simultaneously push it. In consequence, the disc will rotate with an angular velocity ω and its centre of mass C moves with a velocity v. The velocity of the lowest point P of the disc can be given as



$V_P = V_S = 0$, i.e., $V_{CM} = R\omega$

$$\vec{v}_P = \vec{v}_{PC} + \vec{v}_C$$

where $\quad \vec{v}_{PC} = -R\omega\hat{i}$ and $\vec{v}_C = v\hat{i}$

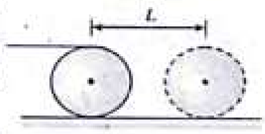
Then, $\quad \vec{v}_P = (v - R\omega)\hat{i}$

The above expression tells us that for different v and ω, the point P will move with different speeds. For suitable velocities v and ω, let us assume that P moves with a velocity which is equal to the velocity of the horizontal surface S, then

$$\vec{v}_P = \vec{v}_S$$

A body in combined motion is said to be rolling over a surface if the surfaces in contact do not slide relative to each other. It means that the relative velocity between the points of contact is zero.

ILLUSTRATION 9.24 A cylindrical drum, pushed along by a board rolls forward on the ground. There is no slipping at any contact. Find the distance moved by the man who is pushing the board, when axis of the cylinder covers a distance L.



Solution. Let v_0 be the linear speed of the axis of the cylinder and ω be its angular speed about the axis. As it does not slip on the ground hence $\omega = v_0/R$. Where R is the radius of the cylinder.

Speed of the topmost point is $v = v_0 + \omega R = 2v_0$

Since time taken by the axis to move a distance L is equal to $t = L/v_0$.

In the same interval of time distance moved by the topmost point is

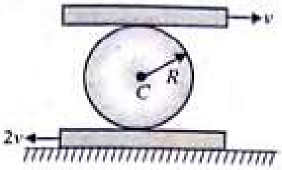
$$S = 2v_0 \times \frac{L}{v_0} = 2L$$

As there is no slipping between any point of contact hence distance moved by the man is $2L$.

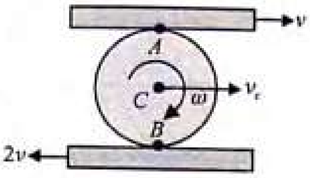
ILLUSTRATION 9.25 A uniform disc of radius R rolls perfectly over two horizontal plank A and B moving with velocities v and $2v$, respectively. Find the

(a) velocity of CM of the disc.

(b) angular velocity of the disc.



Solution. As the disc is rolling points A and B which are on the disc and in contact with the planks will not slide. The velocities of points A and B should be the same as the planks. Let the disc rotate with an angular velocity ω and let the velocity of centre of the mass of the disc be v_c.



Velocity of point A, v_A, $v_c + \omega R = v$ (i)

Velocity of point B, v_B, $\omega R - v_c = 2v$ (ii)

From Eqs. (i) and (ii), $\omega = 3v/R$ and $v_c = -2v$

Hence, velocity of centre of disc will be $2v$ towards the left and the angular velocity will be $3v/R$ the in the clockwise sense.

Solution. Velocity of any point on the circumference of a rolling body,

$$v_p = 2v_{CM}\cos\frac{\theta}{2}$$

For $v_p = v_{CM}$, we have

$$v_{CM} = 2v_{CM}\cos\frac{\theta}{2} \text{ or } \cos\frac{\theta}{2} = \frac{1}{2} \text{ or } \theta = 120°$$

Kinetic Energy of Rolling Wheel

Energy of a Rolling Body

The translational KE of a rolling body is

$$KE_t = \frac{1}{2}mv^2$$

The rotational KE of a rolling body is

$$KE_r = \frac{1}{2}I_0\,\omega^2$$

Since we know that $I_0 = mk^2$ and for rolling $\omega = \dfrac{v}{r}$

$$\Rightarrow \quad KE_r = \frac{1}{2}mk^2\left(\frac{v^2}{r^2}\right) = \frac{1}{2}\frac{k^2}{r^2}mv^2$$

Hence the total KE of the rolling body $KE = KE_t + KE_r$.

Putting $v = r\omega$ for rolling, we obtain the total KE in terms of ω as

$$KE = \frac{1}{2}m(r\omega)^2\left(1+\frac{k^2}{r^2}\right)$$

$$\Rightarrow \quad KE = \frac{1}{2}(mr^2 + mk^2)\omega^2$$

Since mk^2 = MI of a body about its centre of mass $O = I_0$

Hence, $mk^2 + mr^2 = I_0 + mr^2 = I_P$

where I_P = MI of the body about P.

Therefore, we conclude that the combined effects of translation of centre of mass of a body and its rotation about an axis passing through the CM are equivalent to its pure rotation about an axis passing through the point of contact P, of the rolling body.

$$\%\text{ of energy of translation} = \frac{KE_t}{KE}\times 100$$

$$= \frac{\frac{1}{2}mv^2}{\frac{1}{2}mv^2\left(1+\frac{k^2}{r^2}\right)}\times 100 = \frac{r^2}{k^2+r^2}\times 100$$

$$\text{Similarly, }\%\text{ of energy of rotation} = \frac{k^2}{k^2+r^2}\times 100$$

Angular Momentum of Rolling Wheel

Angular momentum of a rolling wheel about an axis passing through the point of contact P and perpendicular to the plane of wheel:

$$\vec{L} = \vec{L}_{\text{translation}} + \vec{L}_{\text{rotation}} = m(\vec{R}\times\vec{v}_{CM}) + I_{CM}\vec{\omega}$$

or $\quad L = m\omega R^2 + I_{CM}\omega$

or $\quad L = (I_{CM} + mR^2)\omega = I_p\omega$

The above relation of the angular momentum is the same as the rolling wheel is having rotation about point of contact.

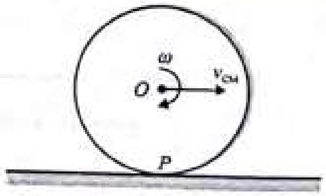


ILLUSTRATION 9.26 A sphere of mass M rolls without slipping on a rough surface with centre of mass has constant speed v_0. If mass of the sphere is m and its radius be R, then find the angular momentum of the sphere about the point of contact.

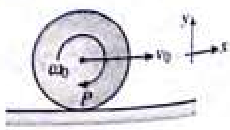
Solution. Since $\vec{L}_P = \vec{L}_{cm} + \vec{r}\times\vec{p}_{cm}$



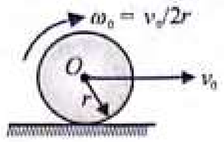
$$= I_{cm}\omega_0(-\hat{k}) + Mv_0R(-\hat{k})$$

Since sphere is in pure rolling motion hence

$$\omega = v_0/R$$

$$\Rightarrow \quad \vec{L}_P = \left[\frac{2}{5}MR^2\left(\frac{v_0}{R}\right) + Mv_0R\right](-\hat{k}) = \frac{7}{5}Mv_0R(-\hat{k})$$

ILLUSTRATION 9.27 A sphere of mass M and radius r shown in the figure slips on a rough horizontal plane. At some instant it has translational velocity v_0 and rotational velocity about the centre $v_0/2r$. Find the translational velocity after the sphere starts pure rolling.



Solution. Velocity of the centre = v_0 and the angular velocity about the centre = $v_0/2r$. Thus, $v_0 > \omega_0 r$. The sphere slips forward and thus the friction by the plane on the sphere will act backward. As the friction is kinetic, its value is $\mu N = \mu Mg$ and the sphere will be decelerated by $a_{CM} = f/M$.

Hence,

$$v(t) = v_0 - \frac{f}{M}t \qquad \text{(i)}$$

This friction will also have a torque $= fr$ about the centre. This torque is clockwise and in the direction of ω_0. Hence, the angular acceleration about the centre will be

$$\alpha = f\frac{r}{(2/5)\,Mr^2} = \frac{5f}{2Mr}$$

and the clockwise angular velocity at time t will be

$$\omega(t) = \omega_0 + \frac{5f}{2Mr}$$

$$= \frac{v_0}{2r} + \frac{5f}{2Mr}t$$

Pure rolling starts when $v(t) = r\omega(t)$,

i.e., $$v(t) = \frac{v_0}{2} + \frac{5f}{2M}t \qquad \text{(ii)}$$

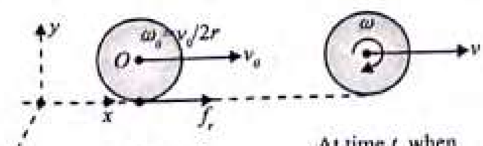
Eliminating t from Eqs. (i) and (ii), we get

$$\frac{5}{2}v(t) + v(t) = \frac{5}{2}v_0 + \frac{v_0}{2}$$

or $$v(t) = \frac{2}{7}\times 3v_0 = \frac{6}{7}v_0$$

Thus, the sphere rolls with translational velocity $6v_0/7$ in the forward direction.

Alternative method: We can solve this problem by using conservation of angular momentum. We can conserve the angular momentum about any point situated on the ground. (As torque of friction force about any point on the ground is zero.)



At $t = 0$ At time t, when rolling starts

Angular momentum about any point O situated on ground at $t = 0$

$$\vec{L}_{\text{initial}} = \vec{L}_{CM} + \vec{r}\times m\vec{v}$$

$$= I_{CM}\omega_0(-\hat{k}) + Mv_0 r(-\hat{k})$$

$$= \left[\frac{2}{5}Mr^2\left(\frac{v_0}{2r}\right) + Mv_0 r\right](-\hat{k})$$

$$\vec{L}_{\text{initial}} = \frac{6}{5}Mv_0 r(-\hat{k}) \qquad \text{(i)}$$

Angular momentum at time t when rolling starts

$$\vec{L}_{\text{final}} = \vec{L}_{\text{cm}} + \vec{r}\times m\vec{v} = \frac{2}{5}mr^2\omega(-\hat{k}) + mvr(-\hat{k})$$

When rolling starts $v = \omega R$ or $\omega = v/r$

Hence, $$\vec{L}_{\text{final}} = \left[\frac{2}{5}mr^2\left(\frac{v}{r}\right) + mvr\right](-\hat{k})$$

$$= \frac{7}{5}mvr(-\hat{k}) \qquad \text{(ii)}$$

Conserving angular momentum, we get

$$\vec{L}_{\text{initial}} = \vec{L}_{\text{final}}$$

$$\frac{6}{5}mv_0 r(-\hat{k}) = \frac{7}{5}mvr(-\hat{k})$$

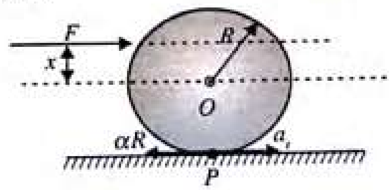
which gives $v = \frac{6}{7}v_0$

Direction of Friction in Case of Translation and Rotation Combined

In case of translation motion we can decide the direction of friction force by direct observation. But the direction of friction cannot be found by direct observation in case of rotational motion, as the body is translating as well as rotating. The direction of friction force is determined after deciding the motion tendency of the point of contact of the body under consideration with the ground.

Let us take an example of analysis of direction of friction in this case.

In the following diagram, a rolling object of mass M and radius R is placed on a rough horizontal surface. A force F is applied as shown.



To find the direction of friction at P, let us consider the surface to be frictionless.

Acceleration of point P due to translation only,

$$a_t = \frac{F}{M}(\rightarrow)$$

Acceleration of point P due to rotation only,

$$a_r = \alpha R = \frac{\tau}{I}R \Rightarrow \frac{FR}{I}x(\leftarrow)$$

Net acceleration of point P is $\vec{a}_P = \vec{a}_t + \vec{a}_r$

$$a_P = \frac{F}{M} - \frac{FRx}{I}(\rightarrow) \qquad \text{(i)}$$

From Eq. (ii), it is clear that motion tendency at point P depends upon both x and I.

Equation (i) can be written as

$$a_P = \frac{F}{M}\left(1 - \frac{Rx}{K^2}\right) \quad \text{(ii)}$$

The motion tendency of point P will be in forward direction if

$$1 - \frac{Rx}{K^2} > 0 \Rightarrow 1 > \frac{Rx}{K^2} \Rightarrow K^2 > Rx \quad \text{(iii)}$$

If this condition is satisfied, friction will act in backward direction.

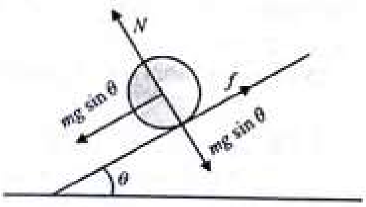
NOTE: We can summerise the situation as

If $K^2 > Rx$: friction will act in backward direction.
If $K^2 = Rx$: no friction will act.
If $K^2 < Rx$: friction will act in forward direction.
If force acts in lower diametric plane, friction will act in backward direction only.

Rolling of a Body on an Inclined Plane

A rigid body of radius of gyration k and radius R rolls (without slipping) down a plane inclined at an angle θ with the horizontal.

When a body is placed on an inclined plane, it tries to slip down and hence a static friction f acts upwards. This friction provides a torque which causes the body to rotate. Let a be the linear acceleration of centre of mass and α be the angular acceleration of the body.



From force diagram: For linear motion parallel to the plane,

$mg \sin \theta - f = ma$

For rotation around the axis through centre of mass, net torque $= I\alpha$.

$\Rightarrow \quad fR = (mk^2)\alpha$

As there is no slipping, the point of contact of the body with the plane is instantaneously at rest.

$\Rightarrow \quad v = R\omega$ and $a = R\alpha$

Solving the following three equations for a and f,

$mg \sin \theta - f = ma$

$\Rightarrow \quad fR = mk^2\alpha$

$a = R\alpha$

$$a = \frac{g \sin \theta}{\left(1 + \frac{k^2}{R^2}\right)} \text{ and } f = \frac{mg \sin \theta}{\left(1 + \frac{R^2}{k^2}\right)}$$

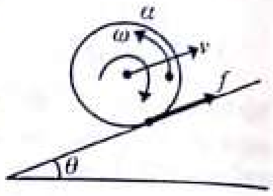
We can also derive the condition for pure rolling (rolling without slipping), to avoid slipping, $f \le \mu_s N$.

$$\frac{g \sin \theta}{1 + \frac{R^2}{k^2}} \le \mu_s mg \cos \theta$$

$$\Rightarrow \quad \mu_s \ge \frac{\tan \theta}{\left(1 + \frac{R^2}{k^2}\right)}$$

This is the condition of μ_s so that the body rolls without slipping.

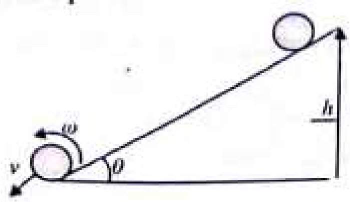
NOTE:



- If a body rolls up an inclined plane the direction of friction force in this case also in upward direction. As body rolls up velocity of centre of mass decreases, hence torque of friction should decrease angular velocity.
- The acceleration of the bodies rolling on inclined plane depends on radius of gyration (k). We can say the bodies with same value of k will have the same acceleration.
- For example, two uniform solid spheres made of different material, unequal mass and unequal radii are released from the same inclined plane if they rolls, they will have same accelerations.
- If a solid sphere and a hollow sphere of the same mass and same radii are released, the hollow sphere will take a longer time and acquires less velocity.
- If a solid sphere, a hollow sphere, a disc and a ring of same mass and radius are released from top of incline and they roll. The solid sphere take the least time while the ring will take maximum time to reach the bottom.
- If all the four objects are released from the top of a smooth incline. All the four bodies will reach the bottom at the same time.
- If all the rolling objects are released on a rough incline, such that friction is not sufficient for pure rolling, still the objects reach the bottom of incline at the same time because acceleration of centre of mass is the same in each case. Each object will have the same velocity of centre of mass but different ω.

ILLUSTRATION 9.28 A solid cylinder rolls down an inclined plane of height h and inclination θ. Calculate its speed at the bottom of the plane using acceleration method and energy method. Also calculate the time taken to reach the bottom.

Solution. Energy Method: Let v and ω be the velocity of the centre of mass and the angular velocity of cylinder, respectively, at the bottom of the plane.



As the cylinder rolls down:

Loss in G PE = Gain in translation KE + gain in rotational KE

$$mgh = \frac{1}{2}mv^2 + \frac{1}{2}\omega^2$$

As the cylinder is rolling without slipping, $v = R\omega$

$$\Rightarrow \quad mgh = \frac{1}{2}mv^2 + \frac{1}{2}\left(\frac{mR^2}{2}\right)\frac{v^2}{R^2}$$

$$\Rightarrow \quad v = \sqrt{\frac{4gh}{3}}$$

Force/Torque Method: From the result of the last example (using $k^2 = R^2/2$), the acceleration of the cylinder is

$$\frac{g\sin\theta}{1+\frac{1}{2}} = \frac{2}{3}g\sin\theta$$

Using $v^2 = u^2 + 2as$ down the plane (taking downward direction positive)

$$\Rightarrow \quad v = \sqrt{0 + 2a\frac{h}{\sin\theta}}$$

$$= \sqrt{2\left(\frac{2}{3}g\sin\theta\right)\frac{h}{\sin\theta}} = \sqrt{\frac{4gh}{3}}$$

$$\text{Time to reach bottom} = t = \frac{v-u}{a} = \frac{\sqrt{\frac{4gh}{3}} - 0}{\frac{2}{3}g\sin\theta} = \sqrt{\frac{3h}{g}}\frac{1}{\sin\theta}$$

In the forthcoming illustration, we will learn the application of various methods, i.e., force/torque, conservation of mechanical energy, work–energy theorem and concept of angular momentum in problem solving.

Concept Application Exercise 9.6

1. Figures (a) and (b) show two different arrangements of a spool being pulled with a constant force F in each case. Identify the direction of motion of the centre of mass, and the direction of friction force in each case.

   (a) The CM moves along.............................x-axis.
   (b) The friction force acts along ....x-axis.
   (c) The CM moves along.............................x-axis.
   (d) The friction force acts along ....x-axis.

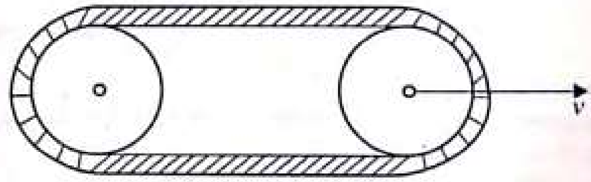
2. A sphere moving with a velocity v_0 on a smooth surface suddenly enters on a rough horizontal surface as shown in the figure. State which of the following statements are true or false

   (a) The sphere loses translational kinetic energy and gains rotational kinetic energy.
   (b) The total energy of the sphere is conserved.
   (c) The angular momentum of the sphere about any point on the surface is conserved.
   (d) The final velocity attained by the centre of mass is $2v_0/3$.

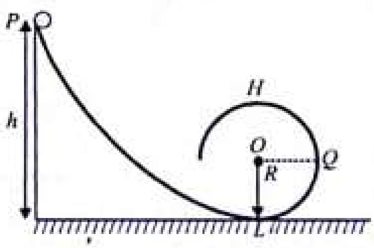
3. A cylinder of mass m and radius R rolls on a stationary plank of mass M. The lower surface of the plank is smooth and the upper surface is sufficiently rough with a coefficient of friction μ. A man is to hold the plank stationary with respect to the ground, as shown the figure.

   The force exerted by the man to keep the plank stationary is equal to.......

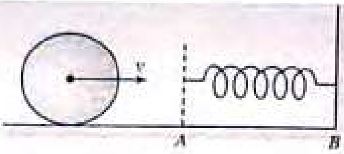
4. Calculate the kinetic energy of a tractor crawler belt of mass m if the tractor moves with a velocity v. There is no slipping. Neglect the size of the wheels.



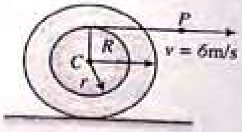
5. A small solid marble of mass M and radius r rolls down along the loop track, without slipping. Find the height h above the base, from where it has to start rolling down the incline such that the sphere just completes the vertical circular loop of radius R.



6. A sphere of mass m and radius R rolls without sliding on a horizontal surface. It collides with a light spring of stiffness K with a kinetic energy E. If the surface (AB) under the spring is smooth, find the maximum compression of the spring.



7. A cotton reel rolls without sliding such that the point P of the string has velocity $v = 6$ m s^{-1}. If $r = 10$ cm and $R = 20$ cm then find the
(a) Velocity of its centre C
(b) Angular velocity of the cotton reel



SOLVED EXAMPLES

1. A circular disc X of radius R is made from an iron plate of thickness t, and another disc Y of radius $4R$ is made from an iron plate of thickness $t/4$. Then the relation between the moment of inertia I_X and I_Y is

(a) $I_Y = 64 I_X$ (b) $I_Y = 32 I_X$
(c) $I_Y = 16 I_X$ (d) $I_Y = I_X$

Sol. (a) Moment of Inertia of disc $I = \frac{1}{2}MR^2$

$$= \frac{1}{2}(\pi R^2 t\rho)R^2 = \frac{1}{2}\pi t\rho R^4$$

[As $M = V \times \rho = \pi R^2 t\rho$ where t = thickness, ρ = density]

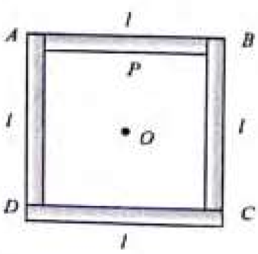
$$\therefore \quad \frac{I_y}{I_x} = \frac{t_y}{t_x}\left(\frac{R_y}{R_x}\right)^4 \quad \text{[If } \rho = \text{constant]}$$

$$\Rightarrow \quad \frac{I_y}{I_x} = \frac{1}{4}(4)^4 = 64 \quad \text{[Given } R_y = 4R_x,\ t_y = \frac{t_x}{4}]$$

$$\Rightarrow \quad I_y = 64 I_x$$

2. Four thin rods of same mass M and same length l, form a square as shown in the figure. Moment of inertia of this system about an axis through centre O and perpendicular to its plane is

(a) $\frac{4}{3}Ml^2$
(b) $\frac{Ml^2}{3}$
(c) $\frac{Ml^2}{6}$
(d) $\frac{2}{3}Ml^2$



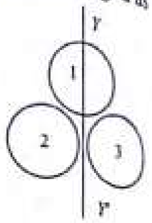
Sol. (a) Moment of inertia of rod AB about point $P = \frac{1}{12}Ml^2$

M.I. of rod AB about point $O = \frac{Ml^2}{12} + M\left(\frac{l}{2}\right)^2 = \frac{1}{3}Ml^2$

[by the theorem of parallel axis]

and the system consists of 4 rods of similar type so by the symmetry $I_{\text{System}} = \frac{4}{3}Ml^2$.

3. Three rings each of mass M and radius R are arranged as shown in the figure. The moment of inertia of the system about YY' will be



(a) $3MR^2$ (b) $\frac{3}{2}MR^2$
(c) $5MR^2$ (d) $\frac{7}{2}MR^2$

Sol. (d) MI of system about YY': $I = I_1 + I_2 + I_3$

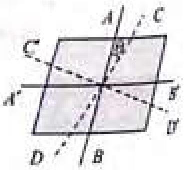
where I_1 = moment of inertia of ring about diameter, $I_2 = I_3$ = MI of inertia of ring about a tangent in a plane

$$\therefore \quad I = \frac{1}{2}mR^2 + \frac{3}{2}mR^2 + \frac{3}{2}mR^2 = \frac{7}{2}mR^2$$

4. Let I be the moment of inertia of an uniform square plate about an axis AB that passes through its centre and is parallel to two of its sides. CD is a line in the plane of the plate that passes through the centre of the plate and makes an angle θ with AB. The moment of inertia of the plate about the axis CD is then equal to

(a) I (b) $I\sin^2\theta$
(c) $I\cos^2\theta$ (d) $I\cos^2\frac{\theta}{2}$

Sol. (a) Let I_Z is the moment of inertia of square plate about the axis which is passing through the centre and perpendicular to the plane.



$I_Z = I_{AB} + I_{A'B'} = I_{CD} + I_{C'D'}$
[By the theorem of perpendicular axis]
$I_Z = 2I_{AB} = 2I_{A'B'} = 2I_{CD} = 2I_{C'D'}$
[As AB, $A'B'$ and CD, $C'D'$ are symmetric axis]
Hence $I_{CD} = I_{AB} = I$

5. The moment of inertia of a rod of length l about an axis passing through its centre of mass and perpendicular to rod is I. The moment of inertia of hexagonal shape formed by six such rods, about an axis passing through its centre of mass and perpendicular to its plane will be

(a) $16I$ (b) $40I$
(c) $60I$ (d) $80I$

Sol. (c) Moment of inertia of rod AB about its centre and perpendicular to the length $= \frac{ml^2}{12} = I \Rightarrow ml^2 = 12I$

Now moment of inertia of the rod about the axis which is passing through O and perpendicular to the plane of hexagon $I_{\text{rod}} = \frac{ml^2}{12} + mx^2$

[From the theorem of parallel axes]

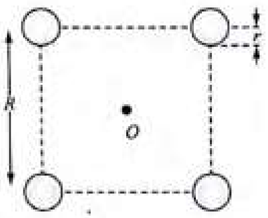
$$= \frac{ml^2}{12} + m\left(\frac{\sqrt{3}}{2}l\right)^2 = \frac{5ml^2}{6}$$

Now the moment of inertia of system,

$$I_{system} = 6 \times I_{rod} = 6 \times \frac{5ml^2}{6} = 5ml^2$$

$I_{system} = 5\,(12\,I) = 60I$ [As $ml^2 = 12I$]

6. Four spheres, each of mass M and radius ω are situated at the four corners of square of side R. The moment of inertia of the system about an axis perpendicular to the plane of square and passing through its centre will be



(a) $\frac{5}{2}M\,(4r^2+5R^2)$

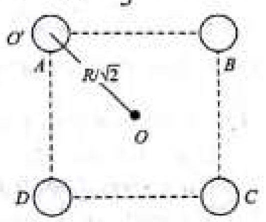
(b) $\frac{2}{5}M\,(4r^2+5R^2)$

(c) $\frac{2}{5}M\,(4r^2+5r^2)$

(d) $\frac{5}{2}M\,(4r^2+5r^2)$

Sol. (b) *MI* of sphere A about its diameter $I_{O'} = \frac{2}{5}Mr^2$

Now *MI* of sphere A about an axis perpendicular to the plane of square and passing through its centre will be



$$I_O = I_{O'} + M\left(\frac{R}{\sqrt{2}}\right)^2$$

$$= \frac{2}{5}Mr^2 + \frac{MR^2}{2} \quad \text{[by the theorem of parallel axis]}$$

Moment of inertia of system (i.e. four sphere)

$$= 4I_0 = 4\left[\frac{2}{5}Mr^2 + \frac{MR^2}{2}\right] = \frac{2}{5}M\left[4r^2+5R^2\right]$$

7. A horizontal heavy uniform bar of weight W is supported at its ends by two men. At the instant, one of the men lets go off his end of the rod, the other feels the force on his hand changed to

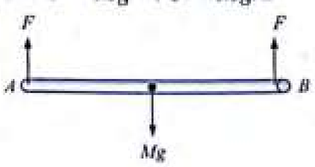
(a) W (b) $\frac{W}{2}$

(c) $\frac{3W}{4}$ (d) $\frac{W}{4}$

Sol. (d) Let the mass of the rod is $M \Rightarrow$ Weight $(W) = Mg$

Initially for the equilibrium $F + F = Mg \Rightarrow F = Mg/2$

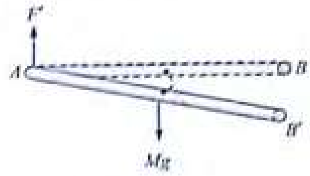
When one man withdraws, the torque on the rod



$$\tau = I\alpha = Mg\frac{l}{2}$$

$$\Rightarrow \frac{Ml^2}{3}\alpha = Mg\frac{l}{2} \quad [\text{As } I = Ml^2/3]$$

$\Rightarrow$ Angular acceleration,



$$\alpha = \frac{3}{2}\frac{g}{l}$$

and linear acceleration,

$$a = \frac{l}{2}\alpha = \frac{3g}{4}$$

Now if the new normal force at A is F' then $Mg - F' = Ma$

$$\Rightarrow \quad F' = Mg - Ma = Mg - \frac{3Mg}{4} = \frac{Mg}{4} = \frac{W}{4}.$$

8. A thin circular ring of mass M and radius R is rotating about its axis with a constant angular velocity ω. Four objects each of mass m, are kept gently to the opposite ends of two perpendicular diameters of the ring. The angular velocity of the ring will be

(a) $\frac{M\omega}{M+4m}$ (b) $\frac{(M+4m)\omega}{M}$

(c) $\frac{(M-4m)\omega}{M+4m}$ (d) $\frac{M\omega}{4m}$

Sol. (a) Initial angular momentum of ring $= I\omega = MR^2\omega$

If four objects, each of mass m, are kept gently to the opposite ends of two perpendicular diameters of the ring, then final angular momentum $= (MR^2 + 4MR^2)\omega'$

By the conservation of angular momentum,

Initial angular momentum = Final angular momentum

$$MR^2\omega = (MR^2 + 4mR^2)\,\omega' \Rightarrow \omega' = \left(\frac{M}{M+4m}\right)\omega$$

9. A circular platform is free to rotate in a horizontal plane about a vertical axis passing through its center. A tortoise is sitting at the edge of the platform. Now, the platform is given an angular velocity ω_0. When the tortoise moves along a chord of the platform with a constant velocity (with respect to the platform), the angular velocity of the platform $\omega(t)$ will vary with time t as

(a) 
(b) 
(c) 
(d) 
Sol. (b) The angular momentum (L) of the system is conserved, i.e. $L = I\omega$ = constant

When the tortoise walks along a chord, it first moves closer to the centre and then away from the centre. Hence, M.I. first decreases and then increases. As a result, ω will first increase and then decrease. Also the change in ω will be non-linear function of time.

10. Two discs of moment of inertia I_1 and I_2 and angular speeds ω_1 and ω_2 are rotating along collinear axes passing through their centre of mass and perpendicular to their plane. If the two are made to rotate together along the same axis the rotational KE of system will be

(a) $\dfrac{I_1\omega_1+I_2\omega_2}{2(I_1+I_2)}$ (b) $\dfrac{(I_1+I_2)(\omega_1+\omega_2)^2}{2}$

(c) $\dfrac{(I_1\omega_1+I_2\omega_2)^2}{2(I_1+I_2)}$ (d) None of these

Sol. (c) By the law of conservation of angular momentum, $I_1\omega_1+I_2\omega_2=(I_1+I_2)\omega$

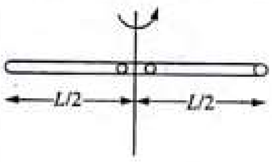
Angular velocity of system, $\omega=\dfrac{I_1\omega_1+I_2\omega_2}{I_1+I_2}$

Rotational kinetic energy

$$=\frac{1}{2}(I_1+I_2)\,\omega^2=\frac{1}{2}(I_1+I_2)\left(\frac{I_1\omega_1+I_2\omega_2}{I_1+I_2}\right)^2$$

$$=\frac{(I_1\omega_1+I_2\omega_2)^2}{2(I_1+I_2)}$$

11. A smooth uniform rod of length L and mass M has two identical beads of negligible size, each of mass m, which can slide freely along the rod. Initially, the two beads are at the centre of the rod and the system is rotating with angular velocity ω_0 about an axis perpendicular to the rod and passing through the mid point of the rod (see figure). There are no external forces. When the beads reach the ends of the rod, the angular velocity of the system is



(a) ω_0 (b) $\dfrac{M\omega_0}{M+12m}$

(c) $\dfrac{M\omega_0}{M+2m}$ (d) $\dfrac{M\omega_0}{M+6m}$

Sol. (d) Since there are no external forces, therefore, the angular momentum of the system remains constant.

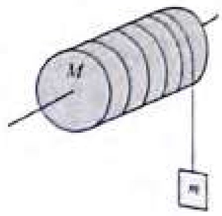
Initially when the beads are at the centre of the rod angular momentum, $L_1=\left(\dfrac{ML^2}{12}\right)\omega_0$ .....(i)

When the beads reach the ends of the rod, then angular momentum, $L_2=\left(m\left(\dfrac{L}{2}\right)^2+m\left(\dfrac{L}{2}\right)^2+\dfrac{ML^2}{12}\right)\omega'$ .....(ii)

Equating (i) and (ii), $\dfrac{ML^2}{12}\omega_0=\left(\dfrac{mL^2}{2}+\dfrac{ML^2}{12}\right)\omega'$

$\Rightarrow \omega'=\dfrac{M\omega_0}{M+6m}$.

12. In the following figure, a body of mass m is tied at one end of a light string and this string is wrapped around the solid cylinder of mass M and radius R. At the moment $t=0$, the system starts moving. If the friction is negligible, angular velocity at time t would be



(a) $\dfrac{mgRt}{(M+m)}$

(b) $\dfrac{2Mgt}{(M+2m)}$

(c) $\dfrac{2mgt}{R(M-2m)}$

(d) $\dfrac{2mgt}{R(M+2m)}$

Sol. (d) We know the tangential acceleration

$$a=\frac{g}{1+\dfrac{I}{mR^2}}=\frac{g}{1+\dfrac{1/2MR^2}{mR^2}}=\frac{2mg}{2m+M}$$

$$\left[\text{As } I=\frac{1}{2}MR^2 \text{ for cylinder}\right]$$

After time t, linear velocity of mass m, $v=u+at=0+\dfrac{2mgt}{2m+M}$

So, angular velocity of the cylinder, $\omega=\dfrac{v}{R}=\dfrac{2mgt}{R(M+2m)}$

13. A number of holes are drilled along a diameter of a disc of radius R. To get minimum time period of oscillations, the disc should be suspended from a horizontal axis passing through a hole whose distance from the centre should be

(a) $\dfrac{R}{2}$ (b) $\dfrac{R}{\sqrt{2}}$

(c) $\dfrac{R}{2\sqrt{2}}$ (d) Zero

Sol. (b) $T=2\pi\sqrt{\dfrac{L}{g}}$ where $L=\dfrac{l^2+k^2}{l}$

Here $k^2=\dfrac{R^2}{2}$

$$\therefore \quad L=\frac{l^2+\dfrac{R^2}{2}}{l}=l+\frac{R^2}{2l}$$

For minimum time period, L should be minimum. Hence

$$\frac{dL}{dl}=0$$

$$\Rightarrow \quad \frac{d}{dl}\left(l+\frac{R^2}{2l}\right)=0$$

$$\Rightarrow \quad 1+\frac{R^2}{2}\left(\frac{-1}{l^2}\right)=1-\frac{R^2}{2l^2}=0\Rightarrow l=\frac{R}{\sqrt{2}}$$

14. A thick walled hollow sphere has outer radius R. It rolls down an inclined plane without slipping and its speed at the bottom is v. If the inclined plane is frictionless and the sphere slides down without rolling, its speed at the bottom is $5v/4$. What is the radius of gyration of the sphere?

(a) $\dfrac{R}{\sqrt{2}}$ (b) $\dfrac{R}{2}$

(c) $\dfrac{3R}{4}$ (d) $\dfrac{\sqrt{3}R}{4}$

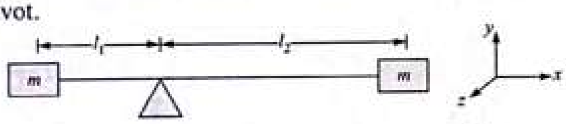
Sol. (c) Case 1: $mgh = \frac{1}{2}mv^2 + \frac{1}{2}mk^2\omega^2$

Case 2: $mgh = \frac{1}{2}m\times\left(\frac{5v}{4}\right)^2$

$$\frac{1}{2}mk^2\frac{v^2}{R^2}+\frac{1}{2}mv^2 = \frac{1}{2}m\times\frac{25v^2}{16}$$

$$\frac{k^2}{R^2}+1=\frac{25}{16} \Rightarrow k=\frac{3R}{4}$$

15. Two blocks each of the mass m are attached to the ends of a massless rod which pivots as shown in the figure. Initially, the rod is held in the horizontal position and then released. Calculate the net torque on this system above pivot.



(a) $(ml_2g - ml_1g)\hat{k}$ (b) $(ml_1g - ml_2g)\hat{k}$

(c) $(ml_1g + ml_2g)\hat{k}$ (d) $-(ml_1g + ml_2g)\hat{k}$

Sol. (b) Torque due to the weight of left m:

$\vec{\tau}_1 = mg\,l_1\,\hat{k}$ ($\because$ this is clock wise)

Torque due to weight of right m:

$\vec{\tau}_2 = -mg\,l_2\,\hat{k}$ ($\because$ this is clockwise)

So net torque: $\vec{\tau} = \vec{\tau}_1 + \vec{\tau}_2 = (mgl_1 - mgl_2)\hat{k}$

16. Given a uniform disc of mass M and radius R. A small disc of radius $R/2$ is cut from this disc in such a way that the distance between the centres of the two discs is $R/2$. Find the moment of inertia of the remaining disc about a diameter of the original disc perpendicular to the line connecting the centres of the two discs.

(a) $3MR^2/32$ (b) $5MR^2/16$

(c) $11MR^2/64$ (d) None of these

Sol. (c) Mass of cut disc: $m_1 = M/4$

Moment of inertia of original disc about axis 1:

$$I = \frac{1}{4}MR^2$$

Moment of Inertia of small disc about axis 1:

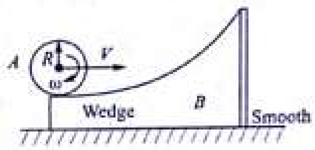
$$I' = \frac{1}{4}m_1\left(\frac{R}{2}\right)^2 + m_1\left(\frac{R}{2}\right)^2$$

or $I' = \dfrac{5}{16}m_1R^2 = \dfrac{5}{64}MR^2$

Required moment of inertia:

$$I - I' = \frac{1}{4}MR^2 - \frac{5}{64}MR^2 = \frac{11}{64}MR^2$$

17. In the figure, a cylinder A is initially rolling with velocity v on the horizontal surface of the wedge B (of same mass as A). All surfaces are smooth and B has no initial velocity. Then maximum height reached by cylinder on the wedge will be

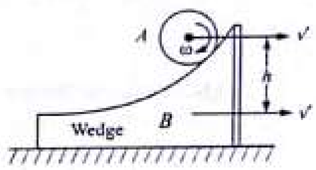


(a) $v^2/4g$ (b) v^2/g

(c) $v^2/2g$ (d) $v^2/8g$

Sol. (a) At the maximum height, vertical velocity of cylinder is zero. But horizontal velocity of the wedge and cylinder will be same.

In the absence of friction between the cylinder and the wedge surface, angular velocity of cylinder remains constant.



From energy conservation:

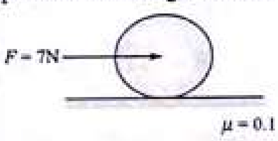
$$\frac{1}{2}mv^2+\frac{1}{2}I\omega^2 = \frac{1}{2}mv'^2+\frac{1}{2}I\omega^2+\frac{1}{2}mv'^2+mgh \quad ..(i)$$

By the conservation of linear momentum

$$mv = 2mv' \Rightarrow v' = v/2 \quad ...(ii)$$

From (i) and (ii): $h = v^2/4g$

18. A solid sphere of mass 10 kg is placed on a rough surface having coefficient of friction $\mu = 0.1$. A constant force $F = 7$ N is applied along a line passing through the centre of the sphere as shown in the figure. The value of frictional force on the sphere is



(a) 1 N (b) 2 N

(c) 3 N (d) 7 N

Sol. (b) Let f the be frictional force towards left for pure rolling.

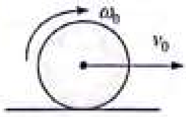
$$a = R\times\alpha$$

where $a = \dfrac{F-f}{m} = \dfrac{7-f}{10}$

$$\alpha = \frac{\tau}{I} = \frac{fR}{I} = \frac{fR}{\frac{2}{5}mR^2} = \frac{5f}{2mR}$$

Hence, $\frac{7-f}{10}=\frac{5f}{20} \Rightarrow f = 2\text{ N}$

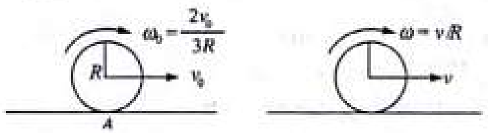
19. A solid sphere of radius R starts rotating on rough horizontal surface with translational velocity v_0 and initial angular velocity $\omega_0 = 2v_0/3R$. The sphere starts pure rolling after some time t. Find the angle by which sphere rotates upto the instant at which pure rolling starts, if v is the translational velocity at pure rolling. Assume uniformly accelerated motion upto start of pure rolling.



(a) $\frac{33}{38}\frac{vt}{R}$ (b) $\frac{37}{38}\frac{vt}{R}$

(c) $\frac{31}{38}\frac{vt}{R}$ (d) $\frac{29}{37}\frac{vt}{R}$

Sol. *(a)* $\omega_0 = \frac{2v_0}{3R}$ or, $v_0 = \frac{3}{2}R\omega_0$



Angular momentum is conserved about A.

$L_1 = L_2$

$\omega_0 = \frac{2v_0}{3R}$ or, $v_0 = \frac{3}{2}R\omega_0$

or $\frac{2}{5}mR^2 \times \frac{2v_0}{3R} + mv_0R = \frac{2}{5}mR^2\frac{v}{R} + mvR$

or $v_0 = \frac{21}{19}v$ .... (i)

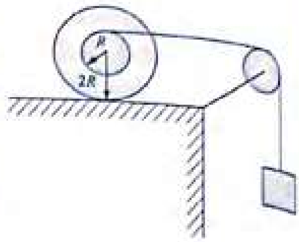
$\omega = \omega_0 + \alpha t \Rightarrow v/R = 2v_0/3R + \alpha t \Rightarrow \alpha = \frac{5v}{19Rt}$

where t is the time in which pure rolling starts.

Pure rolling starts when sphere rotates by an angle,

$$\theta = \omega_0 t + \frac{1}{2}\alpha t^2 = \frac{2v_0}{3R}t + \frac{1}{2}\cdot\frac{5v}{19Rt}\cdot t^2 = \frac{33}{38}\frac{vt}{R}$$

20. In the figure mass of both spherical body and block is m. Moment of inertia of the spherical body about centre of mass is $2mR^2$. The spherical body rolls on the horizontal surface. There is no slipping at any surfaces in contact. The ratio of kinetic energy of the spherical body to that of block is



(a) $\frac{3}{4}$ (b) $\frac{1}{3}$ (c) $\frac{2}{3}$ (d) $\frac{1}{2}$

Sol. *(c)* Let v be the linear velocity of centre of mass of the spherical body and ω its angular velocity about centre of mass. Then

$$\omega = \frac{v}{2R}$$

K.E. of spherical body,

$$K_1 = \frac{1}{2}mv^2 + \frac{1}{2}\omega^2$$

$$= \frac{1}{2}mv^2 + \frac{1}{2}(2mR)^2\left(\frac{v^2}{4R^2}\right)$$

$$= \frac{3}{4}mv^2 \quad ...(i)$$

Speed of the block will be

$$v' = (\omega)(3R) = 3R_\omega = (3R)\left(\frac{v}{2R}\right) = \frac{3}{2}v$$

$\therefore$ K.E. of block $K_2 = \frac{1}{2}mv'^2 = \frac{1}{2}m\left(\frac{3}{2}v\right)^2 = \frac{9}{8}mv^2$ ...(ii)

From equations (i) and (ii), $\frac{K_1}{K_2} = \frac{2}{3}$

EXERCISES

Moment of Inertia

1. Two circular discs A and B are of equal masses and thicknesses but made of metal with densities d_A and d_B $(d_A > d_B)$. If their moments of inertia about an axis passing through their centres and perpendicular to circular faces are I_A and I_B, then

(a) $I_A = I_B$ (b) $I_A > I_B$

(c) $I_A < I_B$ (d) $I_A \geq I_B$

2. Four identical rods are joined end to end to form a square. The mass of each rod is M. The moment of inertia of the square about the median line is

(a) $\frac{Ml^2}{3}$ (b) $\frac{Ml^2}{4}$

(c) $\frac{Ml^2}{6}$ (d) $\frac{2Ml^2}{3}$

3. In problem 2, the moment of inertia of the system about an axis passing through the point of intersection of diagonals and perpendicular to the plane of the square is

(a) $\frac{4Ml^2}{3}$ (b) $\frac{13Ml^2}{3}$

(c) $\frac{Ml^2}{6}$ (d) $\frac{13Ml^2}{6}$

4. In problem 2, the moment of inertia of the system about one of the diagonals is

(a) $\frac{2Ml^2}{3}$ (b) $\frac{13Ml^2}{3}$

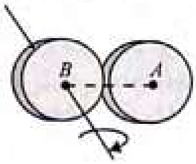
(c) $\frac{Ml^2}{6}$ (d) $\frac{13Ml^2}{6}$

5. Two circular discs are of same thickness. The diameter of A is twice that of B. The moment of inertia of A as compared to that of B is

(a) twice as large (b) four times as large

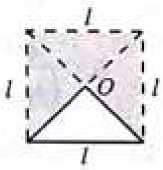
(c) eight times as large (d) 16 times as large

6. Two thin discs, each of mass M and radius r metre, are attached as shown in the figure, to form a rigid body. The rotational inertia of this body about an axis perpendicular to the plane of disc B passing through its centre is



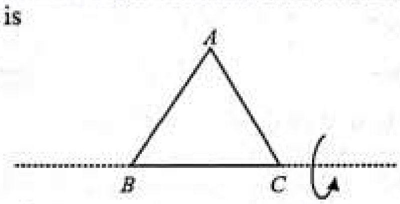
(a) $2Mr^2$ (b) $3Mr^2$ (c) $4Mr^2$ (d) $5Mr^2$

7. An isosceles triangular piece is cut from a square plate of side l. The piece is one-fourth of the square and mass of the remaining plate is M. The moment of inertia of the plate about an axis passing through O and perpendicular to its plane is



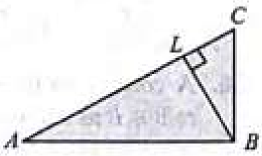
(a) $\frac{Ml^2}{6}$ (b) $\frac{Ml^2}{12}$ (c) $\frac{Ml^2}{24}$ (d) $\frac{Ml^2}{3}$

8. Three identical rods, each of mass m and length l, form an equaliteral triangle. Moment of inertia about one of the sides is



(a) $\frac{ml^2}{4}$ (b) ml^2 (c) $\frac{3ml^2}{4}$ (d) $\frac{2ml^2}{3}$

9. About which axis, the moment of inertia in the given triangular lamina is maximum?



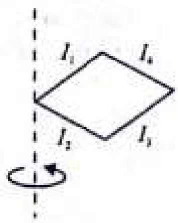
(a) AB

(b) BC

(c) AC

(d) BL

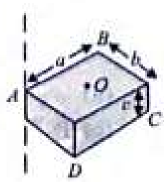
10. The moment of inertia of a system of four rods, each of length l and mass m, about the axis shown is



(a) $\frac{2}{3}ml^2$ (b) $2ml^2$

(c) $3ml^2$ (d) $\frac{8}{3}ml^2$

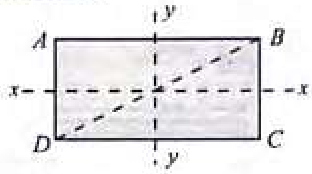
11. Figure shows a uniform solid block of mass M and edge lengths a, b and c. Its M.I. about an axis through one edge and perpendicular (as shown) to the large face of the block is



(a) $\frac{M}{3}(a^2+b^2)$ (b) $\frac{M}{4}(a^2+b^2)$

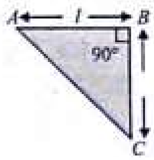
(c) $\frac{7M}{12}(a^2+b^2)$ (d) $\frac{M}{12}(a^2+b^2)$

12. In rectangle $ABCD$, $AB = 2l$ and $BC = l$. Axes xx and yy pass through the centre of the rectangle. The moment of inertia is least about



(a) DB (b) BC (c) xx (d) yy

13. Figure shows a thin metallic triangular sheet ABC. The mass of the sheet is M. The moment of inertia of the sheet about side AC is



(a) $\frac{Ml^2}{18}$ (b) $\frac{Ml^2}{12}$

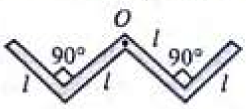
(c) $\frac{Ml^2}{6}$ (d) $\frac{Ml^2}{4}$

14. The moment of inertia of a door of mass m, length $2l$ and width l about its longer side is

(a) $\frac{11ml^2}{24}$ (b) $\frac{5ml^2}{24}$

(c) $\frac{ml^2}{3}$ (d) none of these

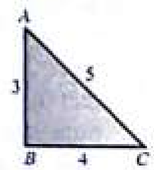
15. A thin rod of length $4l$ and mass $4m$ is bent at the points as shown in the figure. What is the moment of inertia of the rod about the axis passing through point O and perpendicular to the plane of the paper.



(a) $\frac{Ml^2}{3}$ (b) $\frac{10Ml^2}{3}$

(c) $\frac{Ml^2}{12}$ (d) $\frac{Ml^2}{24}$

16. ABC is a triangular plate of uniform thickness. The sides are in the ratio shown in the figure. I_{AB}, I_{BC}, I_{CA} are the moments of inertia of the plated about AB, BC and CA respectively. Which one of the following relation is correct?



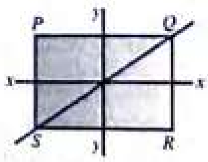
(a) I_{CA} is maximum

(b) $I_{AB} > I_{BC}$

(c) $I_{BC} > I_{AB}$

(d) $I_{AB} + I_{BC} = I_{CA}$

17. In a rectangle $PQRS$, $PQ = 5l$ and $RS = 2l$. Axes xx and yy pass through centre of the rectangle. The moment of inertia is least about

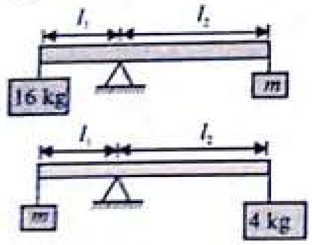


(a) SQ (b) RS

(c) xx (d) yy

Torque and Torque Equation

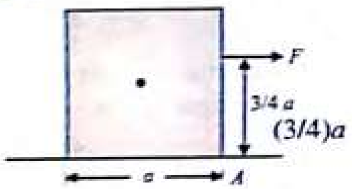
18. In an experiment with a beam balance, an unknown mass m is balanced by two known masses of 16 kg and 4 kg as shown in the figure.



The value of the unknown mass m is

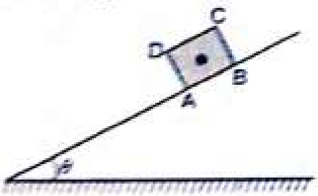
(a) 10 kg (b) 6 kg
(c) 8 kg (d) 12 kg

19. A cube of side a and mass m is to be tilted at point A by applying a force F as shown in the figure. The minimum force required is



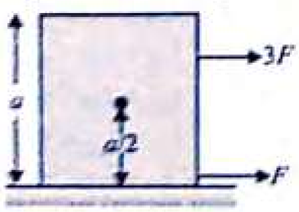
(a) mg (b) $\frac{2}{3}mg$
(c) $\frac{3}{2}mg$ (d) $\frac{3}{4}mg$

20. A cube of side a is placed on an inclined plane of inclination θ. What is the maximum value of θ for which the cube will not topple?



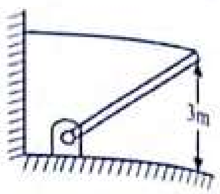
(a) 15° (b) 30° (c) 45° (d) 60°

21. A rectangular block of mass M and height a is resting on a smooth level surface. A force F is applied to one corner as shown in the figure. At what point should a parallel force $3F$ be applied in order that the block shall undergo pure translational motion? Assume normal contact force between the block and surface passes through the centre of gravity of the block.



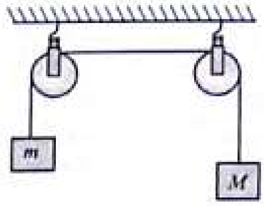
(a) $\frac{a}{3}$ vertically above centre of gravity
(b) $\frac{a}{6}$ vertically above centre of gravity
(c) No such point exists
(d) it is not possible

22. A uniform rod of mass 15 kg is held stationary with the help of a light string as shown in the figure. The tension in the string is



(a) 150 N (b) 225 N
(c) 100 N (d) None of the above

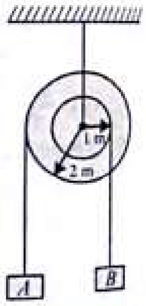
23. Each pulley in the figure has radius r and moment of inertia I. The acceleration of the block is



(a) $\dfrac{(M-m)g}{\left(M+m+\frac{2I}{r^2}\right)}$ (b) $\dfrac{(M-m)g}{\left(M+m-\frac{2I}{r^2}\right)}$

(c) $\dfrac{(M-m)g}{\left(M+m+\frac{I}{r^2}\right)}$ (d) $\dfrac{(M-m)g}{\left(M+m-\frac{I}{r^2}\right)}$

24. In the pulley system shown, if radii of the bigger and smaller pulley are 2 m and 1 m, respectively, and the acceleration of block A is 5 m s^{-2} in the downward direction, the acceleration of block B will be

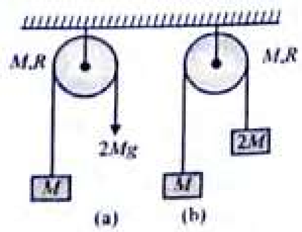


(a) 0 m s^{-2} (b) 5 m s^{-2}
(c) 10 m s^{-2} (d) $\frac{5}{2}$ m s^{-2}

25. A uniform disc of mass M and radius R is mounted on an axle supported in frictionless bearings. A light cord is wrapped around the rim of the disc and a steady downward pull T is exerted on the cord. The angular acceleration of the disc is

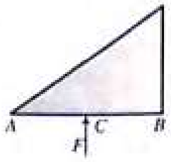
(a) $\frac{T}{MR}$ (b) $\frac{MR}{T}$ (c) $\frac{2T}{MR}$ (d) $\frac{MR}{2T}$

26. A cord is wrapped on a pulley (disk) of mass M and radius R as shown in the figure. To one end of the cord, a block of mass M is connected as shown and to other end in (a) a force of 2 Mg and in (b) a block of mass $2M$. Let angular acceleration of the disk in A and B is α_A and α_B respectively, then (cord is not slipping on the pulley).



(a) $\alpha_A = \alpha_B$ (b) $\alpha_A > \alpha_B$
(c) $\alpha_A < \alpha_B$ (d) None of these

27. A triangular plate of uniform thickness and density is made to rotate about an axis perpendicular to the plane of the paper (a) passing through A, (b) passing through B, by the application of the same force F, at C (mid-point of AB) as shown. Now,

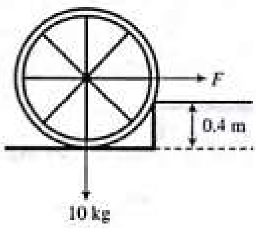


(a) angular acceleration in both the cases is the same
(b) angular acceleration for case (a) is larger
(c) angular acceleration for case (b) is larger
(d) there would be no angular acceleration for case (a)

28. Three children are sitting on a see-saw in such a way that is balances. A 20 kg and a 30 kg boy are on opposite sides at a distance of 2m from the pivot. It the third boy jumps off, thereby destroying balance, then the initial angular acceleration of the board is: (Neglect weight of board)

(a) 0.01 rad s^{-2} (b) 1.0 rad s^{-2}
(c) 10 rad s^{-2} (d) 100 rad s^{-2}

29. Calculate the force F that is applied horizontally at the axle of the wheel which is necessary to raise the wheel over the obstacle of height 0.4 m. Radius of wheel is 1m and mass = 10 kg . F is

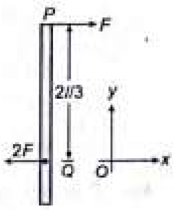


(a) 100 N (b) 66 N
(c) 167 N (d) 133.3 N

30. A string is wrapped around a cylinder of mass M and radius R. The string is pulled vertically upwards to prevent the centre of mass from falling as the cylinder unwinds the string. The tension in the string is

(a) $\frac{Mg}{6}$ (b) $\frac{Mg}{3}$
(c) $\frac{Mg}{2}$ (d) $\frac{2Mg}{3}$

31. Two forces F and $2F$ are applied on a rod of length l and mass m, as shown. The angular acceleration of the rod is



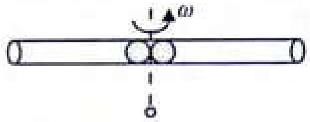
(a) $\frac{8F}{ml}(-\hat{k})$ (b) $\frac{4F}{ml}(\hat{k})$
(c) $\frac{4F}{ml}(-\hat{k})$ (d) $\frac{8F}{ml}(\hat{k})$

32. The mass of a sphere placed on a smooth horizontal surface is distributed non-uniformly. A horizontal force equal to weight of sphere is applied at a distance 'a' from centre of the sphere for a short time. The sphere is rotated by an angle θ, but it behaves as if in stable equilibrium. Find the distance between centre and CG of the sphere:

(a) $a \tan \theta$ (b) $a \cot \theta$
(c) $a \sec \theta$ (d) $a \operatorname{cosec} \theta$

Angular Momentum and Energy of Rigid Body

33. A smooth tube of certain mass is rotated in a gravity-free space and released. The two balls shown in the figure move towards the ends of the tube. For the whole system, which of the following quantities is not conserved.

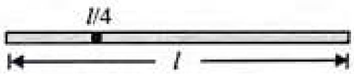


(a) Angular momentum (b) Linear momentum
(c) Kinetic energy (d) Angular speed

34. Two bodies with moments of inertia I_1 and I_2 ($I_1 > I_2$) have equal angular momenta. If their kinetic energies of rotation are E_1 and E_2, respectively, then

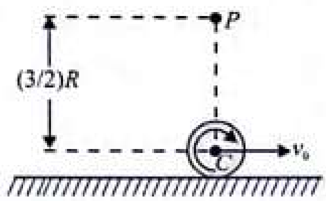
(a) $E_1 = E_2$ (b) $E_1 < E_2$
(c) $E_1 > E_2$ (d) $E_1 \geq E_2$

35. A uniform thin rod of length l and mass m is hinged at a distance $l/4$ from one of the end and released from horizontal position as shown in the figure. The angular velocity of the rod as it passes the vertical position is



(a) $2\sqrt{\frac{5g}{7l}}$ (b) $2\sqrt{\frac{6g}{7l}}$
(c) $\sqrt{\frac{3g}{7l}}$ (d) $2\sqrt{\frac{g}{l}}$

36. A disc of mass M and radius R rolls without slipping on a horizontal surface. If the velocity of its centre is v_0, then the total angular momentum of the disc about a fixed point P at a height $(3/2)R$ above the centre C

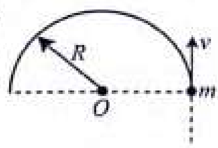


(a) increases continuously as the disc moves away
(b) decreases continuously as the disc moves away
(c) is equal to $2MRv_0$
(d) is equal to MRv_0

37. A child is standing with folded hands at the centre of a platform rotating about its central axis. The kinetic energy of the system is K. The child now stretches his arms so that the moment of inertia of the system doubles. The kinetic energy of the system now is

(a) $2K$ (b) $\frac{K}{2}$
(c) $\frac{K}{4}$ (d) $4K$

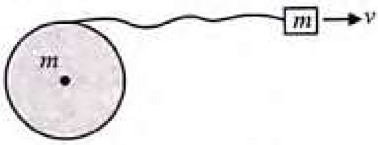
38. A small bead of mass m moving with velocity v gets threaded on a stationary semicircular ring of mass m and radius R kept on a horizontal table. The ring can freely rotate about its centre. The bead comes to rest relative to the ring. What will be the final angular velocity of the system?



(a) $\frac{v}{R}$ (b) $\frac{2v}{R}$

(c) $\frac{v}{2R}$ (d) $\frac{3v}{R}$

39. A block of mass m is attached to a pulley disc of equal mass m and radius r by means of a slack string as shown. The pulley is hinged about its centre on a horizontal table and the block is projected with an initial velocity of 5 m/s. Its velocity when the string becomes taut will be



(a) 3 m/s (b) 2.5 m/s

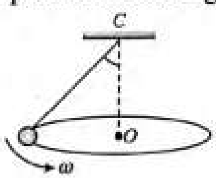
(c) 5/3 m/s (d) 10/3 m/s

40. Two points of a rod move with velocities $3v$ and v perpendicular to the rod and in the same direction separated by a distance 'r'. The angular velocity of the rod is

(a) $\frac{3v}{r}$ (b) $\frac{4v}{r}$

(c) $\frac{5v}{r}$ (d) $\frac{2v}{r}$

41. A conical pendulum consists of a simple pendulum moving in a horizontal circle as shown in the figure. C is the pivot, O the centre of the circle in which the pendulum bob moves and ω the constant angular velocity of the bob. If $\vec{L}$ is the angular momentum about point C, then



(a) $\vec{L}$ is constant

(b) only direction of $\vec{L}$ is constant

(c) only magnitude of $\vec{L}$ is constant

(d) none of the above

42. Two rigid bodies A and B rotate with angular momenta L_A and L_B respectively. The moments of inertia of A and B about the axes of rotation are I_A and I_B respectively. If $I_A = I_B/4$ and $L_A = 5L_B$, Then the ratio of rotational kinetic energy K_A of A to the rotational kinetic energy K_B of B is given by

(a) $\frac{K_A}{K_B} = \frac{25}{4}$ (b) $\frac{K_A}{K_B} = \frac{5}{4}$

(c) $\frac{K_A}{K_B} = \frac{1}{4}$ (d) $\frac{K_A}{K_B} = 100$

43. Two discs, each having moment of inertia 5 kg m^2 about its central axis, rotating with speeds 10 rad s^{-1} and 20 rad s^{-1}, are brought in contact face to face with their axes of rotation coincided. The loss of kinetic energy in the process is

(a) 2 J (b) 5 J (c) 125 J (d) 0 J

44. A boy stands over the centre of a horizontal platform which is rotating freely with a speed of 2 revolutions/s about a vertical axis through the centre of the platform and straight up through the boy. He holds 2 kg masses in each of his hands close to his body. The combined moment of inertia of the system is 1 kg × metre^2. The boy now stretches his arms so as to hold the masses far from his body. In this situation, the moment of inertia of the system increases to 2 kg × metre^2. The kinetic energy of the system in the latter case as compared with that in the previous case will

(a) Remain unchanged (b) Decrease

(c) Increase (d) Remain uncertain

45. A sphere is released on a smooth inclined plane from the top. When it moves down, its angular momentum is

(a) conserved about every point

(b) conserved about the point of contact only

(c) conserved about the centre of the sphere only

(d) conserved about any point on a line parallel to the inclined plane and passing through the centre of the ball

46. A horizontal 90 kg merry-go-round is a solid disk of radius 1.50 m and is started from rest by a constant horizontal force of 50.0 N applied tangentially to the edge of the disk. The kinetic energy of the disk after 3.00 is

(a) 125 J (b) 500 J (c) 250 J (d) 150 J

47. A solid uniform disk of mass m and radius R is pivoted about a horizontal axis through its center and a small body of mass m is attached to the rim of the disk. If the disk is released from rest with the small body, initially at the same level as the centre, the angular velocity when the small body reaches the lowest point of the disk is

(a) $\sqrt{\frac{12g}{13r}}$ (b) $\sqrt{\frac{11g}{12r}}$

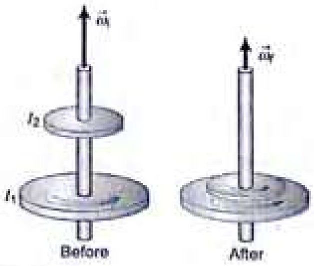
(c) $\sqrt{\frac{12g}{11r}}$ (d) $\sqrt{\frac{7g}{11r}}$

48. A solid sphere of mass m and radius r is released from rest from the given position. If it rolls without sliding on the circular track of radius R, its speed when it reaches its lowest position will be

(a) $\sqrt{\frac{8}{7}g(R-r)}$ (b) $\sqrt{\frac{10}{7}g(R-r)}$

(c) $\sqrt{\frac{10}{9}g(R-r)}$ (d) $\sqrt{\frac{5}{7}g(R-r)}$

49. A disk with moment of inertia I_1 rotates about a frictionless, vertical axle with angular speed ω_1. A second disk, this one having moment of inertia I_2 and initially not rotating, drops onto the first disk (figure). Because of friction between the surfaces, the two eventually reach the same angular speed ω_f. The value of ω_f is



(a) $\frac{I_1+I_2}{I_1}\omega_i$ (b) $\frac{I_1}{I_1+I_2}\omega_i$

(c) $\frac{I_1+I_2}{I_2}\omega_i$ (d) $\frac{I_1}{I_2}\omega_i$

50. A girl of mass M stands on the rim of a frictionless merry-go-round of radius R and rotational inertia I that is not moving. She throws a rock of mass m horizontally in a direction that is tangent to the outer edge of the merry-go-round. The speed of the rock, relative to the ground, is v. Afterward, the linear speed of the girl is

(a) $\frac{mvR^2}{I+MR^2}$ (b) $\frac{(m+M)vR^2}{I+MR^2}$

(c) $\frac{mvR^2}{I+(M+m)R^2}$ (d) $\frac{mvR^2}{I+(M-m)R^2}$

51. A particle is moving along a line $y = x + a$ with a constant velocity v. Find the angular momentum of the particle about the origin.

(a) mva (b) $mva\sqrt{2}$

(c) $\frac{mva}{\sqrt{2}}$ (d) $\frac{mvy}{x\sqrt{2}}$

52. Two men of equal masses stand at opposite ends of the diameter of a turntable disc of a certain mass, moving with constant angular velocity. The two men make their way to the middle of the turntable at equal rates. In doing so

(a) kinetic energy of rotation has increased while angular momentum remains the same.

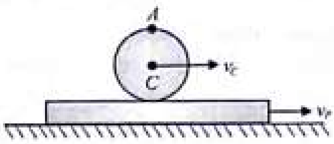
(b) kinetic energy of rotation has decreased while angular momentum remains same.

(c) kinetic energy of rotation has decreased but angular momentum has increased.

(d) both kinetic energy of rotation and angular momentum have decreased.

Problems Based on Rolling

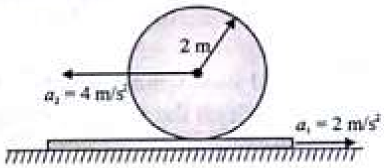
53. In the figure, the velocities are in ground frame and the cylinder is performing pure rolling on the plank, velocity of point 'A' would be



(a) $2v_C$ (b) $2v_C + v_P$

(c) $2v_C - v_P$ (d) $2(v_C - v_P)$

54. In the figure, a sphere of radius 2 m rolls on a plank. The accelerations of the sphere and the plank are indicated. The value of α is



(a) 2 rad/s^2 (b) 4 rad/s^2

(c) 3 rad/s^2 (d) 1 rad/s^2

55. A ring of radius R is first rotated with an angular velocity ω_0 and then carefully placed on a rough horizontal surface. The coefficient of friction between the surface and the ring is μ. Time after which its angular speed is reduced to half is

(a) $\frac{\omega_0\mu R}{2g}$ (b) $\frac{\omega_0 g}{2\mu R}$

(c) $\frac{2\omega_0 R}{\mu g}$ (d) $\frac{\omega_0 R}{2\mu g}$

56. If a spherical ball rolls on a table without slipping, the fraction of its total energy associated with rotation is

(a) $\frac{3}{5}$ (b) $\frac{2}{7}$

(c) $\frac{2}{5}$ (d) $\frac{3}{7}$

57. A force F acts tangentially at the highest point of a disc of mass m kept on a rough horizontal plane. If the disc rolls without slipping, the acceleration of centre of the disc is:

(a) $\frac{2F}{3m}$ (b) $\frac{10F}{7m}$

(c) zero (d) $\frac{4F}{3m}$

58. A body is rolling without slipping on a horizontal plane. The rotational energy of the body is 40% of the total kinetic energy. Identify the body.

(a) Ring (b) Hollow cylinder

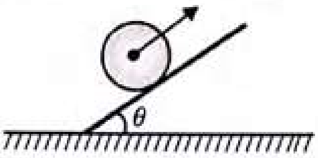
(c) Solid cylinder (d) Hollow sphere

59. A solid sphere rolls down two different inclined planes of the same height but of different inclinations:
(a) the speeds will be same but time of descent will be different
(b) in both cases, the speeds and time of descent will be same
(c) speeds and time of descent both will be different
(d) the speeds will be different but time of descent will be same

60. A body of mass m slides down an smooth incline and reaches the bottom with a velocity v. Now smooth incline surface is made rough and the same mass was in the form of a ring which rolls down this incline, the velocity of the ring at the bottom would have been:
(a) $\sqrt{2}\,v$ (b) v
(c) $\left(\sqrt{\frac{2}{5}}\right)v$ (d) $v/\sqrt{2}$

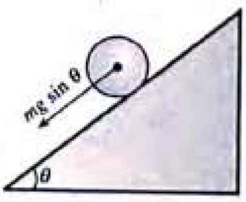
61. A ring, cylinder and solid sphere are placed on the top of a rough incline on which the sphere can just roll without slipping. When all of them are released at the same instant from the same position, then
(a) all of them reach the ground at the same instant
(b) the sphere reaches first and the ring at the last
(c) the sphere reaches first and the cylinder and ring reach together
(d) none of the above

62. A sphere has to purely roll upwards. At an instant when the velocity of sphere is v, frictional force acting on it is



(a) downwards and $\mu mg \cos\theta$
(b) downwards and $\frac{2mg\sin\theta}{7}$
(c) upwards and $\mu mg\cos\theta$
(d) upwards and $\frac{2mg\sin\theta}{7}$

63. A solid cylinder of mass 3 kg is placed on a rough inclined plane of inclination 30°. If $g = 10\ \text{ms}^{-2}$, then the minimum frictional force required for it to roll without slipping down the plane is

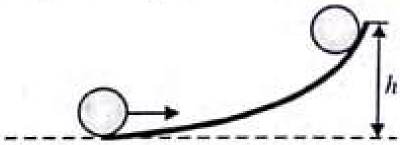


(a) 2 N (b) 5 N
(c) 15 N (d) 18 N

64. A small solid sphere of radius r rolls down an incline without slipping which ends into a vertical loop of radius R. Find the height above the base so that it just loops the loop
(a) $\frac{5}{2}R$ (b) $\frac{5}{2}(R-r)$
(c) $\frac{25}{10}(R-r)$ (d) $\frac{27}{10}R-\frac{17r}{10}$

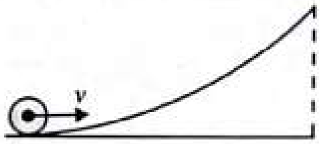
65. A sphere is rolling down an inclined plane without slipping. The ratio of rotational kinetic energy to total kinetic energy is
(a) $\frac{5}{7}$ (b) $\frac{2}{5}$
(c) $\frac{2}{7}$ (d) none of these

66. In the figure shown, a ball without sliding on a horizontal surface. It ascends a curved track up to height h and returns. The value of h is h_1 for sufficiently rough curved track to avoid sliding and is h_2 for smooth curved track, then



(a) $h_1 = h_2$ (b) $h_1 < h_2$
(c) $h_1 > h_2$ (d) $h_2 = 2h_1$

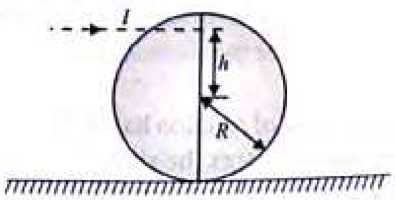
67. A small object of uniform density rolls up a curved surface with an initial velocity v. It reaches up to a maximum height of $3v^2/4g$ w.r.t. the initial position. The object is



(a) ring (b) solid sphere
(c) hollow sphere (d) disc

68. A rolling object rolls without slipping down an inclined plane (angle of inclination θ), then the minimum acceleration it can have is
(a) $g\sin\theta$ (b) $\frac{2g\sin\theta}{3}$
(c) $\frac{g\sin\theta}{2}$ (d) zero

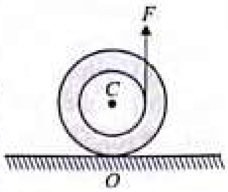
69. A solid sphere rests on a horizontal surface. A horizontal impulse is applied at height h from centre. The sphere starts rolling just after the application of impulse. The ratio h/r will be



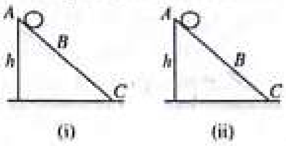
(a) $\frac{1}{2}$ (b) $\frac{2}{5}$
(c) $\frac{1}{5}$ (d) $\frac{2}{3}$

70. A yo-yo is placed on a rough horizontal surface and a constant force F, which is less than its weight, pulls it vertically. Due to this

(a) friction force acts towards left, so it will move towards left
(b) friction force acts towards right, so it will move towards right
(c) it will move towards left, so friction force acts towards left
(d) it will move towards right so friction force acts towards right



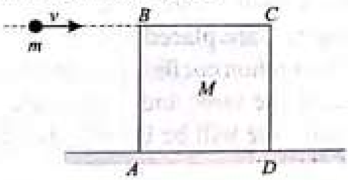
71. In both the figures all other factors are same, except that in Figure (i) AB is rough and BC is smooth while in Figure (ii) AB is smooth and BC is rough. In Figure (i), if a sphere is released from rest it starts rolling. Now consider the Figure (ii), if same sphere is released from top of the inclined plane, what will be the kinetic energy of the sphere on reaching the bottom:



(a) is same in both the cases
(b) is greater in case (i)
(c) is greater in case (ii)
(d) information insufficient

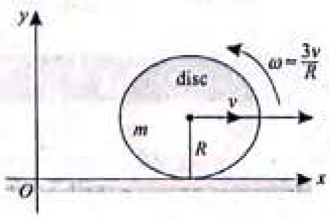
Problems Based on Mixed Concepts

72. A solid cube $ABCD$ of side a and mass M is placed on a rough horizontal surface. A bullet of mass m and speed v is shot at the top of the cube so that cube rotates about point D. The bullet sticks to the cube, $m << M$. Find the angular velocity of the cube.



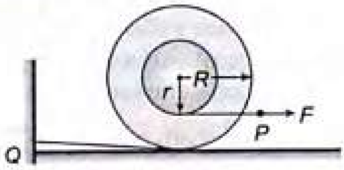
(a) $\frac{6mv}{5Ma}$ (b) $\frac{3Mv}{2ma}$
(c) $\frac{2Mv}{3ma}$ (d) $\frac{2mv}{3Ma}$

73. The angular momentum of the disc which spins with $\vec{\omega} = \frac{3v}{R}\hat{k}$ and its CM moves with a velocity $\vec{v} = v\hat{i}$ about O will be



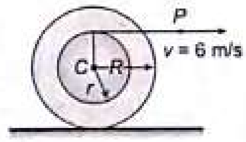
(a) $\frac{3mvR}{2}\hat{k}$ (b) $\frac{mvR}{2}\hat{k}$
(c) $-\frac{3mvR}{2}\hat{k}$ (d) $-\frac{mvR}{2}\hat{k}$

74. Find the acceleration of the body if a force $F = 8$ N pulls the string at P that passes over the body and it is connected by another string to a rigid support at Q. (Take radius of gyration $k = \frac{2}{\sqrt{3}}m$, $R = 2$ m, $r = 1$ m, and mass of the body $m = 3$ kg)



(a) 1 m/s^2 (b) 1.5 m/s^2
(c) 1.2 m/s^2 (d) 2 m/s^2

75. A cotton reel rolls without sliding such that the point P of the string has velocity $v = 6$ m/s. If $r = 10$ cm and $R = 20$ cm, then the velocity of its centre C is

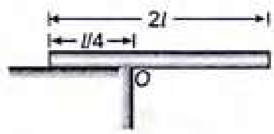


(a) 2.5 m/s (b) 5 m/s
(c) 4m/s (d) 2 m/s

76. A homogenous rod of length $l = \eta x$ and mass M is lying on a smooth horizontal floor. A bullet of mass m hits the rod at a distance x from the middle of the rod at a velocity v_0 perpendicular to the rod and comes to rest after collision. If the velocity of the farther end of the rod just after the impact is in the opposite direction of v_0, then

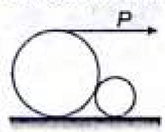
(a) $\eta > 3$ (b) $\eta < 3$
(c) $\eta > 6$ (d) $\eta < 6$

77. One fourth length of a uniform rod of length $2l$ and mass m is placed on a horizontal table and the rod is held horizontally. The rod is released from rest. The normal reaction on the rod as soon as the rod is released will be



(a) $\frac{5mg}{27}$ (b) $\frac{4mg}{27}$
(c) $\frac{mg}{9}$ (d) $\frac{4mg}{19}$

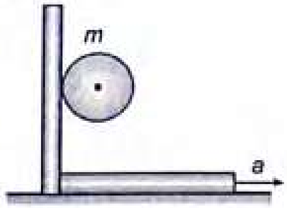
78. Two heavy right circular rollers of radii R and r respectively rest on a rough horizontal plane as shown in figure. The larger roller has a string wound around it to which a horizontal force P can be applied as shown. Assuming that the coefficient of friction μ has the same value for all surfaces of contact and the smaller cylinder should neither roll nor slide. The minimum coefficient of friction so that the larger roller can be pulled over the smaller one is



(a) $\frac{r}{R}$ (b) $\left(\frac{r}{R}\right)^2$

(c) $3\sqrt{\frac{r}{R}}$ (d) $\sqrt{\frac{r}{R}}$

79. A uniform solid sphere rolls down a vertical surface without sliding. If the vertical surface moves with an acceleration $a = \frac{g}{2}$, the minimum coefficient of friction between the sphere and vertical surfaces so as to prevent relative sliding is



(a) 3/7 (b) 4/7

(c) 4/5 (d) 3/5

80. A spherical ball of radius r initially at rest on a rough horizontal surface is hit horizontally at a point at a distance x above the central line. Due to this sharp impulse the centre of the ball acquires a velocity v_c. After some time, the ball will start pure rolling with a velocity equal to

(a) $\frac{5}{7}v_c\left[\frac{x+r}{r}\right]$ (b) $\frac{2}{7}v_c\left[\frac{x+r}{r}\right]$

(c) $\frac{5}{7}v_c\left[\frac{x+r}{x}\right]$ (d) $\frac{2}{7}v_c\left[\frac{x+r}{x}\right]$

81. A uniform rod of length L (in between the supports) and mass m is placed on two supports A and B. The rod breaks suddenly at length $L/10$ from the support B. Find the reaction at support A immediately after the rod breaks.

(a) $\frac{9}{40}mg$ (b) $\frac{19}{40}mg$

(c) $\frac{mg}{2}$ (d) $\frac{9}{20}mg$

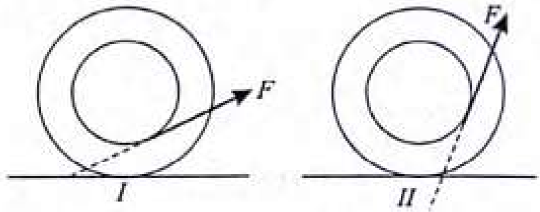
82. A rigid body of radius R, either hollow or solid, lies on a smooth horizontal surface. The body is pulled by a horizontal force acting tangentially from the highest point. The distance travelled by the body in the time in which it makes one full rotation is the same that it will make in one full rotation during pure rolling. The rigid body will be

(a) solid sphere
(b) hollow sphere
(c) circular disc
(d) hollow cylinder

83. A solid sphere is set into rotation at an angular velocity and it is then placed on a rough horizontal surface. The ratio of distances covered by rotational and translational motions up to the start of the pure rolling is (Assume uniformly accelerated motion up to start of pure rolling):

(a) 5/2 (b) 7/2 (c) 7/4 (d) 9/2

84. The string of a step rolling wheel is pulled by applying force F with different lines of action in two situations as shown. The wheel starts rolling without slipping due to application of the force.



(a) The wheel rolls to the right in situation I and to the left in situation II.
(b) The wheel rolls to the left in situation I and to the right in situation II.
(c) The wheel rolls to the right in both situations.
(d) The wheel rolls to the left in both situations.

85. A solid sphere, a hollow sphere and a disc, all having same mass and radius, are placed at the top of an incline and released. The friction coefficients between the objects and the incline are the same and not sufficient to allow pure rolling. Least time will be taken in reaching the bottom by

(a) the solid sphere
(b) the hollow sphere
(c) the disc
(d) all will take the same time

86. In the previous question, the smallest kinetic energy at the bottom of the incline will be achieved by

(a) the solid sphere
(b) the hollow sphere
(c) the disc
(d) all will achieve the same kinetic energy

ARCHIVES

1. The initial angular velocity of a circular disc of mass M is ω_1. Then two small spheres of mass m each are attached gently to diametrically opposite points on the edge of the disc. What is the final angular velocity of the disc?

(a) $\left(\frac{M+m}{M}\right)\omega_1$ (b) $\left(\frac{M+m}{m}\right)\omega_1$

(c) $\left(\frac{M}{M+4m}\right)\omega_1$ (d) $\left(\frac{M}{M+2m}\right)\omega_1$

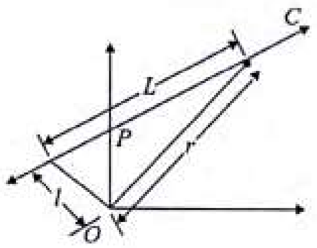
(AIEEE 2002)

2. A solid sphere, a hollow sphere, and a ring are released from the top of an inclined plane (frictionless) so that they slide down the plane. Then the maximum acceleration down the plane is for (no rolling)

(a) solid sphere
(b) hollow sphere
(c) ring
(d) all have the same acceleration **(AIEEE 2002)**

3. The moment of inertia of a circular wire of mass M and radius R about its diameter is
(a) $MR^2/2$ (b) MR^2
(c) $2MR^2$ (d) $MR^2/4$ **(AIEEE 2002)**

4. A particle of mass m moves along a line PC with velocity v as shown. What is the angular momentum of the particle about O?



(a) mvL (b) mvl
(c) mvr (d) zero **(AIEEE 2002)**

5. Let $\vec{F}$ be the force acting on a particle having position vector $\vec{r}$ and $\vec{\tau}$ be the torque of this force about the origin. Then
(a) $\vec{r}\cdot\vec{\tau}=0$ and $\vec{F}\cdot\vec{\tau}\neq 0$
(b) $\vec{r}\cdot\vec{\tau}=0$ and $\vec{F}\cdot\vec{r}=0$
(c) $\vec{r}\cdot\vec{\tau}\neq 0$ and $\vec{F}\cdot\vec{\tau}\neq 0$
(d) $\vec{r}\cdot\vec{\tau}=0$ and $\vec{F}\cdot\vec{\tau}=0$ **(AIEEE 2003)**

6. A circular disc X of radius R is made from an iron plate of thickness t, and another disc Y of radius $4R$ is made from an iron plate of thickness $t/4$. Then the relation between the moment of inertia I_X and I_Y is
(a) $I_Y=32I_X$ (b) $I_Y=16I_X$
(c) $I_Y=I_X$ (d) $I_Y=64I_X$
(AIEEE 2003)

7. A particle performing uniform circular motion has angular momentum L. If its angular frequency is doubled and its kinetic energy halved, then the new angular momentum is
(a) $\frac{L}{4}$ (b) $2L$
(c) $4L$ (d) $\frac{L}{2}$ **(AIEEE 2003)**

8. A solid sphere is rotating in free space. If the radius of the sphere is increased keeping its mass the same, which one of the following will not be affected?
(a) angular velocity
(b) angular momentum
(c) moment of inertia
(d) rotational kinetic energy **(AIEEE 2004)**

9. A solid sphere A and another hollow sphere B are of the same mass and same outer radii. Their moment of inertia about their diameters are, respectively, I_A and I_B such that (d_A and d_B are the densities)
(a) $I_A<I_B$ (b) $I_A>I_B$
(c) $I_A=I_B$ (d) $\frac{I_A}{I_B}=\frac{d_A}{d_B}$ **(AIEEE 2004)**

10. Which of the following statements is false for a particle moving in a circle with a constant angular speed?
(a) The velocity vector is tangent to the circle.
(b) The acceleration vector is tangent to the circle.
(c) The acceleration vector points towards the centre of the circle.
(d) The velocity and acceleration vectors are perpendicular to each other. **(AIEEE 2004)**

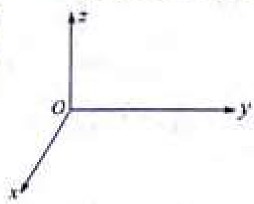
11. An annular ring with inner and outer radii R_1 and R_2 is rolling without slipping with a uniform angular speed. The ratio of the forces experienced by two particles situated on the inner and outer parts of the ring is
(a) $\frac{R_1}{R_2}$ (b) 1
(c) $\left(\frac{R_1}{R_2}\right)^2$ (d) $\frac{R_2}{R_1}$ **(AIEEE 2005)**

[**Note:** The particles should be of same mass.]

12. The moment of inertia of a uniform semi-circular disc of mass M and radius r about a line perpendicular to the plane of the disc through the centre is
(a) $\frac{1}{2}Mr^2$ (b) Mr^2
(c) $\frac{2}{5}Mr^2$ (d) $\frac{1}{4}Mr^2$ **(AIEEE 2005)**

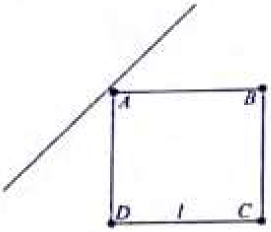
13. A thin circular ring of mass m and radius R is rotating about its axis with a constant angular velocity ω. Two objects each of mass M are attached gently to the opposite ends of a diameter of the ring. The ring now rotates with an angular velocity of
(a) $\frac{\omega m}{m+M}$ (b) $\frac{\omega m}{m+2M}$
(c) $\frac{\omega(m+2M)}{m}$ (d) $\frac{\omega(m-2M)}{m+2M}$
(AIEEE 2006)

14. A force $-F\hat{k}$ acts on O, the origin of the coordinate system. The torque about the point $(1, -1)$ is



(a) $F(\hat{i}+\hat{j})$
(b) $-F(\hat{i}-\hat{j})$
(c) $F(\hat{i}-\hat{j})$
(d) $-F(\hat{i}+\hat{j})$ **(AIEEE 2006)**

15. Four point masses, each of value m, are placed at the corners of a square $ABCD$ of side l. The moment of inertia of this system about an axis passing through A and parallel to BD is



(a) $3ml^2$ (b) ml^2

(c) $2ml^2$ (d) $\sqrt{3}\, ml^2$ **(AIEEE 2006)**

16. A round uniform body of radius R, mass M, and moment of inertia I rolls down (without slipping) an inclined plane making an angle θ with the horizontal. Then its acceleration is

(a) $\dfrac{g\sin\theta}{1+\dfrac{MR^2}{I}}$ (b) $\dfrac{g\sin\theta}{1-\dfrac{I}{MR^2}}$

(c) $\dfrac{g\sin\theta}{1-\dfrac{MR^2}{I}}$ (d) $\dfrac{g\sin\theta}{1+\dfrac{I}{MR^2}}$

(AIEEE 2007)

17. The angular momentum of a particle rotating with a central force is constant due to

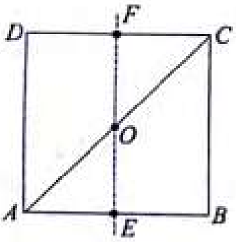
(a) constant linear momentum

(b) zero torque

(c) constant torque

(d) constant force **(AIEEE 2007)**

18. For the given uniform square lamina $ABCD$, whose centre is O,



(a) $I_{AD} = 3I_{EF}$ (b) $I_{AC} = I_{EF}$

(c) $I_{AC} = \sqrt{2}\, I_{EF}$ (d) $\sqrt{2}\, I_{AC} = I_{EF}$

(AIEEE 2007)

19. Consider a uniform square plate of side a and mass M. The moment of inertia of this plate about an axis perpendicular to its plane and passing through one of its corners is

(a) $\dfrac{5}{6}Ma^2$ (b) $\dfrac{1}{12}Ma^2$

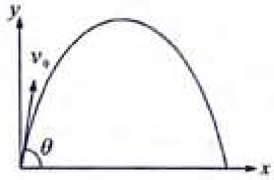
(c) $\dfrac{7}{12}Ma$ (d) $\dfrac{2}{3}Ma^2$ **(AIEEE 2008)**

20. A thin uniform rod of length l and mass m is swinging freely about a horizontal axis passing through its end. Its maximum angular speed is ω. Its centre of mass rises to a maximum height of

(a) $\dfrac{1}{3}\dfrac{l^2\omega^2}{g}$ (b) $\dfrac{1}{6}\dfrac{l\omega}{g}$

(c) $\dfrac{1}{2}\dfrac{l^2\omega^2}{g}$ (d) $\dfrac{1}{6}\dfrac{l^2\omega^2}{g}$ **(AIEEE 2009)**

21. A small particle of mass m is projected at an angle θ with the x-axis with an initial velocity v_0 in the x-y plane as shown in the figure. At a time $t < (v_0 \sin\theta/g)$, the angular momentum of the particle is



(a) $-mgv_0t^2\cos\theta\,\hat{j}$ (b) $mgv_0t\cos\theta\,\hat{k}$

(c) $-\dfrac{1}{2}mgv_0t^2\cos\theta\,\hat{k}$ (d) $\dfrac{1}{2}mgv_0t^2\cos\theta\,\hat{i}$

(AIEEE 2010)

22. A thin horizontal circular disc is rotating about a vertical axis passing through its centre. An insect is at rest at a point near the rim of the disc. The insect now moves along a diameter of the disc to reach its other end. During the journey of the insect, the angular speed of the disc

(a) remains unchanged

(b) continuously decreases

(c) continuously increases

(d) first increases and then decreases **(AIEEE 2011)**

23. A mass m hangs with the help of a string wrapped around a pulley on a frictionless bearing. The pulley has mass m and radius R. Assuming pulley to be a perfect uniform circular disc, the acceleration of the mass m, if the string does not slip on the pulley, is

(a) $3g/2$ (b) g

(c) $2g/3$ (d) $g/3$ **(AIEEE 2011)**

24. A pulley of radius 2 m is rotated about its axis by a force $F = (20t - 5t^2)$ newton (where t is measured in seconds) applied tangentially. If the moment of inertia of the pulley about its axis of rotation is 10 kgm^2, the number of rotations made by the pulley before its direction of motion is reversed, is:

(a) less than 3

(b) more than 3 but less than 6

(c) more than 6 but less than 9

(d) more than 9 **(AIEEE 2011)**

25. A hoop of radius r and mass m rotating with an angular velocity ω_0 is placed on a rough horizontal surface. The

initial velocity of the centre of the hoop is zero. What will be the velocity of the centre of the hoop when it ceases to slip?

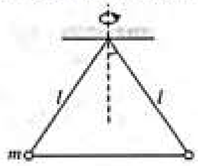
(a) $\frac{r\omega_0}{3}$ (b) $\frac{r\omega_0}{2}$

(c) $r\omega_0$ (d) $\frac{r\omega_0}{4}$ **(JEE Main 2013)**

26. A bob of mass m attached to an inextensible string of length l is suspended from a vertical support. The bob rotates in a horizontal circle with an angular speed ω rad/s about the vertical. About the point of suspension,

(a) angular momentum changes in direction but not in magnitude.
(b) angular momentum changes both in direction and in magnitude.
(c) angular momentum is conserved.
(d) angular momentum changes in magnitude but not in direction. **(JEE Main 2014)**

27. A mass m is supported by a massless string wound around a uniform hollow cylinder of mass m and radius R. If the string does not slip on the cylinder, with what acceleration will the mass fall on release?



(a) $\frac{5g}{6}$ (b) g

(c) $\frac{2g}{3}$ (d) $\frac{g}{2}$ **(JEE Main 2014)**

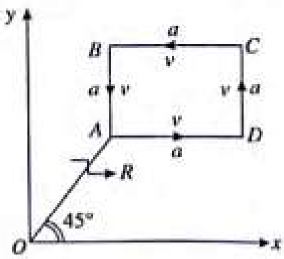
28. From a solid sphere of mass M and radius R, a cube of maximum possible volume is cut. The moment of inertia of cube about an axis passing through its centre and perpendicular to one of its faces is

(a) $\frac{MR^2}{32\sqrt{2}\pi}$ (b) $\frac{MR^2}{16\sqrt{2}\pi}$

(c) $\frac{4MR^2}{9\sqrt{3}\pi}$ (d) $\frac{4MR^2}{3\sqrt{3}\pi}$

(JEE Main 2015)

29. A particle of mass m is moving along side of a square of side 'a', with a uniform speed v in the x-y plane as shown in the figure:



Which of the following statements is false for the angular momentum $\vec{L}$ about the origin?

(a) $\vec{L} = -\frac{mv}{\sqrt{2}}R\hat{k}$ when the particle is moving from A to B

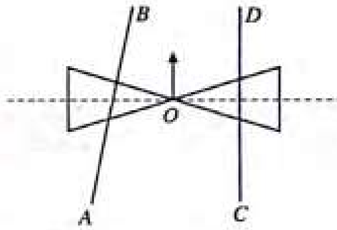
(b) $\vec{L} = mv\left[\frac{R}{\sqrt{2}} - a\right]\hat{k}$ when the particle is moving from C to D.

(c) $\vec{L} = mv\left[\frac{R}{\sqrt{2}} + a\right]\hat{k}$ when the particle is moving from B to C.

(d) $\vec{L} = \frac{mv}{\sqrt{2}}R\hat{k}$ when the particle is moving from D to A.

(JEE Main 2016)

30. A roller is made by joining together two cones at their vertices O. It is kept on two rails AB and CD which are placed asymmetrically (see figure), with its axis perpendicular to CD and its centre O at the centre of line joining AB and CD (see figure). It is given a light push so that it starts rolling with its centre O moving parallel to CD in the direction shown. As it moves, the roller will tend to:



(a) turn left
(b) turn right
(c) go straight
(d) turn left and right alternately

(JEE Main 2016)

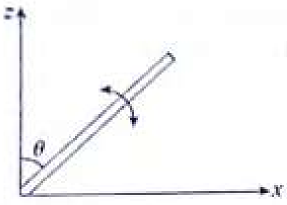
31. The moment of inertia of a uniform cylinder of length l and radius R about its perpendicular bisector is I. What is the ratio l/R such that the moment of inertia is minimum?

(a) 1 (b) $\frac{3}{\sqrt{2}}$

(c) $\sqrt{\frac{3}{2}}$ (d) $\frac{\sqrt{3}}{2}$

(JEE Main 2017)

32. A slender uniform rod of mass M and length l is pivoted at one end so that it can rotate in a vertical plane (see figure). There is negligible friction at the pivot. The free end is held vertically above the pivot and then released. The angular acceleration of the rod when it makes an angle θ with the vertical is

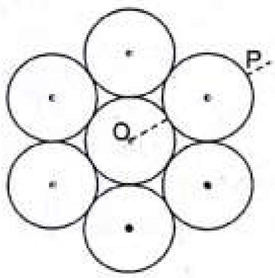


(a) $\frac{3g}{2l}\cos\theta$ (b) $\frac{2g}{3l}\cos\theta$

(c) $\frac{3g}{2l}\sin\theta$ (d) $\frac{2g}{3l}\sin\theta$

(JEE Main 2017)

33. Seven identical circular planar disks, each of mass M and radius R are welded symmetrically as shown. The moment of inertia of the arrangement about the axis normal to the plane and passing through the point P is

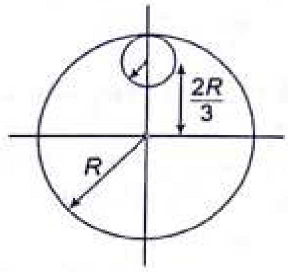


(a) $\frac{181}{2}MR^2$ (b) $\frac{19}{2}MR^2$

(c) $\frac{55}{2}MR^2$ (d) $\frac{73}{2}MR^2$

(JEE Main 2018)

34. From a uniform circular disc of radius R and mass $9M$, a small disc of radius $R/3$ is removed as shown in the figure. The moment of inertia of the remaining disc about an axis perpendicular to the plane of the disc and passing through centre of disc is:



(a) $\frac{37}{9}MR^2$ (b) $4\,MR^2$

(c) $\frac{40}{9}MR^2$ (d) $10\,MR^2$

(JEE Main 2018)

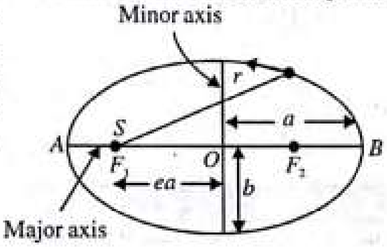
Chapter 10

Gravitation

KEPLER'S LAWS

A heavenly body revolving around a planet in an orbit is called a natural satellite. For example, Moon revolves around the planet earth, so Moon is the satellite of earth. Their motions can be studied with the help of Kepler's laws, as stated in the following:

Law of orbit: Each planet moves around the Sun in an elliptical orbit with the Sun at one of the foci as shown in the figure. The eccentricity of an ellipse is defined as the ratio of the distance SO and AO, i.e., $e = SO/AO$.



$\therefore \quad e = \dfrac{SO}{a}$

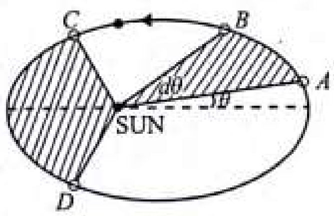
$SO = ea$

The distance of closest approach with the Sun at F_1 is AS. This distance is called perigee. The greatest distance (BS) of the planet from the Sun is called apogee.

Perigee $(AS) = AO - OS = a - ea = a(1 - e)$

Apogee $(BS) = OB + OS = a + ea = a(1 + e)$

Law of areas: The line joining the Sun and a planet sweeps out equal areas in equal intervals of time. A planet takes the same time to travel from A to B as from C to D as shown in the figure (the shaded areas are equal). Naturally, the planet has to move faster from C to D. In other words, areal velocity of a planet is constant at dA/dt = constant. The law of areas is identical with the law of conservation of angular momentum.



$$\text{Areal velocity} = \frac{\text{Area swept}}{\text{Time}}$$

$$= \frac{\frac{1}{2} r\,(r\,d\theta)}{dt} = \frac{1}{2} r^2 \frac{d\theta}{dt} = \text{constant}$$

Hence, $\frac{1}{2} r^2 \omega = \text{constant}$

or $\quad mr^2 \omega = \text{constant}$

where $\quad mr^2 = MI$ of the planet relative to Sun $= I$

$I\omega =$ constant or $\vec{L}$ = constant

Law of periods: The square of the time for a planet to complete a revolution about the Sun is proportional to the cube of semimajor axis of the elliptical orbit.

$$T^2 \propto a^3 \qquad \text{(i)}$$

where T = Time period of revolution of the planet a = semi-major axis of the ellipse. The orbits of all the planets except Mercury and Pluto are very close to being circular. Hence, we can take the orbits of planets as sufficiently circular since the semi-major axis becomes the radius of the circle. Hence, Eq. (i) can be written as

$$T^2 = Kr^3$$

ILLUSTRATION 10.1 The mean distance of Mars from the Sun is 1.524 times that of the Earth from the Sun. Find the number of years required for Mars to make one revolution about the Sun.

Solution. For planets revolving around the Sun, $T^2 \propto r^3$

$\Rightarrow \quad \dfrac{T_1^2}{T_2^2} = \dfrac{r_1^3}{r_2^3}$ (T_1 = time period of Mars, T_2 = time period of the Earth)

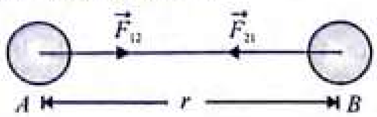
$\Rightarrow \quad \dfrac{T_1}{T_2} = \left(\dfrac{r_1}{r_2}\right)^{3/2}$

$\Rightarrow \quad T_1 = T_2\left(\dfrac{r_1}{r_2}\right)^{3/2} = (1\text{ year})\,(1.524)^{3/2} = 1.88$ years

NEWTON'S LAW OF GRAVITATION

It states that every body in this universe attracts every other body with a force which is directly proportional to the product of their masses and is inversely proportional to the square of the distance between them.

Consider two point mass bodies A and B of masses m_1 and m_2. Let r be the distance between their centres and F be the force of attraction between them.



According to Newton's law of gravitation,

$$F \propto \frac{m_1 m_2}{r^2} \text{ or } F = \frac{G m_1 m_2}{r^2} \quad \text{(ii)}$$

Definition of G

Let $m_1 = m_2 = 1$ and $r = 1$.

From Eq. (ii), $F = G\frac{1\times 1}{1^2} = G$ or $G = F$

Thus universal gravitational constant is equal to the force of attraction acting between two bodies each of unit mass, whose centres are placed unit distance apart.

Gravitational constant is a scalar quantity. Its value is same throughout the universe and is independent of the nature and size of the bodies as well as the nature of the medium between the bodies. The value of G in SI unit is 6.67×10^{11} Nm^{2}kg^{-2} and in CGS system its value is 6.67×10^{-8} dyne cm^2 g^{-2}.

The dimensional formula for G is

$$\frac{Fr^2}{m_1 m_2} = \frac{(MLT^{-2})}{M \times M} = [M^{-1}L^3T^{-2}]$$

NOTE: Newton's law of gravitation holds good for objects lying at very large distances and also at very short distances. It fails when the distance between the objects is less than 10^{-9} m (i.e., of the order of intermolecular distances).

Evidence in Support of Newton's Law of Gravitation

(1) The rotation of earth around the Sun or the rotation of Moon around the earth is explained on the basis of this law.

(2) The prediction about solar and lunar eclipses, made on the basis of this law, always came out to be true.

(3) The formation of tides in the ocean is due to force of attraction between the Moon and ocean water.

(4) The prediction about the orbits and time period of the modern artificial satellites made on the basis of this law are found to be very accurate.

Important Characteristics of Gravitational Force

According to Newton's law of gravitation, the gravitational force of attraction between two given bodies

(1) is independent of nature of intervening medium.

(2) is independent of the presence or absence of other bodies.

(3) is independent of nature and size of the bodies, till their masses remain the same and the distance between their centres is fixed.

(4) forms action and reaction pair, i.e., the gravitational forces are equal in magnitude and opposite in direction and hence obey Newton's third law of motion.

(5) is a central force as it acts along the line joining the centres of the two bodies.

(6) is conservative in nature.

ILLUSTRATION 10.2 The mass of planet Jupiter is 1.9×10^{27} kg and that of the Sun is 1.99×10^{30} kg. The mean distance of Jupiter from the Sun is 7.8×10^{11} m. Calculate the gravitational force which Sun exerts on Jupiter. Assuming that Jupiter moves in circular orbit around the Sun, also calculate the speed of Jupiter. G = 6.67×10^{-11} Nm^2 kg^{-2}.

Solution. Here, $M_j = 1.9 \times 10^{27}$ kg

$$M_s = 1.99 \times 10^{30} \text{ kg}; r = 17.8 \times 10^{11} \text{ m}$$

$$G = 6.67 \times 10^{-11} \text{ Nm}^2 \text{ kg}^{-2} : F = ?$$

Now $$F = \frac{GM_J M_S}{r^2} = \frac{6.67 \times 10^{11} \times 1.9 \times 10^{27} \times 1.99 \times 10^{30}}{(7.8 \times 10^{11})^2}$$

$$= 4.15 \times 10^{23} \text{ N}$$

Since the gravitational pull of the Sun on Jupiter provides the required centripetal force to Jupiter, therefore the velocity of Jupiter v can be given by the relation,

$$F = \frac{M_J v^2}{r}$$

or $$v = \sqrt{\frac{F_r}{M_J}} = \sqrt{\frac{4.15 \times 10^{23} \times 7.8 \times 10^{11}}{1.9 \times 10^{27}}} = 1.3 \times 10^4 \text{ ms}^{-1}$$

ILLUSTRATION 10.3 Gravitational force between two point masses m and M separated by a distance r is F. Now if a point mass $3m$ is placed next to m, what will be the (a) force on M due to m and (b) total force on M?

Solution.

(a) If r is the distance between two point masses m and M, then the gravitational force on m due to mass M is $F = GMm/r^2$. Since the gravitational force between two point masses is independent of the presence of other masses, so if a point mass $3m$ is placed next to m, the force on M due to m is $F = \frac{GMm}{r^2}$.

(b) Total force on the body of mass M is F, i.e.,

$$F = \frac{GM \times (m + 3m)}{r^2} = \frac{4GMm}{r^2} = 4F$$

INERTIAL AND GRAVITATIONAL MASSES

The mass of a body is the quantity of matter possessed by a body. There are two different concepts about the mass of body as discussed below.

Inertial Mass

Inertial mass of a body is related to its inertia of linear motion and is defined by Newton's second law of motion.

Let a body of mass m_i move with acceleration a under the action of an external force F. According to Newton's second law of motion,

$$F = m_i a \text{ or } m_i = \frac{F}{a} \quad \text{(i)}$$

The mass m_i of the body in this sense is the inertial mass of the body. If $a = 1$, then from Eq. (i) $m_i = F$.

Thus, inertial mass of a body is equal to the magnitude of external force required to produce unit acceleration in the body.

In fact, inertial mass of a body is the measure of the ability of the body to oppose the production of acceleration in its motion by an external force.

Properties of Inertial Mass

(1) Inertial mass of a body is proportional to the quantity of matter contained in the body.

(2) Inertial mass of a body is independent of size, shape and state of the body.

(3) Inertial mass of a body does not depend upon the temperature of the body.

(4) Inertial mass of a body is not affected by the presence or absence of other bodies near it.

(5) Inertial mass is conserved when the two bodies combine physically or chemically.

(6) Inertial mass can be added by simple laws of algebra, irrespective of the materials of the bodies.

(7) Inertial mass of a body increases with the speed of the body. When a body moves with a velocity v, its inertial mass m is given by

$$m = \frac{m_0}{\sqrt{1 - v^2/c^2}} \quad \text{(ii)}$$

where m_0 is the rest mass of the body, c is the velocity of light in vacuum. The mass m is affected only when the velocity of the body is comparable with the velocity of light.

Gravitational Mass

Gravitational mass of a body is related to gravitational pull on the body and is defined by Newton's law of gravitation.

If a body of mass m_G is placed on the surface of earth of radius R and mass M, then gravitational pull on the body is given by

$$F = \frac{GMm_G}{R^2} \text{ which gives } m_G = \frac{F}{(GM/R^2)} = \frac{F}{I} \quad \text{(iii)}$$

The mass m_G of the body in this sense is the gravitational mass of the body. The inertia of the body has no effect on the gravitational mass of the body. If $I = 1$, then from Eq. (iii), $m_G = F$. Thus, gravitational mass of a body is defined as the magnitude of gravitational pull experienced by the body in a gravitational field of unit intensity.

The properties of gravitational mass are the same as those of inertial mass except those mentioned below in the comparison of inertial mass and gravitational mass.

Comparison of Inertial and Gravitational Mass

(1) Both inertial and gravitational masses are measured in the same units.

(2) Both are scalar quantities.

(3) Both do not depend on the shape and state of the body.

(4) Gravitational mass of a body is affected by the presence of other bodies near it whereas the inertial mass of a body remains unaffected by the presence of other bodies near it.

(5) The inertial mass of a body is measured by finding its acceleration, produced by the applied force and gravity plays no part in the measurement. On the other hand, the gravitational mass of a body is measured by finding the gravitational pull on it and inertia plays no part in the measurement.

(6) The gravitational mass is measured by spring balance whereas inertial mass is measured by inertial balance.

(7) Both are equivalent to each other.

Concept Application Exercise 10.1

1. A mass M is broken into two parts of masses m_1 and m_2. How are m_1 and m_2 related so that force of gravitational attraction between the two parts is maximum?
2. Imagine a light planet revolving around a very massive star in a circular orbit of radius R with a period of revolution T. If the gravitational force of attraction between the planet and the star is proportional to $R^{-5/2}$, then find the relation between T and R.
3. A planet of mass m moves around the Sun of mass M in an elliptical orbit. The maximum and minimum distance of the planet from the Sun are r_1 and r_2, respectively. Find the relation between the time period of the planet in terms of r_1 and r_2.
4. Suppose the gravitational force varies inversely as the n^{th} power of the distance. Show that the time period of a planet in circular orbit of radius R around the Sun will be proportional to $R^{(n+1)/2}$.
5. The distance of planet Jupiter from the Sun is 5.2 times that of the earth. Find the period of revolution of Jupiter around the Sun.
6. The distance of the two planets from the Sun are 10^{13} m and 10^{12} m, respectively. Find the ratio of time periods and speeds of the two planets.

INTENSITY OF GRAVITATIONAL FIELD

The intensity of the gravitational field of a body at a point in the field is defined as the force experienced by a body of unit mass placed at that point provided the presence of unit mass does not disturb the original gravitational field. It is always directed towards the centre of gravity of the body whose gravitational

field is considered. Intensity of the gravitational field at a point is a vector quantity and is denoted by $\vec{E}$.

Let M be the mass of a body with centre of gravity at O. Let F be the gravitational force of attraction experienced by a test mass m_0 when placed at P in the gravitational field of the body, such that $OP = x$. According to Newton's law of gravitation,

$$F = MG\, m_0/x^2$$

Intensity of gravitational field at P will be

$$E = F/m_0 = \frac{GMm_0/x^2}{m_0} = \frac{GM}{x^2} \qquad \text{(i)}$$

In vector form,

$$\vec{E} = -\frac{Gm}{x^2}\hat{x} \qquad \text{(ii)}$$

Here the negative sign shows that the gravitational intensity is of attractive force.

It means that the intensity of gravitational field at a point in the gravitational field is equal to the acceleration of test mass placed at that point.

If the gravitational field is due to earth and point P lies on the surface of the earth then $x = R$. Now

$$E = \frac{GM}{R^2} = g$$

where g is the acceleration due to gravity at the surface of earth.

Unit of intensity of gravitational field in SI system is N kg^{-1} or m s^{-2} and in CGS system, it is dyne g^{-1} or cm s^{-2}.

Dimensional formula of gravitational intensity

$$E = F/m_0 = \frac{[MLT^{-2}]}{[M]} = [M^0LT^{-2}]$$

Acceleration Due to Gravity

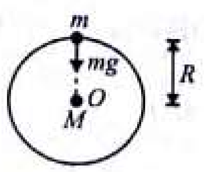
If a force F acting on a body of mass m produces an acceleration a then according to Newton's second law of motion $F = ma$. If the force on the body is due to gravity of earth, then acceleration in the body is called acceleration due to gravity, which is denoted by g, i.e., $a = g$. Then,

$$F = mg \text{ or } g = \frac{F}{m}$$

If $m = 1$, then $g = \frac{F}{1} = F$. Thus, acceleration due to gravity is defined as the force of gravity acting on a unit mass of the body placed on or near the surface of the earth.

Relation Between g and G

Consider earth to be a spherical body of mass M, radius R with centre O. Suppose a body of mass m is placed on the surface of earth, where acceleration due to gravity is g.



The force on the body of mass m, outside the surface of earth is due to earth whose mass M is concentrated at the centre O. Let F be the force of attraction between the body and the earth.

According to Newton's law of gravitation

$$F = \frac{GMm}{R^2}$$

From gravity pull, $F = mg$

$$\therefore \quad mg = \frac{GMm}{R^2} \quad \Rightarrow \quad g = \frac{GM}{R^2} \qquad \text{(i)}$$

From Eq. (i), we note that the value of acceleration due to gravity is independent of mass, shape and size of the body but depends upon mass and radius of the earth.

Mass and Density of Earth

Mass of Earth

From Eq. (i), we find

$$M = \frac{gR^2}{G} \qquad \text{(i)}$$

We know that $R = 6.4 \times 10^6$ m

$$G = 6.66 \times 10^{-11} \text{ Nm}^2 \text{ kg}^{-2}$$

and $\quad g = 9.8 \text{ ms}^{-2}$

Then, $M = \dfrac{9.8 \times (6.4 \times 10^6)^2}{6.66 \times 10^{-11}} = 6.018 \times 10^{24}$ kg

Density of Earth

Consider earth to be a spherical body of radius R. Let ρ be the uniform density of the material of the earth.

Now, density $\rho = \dfrac{\text{Mass}}{\text{Volume}}$

$$= \frac{M}{\frac{4}{3}\pi R^3} = \frac{3M}{4\pi R^3} \qquad \text{(ii)}$$

From Eqs. (i) and (ii), we get

$$\rho = \frac{\frac{3gR^2}{G}}{4\pi R^3} = \frac{3g}{4\pi RG} \qquad \text{(iii)}$$

We know that g = 9.8 ms^{-2}

$$R = 6.4 \times 10^6 \text{ m}$$

$$G = 6.66 \times 10^{-11} \text{ Nm}^2 \text{ kg}^{-2}$$

Hence, $\rho = \dfrac{3 \times 9.8}{4 \times \frac{22}{7} \times 6.4 \times 10^6 \times (6.67 \times 10^{-11})}$

$$= 5.4783 \times 10^3 \text{ kg m}^{-3} \approx 5.5 \times 10^3 \text{ kg m}^{-3}$$

Variation of Acceleration Due to Gravity

The value of acceleration due to gravity changes with height (i.e., altitude), depth, shape of the earth and rotation of earth about its own axis. The effect of each of the above factors on the value of g has been discussed below.

Effect of Altitude

Consider earth to be a sphere of mass M, radius R with centre at O. Let g be the value of acceleration due to gravity at a point A on the surface of earth.

$$g = \frac{GM}{R^2} \quad \text{(iv)}$$

If g' is the acceleration due to gravity at point B, at a height h above the surface of earth, then the force on the body at B is due to earth whose mass M is concentrated at the centre O of earth.

$$g' = \frac{GM}{(R+h)^2} \quad \text{(v)}$$

Dividing Eq. (v) by Eq. (iv), we get

$$\frac{g'}{g} = \frac{GM}{(R+h)^2} \times \frac{R^2}{GM} = \frac{R^2}{(R+h)^2} \quad \text{(vi)}$$

$$= \frac{R^2}{R^2(1+\frac{h}{R})^2} = \left(1+\frac{h}{R}\right)^{-2}$$

If $h \ll R$, then h/R is very small compared to 1. Expanding the R.H.S. of the above equation by Binomial theorem and neglecting the square and higher powers of h/R, we get

$$\frac{g'}{g} = 1 - \frac{2h}{R}$$

$$g' = g\left(1 - \frac{2h}{R}\right) \quad \text{(vii)}$$

From Eqs. (vi) and (vii), we note that the value of acceleration due to gravity decreases with height.

NOTE:

- Relation (vi) is used to find the value of acceleration due to gravity at a height h, when h is comparable to the radius of earth R and relation (vii) is used to find g' when h is very small as compared to R.
- With height h, the decrease in the value of g is

  $$g - g' = \frac{2hg}{R}$$

  Therefore, fractional decrease in the value of g is

  $$\frac{g' - g}{g} = \frac{2h}{R}$$

  Therefore, % decrease in the value of g is

  $$\left(\frac{g-g'}{g}\right) \times 100 = \frac{2h}{R} \times 100$$

ILLUSTRATION 10.4 How much above the surface of earth does the acceleration due to gravity reduce by 36% of its value on the surface of earth? Radius of earth = 6400 km.

Solution. Since the acceleration due to gravity reduces by 36%, the value of acceleration due to gravity there is $100 - 36 = 64\%$. It means, $g' = \frac{64}{100} g$. If h is the height of location above the surface of earth, then

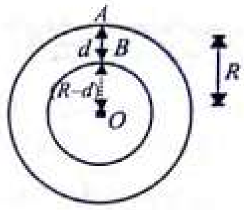
$$g' = g\frac{R^2}{(R+h)^2}$$

or $$\frac{64}{100} g = g\frac{R^2}{(R+h)^2}$$

$$\frac{8}{10} = \frac{R}{R+h} \quad \text{or} \quad 8R + 8h = 10R$$

$$\Rightarrow \quad h = \frac{2R}{8} = \frac{R}{4} = \frac{6.4 \times 10^6}{4} = 1.6 \times 10^6 \text{ m}$$

Effect of Depth



Consider earth to be a homogeneous sphere of radius R and mass M with centre at O. Let g be the value of acceleration due to gravity at a point A on the surface of the earth. Then

$$g = \frac{GM}{R^2}$$

If ρ is uniform density of the material of earth, then

$$M = \frac{4}{3}\pi R^3 \rho$$

$$g = \frac{G \times \frac{4}{3}\pi R^3 \rho}{R^2} = \frac{4}{3}\pi G R \rho \quad \text{(viii)}$$

Let g' be the acceleration due to gravity at the point B at a depth d below the surface of earth. The distance of the point B from the centre of the earth is $(R - d)$. The earth can be supposed to be made of (i) a smaller sphere of radius $(R - d)$ and, (ii) a spherical shell of thickness d.

$$g' = \frac{GM'}{(R-d)^2}$$

and $$M' = \frac{4}{3}\pi (R-d)^3 \rho$$

$$g' = \frac{G \times \frac{4}{3}\pi (R-d)^3 \rho}{(R-d)^2} = \frac{4}{3}\pi G (R-d) \rho \quad \text{(ix)}$$

Dividing Eq. (ix) by Eq. (viii), we get

$$\frac{g'}{g} = \frac{\frac{4}{3}\pi G(R-d)\rho}{\frac{4}{3}\pi G R \pi} = \frac{R-d}{R} = \frac{R}{R} - \frac{d}{R}$$

$$\Rightarrow \quad g' = g\left(1 - \frac{d}{R}\right) \quad \text{(x)}$$

From Eq. (x), we note that the value of acceleration due to gravity decreases with depth.

At the centre of the earth, $d = R$, $g' = g_0$ (say)

From Eq. (x) we get,

$$g' = g\left(1 - \frac{d}{R}\right) \quad \text{(xi)}$$

It means the acceleration due to gravity is zero at the centre of the earth. Therefore, the weight of the body of mass m at the centre of the earth $= mg_0 = 0$, but the mass of the body will not be zero. Thus, the value of acceleration due to gravity is maximum at the earth's surface and becomes zero at the centre of the earth.

NOTE: Decrease in the value of g with depth d is $g - g' = \frac{dg}{R}$.

Therefore, fractional decrease in the value of g with depth d

$$\frac{g-g'}{g} = \frac{d}{R} \quad \text{(xii)}$$

Therefore, % decrease in the value of g

$$\frac{g-g'}{g} \times 100 = \frac{d}{R} \times 100 \quad \text{(xiii)}$$

ILLUSTRATION 10.5 Find the percentage decrease in the weight of the body when taken to a depth of 32 km below the surface of earth. Radius of the earth is 6400 km.

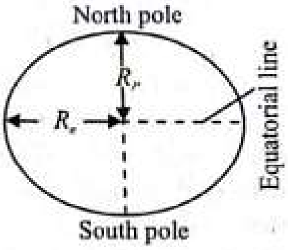
Solution. Here, $d = 32$ km; $R = 6400$ km

Weight of body at depth d is $= mg' = mg\left(1 - \frac{d}{R}\right)$

$$\% \text{ decrease in weight } = \frac{mg - mg'}{mg}$$

$$= \frac{d}{R} \times 100 = \frac{32}{6400} \times 100 = 0.5\%$$

Effect of Shape of Earth



Earth is not a perfect sphere. It is flattened at the poles and bulges out at the equator. Equatorial radius R_e of the earth is about 21 km greater than the polar radius R_P.

Now,

$$g = \frac{GM}{R^2}$$

Since G and M are constants. Therefore,

$$g \propto \frac{1}{R^2}$$

Thus, we conclude that the value of g is least at the equator and maximum at the pole. It means, the value of acceleration due to gravity increases as we go from equator to the pole.

At sea level, the value of g at pole is greater than its value at equator by 1.80 cm s^{-2}.

ILLUSTRATION 10.6 (a) Find the height from the earth's surface where g will be 25% of its value on the surface of earth ($R = 6400$ km). (b) Find the percentage increase in the value of g at a depth h from the surface of earth.

Solution.

(a) At a height h above the earth's surface, we have

$$g' = g\left(\frac{R}{R+h}\right)^2 \Rightarrow \frac{g}{4} = g\left(\frac{R}{R+h}\right)^2 \Rightarrow \frac{R}{R+h} = \frac{1}{2}$$

$$\Rightarrow \quad h = R = 6400 \text{ km}$$

(b) At a depth h below earth's surface, we have

$$g' = g\left(1 - \frac{h}{R}\right) \Rightarrow \frac{g'}{g} = 1 - \frac{4}{6400}$$

$$\frac{g-g'}{g} = \frac{4}{6400} \Rightarrow \frac{\Delta g}{g} = \frac{1}{16}$$

$$\therefore \% \text{ age} = \frac{\Delta g}{g} \times 100 = \frac{1}{16} \% \text{ increase}$$

CONCEPT APPLICATION EXERCISE 10.2

1. If a planet of given density were made larger, its force of attraction for an object on its surface would increase because of the greater distance from the object to the centre of the planet. Which effect predominates?
2. A stone is dropped along the centre of a deep vertical mine shaft. Assume no air resistance but consider the earth's rotation. Will the stone continue along the centre of the shaft? If not, describe the motion.
3. Show that if the earth were not rotating about its axis the value of g at the equator would exceed its present value by 3.36 cm/s^{-2}. Given the radius of earth $= 6.37 \times 10^6$ m and angular speed of earth $= 7.27 \times 10^{-5}$ rad/s^{-1}.
4. How far away from the earth does the acceleration due to gravity become 10% of its value on earth's surface? Radius of earth $= 6.37 \times 10^6$ m.
5. (a) Assuming the earth to be a sphere of uniform density, calculate the value of acceleration due to gravity at a point (i) 1600 km above the earth, (ii) 1600 km below the earth, (b) Also find the rate of variation of acceleration due to gravity above and below the earth's surface. Radius of earth = 6400 km. $g = 9.8$ m/s^2.
6. How much faster than its present speed should the earth (radius 6.37×10^6 m) rotate so that the bodies lying on the equator may fly off into space? (At equator, $g = 9.78$ m/s^{-2}.)

GRAVITATIONAL POTENTIAL

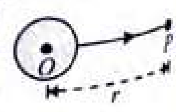
Gravitational potential at a point in a gravitational field of a body is defined as the amount of work done in bringing a body of unit mass from infinity to that point without acceleration.

If W is the amount of work done in bringing a body of mass m_0 from infinity to a point P in the gravitational field without acceleration, then gravitational potential at P is $V = W/m_0$

Gravitational potential is a scalar quantity, since work done is a scalar. Unit of gravitational potential at a point in SI system is J kg^{-1} and in cgs system it is erg g^{-1}. Dimensional formula for gravitational potential is given by

$$\frac{W}{m_0} = \frac{[ML^2T^{-2}]}{[M]} = [M^0L^2T^{-2}]$$

Expression for Gravitational Potential at a Point



Let earth to be a perfect sphere of radius R and mass M. The mass of the earth can be supposed to be concentrated at its centre O. Let us calculate the gravitational potential at any point P, where $OP = r$ and $r > R$.

$$V_p = -\frac{GM}{r} \quad \text{(i)}$$

From Eq. (i), we note the following:

(1) The gravitational potential at a point is always negative.

(2) When $r = \infty$, from (1), $V_P = 0$, hence gravitational potential is maximum (= zero) at infinity.

(3) At the surface of earth, $r = R$, therefore $V_P = -GM/R$ at the surface of earth.

The unit of gravitational potential is J kg^{-1}. Dimensional formula of gravitational potential is

$$\frac{\text{Work}}{\text{Mass}} = \frac{[ML^2T^{-2}]}{[M]} = [M^0L^2T^{-2}]$$

Gravitational potential is a scalar field because at any point in space it has only magnitude and no direction.

Relation Between Gravitational Field and Potential

The work done by an external agent to move unit mass from a point to another point in the direction of the field E, slowly through an infinitesimal distance dr = Force by external agent x distance moved = $-Edr$.

Thus, $\quad dV = -Edr \Rightarrow E = \frac{-dV}{dr}$

Therefore, gravitational field at any point is equal to the negative gradient of potential at that point.

GRAVITATIONAL POTENTIAL ENERGY

We know that potential energy of a body at a given position is defined as the energy stored in the body at that position. If the position of a body changes on account of the forces acting on it, then change in its potential energy is equal to the amount of work done on the body by the forces acting on it, for the given change in position. As this work done is independent of the path followed, so the gravitational forces are conservative forces.

When the body is at infinity with respect to another body, the gravitational attraction on the body is zero. Therefore, its potential energy is zero, which is called zero level of potential energy.

If W_0 is the zero level of potential energy of the body and W is the work done in raising the body from the position of zero level potential energy to present location, then PE of the body $= W + W_0$.

If initially the body is at infinity, then the zero level of PE is zero, i.e., $W_0 = 0$. Now, PE of the body = W.

Gravitational potential energy of a body at a point in a gravitational field of another body is defined as the amount of work done in bringing the given body from infinity to that point without acceleration.

Expression for Gravitational Potential Energy

Consider a gravitational field due to earth of mass M and radius R. The mass of the earth can be supposed to be concentrated at its centre O. Let us calculate the gravitational potential energy of the body of mass m placed at point P in the gravitational field, where $OP = r$ and $r > R$. Join OP and produce it onwards. Take two points A and B on this line such that $OA = x$ and $AB = dx$.

The gravitational force of attraction on the body at A will be $F = GMm/x^2$.

Small amount of work done in bringing the body without acceleration through a very small distance AB (= dx) is given by

$$dW = Fdx = \frac{GMm}{x^2}dx$$

Total work done in bringing the body from infinity to point P is given by

$$W = \int_{\infty}^{r} \frac{GMm}{x^2}dx = -GMm\int_{\infty}^{r} x^{-2}dx$$

$$= -GMm\left[\frac{1}{x}\right]_{\infty}^{r} = -GMm\left[\frac{1}{r} - \frac{1}{\infty}\right]$$

$$= \frac{-GMm}{r} \quad \text{(ii)}$$

Since this work done is stored in the body as its gravitational potential energy U, therefore gravitational potential energy of the body of mass m placed at point P in the gravitational field of earth of mass M at distance r will be

$$U = \frac{-GMm}{r} \quad \text{(iii)}$$

From Eqs. (i) and (iii), we note that $U = V_p \times m$.

That is, gravitational potential energy = gravitational potential × mass of the body.

NOTE:

- The gravitational potential energy of a point mass m at a distance r (>R) from the centre of earth is
$$U = mV = -\frac{GMm}{r}$$
- Gravitational potential energy of a point mass m relative to infinity at the surface of earth will be
$$U = -\frac{GMm}{R} \quad (\because r = R)$$
- The potential energy of a point mass m at the centre of earth relative to infinity will be given by
$$U = mV_C = -\frac{3}{2}\frac{GMm}{R} \quad \left[\because V_C = \frac{3}{2}V_S = -\frac{3GM}{2R}\right]$$
The potential energy of a body at the centre of earth is minimum but not zero.
- If there is a gravitational field due to point masses $m_1, m_2, m_3, \ldots$ then gravitational potential energy of a point mass body m_0 at a point in the gravitational field is
$$U = -\left[\frac{Gm_0m_1}{r_{01}} + \frac{Gm_0m_2}{r_{02}} + \frac{Gm_0m_3}{r_{03}} + \cdots\right]$$

ILLUSTRATION 10.7 If g is the acceleration due to gravity on the surface of earth, find the gain in potential energy of an object of mass m raised from the surface of earth to a height equal to the radius R of the earth.

Solution. Let M, R be the mass and radius of the earth. Then

$$g = GM/R^2$$

or $$GM = gR^2 \quad \text{(i)}$$

Potential energy of the object on the surface of earth

$$U_1 = \frac{-GMm}{R}$$

The potential energy of the object at a height equal to radius of the earth is

$$U_2 = \frac{-GMm}{2R}$$

Gain in PE is

$$U_2 - U_1 = -\frac{GMm}{2R} + \frac{GMm}{R}$$

$$= \frac{GMm}{2R} = \frac{(gR^2)m}{2R} = \frac{1}{2} mg\,R$$

ILLUSTRATION 10.8 Two particles of masses m and M are initially at rest at an infinite distance apart. They move towards each other and gain speeds due to gravitational attraction. Find their speeds when the separation between the masses becomes equal to d.

Solution. Let v_1 and v_2 be the speeds of two masses m and M, respectively, when they are at a separation d.

As they approach each other, the kinetic energy increases and GPE decreases. Hence, for the system,

Loss in GPE = Gain in KE

$$\Rightarrow \quad (\text{GPE})_i - (\text{GPE})_f = \text{KE}_f - \text{KE}_i$$

$$\Rightarrow \quad 0 - \left(-\frac{GMm}{d}\right) = \left(\frac{1}{2} mv_1^2 + \frac{1}{2} Mv_2^2\right) - 0$$

$$\frac{GMm}{d} = \frac{1}{2} mv_1^2 + \frac{1}{2} Mv_2^2$$

As there is no external force on this system, its total momentum remains conserved.

$$p_i = p_f$$

$$0 = mv_1 - Mv_2$$

Combining the two equations, we have

$$v_1 = \sqrt{\frac{2GM^2}{d(m+M)}}$$

and $$v_2 = \sqrt{\frac{2GM^2}{d(m+M)}}$$

Escape Speed

The minimum speed required to project a body from the surface of the earth so that it never returns to the surface of the earth is called escape speed. If a velocity greater than the escape velocity is imparted, the body will escape and leave the surface. If a velocity lesser than the escape velocity is given, it will fall back to the surface or be in an orbit. A body thrown with escape speed goes out of the gravitational pull of the earth. Work done to displace the body from the surface of the earth ($r = R_e$) to infinity ($r = \infty$) is given by

$$\int dW = \int_{R_e}^{\infty} \frac{GM_e m}{r^2}\, dr$$

or $$W = GM_e m \int_{R_e}^{\infty} \frac{1}{r^2}\, dr = -GM_e m \left[\frac{1}{r}\right]_{R_e}^{\infty}$$

$$= -GM_e m \left[\frac{1}{\infty} - \frac{1}{R_e}\right] \Rightarrow W = \frac{GM_e m}{R_e}$$

Let v_e be the escape speed of the body of mass m, then kinetic energy of the body is given by

$$\frac{1}{2} mv_e^2 = \frac{GM_e m}{R_e} \Rightarrow v_e = \sqrt{2gR_e} = 11.2 \text{ km s}^{-1}$$

☞ Important Results

1. Escape speed depends on the mass and size of the planet. That is why escape velocity on the Jupiter is more than that on the earth.
2. Escape speed is independent of the mass of the body.
3. Any body thrown upward with escape speed starts moving around the Sun.
   (a) The value of escape speed of a body does not depend upon the mass (m) of the body and its angle of projection from the surface of earth or any other planet.
   (b) The value of escape speed depends upon the mass and radius of the planet from the surface of which the body is to be projected. Clearly, the value of escape speed of a body will be different for different planets.
   (c) For earth, $g = 9.8 \text{ ms}^{-2}$, $R = 6.4 \times 10^6$ m.
   $$\therefore \quad v_e = \sqrt{2gR_e} = \sqrt{2 \times 9.8 \times 6.4 \times 10^6}$$
   $$= 11.2 \times 10^3 \text{ ms}^{-1} = 11.2 \text{ km s}^{-1}$$
   (d) If a body is projected from a planet with a speed v which is smaller than the escape speed v_e (i.e., $v < v_e$) then the body will reach a certain height, may either move in an orbit around the planet or may fall back to the planet.
   (e) If speed of projection (v) of the body from the surface of a planet is greater than the escape speed (v_e) of that planet, the body will escape out from the gravitational field of that planet and will move in the interstaller field of that planet with speed v' which can be obtained using law of conservation of energy, according to which
   $$\frac{1}{2} mv^2 + \left(-\frac{GMm}{R}\right) = \frac{1}{2} mv'^2 + 0$$
   $$v'^2 = v^2 - \frac{2GM}{R} = v^2 - v_e^2 \quad \left[\because v_e = \sqrt{\frac{2GM}{R}}\right]$$
   $$v' = \sqrt{v^2 - v_e^2}$$

NOTE:
- In deriving the expression for escape speed, we have neglected the resistance to the body by earth's atmosphere. Therefore in reality, the value of escape speed is slightly greater than the value calculated from these relations.
- Escape speed of Sun is 618 km/s.

ILLUSTRATION 10.9 The escape speed from earth's surface is 11 km s^{-1}. A certain planet has a radius twice that of earth but its mean density is the same as that of the earth. Find the value of the escape speed from the planet.

Solution. Let M, R, ρ be the mass, radius and density of earth and M, R, ρ be the corresponding values for the planet. Then escape speed from earth's surface is

$$v_e = \sqrt{\frac{2GM}{R}} = \sqrt{\frac{2G}{R} \times \frac{4}{3}\pi R^3 \rho} = \sqrt{\frac{8\pi G\rho R^2}{3}}$$

Escape speed from planet's surface is

$$v_e = \sqrt{\frac{8\pi G\rho (2R)^2}{3}} = 2\sqrt{\frac{8\pi G\rho R^2}{3}} = 2v_e = 2 \times 11 = 22 \text{ km/s}$$

ILLUSTRATION 10.10 A spaceship goes into a circular orbit close to the earth's surface. What additional velocity must be imparted to the ship so that it is able to escape the gravitational pull of the earth? ($R = 6400$ km, $g = 9.8$ m s^{-2})

Solution. The orbital velocity in a circular orbit close to the earth is $v = \sqrt{gR}$.

The velocity required to escape $v_e = \sqrt{2gR}$.

Hence additional velocity required is $v_e - v = (\sqrt{2} - 1)\sqrt{gR}$.

Therefore,

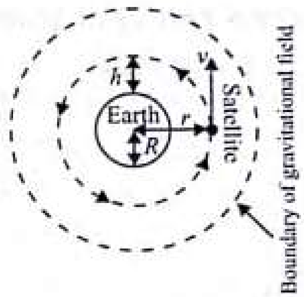
$$v_e - v = 0.414 \times \sqrt{9.8 \times 6400 \times 10^3}$$
$$= 3278.71 \text{ m/s} = 3.278 \text{ km s}^{-1}$$

CONCEPT APPLICATION EXERCISE 10.3

1. The radius of a planet is twice that of the earth but its average density is the same. If the escape speed at the planet and at the earth are v_p and v_e, respectively, then prove that $v_p = 2v_e$.
2. A particle is projected vertically upwards from the surface of the earth (radius R) with a kinetic energy equal to half of the minimum value needed for it to escape. Find the height to which it rises above the surface of earth.
3. What is the escape velocity of the object, if the magnitude of the potential energy per unit mass of the object at the surface of earth is E?
4. A body is released at a distance far away from the surface of the earth. Calculate its speed when it is near the surface of earth. Given $g = 9.8$ m s^{-2}, radius of earth $R = 6.37 \times 10^6$ m.
5. A rocket is launched from the surface of earth with an initial speed of 10 km s^{-1}. How far above the surface of earth would it go? Radius of earth = 6400 km. Neglect atmospheric resistance.
6. Two earth satellites A and B, each of mass m are to be launched into circular orbits about earth's centre at altitudes 6400 km and 19200 km, respectively. The radius of earth is 6400 km. Find (i) the ratio of potential energy of B to that of A, (ii) ratio of kinetic energy of B to that of A and (iii) which one has greater total energy?
7. Calculate the radius of an isolated sphere of density 3.0 g cm^{-3} from the surface of which the escape velocity be 40 m s^{-1}.

ORBITAL SPEED, TIME PERIOD AND HEIGHT OF SATELLITE

Orbital Speed



Orbital speed of a satellite is the minimum speed required to put the satellite into a given orbit around earth. The value of orbital speed is different for different orbits around earth and is independent of the mass of the satellite. Let

M = mass of earth
R = radius of earth
m = mass of the satellite
v = orbital speed of the satellite
h = height of the satellite above the surface of earth
r = radius of the orbit of the satellite = $R + h$

The centripetal force required to keep the satellite in its orbit,

$$F = \frac{mv^2}{r}$$

According to Newton's law of gravitation, gravitational pull acting on the satellite = $GM\,m/r^2$.

In equilibrium, the gravitational pull provides the required centripetal force to the satellite. Therefore,

$$\frac{mv^2}{r} = \frac{GMm}{r^2}$$

$$\Rightarrow \quad v = \sqrt{\frac{GM}{r}} \qquad \text{(i)}$$

If g is the value of acceleration due to gravity on the surface of earth, then

$$g = \frac{GM}{R^2} \text{ or } GM = gR^2$$

Putting this value in Eq. (i), we get

$$v = \sqrt{\frac{gR^2}{r}} = R\sqrt{\frac{g}{R + h}} \qquad \text{(ii)}$$

It is clear from Eq. (ii) that:

- The orbital speed of a satellite is independent of the mass of the satellite. It decreases with an increase in the radius of orbit or increase in the height of the satellite. It depends upon the mass and radius of the earth/planet around which the revolution of the satellite is taking place.

- The direction of orbital speed of a satellite at an instant is along the tangent to the orbital path of the satellite at that instant.
- When a satellite is orbiting very close to the surface of earth $h \ll R$, then

$$r = R + h \approx R \text{ and } v = v_0 \text{ (say)}$$

From Eq. (ii), $v_0 = R\sqrt{g/R} = \sqrt{gR}$

Substituting $g = 9.8 \text{ ms}^{-2}$

and $R = 6.4 \times 10^6$ m

We get $v_0 = \sqrt{9.8 \times 6.4 \times 10^6} = 7.92 \times 10^3 \text{ m s}^{-1}$
$= 7.92 \text{ km s}^{-1}$

Time Period of Satellite

It is the time taken by a satellite to complete one revolution around the earth and is denoted by T. Thus

$$T = \frac{\text{Distance travelled in one revolution}}{\text{Orbital velocity}} = \frac{2\pi r}{v}$$

$$= \frac{2\pi r}{R}\sqrt{\frac{r}{g}} = \frac{2\pi}{R}\sqrt{\frac{r^3}{g}} = \frac{2\pi r}{R}\sqrt{\frac{(R+h)^3}{g}} \quad \text{(iii)}$$

If the earth is supposed to be a sphere of mean density ρ, then the mass of the earth is

$$M = \frac{4}{3}\pi R^3 \rho \text{ and } g = \frac{GM}{R^2} = \frac{G}{R^2}\left(\frac{4}{3}\pi R^3 \rho\right) = \frac{4\pi a R\pi}{3}$$

Substituting this value of g in Eq. (iii), we get

$$T = \frac{2\pi}{R}\sqrt{\frac{3(R+h)^3}{4\pi G R\rho}} = \sqrt{\frac{4\pi^2}{R^2} \times \frac{3(R+h)^3}{4\pi G R \rho}}$$

$$= \sqrt{\frac{3\pi(R+h)^3}{G\rho R^3}} \quad \text{(iv)}$$

For a satellite orbiting close to the surface of earth, $h \ll R$.

$\therefore \quad h + R \approx R$

From Eq. (iii), $T = \sqrt{\frac{3\pi}{G\rho}}$

From Eq. (iv), $T = \frac{2\pi}{R}\sqrt{\frac{R^3}{g}} = 2\pi\sqrt{\frac{R}{g}} \quad \text{(v)}$

By substituting $g = 9.8 \text{ ms}^{-2}$ and $R = 6.4 \times 10^6$ m in Eq. (v), we get the value of $T = 5.08 \times 10^3 \text{ s} = 84.6$ min.

It means a satellite orbiting close to the surface of the earth has a time period of revolution about 84.6 min.

It is clear from Eq. (iv) that the period of revolution of a satellite depends only upon its height above the earth's surface. The larger is the height of a satellite above the surface of earth, greater will be its period of revolution.

Altitude or Height of Satellite Above the Earth's Surface

Squaring both sides of Eq. (iii), we get

$$T^2 = \frac{4\pi^2(R+h)^3}{R^2 g} \Rightarrow (R+h)^3 = \frac{T^2R^2g}{4\pi^2}$$

$$R + h = \left(\frac{T^2R^2g}{4\pi^2}\right)^{1/3} \Rightarrow h = \left(\frac{T^2R^2g}{4\pi^2}\right)^{1/3} - R \quad \text{(vi)}$$

Knowing the values of T, R and g, the height h of the satellite above the surface of earth can be calculated from Eq. (vi).

Energy of an Orbiting Satellite

The total mechanical energy of a satellite revolving around the earth is the sum of its potential energy (U) and kinetic energy (K).

The potential energy of a satellite is due to its position with respect to earth. It appears because of the gravitational pull acting on the satellite due to earth. If a satellite of mass m is revolving around the earth of mass M, radius R, with orbital velocity v, in an orbit of radius r, then potential energy of the satellite is

$$U = -GMm/r$$

The kinetic energy of a satellite,

$$K = \frac{1}{2}mv^2 = \frac{1}{2}m\left(\frac{GM}{r}\right) \qquad [\because v = \sqrt{GM/r}]$$

Thus, total mechanical energy of a satellite is $E = U + K$

$$= -\frac{GMm}{r} + \frac{1}{2}\frac{GMm}{r} = -\frac{GMm}{2r}$$

$$\Rightarrow \qquad E = -\frac{GMm}{2r} = -\frac{GMm}{2(R+h)}$$

If the satellite is orbiting close to earth, then $r = R$. Now, total energy of the satellite is $E = -GMm/2R$.

In the total energy of a circularly orbiting satellite which is negative, the potential energy is negative and magnitude of potential energy is twice the magnitude of the positive kinetic energy. We know that the total energy of a body is positive or zero, when it is at infinity from the earth. Therefore, the satellite will escape to infinity if its total energy becomes zero or positive. Since a satellite is always at finite distance from the earth, its total energy can never be positive or zero.

Binding Energy of a Satellite

The energy required to remove the satellite from its orbit around the earth to infinity is called binding energy of the satellite. Binding energy is equal to negative value of total mechanical energy of a satellite in its orbit. Thus binding energy is

$$-E = \frac{GMm}{2r}$$

ILLUSTRATION 10.11 An artificial satellite revolves round the earth at a height of 1000 km. The radius of the earth is 6.38×10^3 km. Mass of the earth $= 6 \times 10^{24}$ kg; $G = 6.67 \times 10^{-11}$ $\text{Nm}^2\text{kg}^{-2}$. Find the orbital speed and period of revolution of the satellite.

Solution. Here, $h = 1000 \text{ km} = 1000 \times 10^3 \text{ m} = 10^6$ m

$$r = R + h = 6.38 \times 10^6 + 10^6 = 7.38 \times 10^6 \text{ m}$$

Orbital speed,

$$v_0 = \sqrt{\frac{GM}{R+h}} = \sqrt{\frac{6.67 \times 10^{-11} \times 6 \times 10^{24}}{7.38 \times 10^6}} = 7364 \text{ ms}^{-1}$$

Time period,

$$T = \frac{2\pi r}{v_0} = \frac{2 \times (22/7) \times (7.38 \times 10^6)}{7.364 \times 10^3} = 6297 \text{ s}$$

ILLUSTRATION 10.12 A satellite orbits the earth at a height of 3.6×10^6 m from its surface. Compute its (a) kinetic energy, (b) potential energy, (c) total energy. Mass of the satellite = 500 kg, mass of the earth = 6×10^{24} kg, radius of the earth = 6.4×10^6, $G = 6.67 \times 10^{-11}$ N m^2 kg^{-2}.

Solution. Here, $r = R + h = 6.4 \times 10^6 + 3.6 \times 10^6 = 10^7$ m.

Orbital velocity of the satellite around the earth is given by

$$v_0 = \sqrt{\frac{GM}{(R+h)}} = \sqrt{\frac{6.67 \times 10^{-11} \times 6 \times 10^{24}}{10^7}}$$

$$= \sqrt{6.67 \times 6 \times 10^6} \text{ m s}^{-1}$$

(a) KE of the satellite = $1/2\, mv_o^2$

$$= \frac{1}{2} \times 500 \times 6.67 \times 6 \times 10^6 = 10^{10} \text{ J}$$

(b) PE of the satellite $= -\frac{GMm}{R+h}$

$$= -\frac{6.67 \times 10^{-11} \times (6 \times 10^{24}) \times 500}{10^7}$$

$$= -2 \times 10^{10} \text{ J}$$

(c) Total energy = KE + PE = $10^{10} - 2 \times 10^{10} = -10^{10}$ J

GEOSTATIONARY OR GEOSYNCHRONOUS SATELLITES

A satellite which appears to be at fixed position at a definite height (i.e., stationary) to an observer on earth is called geostationary satellite. This satellite is also called the geosynchronous satellite as its angular speed is synchronized with the angular speed of the earth about its axis, i.e., this satellite revolves around the earth with the same angular speed in the same direction as is done by earth around its axis.

Obviously, the speed of such a satellite relative to earth is zero. That is why it appears to be stationary w.r.t. any point on the surface of earth. Clearly, $T = 24$ h for a geostationary satellite.

To calculate the height of geostationary satellite, we use the relation

$$h = \left(\frac{T^2 R^2 g}{4\pi^2}\right)^{\frac{1}{3}} - R$$

Putting, $R = 6.4 \times 10^6$ m, $g = 9.8$ m^{-2}, $T = 24$ h

$= 24 \times 60 \times 60$ s, we get $h = 3.6 \times 10^7$ m

$= 36000$ km

The orbital speed of such a satellite, using the relation $v = R\, Rg/R + h$ is found to be 3.1 km s^{-1}.

Geostationary satellites are used for the purposes of communication as they act as reflectors of suitable waves carrying the messages. Therefore, they are also called communication satellites. Telstar was the first communication satellite launched by U.S.A. in 1962. Since then, a large number of communication satellites have been put in use by various countries. India has also joined this race. INSAT 2B and INSAT 2C are the communication satellites of India.

Essential Conditions for Geostationary Satellite

(1) A geostationary satellite should be at a height nearly 36000 km above the equator of earth.

(2) Its time period of revolution around the earth should be the same as that of the earth about its axis, i.e., exactly 24 h.

(3) It should revolve in an orbit concentric and coplanar with the equatorial plane, so the plane of the orbit of the satellite is normal to the axis of rotation of the earth.

(4) Its sense of rotation should be the same as that of the earth about its own axis, i.e., from west to east. Its orbital speed is nearly 3.1 km s^{-1}.

CONCEPT APPLICATION EXERCISE 10.4

1. Why is there 'weightlessness' in a satellite?
2. A satellite moves in a circular orbit around the earth at height $R_e/2$ from earth's surface where R_e is the radius of the earth. Calculate its period of revolution. Given $R_e = 6.38 \times 10^6$ m.
3. A small satellite revolves around a planet in an orbit just above planet's surface. Taking the mean density of the planet 8000 kg m^{-3} and $G = 6.67 \times 10^{-11}$ N m^{-2}kg^{-2}, find the time period of the satellite.
4. Two satellites of the same mass are launched in the same orbit around the earth so as to rotate opposite to each other. They collide inelastically and stick together as wreckage. Obtain the total energy of the system before and just after the collision. Describe the subsequent motion of the wreckage.
5. Mars and earth have masses in the ratio 1:11 and radii in the ratio 42:79. Compare
   (a) their densities, assuming them to be spheres of uniform density;
   (b) gravitational field strengths at their surfaces;
   (c) escape velocities from their surfaces;
   (d) periods of their satellites near their surfaces.
6. If a satellite is revolving around a planet of mass M in an elliptical orbit of semi-major axis a. Show that the orbital speed of the satellite when it is at a distance r from the planet will be given by

$$v^2 = GM\left[\frac{2}{r} - \frac{1}{a}\right]$$

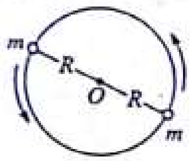
SOLVED EXAMPLES

1. Two particles of equal mass go round a circle of radius R under the action of their mutual gravitational attraction. The speed of each particle is

(a) $v=\frac{1}{2R}\sqrt{\frac{1}{Gm}}$ (b) $v=\sqrt{\frac{Gm}{2R}}$

(c) $v=\frac{1}{2}\sqrt{\frac{Gm}{R}}$ (d) $v=\sqrt{\frac{4Gm}{R}}$

Sol. (c) Centripetal force provided by the gravitational force of attraction between two particles



i.e. $\frac{mv^2}{R}=\frac{Gm\times m}{(2R)^2}$

$\Rightarrow v=\frac{1}{2}\sqrt{\frac{Gm}{R}}$

2. If the change in the value of g at a height h above the surface of the earth is the same as at a depth x below it, then (both x and h being much smaller than the radius of the earth)

(a) $x=h$ (b) $x=2h$

(c) $x=\frac{h}{2}$ (d) $x=h^2$

Sol. (b) The value of g at the height h from the surface of earth

$$g'=g\left(1-\frac{2h}{R}\right)$$

The value of g at depth x below the surface of earth

$$g'=g\left(1-\frac{x}{R}\right)$$

These two are given equal, hence $\left(1-\frac{2h}{R}\right)=\left(1-\frac{x}{R}\right)$

On solving, we get $x=2h$

3. At what depth below the surface of the earth, acceleration due to gravity g will be half its value 1600 km above the surface of the earth?

(a) 4.2×10^6 m (b) 3.19×10^6 m

(c) 1.59×10^6 m (d) None of these

Sol. (a) Radius of earth $R=6400$ km $\Rightarrow h=\frac{R}{4}$

Acceleration due to gravity at a height h

$$g_h=g\left(\frac{R}{R+h}\right)^2=g\left(\frac{R}{R+\frac{R}{4}}\right)^2=\frac{16}{25}g$$

At depth d, value of acceleration due to gravity

$$g_d=\frac{1}{2}g_h \quad \text{(According to problem)}$$

$$\Rightarrow \quad g_d=\frac{1}{2}\left(\frac{16}{25}\right)g\Rightarrow g\left(1-\frac{d}{R}\right)=\frac{1}{2}\left(\frac{16}{25}\right)g$$

By solving we get $d=4.3\times10^6$m.

4. The masses and radii of the earth and moon are M_1, R_1 and M_2, R_2, respectively. Their centres are distance d apart. The minimum velocity with which a particle of mass m should be projected from a point midway between their centres so that it escapes to infinity is

(a) $2\sqrt{\frac{G}{d}(M_1+M_2)}$ (b) $2\sqrt{\frac{2G}{d}(M_1+M_2)}$

(c) $2\sqrt{\frac{Gm}{d}(M_1+M_2)}$ (d) $2\sqrt{\frac{Gm(M_1+M_2)}{d(R_1+R_2)}}$

Sol. (a) Gravitational potential at mid point

$$V=\frac{-GM_1}{d/2}+\frac{-GM_2}{d/2}$$

Now, $PE=m\times V=\frac{-2Gm}{d}(M_1+M_2)$

[m = mass of particle]

So, for projecting particle from mid point to infinity

KE = |PE|

$$\Rightarrow\frac{1}{2}mv^2=\frac{2Gm}{d}(M_1+M_2)$$

$$\Rightarrow v=2\sqrt{\frac{G(M_1+M_2)}{d}}$$

5. A body of mass m kg starts falling from a point $2R$ above the Earth's surface. Its kinetic energy when it has fallen to a point R above the Earth's surface [R: Radius of Earth, M: Mass of Earth, G: Gravitational Constant]

(a) $\frac{1}{2}\frac{GMm}{R}$ (b) $\frac{1}{6}\frac{GMm}{R}$

(c) $\frac{2}{3}\frac{GMm}{R}$ (d) $\frac{1}{3}\frac{GMm}{R}$

Sol. (b) Potential energy, $U=\frac{-GMm}{r}=-\frac{GMm}{R+h}$

$U_{\text{initial}}=-\frac{GMm}{3R}$ and $U_{\text{final}}=-\frac{-GMm}{2R}$

Loss in PE = gain in KE $=\frac{GMm}{2R}-\frac{GMm}{3R}=\frac{GMm}{6R}$

6. v_e and v_p denotes the escape velocity from the earth and another planet having twice the radius and the same mean density as the earth. Then

(a) $v_e=v_p$ (b) $v_e=v_p/2$

(c) $v_e=2v_p$ (d) $v_e=v_p/4$

Sol. (b) $v_e=\sqrt{\frac{2GM}{R}}=R\sqrt{\frac{8}{3}\pi G\rho}$

If mean density is constant, then $v_e\propto R$

$$\frac{v_e}{v_p}=\frac{R_e}{R_p}=\frac{1}{2}\quad\Rightarrow\quad v_e=\frac{v_p}{2}$$

7. A missile is launched with a velocity less than the escape velocity. The sum of its kinetic and potential energy is
   (a) Positive
   (b) Negative
   (c) Zero
   (d) May be positive or negative depending upon its initial velocity

Sol. (b) If missile is launched with escape velocity, then it will escape from the gravitational field and at infinity its total energy becomes zero.
But if the velocity of projection is less than escape velocity, then sum of energies will be negative. This shows that attractive force is working on the satellite.

8. A satellite is moving around the earth with speed v in a circular orbit of radius r. If the orbit radius is decreased by 1%, its speed will
   (a) increase by 1% (b) increase by 0.5%
   (c) decrease by 1% (d) decrease by 0.5%

Sol. (b) $v \propto \frac{1}{\sqrt{r}}$

$$\% \text{ increase in speed} = \frac{1}{2}(\% \text{ decrease in radius})$$

$$= \frac{1}{2}(1\%) = 0.5\%$$

i.e., speed will increase by 0.5%.

9. Two identical satellites are at R and $7R$ away from earth surface, the wrong statement is (R = Radius of earth)
   (a) Ratio of total energy will be 4
   (b) Ratio of kinetic energies will be 4
   (c) Ratio of potential energies will be 4
   (d) Ratio of total energy will be 4 but ratio of potential and kinetic energies will be 2

Sol. (d) Orbital radius of satellites, $r_1 = R + R = 2R$

$$r_2 = R + 7R = 8R$$

$$U_1 = \frac{-GMm}{r_1} \text{ and } U_2 = \frac{-GMm}{r_2}$$

$$K_1 = \frac{GMm}{2r_1} \text{ and } K_2 = \frac{GMm}{2r_2}$$

$$E_1 = \frac{GMm}{2r_1} \text{ and } E_2 = \frac{GMm}{2r_2}$$

$$\therefore \quad \frac{U_1}{U_2} = \frac{K_1}{K_2} = \frac{E_1}{E_2} = 4$$

10. In the following four periods,
   (i) Time of revolution of a satellite just above the earth's surface (T_{st})
   (ii) Period of oscillation of mass inside the tunnel bored along the diameter of the earth (T_{ma})
   (iii) Period of simple pendulum having a length equal to the earth's radius in a uniform field of 9.8 N/kg (T_{sp})
   (iv) Period of an infinite length simple pendulum in the earth's real gravitational field (T_{is})

   (a) $T_{st} > T_{ma}$ (b) $T_{ma} > T_{st}$
   (c) $T_{sp} < T_{is}$ (d) $T_{st} = T_{ma} = T_{sp} = T_{is}$

Sol. (c) (i) $T_{st} = 2\pi\sqrt{\frac{(R+h)^3}{GM}} = 2\pi\sqrt{\frac{R}{g}}$

[As $h << R$ and $GM = gR^2$]

(ii) $T_{ma} = 2\pi\sqrt{\frac{R}{g}}$

(iii) $T_{sp} = 2\pi\sqrt{\frac{1}{g\left(\frac{1}{l}+\frac{1}{R}\right)}} = 2\pi\sqrt{\frac{R}{2g}}$

[As $l = R$]

(iv) $T_{is} = 2\pi\sqrt{\frac{R}{g}}$ [As $l = \infty$]

11. The magnitudes of the gravitational force at distances r_1 and r_2 from the centre of a uniform sphere of radius R and mass M are F_1 and F_2, respectively. Then

   (a) $\frac{F_1}{F_2} = \frac{r_2}{r_1}$ if $r_1 < R$ and $r_2 < R$

   (b) $\frac{F_1}{F_2} = \frac{r_1^2}{r_2^2}$ if $r_1 > R$ and $r_2 > R$

   (c) $\frac{F_1}{F_2} = \frac{r_1}{r_2}$ if $r_1 > R$ and $r_2 > R$

   (d) $\frac{F_1}{F_2} = \frac{r_2^2}{r_1^2}$ if $r_1 < R$ and $r_2 < R$

Sol. (b) $g = \frac{4}{3}\pi\rho G r \;\therefore\; g \propto r$ if $r > R$

$$g = \frac{GM}{r^2} \;\therefore\; g \propto \frac{1}{r^2} \text{ if } r > R$$

If $r_1 < R$ and $r_2 < R$, then $\frac{F_1}{F_2} = \frac{g_1}{g_2} = \frac{r_1}{r_2}$

If $r_1 > R$ and $r_2 > R$, then $\frac{F_1}{F_2} = \frac{g_1}{g_2} = \left(\frac{r_2}{r_1}\right)^2$

12. A rocket of mass M is launched vertically from the surface of the earth with an initial speed V. Assuming the radius of the earth to be R and negligible air resistance, the maximum height attained by the rocket above the surface of the earth is

   (a) $R/\left(\frac{gR}{2V^2}-1\right)$ (b) $R\left(\frac{gR}{2V^2}-1\right)$

   (c) $R/\left(\frac{2gR}{V^2}-1\right)$ (d) $R\left(\frac{2gR}{V^2}-1\right)$

Sol. (c) $\Delta K.E. = \Delta U$

$$\Rightarrow \frac{1}{2}MV^2 = GM_eM\left(\frac{1}{R}-\frac{1}{R+h}\right) \quad \text{...(i)}$$

Also $g = \dfrac{GM_e}{R^2}$ ...(ii)

On solving (i) and (ii), $h = \dfrac{R}{\left(\dfrac{2gR}{V^2}-1\right)}$

13. Two bodies of masses m_1 and m_2 are initially at rest at infinite distance apart. They are then allowed to move towards each other under mutual gravitational attraction. Their relative velocity of approach at a separation distance r between them is

(a) $\left[2G\dfrac{(m_1-m_2)}{r}\right]^{1/2}$ (b) $\left[\dfrac{2G}{r}(m_1+m_2)\right]^{1/2}$

(c) $\left[\dfrac{r}{2G(m_1m_2)}\right]^{1/2}$ (d) $\left[\dfrac{2G}{r}m_1m_2\right]^{1/2}$

Sol. (b) Let velocities of these masses at r distance from each other be v_1 and v_2, respectively.
By conservation of momentum.

$$m_1v_1 - m_2v_2 = 0$$
$$\Rightarrow m_1v_1 = m_2v_2 \quad \text{... (i)}$$

By conservation of energy
change in PE = change in KE

$$\frac{Gm_1m_2}{r} = \frac{1}{2}m_1v_1^2 + \frac{1}{2}m_2v_2^2$$
$$\Rightarrow \frac{m_1^2v_1^2}{m_1} + \frac{m_2^2v_2^2}{m_2} = \frac{2Gm_1m_2}{r} \quad \text{...(ii)}$$

On solving equations (i) and (ii),

$$v_1 = \sqrt{\frac{2Gm_2^2}{r(m_1+m_2)}} \text{ and } v_2 = \sqrt{\frac{2Gm_1^2}{r(m_1+m_2)}}$$
$$\therefore v_{app} = |v_1| + |v_2| = \sqrt{\frac{2G}{r}(m_1+m_2)}$$

14. A projectile is projected with velocity kv_e in vertically upward direction from the ground into the space. (v_e is escape velocity and $k < 1$). If air resistance is considered to be negligible, then the maximum height from the centre of earth to which it can go will be (R = radius of earth)

(a) $\dfrac{R}{k^2+1}$ (b) $\dfrac{R}{k^2-1}$

(c) $\dfrac{R}{1-k^2}$ (d) $\dfrac{R}{k+1}$

Sol. (c) Kinetic energy = Potential energy

$$\frac{1}{2}m(kv_e)^2 = \frac{mgh}{1+\frac{h}{R}} \Rightarrow \frac{1}{2}mk^2 2gR = \frac{mgh}{1+\frac{h}{R}}$$

$$\Rightarrow h = \frac{Rk^2}{1-k^2}$$

Height of projectile from the earth's surface = h

Height from the centre, $r = R + h = R + \dfrac{Rk^2}{1-k^2}$

By solving, we get $r = \dfrac{R}{1-k^2}$

15. A satellite is launched into a circular orbit of radius R around the earth. A second satellite is launched into an orbit of radius $(1.01)R$. The period of the second satellite is larger than that of the first one by approximately

(a) 0.5% (b) 1.0%
(c) 1.5% (d) 3.0%

Sol. (c) In the problem, the orbital radius is increased by 1%.
Time period of satellite, $T \propto r^{3/2}$
Percentage change in time period

$$= \frac{3}{2}(\% \text{ change in orbital radius}) = \frac{3}{2}(1\%) = 1.5\%$$

16. If the distance between the earth and the sun becomes half its present value, the number of days in a year would have been

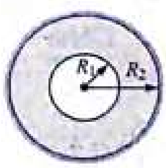
(a) 64.5 (b) 129
(c) 182.5 (d) 730

Sol. (b) According to Kepler's third law, the ratio of the squares of the periods of any two planets revolving about the sun is equal to the ratio of the cubes of their average distances from the sun, i.e.,

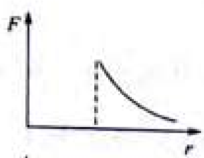
$$\left(\frac{T_1}{T_2}\right)^2 = \left(\frac{r_1}{r_2}\right)^3 = \left[\frac{r_1}{\frac{1}{2}r_1}\right]^3 = 8 \Rightarrow \frac{T_1}{T_2} = 2\sqrt{2}$$

$$\therefore T_2 = \frac{T_1}{2\sqrt{2}} = \frac{365 \text{ days}}{2\sqrt{2}} = 129 \text{ days}$$

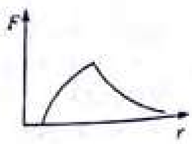
17. A sphere of mass M and radius R_2 has a concentric cavity of radius R_1 as shown in figure. The force F exerted by the sphere on a particle of mass m located at a distance r from the centre of sphere varies as $(0 \le r \le \infty)$



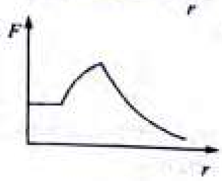
(a)



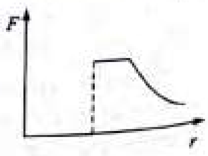
(b)



(c)



(d)



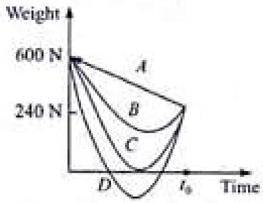
Sol. (b) $F = 0$ when $0 \le r \le R_1$

Because intensity is zero inside the cavity.

F increases when $R_1 \le r \le R_2$

$F \propto \frac{1}{r^2}$ when $r > R_2$

18. Suppose, the acceleration due to gravity at the Earth's surface is 10 m/s^2 and at the surface of Mars it is 4.0 m/s^2. A 60-kg passenger goes from the Earth to the Mars in a spaceship moving with a constant velocity. Neglect all other objects in the sky. Which part of figure best represents the weight (net gravitational force) of the passenger as a function of time?



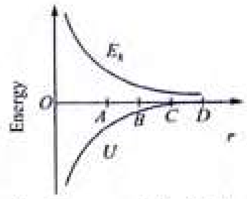
(a) A (b) B
(c) C (d) D

Sol. (c) Initially the weight of the passenger

$= 60 \times 10 = 600$ N

Finally the weight of the passenger $= 60 \times 4 = 240$ N and during the flight in between somewhere its weight will be zero because at that point gravitational pull of Earth and Mars will be equal.

19. The curves for potential energy (U) and kinetic energy (E_k) of a two particle system are shown in figure. At what points the system will be bound?

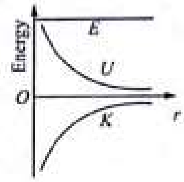


(a) Only at point D (b) Only at point A
(c) At point D and A (d) At points A, B and C

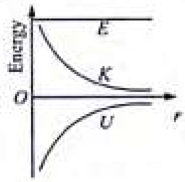
Sol. (d) The system will be bound at points where total energy is negative. In the given curve at point A, B and C, the PE is more than KE

20. The correct graph representing the variation of total energy (E_t), kinetic energy (E_k) and potential energy (U) of a satellite with its distance from the centre of Earth is

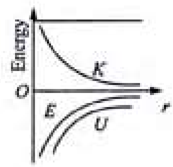
(a)



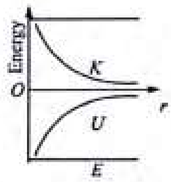
(b)



(c)



(d)



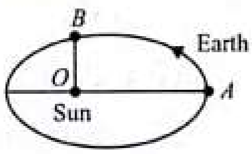
Sol. (c) $U = \frac{-GMm}{r}, K = \frac{GMm}{2r}$ and $E = \frac{-GMm}{2r}$

For a satellite U, K and E varies with r and also U and E remains negative whereas K remains always positive.

EXERCISES

Kepler's Laws of Planetary Motion and Newton's Law of Gravitation

1. The earth moves around the Sun in an elliptical orbit as shown in the figure. The ratio $OA/OB = x$. The ratio of the speed of the earth at B to that at A is nearly



(a) $\sqrt{x}$ (b) x
(c) $x\sqrt{x}$ (d) x^2

2. A planet is revolving in an elliptical orbit around the Sun. Its closest distance from the Sun is r_{min} and the farthest distance is r_{max}. If the velocity of the planet at the distance of the closest approach is v_1 and that at the farthest distance from the Sun is v_2, then v_1/v_2

(a) $\frac{r_{max}}{r_{min}}$ (b) $\frac{r_{min}}{r_{max}}$

(c) $\frac{r_{min}+r_{max}}{r_{max}-r_{min}}$ (d) none

3. Imagine a light planet revolving around a very massive star in a circular orbit of radius r with a period of revolution T. If the gravitational force of attraction between the planet and the star is proportional to $r^{5/2}$, then the square of the time period will be proportional to

(a) r^3 (b) r^2
(c) $r^{2.5}$ (d) $r^{3.5}$

4. The gravitational force between two objects is proportional to $1/R$ (and not as $1/R^2$) where R is separation between them, then a particle in circular orbit under such a force would have its orbital speed v proportional to

(a) $\frac{1}{R^2}$ (b) R^0

(c) R^1 (d) $\frac{1}{R}$

5. Two particles of equal mass go around a circle of radius R under the action of their mutual gravitational attraction. The speed of each particle is

(a) $v = \frac{1}{2R}\sqrt{\left(\frac{1}{Gm}\right)}$ (b) $v = \sqrt{\left(\frac{Gm}{2R}\right)}$

(c) $v = \frac{1}{2}\sqrt{\left(\frac{Gm}{R}\right)}$ (d) $v = \sqrt{\left(\frac{4Gm}{R}\right)}$

6. If three uniform spheres, each having mass M and radius R, are kept in such a way that each touches the other two, the magnitude of the gravitational force on any sphere due to the other two is

(a) $\frac{GM^2}{4r^2}$ (b) $\frac{2GM^2}{r^2}$

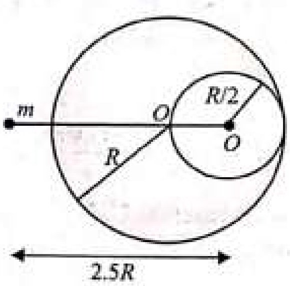
(c) $\frac{2GM^2}{4r^2}$ (d) $\frac{\sqrt{3}GM^2}{4r^2}$

7. The distance between the centres of the Moon and the earth is D. The mass of the earth is 81 times the mass of the Moon. At what distance from the centre of the Earth, the gravitational force will be zero?

(a) $\frac{D}{2}$ (b) $\frac{2D}{3}$

(c) $\frac{4D}{3}$ (d) $\frac{9D}{10}$

8. A solid sphere of radius $R/2$ is cut out of a solid sphere of radius R such that the spherical cavity so formed touches the surface on one side and the centre of the sphere on the other side, as shown. The initial mass of the solid sphere was M. If a particle of mass m is placed at a distance $2.5R$ from the centre of the cavity, then what is the gravitational attraction on the mass m?



(a) $\frac{GMm}{R^2}$ (b) $\frac{GMm}{2R^2}$

(c) $\frac{GMm}{8R^2}$ (d) $\frac{23}{100}\frac{GMm}{R^2}$

9. As observed from the earth, the sun appears to move in an approximate circular orbit. For the motion of another planet like mercury as observed from the earth, this would

(a) be similarly true

(b) not be true because the force between the earth and mercury is not inverse square law

(c) not be true because the major gravitational force on mercury is due to the sun

(d) not be true because mercury is influenced by forces other than gravitational forces

10. In our solar system, the inter-planetary region has chunks of matter (much smaller in size compared to planets) called asteroids. They

(a) will not move around the sun, since they have very small masses compared to the sun

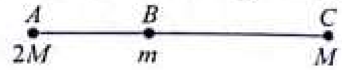
(b) will move in an irregular way because of their small masses and will drift away into outer space

(c) will move around the sun in closed orbits but not obey Kepler's laws

(d) will move in orbits like planets and obey Kepler's laws

11. Particles of masses $2M$, m and M are respectively at points A, B and C with $AB = \frac{1}{2}(BC)$. m is much-much smaller than M and at time $t = 0$, they are all at rest as given in figure.

At subsequent times before any collision takes place.



(a) m will remain at rest

(b) m will move towards M

(c) m will move towards $2M$

(d) m will have oscillatory motion

12. In planetary motion the areal velocity of position vector of a planet depends on angular velocity (ω) and the distance of the planet from sun (r). If so the correct relation for areal velocity is

(a) $\frac{dA}{dt} \propto \omega r$ (b) $\frac{dA}{dt} \propto \omega^2 r$

(c) $\frac{dA}{dt} \propto \omega r^2$ (d) $\frac{dA}{dt} \propto \sqrt{\omega r}$

13. The maximum and minimum distances of a comet from the sun are 8×10^{12} m and 1.6×10^{12} m. If its velocity when nearest to the sun is 60 m/s, what will be its velocity in m/s when it is farthest?

(a) 12 (b) 60

(c) 112 (d) 6

14. Three identical point masses, each of mass 1 kg lie in the x-y plane at points (0, 0), (0, 0.2m) and (0.2m, 0). The net gravitational force on the mass at the origin is

(a) $1.67\times10^{-9}(\hat{i}+\hat{j})$ N

(b) $3.34\times10^{-10}(\hat{i}+\hat{j})$ N

(c) $1.67\times10^{-9}(\hat{i}-\hat{j})$ N

(d) $3.34\times10^{-10}(\hat{i}+\hat{j})$ N

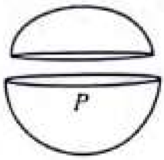
15. A planet moves around the sun. At a given point P, it is closed from the sun at a distance d_1 and has a speed v_1. At another point Q, when it is farthest from the sun at a distance d_2, its speed will be

(a) $\frac{d_1^2 v_1}{d_2^2}$ (b) $\frac{d_2 v_1}{d_1}$

(c) $\frac{d_1 v_1}{d_2}$ (d) $\frac{d_2^2 v_1}{d_1^2}$

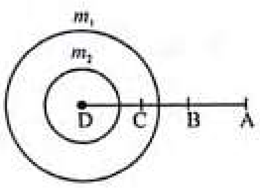
Gravitational Field and Acceleration Due to Gravity

16. A spherical shell is cut into two pieces along a chord as shown in the figure. P is a point on the plane of the chord. The gravitational field at P due to the upper part is I_1 and that due to the lower part is I_2. What is the relation between them?



(a) $I_1 > I_2$ (b) $I_1 < I_2$
(c) $I_1 = I_2$ (d) no definite relation

17. Figure shows two shells of masses m_1 and m_2. The shells are concentric. At which point, a particle of mass m shall experience zero force?



(a) A (b) B
(c) C (d) D

18. If g is same at a height h and at a depth d, then
(a) $R = 2d$ (b) $d = 2h$
(b) $h = d$ (d) none

19. If R is the radius of the earth and g the acceleration due to gravity on the earth's surface, the mean density of the earth is
(a) $\frac{4\pi G}{3gR}$ (b) $\frac{3\pi R}{4gG}$
(c) $\frac{3g}{4\pi RG}$ (d) $\frac{\pi R}{12G}$

20. The value of g (acceleration due to gravity) at earth's surface is 10 ms^{-2}. Its value in ms^{-2} at the centre of the earth which is assumed to be a sphere of radius R metre and uniform mass density is
(a) 5 (b) $\frac{10}{R}$
(c) $\frac{10}{2R}$ (d) zero

21. If the radius of the earth decreases by 10%, the mass remaining unchanged, what will happen to the acceleration due to gravity?
(a) Decreases by 19%
(b) Increases by 19%
(c) Decreases by more than 19%
(d) Increases by more than 19%

22. The distances from the centre of the Earth, where the weight of a body is zero and one-fourth that of the weight of the body on the surface of the Earth are (assume R is the radius of the earth)
(a) $0, \frac{R}{4}$ (b) $0, \frac{3R}{4}$
(c) $\frac{R}{4}, 0$ (d) $\frac{3R}{4}, 0$

23. If a man at the equator would weigh (3/5)th of his weight, The angular speed of the earth is
(a) $\sqrt{\frac{2}{5}\frac{g}{R}}$ (b) $\sqrt{\frac{g}{R}}$
(c) $\sqrt{\frac{R}{g}}$ (d) $\sqrt{\frac{2}{5}\frac{R}{g}}$

24. How many hours would make a day if the Earth were rotating at such a high speed that the weight of a body on the equator were zero?
(a) 6.2 h (b) 1.4 h
(c) 28 h (d) 5.6 h

25. If the mass of a planet is 10% less than that of the earth and the radius is 20% greater than that of the earth, the acceleration due to gravity on the planet will be
(a) 5/8 times that on the surface of the earth
(b) 3/4 times that on the surface of the earth
(c) 1/2 times that on the surface of the earth
(d) 9/10 times that on the surface of the earth

26. What should be the angular velocity of rotation of the earth about its own axis so that the weight of a body at the equator reduces to 3/5 or its present value? (Take R as the radius of the earth)
(a) $\sqrt{\frac{g}{3R}}$ (b) $\sqrt{\frac{2g}{3R}}$
(c) $\sqrt{\frac{2g}{5R}}$ (d) $\sqrt{\frac{2g}{7R}}$

27. The value of g at a certain height h above the free surface of the earth is $x/4$ where x is the value of g at the surface of the earth. The height h is
(a) R (b) $2R$
(c) $3R$ (d) $4R$

28. The mass of the moon is 1/81 of the earth but the gravitational pull is 1/6 of the earth. It is due to the fact that
(a) The radius of the moon is 81/6 of the earth
(b) The radius of the earth is $9/\sqrt{6}$ of the moon
(c) Moon is the satellite of the earth
(d) None of the above

29. Acceleration due to gravity on moon is 1/6 of the acceleration due to gravity on earth. If the ratio of densities of earth (ρ_e) and moon (ρ_m) is $\left(\frac{\rho_e}{\rho_m}\right) = \frac{5}{3}$ then radius of moon R_m in terms of R_e will be
(a) $\frac{5}{18}R_e$ (b) $\frac{1}{6}R_e$
(c) $\frac{7}{18}R_e$ (d) $\frac{1}{2\sqrt{3}}R_e$

30. The radii of two planets are respectively R_1 and R_2 and their densities are respectively ρ_1 and ρ_2. The ratio of the accelerations due to gravity at their surfaces is

(a) $g_1 : g_2 = \frac{\rho_1}{R_1^2} : \frac{\rho_2}{R_2^2}$

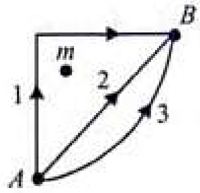
(b) $g_1 : g_2 = R_1R_2 : \rho_1\rho_2$

(c) $g_1 : g_2 = R_1\rho_2 : R_2\rho_1$

(d) $g_1 : g_2 = R_1\rho_1 : R_2\rho_2$

Gravitational Potential, Energy and Escape Velocity

31. If W_1, W_2 and W_3 represent the work done in moving a particle from A to B along three different paths 1, 2 and 3, respectively, (as shown in the figure) in the gravitational field of a point mass m, find the correct relation between W_1, W_2 and W_3.



(a) $W_1 > W_2 > W_3$ (b) $W_1 = W_2 = W_3$

(b) $W_1 < W_2 < W_3$ (d) $W_2 > W_1 > W_3$

32. If g is acceleration due to gravity on the Earth's surface, the gain in the potential energy of an object of mass m raised from the surface of Earth to a height equal to the radius R of the earth is

(a) $\frac{1}{2} mgR$ (b) $2mgR$

(c) mgR (d) $\frac{1}{4} mgR$

33. A space ship is launched into a circular orbit close to the surface of the earth. The additional velocity now imparted to the spaceship in the orbit to overcome the gravitational pull is

(a) 11.2 km s^{-1} (b) 8 km s^{-1}

(c) 3.2 km s^{-1} (d) 1.414×8 km s^{-1}

34. A skylab of mass m kg is first launched from the surface of the earth in a circular orbit of radius $2R$ (from the centre of the earth) and then it is shifted from this circular orbit to another circular orbit of radius $3R$. The minimum energy required to place the lab in the first orbit and to shift the lab from first orbit to the second orbit are

(a) $\frac{3}{4}mgR, \frac{mgR}{6}$ (b) $\frac{3}{4}mgR, \frac{mgR}{12}$

(c) mgR, mgR (d) $2mgR, mgR$

35. The gravitational potential due to earth at infinite distance from it is zero. Let the gravitational potential at a point P be -5 J kg^{-1}. Suppose, we arbitrarily assume the gravitational potential at infinity to be $+10$ J kg^{-1}, then the gravitational potential at P will be

(a) -5 J kg^{-1} (b) $+5$ J kg^{-1}

(c) -15 J kg^{-1} (d) $+15$ J kg^{-1}

36. Two bodies of masses M_1 and M_2 are placed at a distance R apart. Then at the position where the gravitational field due to them is zero, the gravitational potential is

(a) $-G\frac{\sqrt{M_1}}{R}$ (b) $-G\frac{\sqrt{M_2}}{R}$

(c) $-(\sqrt{M_1}+\sqrt{M_2})^2\frac{G}{R}$ (d) $-(\sqrt{M_1}-\sqrt{M_2})^2\frac{G}{R}$

37. In the solar system, the Sun is in the focus of the system for Sun–Earth binding system. Then the binding energy for the system will be [given that radius of the earth's orbit round the Sun is 1.5×10^{11} m and mass of the earth $= 6 \times 10^{24}$ kg]

(a) 2.7×10^{33} J (b) 5.4×10^{33} J

(c) 2.7×10^{30} J (d) 5.4×10^{30} J

38. The minimum energy required to launch a m kg satellite from the Earth's surface in a circular orbit at an altitude $2R$, where R is the radius of earth is

(a) $\frac{5}{3} mgR$ (b) $\frac{4}{3} mgR$

(c) $\frac{5}{6} mgR$ (d) $\frac{5}{4} mgR$

39. In order to shift a body of mass m from a circular orbit of radius $3R$ to a higher orbit of radius $5R$ around the earth, the work done is

(a) $\frac{3GMm}{5R}$ (b) $\frac{GMm}{2R}$

(c) $\frac{2}{15}\frac{GMm}{R}$ (d) $\frac{GMm}{5R}$

40. A body of mass m is situated at a distance $4R_e$ above the earth's surface, where R_e is the radius of earth. How much minimum energy be given to the body so that it may escape

(a) mgR_e (b) $2\,mgR_e$

(c) $\frac{mgR_e}{5}$ (d) $\frac{mgR_e}{16}$

41. Assuming earth as a uniform sphere of radius R, if we project a body along the smooth diametrical chute from the centre of earth with a speed v such that it will just reach the earth's surface then v is equal to

(a) $\sqrt{gR}$ (b) $\sqrt{2gR}$

(c) $\sqrt{\frac{gR}{2}}$ (d) none of these

42. In the above question, escape speed from the centre of earth is

(a) $\sqrt{2gR}$ (b) $\sqrt{gR}$

(c) $\sqrt{gR}$ (d) $\sqrt{\frac{3gR}{2}}$

43. In question 41, the minimum external work done in shifting a particle from centre of earth to earth's surface is W_1 and that from surface of earth to infinity is W_2, then W_1/W_2 is equal to

(a) 1 : 1 (b) 1 : 2

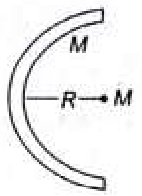
(c) 2 : 1 (d) 1 : 3

44. The escape velocity from the centre of a uniform ring of mass M and radius R is

(a) $\sqrt{\frac{2GM}{R}}$ (b) $\sqrt{\frac{GM}{R}}$

(c) $\sqrt{\frac{GM}{2R}}$ (d) $2\sqrt{\frac{GM}{R}}$

45. The potential energy of interaction between the semi-circular ring of mass M and radius R, and the particle of mass M placed at the centre of curvature of the semi-circular arc is



(a) $-\frac{GM^2}{R}$ (b) $-\frac{2GM^2}{R}$

(c) $-\frac{GM^2}{\pi R}$ (d) none of these

Motion of Satellite

46. Two satellites A and B of masses m_1 and m_2 ($m_1 = 2\,m_2$) are moving in circular orbits of radii r_1 and r_2 ($r_1 = 4r_2$), respectively, around the earth. If their periods are T_A and T_B, then the ratio T_A/T_B is

(a) 4 (b) 16

(c) 2 (d) 8

47. A satellite of mass m is revolving around the earth at height R (radius of the earth) from the earth's surface. Its potential energy will be

(a) mgR (b) $0.67\,mgR$

(c) $-\frac{mgR}{2}$ (d) $0.33\,mgR$

48. A satellite moves around the earth in a circular orbit with speed v. If m is the mass of the satellite, its total energy is

(a) $-\frac{1}{2}mv^2$ (b) $\frac{1}{2}mv^2$

(c) $\frac{3}{2}mv^2$ (d) $\frac{1}{4}mv^2$

49. Two satellites of masses m_1 and m_2 ($m_1 > m_2$) are revolving around the earth in a circular orbit of radii r_1 and r_2 ($r_1 > r_2$), respectively. Which of the following statements is true regarding their speeds v_1 and v_2?

(a) $v_1 = v_2$ (b) $v_1 > v_2$

(c) $v_1 < v_2$ (d) $\frac{v_1}{r_1} = \frac{v_2}{v_2}$

50. Two satellites A and B of the same mass are revolving around the earth in the concentric circular orbits such that the distance of satellite B from the centre of the earth is thrice as compared to the distance of the satellite A from the centre of the earth. The ratio of the centripetal force acting on B as compared to that on A is

(a) $\frac{1}{3}$ (b) 3

(c) $\frac{1}{9}$ (d) $\frac{1}{\sqrt{3}}$

51. A satellite is seen after each 8 hours over equator at a place on the earth when its sense of rotation is opposite to the earth. The time interval after which it can be seen at the same place when the sense of rotation of earth and satellite is same will be

(a) 8 hours (b) 12 hours

(c) 24 hours (d) 6 hours

52. A satellite is moved from one circular orbit around the earth to another of lesser radius. Which of the following statement is true?

(a) The kinetic energy of satellite increases and the gravitational potential energy of satellite-earth system increases.

(b) The kinetic energy of satellite increases and the gravitational potential energy of satellite-earth system decreases.

(c) The kinetic energy of satellite decreases and the gravitational potential energy of satellite-earth system decreases.

(d) The kinetic energy of satellite decreases and the gravitational potential energy of satellite-earth system increases.

53. The orbital velocity of an artificial satellite in a circular orbit just above the earth's surface is v. For a satellite orbiting at an altitude of half of the earth's radius, the orbital velocity is

(a) $\frac{3}{2}v$ (b) $\sqrt{\frac{3}{2}}\,v$

(c) $\sqrt{\frac{2}{3}}\,v$ (d) $\frac{2}{3}v$

54. In the following four periods

(i) Time of revolution of a satellite just above the earth's surface (T_{st})

(ii) Period of oscillation of mass inside the tunnel bored along the diameter of the earth (T_{ma})

(iii) Period of simple pendulum having a length equal to the earth's radius in a uniform field of 9.8 N/kg (T_{sp})

(iv) Period of an infinite length simple pendulum in the earth's real gravitational field (T_{is})

(a) $T_{st} > T_{ma}$ (b) $T_{ma} > T_{st}$

(c) $T_{sp} < T_{is}$ (d) $T_{st} = T_{ma} = T_{sp} = T_{is}$

55. In a satellite if the time of revolution is T, then kinetic energy is proportional to

(a) $\frac{1}{T}$ (b) $\frac{1}{T^2}$

(c) $\frac{1}{T^3}$ (d) $T^{-2/3}$

56. A satellite is revolving around the Earth in a circular orbit with a constant speed. If its speed is made 2 times by supplying energy from an external source then what will be the path of satellite after this?

(a) Straight line (b) Circular

(c) Parabola (d) Hyperbola

57. A satellite can be in a geostationary orbit around earth in an orbit of radius r. If the angular velocity of earth about its axis doubles, a satellite can now be in a geostationary orbit around earth of radius

(a) $\frac{r}{2}$ (b) $\frac{r}{2\sqrt{2}}$

(c) $\frac{r}{(4)^{1/3}}$ (d) $\frac{r}{(2)^{1/3}}$

58. A satellite in equatorial plane is rotating in the direction of earth's rotation with time interval between its two consecutive appearances over head of an observer as time period of rotation of the earth, T_E. What is the time period of the satellite?

(a) T_E (b) $2T_E$

(c) $\frac{T_E}{2}$ (d) $\frac{2T_E}{3}$

59. A satellite is orbiting with areal velocity v_a. At what height from the surface of the earth, it is rotating, if the radius of earth is R?

(a) $\frac{4v_a^2}{gR^2} - R$ (b) $\frac{2v_a^2}{gR^2} - R$

(c) $\frac{v_a^2}{gR^2} - R$ (d) $\frac{3v_a^2}{gR^2} - R$

60. A spherical planet has uniform density $\frac{\pi}{2} \times 10^4$ kg/m^3. Find out the minimum period for a satellite in a circular orbit around it in seconds. (Use $G = \frac{20}{3} \times 10^{-11} \frac{\text{N-m}^2}{\text{kg}^2}$).

(a) 7500 (b) 3000

(c) 4500 (d) 6000

Problems Based on Mixed Concepts

61. The maximum vertical distance through which a fully dressed astronaut can jump on the earth is 0.5 m. If mean density of the Moon is two-thirds that of the Earth and radius is one quarter that of the Earth, the maximum vertical distance through which he can jump on the Moon and the ratio of the time of duration of the jump on the Moon to hold on the Earth are

(a) 3 m, 6:1 (b) 6 m, 3:1

(c) 3 m, 1:6 (d) 6 m, 1:6

62. Two satellites of the same mass are launched in the same orbit around the earth so as to rotate opposite to each other. If they collide inelastically and stick together as wreckage, the total energy of the system just after collision is

(a) $-\frac{2GMm}{r}$ (b) $-\frac{GMm}{r}$

(c) $\frac{GMm}{2r}$ (d) $\frac{GMm}{4r}$

63. A ball of mass m is fired vertically upwards from the surface of the earth with velocity nv_e, where v_e is the escape velocity and $n > 1$. To what height will the ball rise? Neglecting air resistance, take radius of the earth as R

(a) $\frac{R}{n^2}$ (b) $\frac{R}{(1-n^2)}$

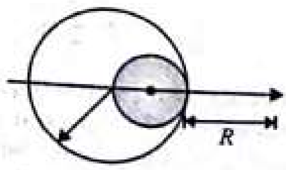
(c) $\frac{Rn^2}{(1-n^2)}$ (d) Rn^2

64. A body is released from a point of distance R' from the centre of earth. Its velocity at the time of striking the earth will be $(R' > R_e)$

(a) $\sqrt{2gR_e}$ (b) $\sqrt{R_e g}$

(c) $\sqrt{2g(R' - R_e)}$ (d) $\sqrt{2gR_e\left(1 - \frac{R_e}{R'}\right)}$

65. A solid sphere of uniform density and radius R applies a gravitational force of attraction equal to F_1 on a particle placed at a distance $2R$ from the centre of the sphere. A spherical cavity of radius $R/2$ is now made in the sphere as shown in the figure. The sphere with the cavity now applies a gravitational force F_2 on the same particle. The ratio F_1/F_2 is



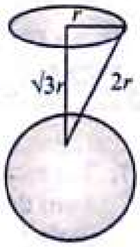
(a) $\frac{1}{2}$ (b) $\frac{3}{4}$

(c) $\frac{7}{8}$ (d) $\frac{9}{7}$

66. The value of g at a particular point is 10 ms^{-2}. Suppose the earth shrinks uniformly to half of its present size without losing any mass. The value of g at the same point (assuming that the distance of the point from the centre of the earth does not change) will now be

(a) 5 $m\,s^{-2}$ (b) 10 $m\,s^{-2}$
(c) 3 $m\,s^{-2}$ (d) 20 $m\,s^{-2}$

67. A uniform ring of mass m and radius r is placed directly above a uniform sphere of mass M and of equal radius. The centre of the ring is directly above the centre of the sphere at a distance $r\sqrt{3}$ as shown in the figure. The gravitational force exerted by the sphere on the ring will be



(a) $\dfrac{GMm}{8r^2}$ (b) $\dfrac{GMm}{4r^2}$
(c) $\sqrt{3}\dfrac{GMm}{8r^2}$ (d) $\dfrac{GMm}{8r^2\sqrt{3}}$

68. A tunnel is dug along a diameter of the earth. If M_e and R_e are the mass and radius, respectively, of the earth, then the force on a particle of mass m placed in the tunnel at a distance r from the centre is

(a) $\dfrac{GM_em}{R_e^3}r$ (b) $\dfrac{GM_em}{R_e^3r}$
(c) $\dfrac{GM_emR_e^3}{r}$ (d) $\dfrac{GM_em}{R_e^2}r$

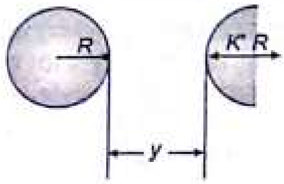
69. A small body of superdense material, whose mass is twice the mass of the earth but whose size is very small compared to the size of the earth, starts from rest at a height $H << R$ above the earth's surface, and reaches the earth's surface in time t. Then t is equal to

(a) $\sqrt{2H/g}$ (b) $\sqrt{H/g}$
(c) $\sqrt{2H/3g}$ (d) $\sqrt{4H/3g}$

70. If a particle of mass m is projected with minimum velocity from the surface of a star with kinetic energy K_1GMm/a and potential energy at surface of the star K_2GMm/a towards the star of same mass m and radius a (K_1 and K_2 are constants) to reach the other star. Find the distance between the centre of the two stars

(a) $\dfrac{2a}{(K_2-K_1)}$ (b) $\dfrac{4a}{(K_2-K_1)}$
(c) $\dfrac{2a}{(K_1-K_2)}$ (d) $\dfrac{a}{(K_1-K_2)}$

71. In a cosmic event, suppose a planet heavier than the earth with mass KM ($K > 1$) and radius $K'R$ ($K' > 1$) passes through a path near the earth (M and R are the mass and radius of earth). At what closest distance from surface of planet, we are in danger of being thrown into space:



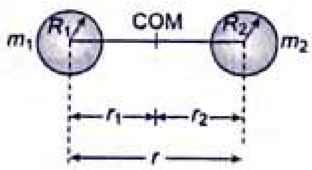
(a) $\left[\dfrac{2KGM}{g}\right]^{1/2}-\dfrac{1}{2}K'R$

(b) $\left[\dfrac{KGM}{2g}\right]^{1/2}-\dfrac{1}{2}K'R$

(c) $\left[\dfrac{KGM}{g}\right]^{1/2}-\dfrac{1}{2}K'R$

(d) $\left[\dfrac{KGM}{g}\right]^{1/2}-K'R$

72. Binary stars of comparable masses rotate under the influence of each other's gravity at a distance $\left[2G/\omega^2\right]^{1/3}$ where ω is the angular velocity of each of the system. If difference between the masses of two stars is 6 units. Find the ratio of the masses of smaller to bigger star.



(a) 4 : 10 (b) 1 : 7
(c) 2 : 8 (d) 3 : 9

73. In the previous problem, if two stars suddenly stop and collide with each other with sum of their radii as 1/10th of the distance r at which they were earlier rotating, find the relative velocity of collapse

(a) $12\sqrt{\dfrac{G}{r}}$ (b) $8\sqrt{\dfrac{G}{r}}$
(c) $10\sqrt{\dfrac{G}{r}}$ (d) $3\sqrt{\dfrac{G}{r}}$

74. Two planets revolve with same angular velocity about a star. The radius of orbit of outer planet is twice the radius of orbit of the inner planet. If T is time period of the revolution of outer planet, find the time in which inner planet will fall into the star. If it was suddenly stopped.

(a) $\dfrac{T\sqrt{2}}{8}$ (b) $\dfrac{T\sqrt{2}}{16}$

(c) $\frac{T\sqrt{2}}{4}$ (d) $\frac{T\sqrt{2}}{32}$

75. A satellite moves eastwards very near the surface of the Earth in equatorial plane with speed (v_0). Another satellite moves at the same height with the same speed in the equatorial plane but westwards. If R = radius of the Earth and ω be its angular speed of the Earth about its own axis. Then find the approximate difference in the two time period as observed on the Earth.

(a) $\frac{4\pi\omega R^2}{v_0^2+R^2\omega^2}$ (b) $\frac{2\pi\omega R^2}{v_0^2-R^2\omega^2}$

(c) $\frac{4\pi\omega R^2}{v_0^2-R^2\omega^2}$ (d) $\frac{2\pi\omega R^2}{v_0^2+R^2\omega^2}$

ARCHIVES

1. The energy required to move a body of mass m from an orbital of radius $2R$ to $3R$ is (where M is the mass of the earth and R is the radius of the earth)

(a) $\frac{GMm}{12R^2}$ (b) $\frac{GMm}{8R}$

(c) $\frac{GMm}{3R^2}$ (d) $\frac{GMm}{6R}$ **(AIEEE 2002)**

2. If suddenly the gravitational force of attraction between the earth and a satellite revolving around it becomes zero, then the satellite will
   (a) continue to move in its orbit with the same velocity.
   (b) move tangentially to the original orbit with the same velocity.
   (c) become stationary in its orbit.
   (d) move towards the earth. **(AIEEE 2002)**

3. The escape velocity of a body depends upon mass as

(a) m^0 (b) m^1

(c) m^2 (d) m^3 **(AIEEE 2002)**

4. The kinetic energy needed to project a body of mass m from the earth's surface (radius R) to infinity is

(a) $\frac{mgR}{2}$ (b) $2\,mgR$

(c) mgR (d) $\frac{mgR}{4}$ **(AIEEE 2002)**

5. The time period of a satellite of the earth is 5 h. If the separation between the earth and the satellite is increased to four times the previous value, the new time period will become

(a) 10 h (b) 80 h

(c) 40 h (d) 20 h **(AIEEE 2003)**

6. Two spherical bodies of masses m and $5M$ and radii R and $2R$, respectively, are released in free space with initial separation between their centres equal to $12R$. If they attract each other by gravitational force only, then the distance covered by the smaller body just before collision is

(a) $2.5R$ (b) $4.5R$

(c) $7.5R$ (d) $1.5R$ **(AIEEE 2003)**

7. The escape velocity for a body projected vertically upward from the surface of the earth is 11 km/s. If the body is projected at an angle of 45° with the vertical, the escape velocity will be

(a) $11\sqrt{2}$ km/s (b) 22 km/s

(c) 11 km/s (d) $\frac{11}{\sqrt{2}}$ km/s

(AIEEE 2003)

8. A satellite of mass m revolves around the earth of radius R at a height x from its surface. If g is the acceleration due to gravity on the surface of the earth, the orbital speed of the satellite is

(a) gx (b) $\left(\frac{gR^2}{R+x}\right)^2$

(c) $\frac{gR^2}{R+x}$ (d) $\frac{gR}{R-x}$ **(AIEEE 2004)**

9. The time period of an earth satellite in circular orbit is independent of
   (a) the mass of the satellite
   (b) radius of its orbit
   (c) both the mass and radius of the orbit
   (d) neither the mass of the satellite nor the radius of its orbit **(AIEEE 2004)**

10. If g is the acceleration due to gravity on the earth's surface, the gain in the potential energy of an object of mass m raised from the earth's surface to a height equal to the radius R of the earth is

(a) $2\,mgR$ (b) $\frac{1}{2}mgR$

(c) $\frac{1}{4}mgR$ (d) mgR **(AIEEE 2004)**

11. Suppose the gravitational force varies inversely as the nth power of distance. Then the time period of a planet in a circular orbit of radius R around the sun will be proportional to

(a) $R^{(n+1)/2}$ (b) $R^{(n-1)/2}$

(c) R^n (d) $R^{(n-2)/2}$ **(AIEEE 2004)**

12. The average density of the earth
   (a) does not depend on g
   (b) is a complex function of g

(c) is directly proportional to g
(d) is inversely proportional to g **(AIEEE 2005)**

13. The change in the value of g at a height h above the surface of the earth is the same as at a depth d below the earth. When both d and h are much smaller than the radius of the earth, which one of the following is correct?
(a) $d=\frac{h}{2}$ (b) $d=\frac{3h}{2}$
(c) $d=2h$ (d) $d=h$ **(AIEEE 2005)**

14. A particle of mass 10 g is kept on the surface of a uniform sphere of mass 100 kg and radius 10 cm. Find the work done against the gravitational force between them to take the particle far away from the sphere.
(a) 13.34×10^{-10} J (b) 3.33×10^{-10} J
(c) 6.67×10^{-9} J (d) 6.67×10^{-10} J
(AIEEE 2005)

15. If g_E and g_M are the acceleration due to gravity on the moon, respectively, and if Millikan oil drop experiment could be performed on the two surfaces, one will find the ratio $\frac{\text{electronic charge on moon}}{\text{electronic charge on earth}}$ to be
(a) 0 (b) $\frac{g_E}{g_M}$
(c) $\frac{g_M}{g_E}$ (d) 1 **(AIEEE 2007)**

16. A planet in a distant solar system is 10 times more massive than the earth and its radius is 10 times smaller. Given that the velocity from the earth is 11 m/s the escape velocity from the surface of the planet would be
(a) 1.1 km/s (b) 11 km/s
(c) 110 km/s (d) 0.11 km/s
(AIEEE 2007)

17. The height at which the acceleration due to gravity becomes $g/9$ (where g is the acceleration due to gravity on the surface of the earth) in terms of R, the radius of the earth is
(a) $2R$ (b) $\frac{R}{\sqrt{2}}$
(c) $\frac{R}{2}$ (d) $\sqrt{2}R$ **(AIEEE 2008)**

18. Directions: The following question contains statement 1 and statement 2. Of the four choices given, choose the one that best describes the two statements.

Statement 1: For a mass M kept at a center of a cube of side a, the flux of gravitational field passing through its side is $4\pi GM$.

Statement 2: If the direction of a field due to a point source is radial and its dependence on the distance r from the source is given is $1/r^2$, its flux through a closed surface depends only on the strength of the source enclosed by the surface and not on the size or shape of the surface.

(a) statement 1 is true, but statement 2 is false.
(b) statement 1 is false, but statement 2 is true.
(c) statement 1 is true, statement 2 is true; statement 2 is the correct explanation for statement 1.
(d) statement 1 is true, statement 2 is true; statement 2 is not the correct explanation for statement 1.
(AIEEE 2008)

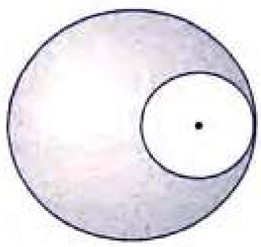
19. Two bodies of masses m and $4m$ are placed at a distance r. The gravitational potential at a point on the line joining them where the gravitational field is zero is
(a) zero (b) $-\frac{4Gm}{r}$
(c) $-\frac{6Gm}{r}$ (d) $-\frac{9Gm}{r}$ **(AIEEE 2011)**

20. The mass of a spaceship is 1000 kg. It is to be launched from the earth's surface out into free space. The value of 'g' and 'R' (radius of earth) are 10 m/s^2 and 6400 km, respectively. The required energy for this work will be
(a) 6.4×10^{11} J (b) 6.4×10^{8} J
(c) 6.4×10^{9} J (d) 6.4×10^{10} J
(AIEEE 2012)

21. What is the minimum energy required to launch a satellite of mass m from the surface of a planet of mass M and radius R in a circular orbit at an altitude of $2R$?
(a) $\frac{2GmM}{3R}$ (b) $\frac{GmM}{2R}$
(c) $\frac{GmM}{3R}$ (d) $\frac{5GmM}{6R}$ **(JEE Main 2013)**

22. Four particles, each of mass M and equidistant from each other, move along a circle of radius R under the action of their mutual gravitational attraction. The speed of each particle is
(a) $\sqrt{\frac{GM}{R}(1+2\sqrt{2})}$ (b) $\frac{1}{2}\sqrt{\frac{GM}{R}(1+2\sqrt{2})}$
(c) $\sqrt{\frac{GM}{R}}$ (d) $\sqrt{2\sqrt{2}\frac{GM}{R}}$
(JEE Main 2014)

23. From a solid sphere of mass M and radius R, a spherical portion of radius $R/2$ is removed, as shown in the figure. Taking gravitational potential $V=0$ at $r=\infty$, the potential at the centre of the cavity thus formed is (G = gravitational constant)



(a) $\dfrac{-GM}{2R}$ (b) $\dfrac{-GM}{R}$

(c) $\dfrac{-2GM}{3R}$ (d) $\dfrac{-2GM}{R}$

(JEE Main 2015)

24. A satellite is revolving in a circular orbit at a height 'h' from the earth's surface (radius of earth R; $h << R$). The minimum increases in its orbital velocity required, so that the satellite could escape from the earth's gravitational field, is close to: (Neglect the effect of atmosphere.)

(a) $\sqrt{2gR}$ (b) $\sqrt{gR}$

(c) $\sqrt{gR/2}$ (d) $\sqrt{gR}\left(\sqrt{2}-1\right)$

(JEE Main 2016)

25. The variation of acceleration due to gravity g with distance d from centre of the earth is best represented by (R = Earth's radius)

(a) 
(b) 
(c) 
(d) 
(JEE Main 2017)

Chapter 11

Elasticity

INTRODUCTION

The elastic behaviour of material plays an important role in engineering design and also constructing bridges, automobiles, ropeways, etc. In this section, we will study the elastic behaviour and the mechanical properties of the solids.

SOME DEFINITIONS

Deforming force: If a force applied on a body produces a change in the normal positions of the molecules of the body, which results in a change in the configuration of the body either in lengths, volume or shape, then the force applied is called deforming force. Thus, a deforming force is the one which when applied changes the configuration of the body.

Elasticity: The property of a material body by virtue of which it regains its original configuration (i.e., shape and size) when the external deforming force is removed is called elasticity.

Perfectly elastic body: A body which regains its original configuration immediately and completely after the removal of deforming force from it is called the perfectly elastic body. Quartz and phosphor bronze are the examples of nearly perfectly elastic bodies.

Plasticity: The property of the material body by virtue of which it does not regain its original configuration when the external force is removed is called plasticity.

Perfectly plastic body: A body which does not regain its original configuration at all on the removal of the deforming force, howsoever small the deforming force may be, is called perfectly plastic body. Putty, mud and paraffin wax are the examples of nearly perfectly plastic bodies. In fact, nothing is perfectly elastic or perfectly plastic. Only the degree of elasticity or plasticity differs from body to body.

CAUSE OF ELASTICITY

In a solid, atoms and molecules are arranged in such a way that each molecule is acted upon by the forces due to the neighbouring molecules. These forces are known as intermolecular forces. When no deforming force is applied on the body, each molecule of the solid (i.e., body) is in its equilibrium position and the intermolecular forces between the molecules of the solid are maximum.

On applying a deforming force on the body, the molecules either come closer or go far apart from each other. As a result of this, the molecules are displaced from their equilibrium position. In other words, intermolecular forces get changed and restoring forces are developed on the molecules. When the deforming force is removed, these restoring forces bring the molecules of the solid to their respective equilibrium positions and hence the solid (or the body) regains its original form.

STRESS

When a deforming force is applied on a body, it changes the configuration of the body by changing the normal positions of the molecules or atoms of the body. As a result, an internal restoring force comes into play which tends to bring the body back to its initial configuration. This internal restoring force acting per unit area of a deformed body is called stress, i.e.,

$$\text{Stress} = \frac{\text{Restoring force}}{\text{Area}} \qquad \text{(i)}$$

The SI unit of stress is N/m^2 or pascal (denoted by Pa) and in CGS system it is dyn/cm^2. The dimensional formula of stress is $ML^{-1}T^{-2}$.

Types of Stress

There are mainly three types of stresses as discussed in the following.

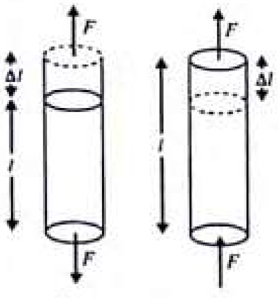
Normal Stress

The intensity of the internal force perpendicular to or normal to the section is called the normal stress or axial stress at a point. That is,

$$\sigma = \lim_{\Delta A \to 0} \frac{\Delta F_n}{\Delta A} \qquad \text{(ii)}$$

If restoring force developed is perpendicular to the cross-sectional area chosen, then the corresponding stress is known as normal stress. It is also known as longitudinal stress. It can be of two types.

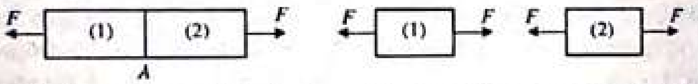
1. **Tensile stress:** If there is an increase in the length or extension of the body in the direction of force applied, the stress set up is called tensile stress.
   When a solid cylinder is stretched by two equal forces applied normal to its cross-sectional area, Figure (a), the restoring force per unit area in the body is called tensile stress.



2. **Compressive stress:** If there is a decrease in the length of the wire or compression of the body due to force applied, the stress set up is called compressive stress. When a solid cylinder is compressed under the action of two equal forces applied normal to its cross-sectional area as shown in Figure (b), then the restoring force per unit area in the body is called compressive stress.

NOTE:

- Tensile or compressive stress can also be termed as longitudinal stress.
- If the two parts of the body on the two sides of cross-sectional area pull each other, then the normal stress is known as tensile stress.



- If the two parts of the body on the two sides of cross-sectional area push each other, then the normal stress is known as compressive stress.

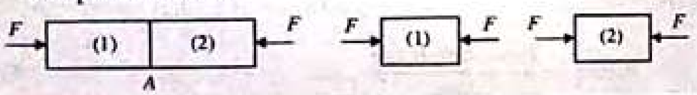


ILLUSTRATION 11.1 Two rods A and B, each of equal length but different materials are suspended from a common support as shown in the figure. The rods A and B can support a maximum load of $W_1 = 600$ N and $W_2 = 6000$ N, respectively. If their cross-sectional areas are $A_1 = 10\text{ mm}^2$ and $A_2 = 1000\text{ mm}^2$, respectively, then identify the stronger material.

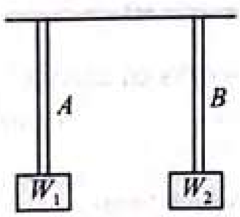


Solution. At first sight, it looks that rod B is stronger as it supports a larger load. But we cannot compare strengths without having a common basis of comparison. Since the rods have different cross-sectional area, therefore, the strengths can be compared by determining the load capacity per unit area.

For rod A

$$\sigma_1 = \frac{W_1}{A_1} = \frac{600\text{ N}}{10\text{ mm}^2} = \frac{600}{10\times10^{-6}} = 60\times10^6\text{ Nm}^{-2}$$

For rod B

$$\sigma_2 = \frac{W_2}{A_2} = \frac{6000\text{ N}}{1000\text{ mm}^2} = \frac{6000}{1000\times10^{-6}} = 6\times10^6\text{ Nm}^{-2}$$

Since $\sigma_1 > \sigma_2$, therefore, the material of rod A is stronger than that of rod B.

Shearing Stress or Tangential Stress

When a deforming force, acting tangentially to the surface of a body produces a change in the shape of the body without any change in volume, the stress set up in the body is called tangential stress.

If a tangential force F applied on the top face of area a of a cubical body whose bottom face is rigidly fixed changes the shape of the cubical body without changing its volume, then

Tangential stress = F/a

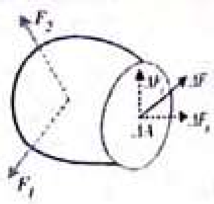
The intensity of the internal force parallel or tangential to the section is called the shear stress or tangential stress at a point. That is,

$$\tau = \lim_{\Delta A\to 0}\frac{\Delta F}{\Delta A} \qquad \text{(iii)}$$

The SI unit of stress is N/m^2 or Pa (pascal).

NOTE:

Sometimes, stress is simply determined by dividing the normal or tangential force with the cross-sectional area.



$$\text{Normal stress} = \frac{F_n}{A} \qquad \text{(iv)}$$

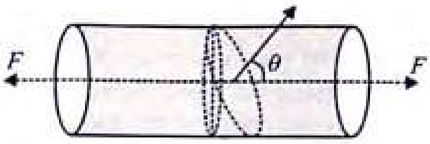
$$\text{Shearing stress} = \frac{F_t}{A} \qquad \text{(v)}$$

As shown in the figure, ΔF_n is the normal component and ΔF_t is the tangential component of internal force ΔF on an infinitesimally small area ΔA of the section of a member loaded in a plane.

- This method does not give stress at all points in the cross-sectional area but it merely gives the average stress.
- When the stress is constant or uniform over the cross section, Eqs. (iv) and (v) define the stress at all points of the cross section.
- A uniform distribution can exist only if the resultant of the applied loads passes through the centroid of the cross section.
- Stresses multiplied by the respective areas on which they act give forces, and it is the sum of these forces at an imaginary cut that keeps a body in equilibrium. That is,

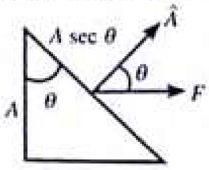
$$F_n = \int \sigma\, dA \text{ and } F_t = \int \tau\, dA$$

ILLUSTRATION 11.2 A bar of cross-section A is subjected to equal and opposite tensile forces at its ends. Consider a plane section of the bar whose normal makes an angle θ with the axis of the bar.



(a) What is the tensile stress on the plane?
(b) What is the shearing stress on this plane?
(c) For what value of θ is the tensile stress maximum?
(d) For what value of θ is the shearing stress maximum?

Solution.



(a) The resolved part of F along the normal is the tensile force on this plane and the resolved part parallel to the plane is the shearing force on this plane.

$$\text{Therefore, tensile stress} = \frac{\text{Force}}{\text{Area}} = \frac{F\cos\theta}{A\sec\theta} = \frac{F}{A}\cos^2\theta$$

($\because$ Area of section $= A\sec\theta$)

(b) $$\text{Shearing stress} = \frac{\text{Force}}{\text{Area}} = \frac{F\sin\theta}{A\sec\theta} = \frac{F}{2A}\sin 2\theta$$

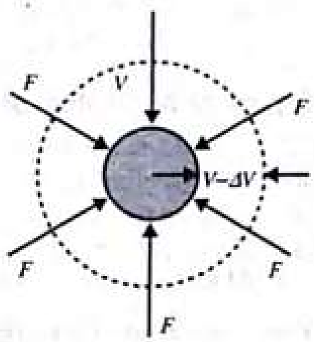
(c) Obviously, tensile stress on the plane is maximum when $\cos^2\theta$ is maximum, that is, $\cos\theta = 1$ or $\theta = 0°$.

(d) Obviously, shearing stress is maximum when $\sin 2\theta$ is maximum, that is

$$\sin 2\theta = 1 \quad \text{or} \quad 2\theta = 90° \quad \text{or} \quad \theta = 45°$$

Volumetric Stress

When a solid body undergoes a change in volume without any change in its geometrical shape on applying the force perpendicular to every point on the surface of body, see figure, the restoring force per unit area in the body is called volumetric stress.



If the deforming forces act on the body from all sides, then corresponding stress developed is known as volume stress. For example, if a block is kept completely immersed in water, hydrostatic pressure acts on all sides of the block. As stress is the ratio of some force and area, it is a kind of pressure.

STRAIN

When a deforming force is applied on a body, there is a change in the configuration of the body. The body is said to be strained or deformed. The ratio of the change in configuration (i.e., shape, length or volume) to the original configuration of the body is called strain. Mathematically, strain is given as

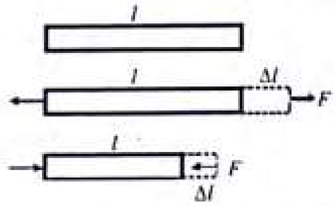
$$\epsilon = \frac{\text{Change in configuration}}{\text{Original configuration}}$$

Strain does not have any unit.

Types of Strain

The change in configuration can be a change either in length, volume or shape of the body. There are three types of strain.

Longitudinal strain: This type of strain is produced when the deforming force causes a change in length of the body. It is defined as the ratio of the change in length to the original length of the body. Consider a wire of length L. The wire is stretched by a force F. Let the change in length of the wire be ΔL. Then longitudinal strain.



$$\epsilon = \frac{\text{Change in length}}{\text{Original length}} = \frac{\Delta L}{L} \qquad \text{(i)}$$

NOTE:

- The above expression measures only the average value of strain. The correct expression for strain at any position is

$$\epsilon = \frac{d\chi}{dL}$$

where $d\chi$ is the differential elongation of the differential length dL.

- Under certain conditions the strain produced in a rod is assumed to be uniform and it can be computed from Eq. (i). These conditions are as follows:
  - The specimen must be of uniform cross section.
  - The material must be homogeneous.
  - The load must be axial so as to produce uniform stress.

  Since strain represents a change in length divided by the original length, strain is a dimensionless quantity. Sometimes, its units are used as metre per metre (m/m). However, it is commonly used in percentage.

ILLUSTRATION 11.3 A steel wire 2 m long is suspended from the ceiling. When a mass is hung at its lower end, the increase in length recorded is 1 cm. Determine the strain in the wire.

Solution. Original length = 2 m

Increase in length = 1 cm = 1×10^{-2} m

$$\text{Longitudinal strain} = \frac{\text{Increase in length}}{\text{Original length}}$$

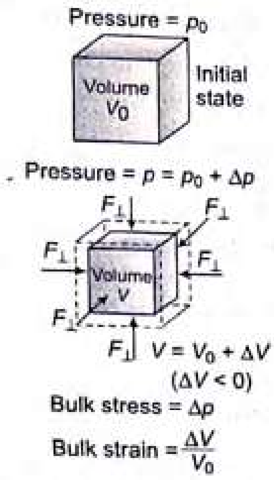
$$= \frac{1\times 10^{-2}\text{ m}}{2\text{ m}} = 5\times 10^{-3}$$

ILLUSTRATION 11.4 A brass rod of length 1 m is fixed to a vertical wall at one end, with the other end keeping free to expand. When the temperature of the rod is increased by 120°C, the length increases by 3 cm. What is the strain?

Solution. After the rod expands to the new length, there are no elastic forces developed internally in it.

So, strain = 0.

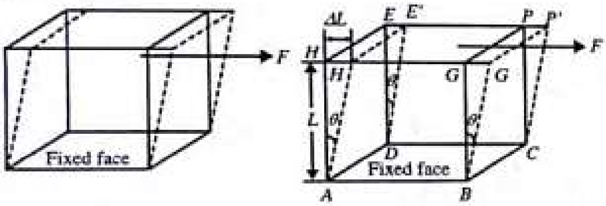
Volume strain: This type of strain is produced when the deforming force produces a change in volume of the body as shown in the figure. It is defined as the ratio of the change in volume to the original volume of the body. If ΔV is change in volume and V is the original volume, then



$$\epsilon_v = \text{Volume strain}$$

$$= \frac{\Delta V}{V}$$

Shear strain: This type of strain is produced when the deforming force causes a change in the shape of the body without changing its volume. It is defined as the angle (θ) through which a face originally perpendicular to the fixed face is turned as shown in the figure.



Consider a cubical body as shown in the figure. Its lower surface $ABCD$ is fixed and a tangential force F is applied on the top surface $EPGH$. Let the vertical planes $AHED$ and $BCPG$ be laterally shifted to positions $AH'E'D$ and $BCP'G'$, respectively, through an angle θ, where $\angle H AH' = 0$. Let $HA = L$ and $HH' = \Delta L$.

$$\text{Shearing strain} = \theta = \frac{\Delta L}{L}$$

Thus, the shearing strain is also defined as the ratio of displacement of a surface under a tangential force to the perpendicular distance of the displaced surface from the fixed surface.

NOTE:

- More precisely, the shearing strain is defined as the angular change between two perpendicular faces of a differential element.
- Strain in a rectangular shaped element is determined from the following parameters:
  - longitudinal deformation d under the action of normal forces F_n
  - shear deformation χ, under the action of tangential forces F_t
- A shearing strain is never accompanied by a change in volume, i.e., in a shear strain, the body gets distorted, resulting only in an alternation in its shape but not in size.
- A change in shape/size, i.e., dimensions need not necessarily imply a strain. For example, if a body is heated to expand, its volume changes. It acquires a new size due to expansion. However, the strain remains zero. Unless and until internal elastic forces operate to bring the body to the original state, no strain exists. When a body is heated, the total energy of molecules increases owing to an increase in the kinetic energy of the molecules. This results in a shift (increment) of the 'equilibrium distance' of molecules and the body acquires a new shape and size in the expanded from, whereby the molecules are in 'zero force' state. Hence, there is no strain. However, if the body is restricted to expand during the process of heating, then the molecules become 'strained', and even if there is no apparent change in dimensions of the body, there is strain. In such a case, strain is measured as the ratio of the change in dimension that would have occurred, had the body been free to expand or contract to the original dimension.

ELASTIC LIMIT

Elastic limit is the upper limit of deforming force up to which, if deforming force is removed, the body regains its original form completely and beyond which if deforming force is increased, the body loses its property of elasticity and gets permanently deformed.

HOOKE'S LAW AND ELASTIC MODULI

Within certain limits (called proportional limit), stress produced in a material is proportional to the strain and the constant of proportionality is the modulus of elasticity. That is,

$$\sigma \propto \epsilon \quad \text{or} \quad \sigma = Y\epsilon \tag{i}$$

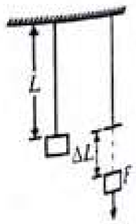
Types of Modulus of Elasticity

Corresponding to the three types of strain, there are three types of modulus of elasticity:

(1) Young's modulus of elasticity (Y)
(2) Bulk modulus of elasticity (K)
(3) Modulus of rigidity (η)

Young's Modulus of Elasticity

It is defined as the ratio of the normal stress to the longitudinal strain. That is,



Young's modulus

$$(Y) = \frac{\text{Longitudinal stress}}{\text{Longitudinal strain}}$$

Normal stress = F/A

Longitudinal strain = $\Delta L/L$

$$Y = \frac{F/A}{\Delta L/L} = \frac{FL}{A\Delta L} \tag{ii}$$

NOTE:

- Extension is proportional to the deforming force and length of the rod, i.e., greater the force larger the deformation; longer the rod larger the extension.

- Extension is inversely proportional to the cross-sectional area A and the modulus of elasticity, i.e., a thicker rod produces less deformation and a stiffer material produces less deformation. Eq. (ii) may be rearranged as

$$F=\left(\frac{YA}{L}\right)\Delta L \qquad \text{(iii)}$$

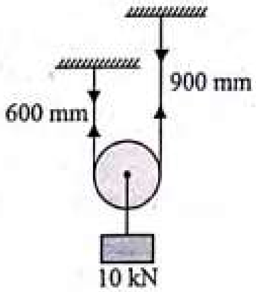
- It indicates that deforming force is proportional to the elongation and the term in the bracket indicates another constant of proportionality called the stiffness constant k. Thus, Eq. (iii) may be written as

$$F=k\Delta L \qquad \text{(iv)}$$

where $k=(YA/L)=$ constant.

- By using Eq. (iv), a rod of uniform cross section may be considered as an elastic spring of stiffness $k=(YA/L)$.
- Longer the rod, lesser the stiffness and thicker the rod, greater the stiffness.

ILLUSTRATION 11.5 A load of 10 kN is supported from a pulley which in turn is supported by a rope of sectional area 1×10^3 mm^2 and modulus of elasticity 10^3 N mm^{-2}, as shown in the figure. Neglecting the friction at the pulley, determine the deflection of the load.



Solution. Let T be the tension in the rope. Then

$2T=10$ kN $\Rightarrow T=5$ kN

Hence, longitudinal stress in the rope is

$$\sigma=\frac{T}{A}=\frac{5\text{ kN}}{10^3\text{ mm}^2}=5\text{N/mm}^2$$

$$\text{Extension in the rope}=\frac{\text{Stress}}{Y}\times L$$

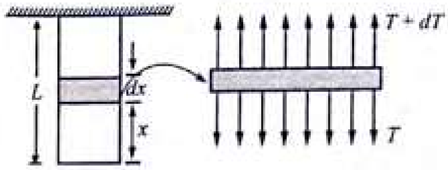
$$=\frac{5\text{ N/mm}^2}{10^3\text{N/mm}^2}\times1500\text{ mm}=7.5\text{ mm}$$

Therefore, deflection of the load, $\delta=\frac{7.5}{2}=3.75$ mm.

ILLUSTRATION 11.6 A rod of uniform cross-sectional area A and length L has a weight W. It is suspended vertically from a fixed support. If the material of the rod is homogeneous and its modulus of elasticity is Y, then determine the total elongation produced in the rod due to its own weight.

Solution. In this case, different parts of the rod does not elongate to the same extent. The element closer to the support elongates more as the stress is higher with respect to the elements closer to the free end of the rod.

To determine total elongation of the rod, let us consider a small element of differential length dx at a distance x from the free end of the rod, as shown in the figure.



The stress at the position of this element is produced by the weight of the rod of length x lying below it, i.e., $(W/L)x$.

Therefore, stress at this section

$$\sigma=\frac{(W/L)x}{A}=\frac{Wx}{AL}$$

The elongation $d\delta$ produced in the differential element dx is

$$d\delta=\frac{\sigma}{Y}dx=\frac{W}{YAL}x\,dx$$

Thus, total elongation produced in the rod can be calculated as

$$\delta=\int d\delta$$

$$\delta=\frac{W}{YAL}\int_0^L x\,dx=\frac{W}{YAL}\left[\frac{x^2}{2}\right]_0^L$$

$$\text{or}\qquad \delta=\frac{1}{2}\frac{WL}{YA} \qquad \text{(v)}$$

NOTE: Equation (v) may be visualized as

$$\delta=\frac{(W/2)L}{YA}$$

which suggests that a rod of uniform mass is equivalent to a massless rod with a concentrated load equal to half weight ($W/2$) of the rod acting at its lower end, as shown in the figure.

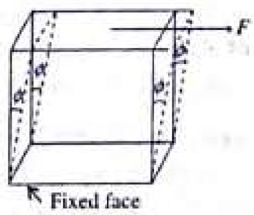
If σ is the density of the material of the rod, then Eq. (v) may be written as

$$\delta=\frac{1}{2}\frac{\rho gL^2}{Y}$$

It indicates that the deflection of the rod is proportional to the square of the length of the rod.

Modulus of Rigidity

It is defined as the ratio of the tangential stress to the shear strain. Let us consider a cube whose lower face is fixed and a tangential force F acts on the upper face whose area is A.



$\therefore$ Tangential stress $=F/A$

If the vertical sides of the cube shifts through an angle ϕ called shear strain, then the modulus of rigidity is given by

$$\eta = \frac{\text{Tangential stress}}{\text{Shear strain}}$$

or $$\eta = \frac{F/A}{\phi} = \frac{F}{A\phi} \quad \text{(vi)}$$

Equation (vi) is an extension of Hooke's law for shearing stress and strain. The constant of proportionality G is called the *shear modulus* or the modulus of rigidity. It is a measure of the resistance to alter the shape of the body. Its units are N m^{-2} or Pa.

ILLUSTRATION 11.7 A 0.05 m cube has its upper face displaced by 0.2 cm by a tangential force of 8 N. Calculate the shearing strain, shearing stress and modulus of rigidity of the material of the cube.

Solution. $l = 5\times10^{-2}\text{ m}$, $\Delta l = 0.2\text{ cm} = 0.2 \times 10^{-2}\text{ m}$, $F = 8\text{ N}$

$$\text{Shearing strain} = \frac{\Delta l}{l} = \frac{0.2}{5} = 0.04$$

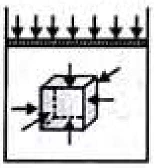
$$\text{Shearing stress} = \frac{F}{l\times l} = \frac{8}{(5\times10^{-2})^2} = 3200\text{ N m}^{-2}$$

Modulus of rigidity,

$$\eta = \frac{\text{Shearing stress}}{\text{Shearing strain}} = \frac{3200}{0.04} = 80000\text{ N m}^{-2} = 8\times10^4\text{ N m}^{-2}$$

Bulk Modulus

If a body is uniformly compressed from all sides then it undergoes a decrease in volume. The figure shows a small metal cube which is uniformly compressed from all sides by placing it inside a liquid column which is compressed externally. If p is the uniform compression on the cube and ΔV is the change in volume V of the cube, then it has been obtained experimentally that $p \propto \Delta V/V$.



A metal placed inside a liquid column is equally compressed from all directions.

Volumetric strain is defined as

$$\epsilon_V = \frac{\Delta V}{V}$$

$$p = -B\left(\frac{\Delta V}{V}\right) \Rightarrow B = -\frac{P}{\Delta V/V} \quad \text{(vii)}$$

The constant of proportionality B is called the bulk modulus of elasticity. Negative sign shows that increase in pressure (p) causes decrease in volume (ΔV).

Compressibility: The reciprocal of bulk modulus of elasticity is called compressibility. Unit of compressibility in SI is $\text{N}^{-1}\text{ m}^2$ or pascal^{-1} (Pa^{-1}).

Bulk modulus of solids is about 50 times that of liquids, and for gases it is 10^{-8} times that of solids.

$K_{\text{solids}} > K_{\text{liquids}} > K_{\text{gases}}$

Isothermal modulus of elasticity of gas $K = P$ (pressure of gas). Adiabatic modulus of elasticity of gas $K = \gamma \times P$ where $\gamma = C_p/C_v$.

NOTE:

- Bulk modulus is different from modulus of elasticity. A material with large bulk modulus is difficult to compress but it does not need to be stiff. For example, water.
- The reciprocal of bulk modulus is defined as compressibility (K)

$$K = (1/B)$$

ILLUSTRATION 11.8 Calculate the density of water near the bottom of the ocean where the pressure is about 500 atm and density of water is 1025 kg/m^3 approximately. Take bulk modulus of water as for water as $2.0\times10^9\text{ N/m}^2$.

Solution. The density of water at the ocean's surface where the pressure is 1 atm is about 1025 kg/m^3. Thus, 1 m^3 of water at the surface has a mass of 1025 kg. Let us calculate the change in volume ΔV of this water when it is at a pressure of 500 atm.

$$\Delta V = \frac{(\Delta p)V}{K}$$

The pressure change Δp is 500 atm – 1 atm = 499 atm, which is equivalent to $499\times10^5\text{ N m}^{-2}$. Thus, the volume change ΔV is

$$\therefore \quad \Delta V = \frac{(499\times10^5\text{N/m}^2)(1\text{ m}^3)}{2.0\times10^9\text{N/m}^2} = 0.025\text{ m}^3$$

The density of the water is then

$$\rho = \frac{m}{V - \Delta V}$$

$$= \frac{1025\text{ kg}}{1.00\text{ m}^3 - 0.025\text{ m}^3} = \frac{1025\text{ kg}}{0.9775\text{ m}^3} = 1051\text{ kg m}^{-3}$$

The water is compressed from only 2% to 3% at the bottom of the ocean where the pressure is several hundred atmosphere. Liquids and solids are not easily compressed.

ILLUSTRATION 11.9 Bulk modulus for rubber is 9.8×10^8 N m^{-2}. To what depth should a rubber ball be taken in a lake so that its volume is decreased by 0.1%?

Solution. $K = \dfrac{(\Delta P)V}{\Delta V}$ or $\Delta P = \dfrac{K\Delta V}{V}$

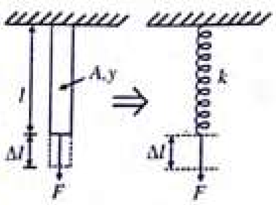
Let h be the required depth and the density of water be ρ. Then

$$h\rho g = \frac{K\Delta V}{V}$$

or $$h = \frac{K\Delta V}{\rho g V} = \frac{9.8\times10^8\times0.1}{10^3\times9.8\times100} = 100\text{ m}$$

ANALOGY OF ROD AS A SPRING

A thin wire can be imagined as a parallel combination of arrays of molecular springs. When we pull a wire, we really pull the springs. Let us take an elastic rod of length l, area of cross-section A and modulus of elasticity y and apply a force F as shown. If the rod elongates under the action of force Δl then we can write.



Young's modulus,

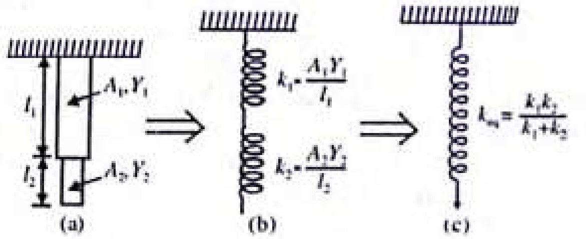
$$Y = \frac{\text{Stress}}{\text{Strain}} \Rightarrow Y = \frac{Fl}{A\Delta l} \quad \text{or} \quad F = \frac{AY}{l}\Delta l$$

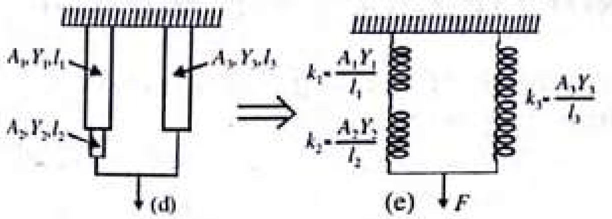
$AY/l = k$ (constant) depends on type of material and geometry of rod. Now,

$$F = k\Delta l \Rightarrow F \propto \Delta l \qquad \text{(i)}$$

If we compare the relation in Eq. (i) with spring force ($F_{spring} = kx$) we can say k in Eq. (i) is equivalent to force constant of the spring. Hence we can write,

$$k = \frac{Ay}{l} = \text{equivalent spring constant.}$$





For the system of rods shown in Figure (a), the replaced spring system is shown in Figure (b) (two springs in series). Figure (c) represents the equivalent spring system. Figure (d) represents another combination of rods and their replaced spring system.

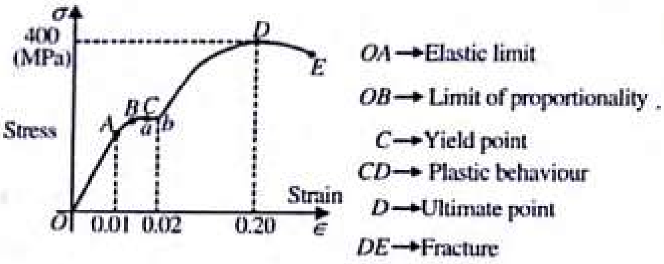
NOTE: Since $k_{eq} = YA/l$, we have $k_{eq}\, l = YA$. It means that the product of stiffness of an elastic wire and its length is always constant. If we cut the wire into two equal parts, the stiffness of each part will be double that of the original wire. Following the same logic we can say that if a spring is cut into N equal parts, each part will have stiffness N times the stiffness of the original spring. Hence, kl = constant, where k = stiffness and l = natural length of the body. It is also equally valid for the springs.

If F is the stretching force applied on the bar, then the same force is transmitted longitudinally to each bar; however, stresses induced will be different and hence elongations of each bar will also be different. Figure (e) shows the free-body diagram of the bar. Stress in the bar is given by

$$\sigma_1 = F/A_1$$

STRESS–STRAIN DIAGRAM

When a wire is stretched by a load, it is seen that for small value of load, the extension produced in the wire is proportional to the load. On removing the load, the wire returns to its original length. The wire regains its original dimensions only when load applied is less or equal to a certain limit. This limit is called elastic limit. Thus, elastic limit is the maximum stress on whose removal, the bodies regain their original dimensions. As shown in the figure, this type of behaviour is represented by OA portion of the graph. As we increase the stress further, a point B is reached where the increase in strain is proportional to the stress. On reaching point B, we remove the stress. Then the wire does not regain its original dimension.



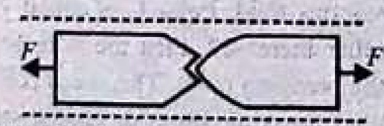
Stress–strain graph for a mild steel rod

As we go beyond point B, even for a very small increase in stress, the strain produced is very large. This type of behaviour is observed around point C and at this stage the wire begins to flow like a viscous fluid. Point C is called yield point. If the stress is further increased, then the wire breaks off at a point D called the breaking point. The stress corresponding to this point is called breaking stress or tensile strength of the material of the wire. A material for which the plastic range CD is relatively high is called ductile material. These materials get permanently deformed before breaking. The materials for which plastic range is relatively small are called brittle materials. These materials break as soon as the elastic limit is crossed.

The stress–strain diagram is used to study the properties of materials under the action of external forces. In these stress-strain diagrams, conventionally the ordinate scale is used for stresses (σ) and the abscissa for strains (ϵ).

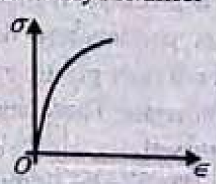
Important Points

- Breaking stress = breaking force/area of cross section.
- Breaking stress is constant for a material.
- Breaking force depends upon the area of the section of the wire of a given material.
- The working stress is always kept lower than that of a breaking stress so that 'safety factor = breaking stress/working stress' may have a large value.
- Breaking strain = elongation or compression/original dimension.
- Breaking strain is constant for material.
- In the yield region, strain is 15–20 times those that takes place up to the proportional limit occurring during yielding.
- A study of stress–strain diagrams shows that the yield point is so close to the elastic limit that for most purposes the two may be taken as one.
- As the deformation is increased further beyond the yield region, the curve moves upward and attains its maximum at a point U (called the ultimate stress) after which the curve moves downward to point B at which the material fails or breaks down.
- The breaking stress is lower than the ultimate stress because the breaking stress is computed by dividing the breaking load by the original cross-sectional area which, although convenient, is incorrect. This error is caused by a phenomenon known as necking. After the point U, the material stretches very rapidly and simultaneously narrows down, as shown in the figure, so that the breaking load is distributed over a smaller area. If the breaking area is measured after failure occurs, and divided into the breaking load, the result is a truer value of the actual failure stress, although this is commonly taken as the maximum stress of the material.



Necking of the mild-steel bar beyond the ultimate point.

- The stress–strain diagrams differ considerably for different materials. The steeper curve indicates a stiffer material; a taller graph indicates a stronger material; a long graph parallel to the ϵ-axis indicates a ductile material and the absence of yield point or plastic zone refers to a brittle material.



Stress–strain graph of a brittle material.

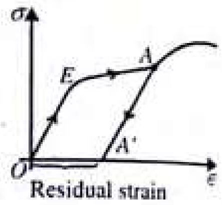
- Even for the same material, the stress–strain graphs differ, depending on the temperature at which the test is conducted, the speed of the test, etc.
- Breaking strain is constant for material.

ELASTICITY AND PLASTICITY

The property by which a body returns to its original shape after removal of the deforming force (or load) is called elasticity. It has been observed experimentally that some bodies return to their original states immediately after the removal of external load while some other bodies take longer time to return back.

The delay in returning to the original state by an elastic body after the removal of external load is called elastic aftereffect. Quartz and phosphor bronze are free from elastic aftereffects.

Plasticity is the property of a body by which it shows a permanent deformation which is not recovered after the removal of external load. In the stress–strain graph as shown in the figure, the region of plastic deformation lies on the right of the elastic limit. If the body is loaded to a stress in the plastic region and then unloaded as shown in the figure, the unloading curve does not retrace the loading curve but it returns back along a different path. The area enclosed by the loop $OEAA'$ gives the energy lost per unit volume of the body. The loop is also called the hysteresis loop.



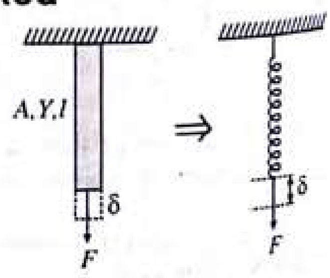
A specimen is loaded to a point A in the plastic region and then unloaded. The specimen shows permanent or residual strain.

On the contrary, if the body is loaded in the elastic region and then unloaded, it returns back by retracing the same path. It indicates that the internal forces between the particles of the body act as conservative forces.

ENERGY STORED IN A DEFORMED BODY

Elastic Potential Energy Stored in a Stretched Wire or in a Rod

We can replace a rod with a springs as shown in the figure. Strain energy stored in equivalent spring is



$$U = \frac{1}{2}k\delta^2 = \frac{1}{2}\left(\frac{AY}{L}\right)\delta^2$$

where $\delta = \dfrac{Fl}{AY}$

$\therefore$ Strain energy $U = \dfrac{1}{2}\dfrac{AY}{l}\dfrac{F^2l^2}{A^2Y^2}$

$$= \frac{1}{2}\frac{F^2 l}{AY} \quad \text{or} \quad U = \frac{1}{2}F\delta$$

This equation can be rearranged as

$$U = \frac{1}{2}\frac{F^2}{A^2}\cdot\frac{lA}{Y} \quad (lA = \text{volume of the rod, } F/A = \text{stress})$$

$$U = \frac{1}{2}\frac{(\text{Stress})^2}{Y}.\text{Volume}$$

Again $U = \frac{1}{2}\frac{F}{A} \times \frac{F}{AY} \times Al \quad (\text{Strain} = \frac{F}{AY})$

$$U = \frac{1}{2} \times \text{Stress} \times \text{Strain} \times \text{Volume}$$

Again $U = \frac{1}{2}\frac{F^2}{A^2Y^2}AlY$

$$U = \frac{1}{2}Y(\text{Strain})^2 \times \text{Volume}$$

$\therefore$ Strain energy density $u = \frac{\text{Strain energy}}{\text{Volume}} = \frac{1}{2}\frac{(\text{Stress})^2}{Y}$

$$u = \frac{1}{2}Y(\text{Strain})^2 = \frac{1}{2}\text{Stress} \times \text{Strain}$$

$$u = \frac{U}{AL} = \frac{\rho^2}{2Y} = \in\frac{1}{2}Y^2 = \frac{1}{2}\in Y^2$$

where $\in = \delta/L$ and $\rho = F/A$.

1. The area under the stress–strain diagram gives the potential energy (or strain energy) stored per unit volume of the specimen.
2. If stress applied is not constant we can write energy stored in any elastic rod

$$U = \frac{1}{2Y}\int \rho^2 dV$$

where ρ = stress and dV = change in volume of rod.

NOTE: The potential energy stored in the rod in terms of stiffness constant k is given by

$$U = \frac{1}{2}k\delta^2$$

where $k = YA/L$.

The potential energy stored in the rod in terms of the maximum stretching force is

ILLUSTRATION 11.10 A catapult consists of two parallel rubber strings, each of lengths 10 cm and cross-sectional area 10 mm^2. When stretched by 5 cm, it can throw a stone of mass 100 gm to a vertical height of 25 m. Determine Young's modulus of elasticity of rubber.

Solution.

A stretched catapult has elastic potential energy stored in it (Strain energy stored in both the rubber strings)

$$U = \left(\frac{1}{2}\frac{YAl^2}{L}\right) \times 2$$

This energy, when imparted to the stone, it flies off a height 20 m. Energy possessed by the stone = mgh.

Now,

$$U = mgh \Rightarrow \frac{YAl^2}{L} = mgh$$

$$Y = \frac{mghL}{Al^2} = \frac{1\times10^{-1}\times10\times25\times10^{-1}}{10\times10^{-6}\times(5\times10^{-2})^2}$$

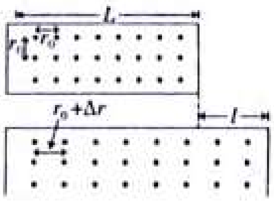
$\therefore \quad Y = 10 \times 10^8$ N/m^2

INTERATOMIC FORCE CONSTANT

The interatomic force F' developed between the atoms is directly proportional to the change in distance Δr between them.

$$F' = k\Delta r \qquad \text{(i)}$$

where k is interatomic force constant. Let L be the length of a wire and r_0 be the interatomic distance between the atoms of the wire. Suppose, when a force F is applied, the length of the wire increases by l, and the distance between its atoms increases from r_0 to $r_0 + \Delta r$. Then longitudinal strain,



$$\frac{l}{L} = \frac{\Delta r}{r_0} \qquad \text{(ii)}$$

If A is the area of cross section of the wire, it will have A/r_0^2 chains of atoms. Therefore, the interatomic force (force acting on chain) is

$$F' = \frac{\text{External force}}{\text{Number of chains}} = \frac{F}{A/r_0^2} = \frac{Fr_0^2}{A}$$

Interatomic force constant is

$$k = \frac{F'}{\Delta r} = \frac{Fr_0^2/A}{\Delta r} = \frac{F}{A}\frac{r_0^2}{\Delta r} \qquad \text{[using Eq. (i)]}$$

But $r_0/\Delta r = L/l$. Hence,

$$k = \frac{F}{A}\frac{L}{l}r_0 = \frac{F/A}{l/L}r_0 \qquad \text{[using Eq. (ii)]}$$

But by definition,

$$\frac{F/A}{l/L} = Y \text{ (Young's modulus of the material of the wire)}$$

$\Rightarrow \quad k = Yr_0$

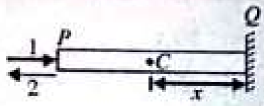
Thus, interatomic force constant k is equal to the product of Young's modulus of the material of the wire and the normal distance r_0 between the atoms of the wire.

☞ Important Points

- Breaking stress depends on the material of the wire. It does not depend upon the diameter or length of the wire.
- Breaking load depends on the area of cross section of the wire.
- The strain persists even when the stress is removed and thus lags behind the stress.
- Steel is highly elastic material.
- Steel is more elastic than rubber.
- Young's modulus decreases with rise in temperature.
- A liquid has zero modulus of rigidity.
- Rubber remains elastic even for a strain of the order of thousand.
- A rise in temperature results, in general, in weakening of elastic properties and a fall in temperature results in strengthening them.
- Young's modulus is independent of length or radius of wire.
- Solids are the most elastic and gases are the least elastic.
- Under tensile stress, the restoring forces are caused by interatomic attraction.
- Under compressional stress, the restoring force is due to the interatomic repulsion.
- Force of repulsion, not the force of attraction, is responsible in the interatomic or intermolecular potential for the formation of a solid.
- Solids have all the three types of elasticity whereas liquids and gases have only volume elasticity, i.e., only bulk modulus is applicable to them. Gases, however, have two types of bulk moduli, viz. isothermal and adiabatic.
- Young's modulus is defined for solids but not for liquids and gases. The value of Young's modulus increases on mixing the impurity in the solid and decreases on increasing the temperature of the body.
- The area under the stress-strain graph represents the work done per unit volume.

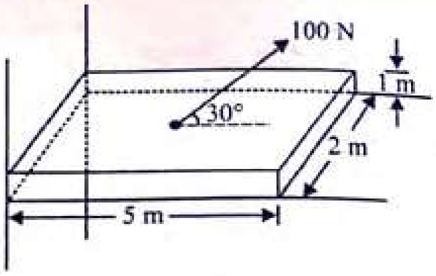
Concept Application Exercise 11.1

1. A horizontal force of magnitude F acts at the end P of a uniform rigid rod which is welded at point Q. In each case 1 and 2, as shown in the figure, find the reaction force acting at a point C at a distance x from the fixed end Q of the rod.

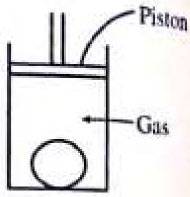


2. A rubber ball of bulk modulus B is taken to a depth h of a liquid of density ρ. Find the fractional change in the radius of the ball.

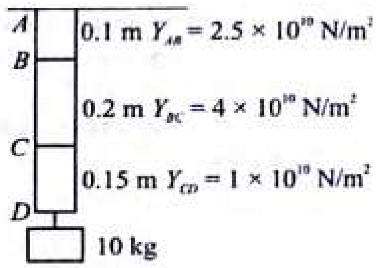
3. Find out longitudinal stress and tangential stress on a fixed block.



4. Find out bulk stress on the spherical object of radius $10/\pi$ cm if area and mass of piston are 50 cm^2 and 50 kg, respectively, for a cylinder filled with gas as shown in the figure.



5. Three rods of uniform area of cross section $A = 10^{-7}$ m^2 are arranged as shown in the figure. Find out the shift in point B, C and D.



6. Find the depth of lake at which density of water is 1% greater than that at the surface. Given compressibility $k = 50 \times 10^{-6}$ atm^{-1}.

Solved Examples

1. A wire of length L and radius r is rigidly fixed at one end. On stretching the other end of the wire with a force F, the increase in its length is l. If another wire of same material but of length $2L$ and radius $2r$ is stretched with a force of $2F$, the increase in its length will be

(a) l (b) $2l$

(c) $\frac{l}{2}$ (d) $\frac{l}{4}$

Sol. (a) $l = \frac{FL}{AY} = \frac{FL}{\pi r^2 Y} \Rightarrow l \propto \frac{FL}{r^2}$ (Y = constant)

$$\therefore \frac{l_2}{l_1} = \frac{F_2}{F_1} \times \frac{L_2}{L_1}\left(\frac{r_1}{r_2}\right)^2 = 2 \times 2 \times \left(\frac{1}{2}\right)^2 = 1$$

$\therefore l_2 = l_1$, i.e., increment in its length will be l.

2. A copper wire and a steel wire of the same diameter and length are connected end to end and a force is applied,

which stretches their combined length by 1 cm. The two wires will have

(a) Different stresses and strains
(b) The same stress and strain
(c) The same strain but different stresses
(d) The same stress but different strains

Sol. (d) Stress $= \dfrac{\text{Force}}{\text{Area}}$

In the present case, force applied and area of cross-section of wires are same, therefore stress has to be the same.

$$\text{Strain} = \frac{\text{Stress}}{Y}$$

Since the Young's modulus of steel wire is greater than the copper wire, therefore, strain in case of steel wire is less than that in case of copper wire.

3. A steel ring of radius r and cross-section area A is fitted on to a wooden disc of radius R $(R > r)$. If Young's modulus be E, then the force with which the steel ring is expanded is

(a) $AE\dfrac{R}{r}$ (b) $AE\left(\dfrac{R-r}{r}\right)$

(c) $\dfrac{E}{A}\left(\dfrac{R-r}{A}\right)$ (d) $\dfrac{Er}{AR}$

Sol. (b) Initial length (circumference) of the ring $= 2\pi r$
Final length (circumference) of the ring $= 2\pi R$
Change in length $= 2\pi R - 2\pi r$

$$\text{Strain} = \frac{\text{Change in length}}{\text{Original length}} = \frac{2\pi(R-r)}{2\pi r} = \frac{R-r}{r}$$

Now Young's modulus, $E = \dfrac{F/A}{l/L} = \dfrac{F/A}{(R-r)/r}$

$$\therefore F = AE\left(\frac{R-r}{r}\right)$$

4. The coefficient of linear expansion of brass and steel are α_1 and α_2. If we take a brass rod of length l_1 and steel rod of length l_2 at 0°C, their difference in length $(l_2 - l_1)$ will remain the same at a temperature if

(a) $\alpha_1 l_2 = \alpha_2 l_1$ (b) $\alpha_1 l_2^2 = \alpha_2 l_1^2$

(c) $\alpha_1^2 l_1 = \alpha_2^2 l_2$ (d) $\alpha_1 l_1 = \alpha_2 l_2$

Sol. (d) $L_2 = l_2(1 + \alpha_2 \Delta\theta)$ and $L_1 = l_1(\alpha_1 \Delta\theta)$

$\Rightarrow (L_2 - L_1) = (l_2 - l_1) + \Delta\theta(l_2\alpha_2 - l_1\alpha_1)$

Now $(L_2 - L_1) = (l_2 - l_1)$ so, $l_2\alpha_2 - l_1\alpha_1 = 0$

5. A 5 m long aluminium wire ($Y = 7\times10^{10}$ N/m^2) of diameter 3 mm supports a 40 kg mass. In order to have the same elongation in a copper wire ($Y = 12\times10^{10}$ N/m^2) of the same length under the same weight, the diameter should now be (in mm).

(a) 1.75 (b) 1.5
(c) 2.5 (d) 5.0

Sol. (c) $l = \dfrac{FL}{\pi r^2 Y} \Rightarrow r^2 \propto \dfrac{1}{Y}$ (F, L and l are constant)

$$\frac{r_2}{r_1} = \left(\frac{Y_1}{Y_2}\right)^{1/2} = \left(\frac{7\times10^{10}}{12\times10^{10}}\right)^{1/2}$$

$$\Rightarrow r_2 = 1.5\times\left(\frac{7}{12}\right)^{1/2} = 1.145 \text{ mm} \Rightarrow \text{dia} = 2.29 \text{ mm}$$

6. The length of an elastic string is a metre when the longitudinal tension is 4 N and b metre when the longitudinal tension is 5 N. The length of the string in metre when the longitudinal tension is 9 N is

(a) $a - b$ (b) $5b - 4a$

(c) $2b - \dfrac{1}{4}a$ (d) $4a - 3b$

Sol. (b) Let L be the original length of the wire and K be the force constant of wire.
Final length = Initial length + Elongation

$$L' = L + \frac{F}{K}$$

For first condition $a = L + \dfrac{4}{K}$ ...(i)

For second condition $b = L + \dfrac{5}{K}$ ...(ii)

By solving equations (i) and (ii), we get

$$L = 5a - 4b \text{ and } K = \frac{1}{b-a}$$

Now when the longitudinal tension is 9 N, length of the string

$= L + \dfrac{9}{K} = 5a - 4b + 9(b-a) = 5b - 4a.$

7. A pan with set of weights is attached with a light spring. When disturbed, the mass-spring system oscillates with a time period of 0.6 s. When some additional weights are added, then time period is 0.7s. The extension caused by the additional weights is approximately given by

(a) 1.38 cm (b) 3.5 cm
(c) 1.75 cm (d) 2.45 cm

Sol. (b) $2\pi\sqrt{\dfrac{m}{k}} = 0.6$ ...(i) and $2\pi\sqrt{\dfrac{m+m'}{k}} = 0.7$ ...(ii)

Dividing (ii) by (i), we get $\left(\dfrac{7}{6}\right)^2 = \dfrac{m+m'}{m} = \dfrac{49}{36}$

$$\frac{m+m'}{m} - 1 = \frac{49}{36} - 1 \Rightarrow \frac{m'}{m} = \frac{13}{36} \Rightarrow m' = \frac{13m}{36}$$

Also $\dfrac{k}{m} = \dfrac{4\pi^2}{(0.6)^2}$

Desired extension $= \dfrac{m'g}{k} = \dfrac{13}{36}\times\dfrac{mg}{k}$

$$= \frac{13}{36} \times 10 \times \frac{0.36}{4\pi^2} = 3.5 \text{ cm}$$

8. The area of cross section of a steel wire ($Y = 2.0 \times 10^{11}$ N/m^2) is 0.1 cm^2. The force required to double its length will be

(a) 2×10^{12} N (b) 2×10^{11} N
(c) 2×10^{10} N (d) 2×10^{6} N

Sol. (d) When the length of wire is doubled, then $l = L$ and strain = 1 $\therefore$ Y = strain = $\frac{F}{A}$

$\therefore$ Force $= Y \times A = 2 \times 10^{11} \times 0.1 \times 10^{-4} = 2 \times 10^{6}$ N

9. A rubber cord catapult has cross-sectional area 25 mm^2 and initial length of rubber cord is 10 cm. It is stretched to 5 cm and then released to project a missile of mass 5 gm. Taking $Y_{rubber} = 5 \times 10^8$ N/m^2 velocity of projected missile is

(a) 20 ms^{-1} (b) 100 ms^{-1}
(c) 250 ms^{-1} (d) 200 ms^{-1}

Sol. (c) Potential energy stored in the rubber cord catapult will be converted into kinetic energy of mass.

$$\frac{1}{2}mv^2 = \frac{1}{2}\frac{YAl^2}{L} \Rightarrow v = \sqrt{\frac{YAl^2}{mL}}$$

$$= \sqrt{\frac{5\times10^8 \times 25\times10^{-6} \times (5\times10^{-2})^2}{5\times10^{-3} \times 10\times10^{-2}}} = 250 \text{ m/s}$$

10. A uniform cube is subjected to volume compression. If each side is decreased by 1%, then bulk strain is

(a) 0.01 (b) 0.06
(c) 0.02 (d) 0.03

Sol. (d) If side of the cube is L, then $V = L^3 \Rightarrow \frac{dV}{V} = 3\frac{dL}{L}$

$\therefore$ % change in volume = 3 × (% change in length)
= 3 × 1% = 3%

$\therefore$ Bulk strain $\frac{\Delta V}{V} = 0.03$

11. A ball falling in a lake of depth 200 m shows 0.1% decrease in its volume at the bottom. What is the bulk modulus of the material of the ball?

(a) 19.6×10^{8} N/m^2 (b) 19.6×10^{-10} N/m^2
(c) 19.6×10^{10} N/m^2 (d) 19.6×10^{-8} N/m^2

Sol. (a) $B = \frac{\Delta p}{\Delta V/V} = \frac{h\rho g}{0.1/100} = \frac{200\times10^3 \times 9.8}{1/1000}$

$= 19.6 \times 10^8$ N/m^2

12. A 5-metre long wire is fixed to the ceiling. A weight of 10 kg is hung at the lower end and is 1 metre above the floor. The wire was elongated by 1 mm. The energy stored in the wire due to stretching is

(a) Zero (b) 0.05 J
(c) 100 J (d) 500 J

Sol. (b) $W = \frac{1}{2} \times F \times l$

$$= \frac{1}{2}mgl = \frac{1}{2} \times 10 \times 10 \times 1 \times 10^{-1} = 0.05 \text{ J}$$

13. A brass rod of cross-sectional area 1 cm^2 and length 0.2 m is compressed lengthwise by a weight of 5 kg. If Young's modulus of elasticity of brass is 1×10^{11} N/m^2 and g = 10 m/s, then increase in the energy of the rod will be

(a) 10^{-5} J (b) 2.5×10^{-5} J
(c) 5×10^{-5} J (d) 2.5×10^{-4} J

Sol. (b) $U = \frac{1}{2} \times \frac{(\text{Stress})^2}{Y} \times \text{Volume}$

$$= \frac{1}{2} \times \frac{F^2 \times A \times L}{A^2 \times Y}$$

$$= \frac{1}{2} \times \frac{F^2 L}{AY} = \frac{1}{2} \times \frac{(50)^2 \times 0.2}{1\times10^{-4} \times 1\times10^{11}} = 2.5 \times 10^{-5} \text{ J}$$

14. If one end of a wire is fixed with a rigid support and the other end is stretched by a force of 10 N, then the increase in length is 0.5 mm. The ratio of the energy of the wire and the work done in displacing it through 1.5 mm by the weight is

(a) $\frac{1}{3}$ (b) $\frac{1}{4}$ (c) $\frac{1}{2}$ (d) 1

Sol. (c) Work done in stretching a wire

$$W = \frac{1}{2}Fl = \frac{1}{2} \times 10 \times 0.5 \times 10^{-3} = 2.5 \times 10^{-3} \text{ J}$$

Work done to displace it through 1.5 mm

$W = F \times l = 5 \times 10^{-3}$ J

The ratio of above two work = 1 : 2

15. The ratio of Young's modulus of the material of two wires is 2 : 3. If the same stress is applied on both, then the ratio of elastic energy per unit volume will be

(a) 3 : 2 (b) 2 : 3
(c) 3 : 4 (d) 4 : 3

Sol. (a) Energy per unit volume = $\frac{(\text{Stress})^2}{2Y}$

$$\frac{E_1}{E_2} = \frac{Y_2}{Y_1} \text{ (Stress is constant)} \Rightarrow \frac{E_1}{E_2} = \frac{3}{2}$$

16. Two rods of different materials having coefficients of linear expansion α_1, α_2 and Young's moduli Y_1 and Y_2 respectively, are fixed between two rigid massive walls. The rods are heated such that they undergo the same increase in temperature. There is no bending of rods. If $\alpha_1 : \alpha_2 = 2 : 3$, the thermal stresses developed in the two rods are equally provided, $Y_1 : Y_2$ is equal to

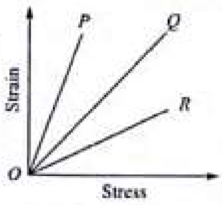
(a) 2 : 3 (b) 1 : 1
(c) 3 : 2 (d) 4 : 9

Sol. (c) Thermal stress = $Y\alpha\,\Delta\theta$.

If thermal stress and rise in temperature are equal, then $Y \propto \frac{1}{\alpha}$

$\Rightarrow \frac{Y_1}{Y_2} = \frac{\alpha_2}{\alpha_1} = \frac{3}{2}$

17. The strain-stress curves of three wires of different materials are shown in the figure. P, Q and R are the elastic limits of the wires. The figure shows that



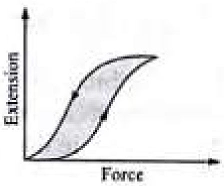
(a) Elasticity of wire P is maximum
(b) Elasticity of wire Q is maximum
(c) Tensile strength of R is maximum
(d) None of the above is true

Sol. (d) As stress is shown on x-axis and strain on y-axis

So we can say that $Y = \cot\theta = \frac{1}{\tan\theta} = \frac{1}{\text{Slope}}$

So the elasticity of wire P is minimum and of wire R is maximum.

18. The diagram below shows a force-extension graph for a rubber band. Consider the following statements:



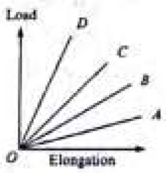
I. It will be easier to compress this rubber than expand it.
II. Rubber does not return to its original length after it is stretched.
III. The rubber band will get heated if it is stretched and released.

Which of these can be deduced from the graph?

(a) III only (b) II and III
(c) I and III (d) I only

Sol. (a) Area of hysterisis loop gives the energy loss in the process of stretching and unstretching of rubber band and this loss will appear in the form of heating.

19. The load-versus-elongation graph for four wires of the same material is shown in the figure. The thickest wire is represented by the line

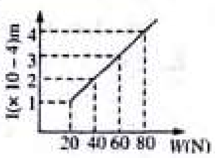


(a) OD (b) OC
(c) OB (d) OA

Sol. (a) $l = \frac{FL}{AY}$ $\therefore$ $l \propto \frac{1}{r^2}$ (Y, L and F are constant)

i.e. for the same load, the thickest wire will show minimum elongation. So, graph D represents the thickest wire.

20. The adjacent graph shows the extension (Δl) of a wire of length 1m suspended from the top of a roof at one end with a load W connected to the other end. If the cross-sectional area of the wire is 10^{-6} m^2, calculate the Young's modulus of the material of the wire.



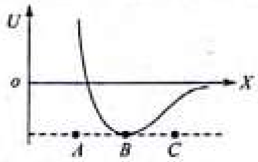
(a) 2×10^{11} N/m^2 (b) 2×10^{-11} N/m^2
(c) 3×10^{-12} N/m^2 (d) 2×10^{-13} N/m^2

Sol. (a) From the graph, $l = 10^{-4}$m, $F = 20$ N.

$A = 10^{-6}$ m^2, $L = 1$ m

$\therefore\ Y = \frac{FL}{Al} = \frac{20 \times 1}{10^{-6} \times 10^{-4}} = 20 \times 10^{10} = 2 \times 10^{11}\,\text{N/m}^2$

21. The potential energy U between two molecules as a function of the distance X between them has been shown in the figure. The two molecules are



(a) attracted when x lies between A and B and are repelled when X lies between B and C
(b) attracted when x lies between B and C and are repelled when X lies between A and B
(c) attracted when they reach B
(d) repelled when they reach B

Sol. (b) $F = -\left(\frac{dU}{dx}\right)$.

In the region BC, slope of the graph is positive.

$\therefore$ F = negative, i.e., force is attractive in nature.

In the region AB, slope of the graph is negative.

$\therefore$ F = positive, i.e., force is repulsive in nature.

22. To break a wire of one meter length, minimum 40 kg-wt is required. Then the wire of the same material of double radius and 6 m length will require breaking weight

(a) 80 kg-wt (b) 240 kg-wt
(c) 200 kg-wt (d) 160 kg-wt

Sol. (d) Breaking force = Breaking stress × Area of cross section of wire

$\therefore$ Breaking force $\propto r^2$ (Breaking distance is constant)

If radius becomes doubled, then breaking force will become 4 times i.e. $40 \times 4 = 160$ kg wt

23. The mass and length of a wire are M and L, respectively. The density of the material of the wire is d. On applying the force F on the wire, the increase in length is l. Then the Young's modulus of the material of the wire will be

(a) $\frac{Fdl}{Ml}$ (b) $\frac{FL}{Mdl}$

(c) $\frac{FMl}{dl}$ (d) $\frac{FdL^2}{Ml}$

Sol. (d) $Y = \frac{FL}{Al} = \frac{FdL^2}{Ml}$

As M = Volume × Density = $A = \times L - d \Rightarrow A = \frac{M}{Ld}$

24. Two exactly similar wires of steel and copper are stretched by equal forces. If the difference in their elongations is 0.5 cm, the elongation (l) of each wire is
Y_s(steel) $= 2.0 \times 10^{11}$ N/m^2
Y_c(copper) $= 1.2 \times 10^{11}$ N/m^2
(a) $l_s = 0.75$ cm, $l_c = 1.25$ cm
(b) $l_s = 1.25$ cm, $l_c = 0.75$ cm
(c) $l_s = 0.25$ cm, $l_c = 0.75$ cm
(d) $l_s = 0.75$ cm, $l_c = 0.25$ cm

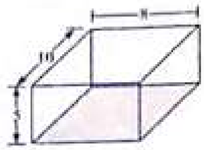
Sol. (a) $l \propto \dfrac{1}{Y} \Rightarrow \dfrac{Y_s}{Y_c} = \dfrac{l_c}{l_s} \Rightarrow \dfrac{l_c}{l_s} = \dfrac{2\times10^{11}}{1.2\times10^{11}} = \dfrac{5}{3}$ ...(i)

Also $l_c - l_s = 0.5$ ...(ii)

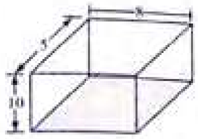
On solving (i) and (ii), we get

$l_c = 1.25$ cm and $l_s = 0.75$ cm

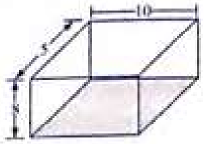
25. A rectangular block of size 10 cm × 8 cm × 5 cm is kept in three different positions P, Q and R in turn as shown in the figure. In each case, the shaded area is rigidly fixed and a definite force F is applied tangentially to the opposite face to deform the block. The displacement of the upper face will be



(P)



(Q)



(R)

(a) Same in all the three cases
(b) Maximum in P position
(c) Maximum in Q position
(d) Maximum in R position

Sol. (d) $\eta = \dfrac{F/A}{x/L} \Rightarrow x = \dfrac{L}{\eta} \times \dfrac{F}{A}$

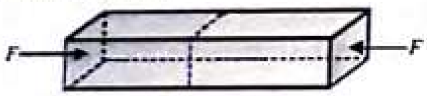
If η and F are constant, then $x \propto \dfrac{L}{A}$

For maximum displacement, area at which force applied should be minimum and vertical side should be maximum. This is given in the R position of rectangular block.

EXERCISES

Stress, Strain and Elasticity

1. In the figure shown, forces of equal magnitude are applied to the two ends of a uniform rod. Consider A as the cross-sectional area of the rod. For this situation, mark out the incorrect statements.



(a) The rod is in compressive stress.
(b) The numerical value of stress developed in the rod is equal to F/A.
(c) The stress is defined as internal force developed at any cross section per unit area.
(d) None of the above.

2. A nylon rope 2 cm in diameter has a breaking strength of 1.5×10^5 N. The breaking strength of a similar rope 1 cm in diameter is
(a) 0.375×10^5 N (b) 2×10^5 N
(c) 6×10^5 N (d) 9×10^4 N

3. The breaking stress for a substance is 10^6 N/m^2. What length of the wire of this substance should be suspended vertically so that the wire breaks under its own weight? (Given: density of material of the wire $= 4 \times 10^3$ kg/m^3 and $g = 10$ ms^{-2})
(a) 10 m (b) 15 m
(c) 25 m (d) 34 m

4. The ratio of diameters of two wires of same material is n:1. The length of each wire is 4 m. On applying the same load, the increases in the length of the thin wire will be ($n > 1$)
(a) n^2 times (b) n times
(c) $2n$ times (d) $(2n + 1)$ times

5. The dimensions of four wires of the same material are given below. In which wire the increase in the length will be maximum?
(a) Length 100 cm, diameter 1 mm
(b) Length 200 cm, diameter 2 mm
(c) Length 300 cm, diameter 3 mm
(d) Length 50 cm, diameter 0.5 mm

6. Two wires of the same material and length are stretched by the same force. Their masses are in the ratio 3:2. Their elongations are in the ratio
(a) 3:2 (b) 9:4
(c) 2:3 (d) 4:9

7. Two wires of the same length and same material but radii in the ratio of 1:2 are stretched by unequal forces to produce equal elongation. The ratio of the two forces is
(a) 1:1 (b) 1:2
(c) 1:3 (d) 1:4

8. When a weight of 5 kg is suspended from a copper wire of length 30 m and diameter 0.5 mm, the length of the wire increases by 2.4 cm. If the diameter is doubled, the extension produced is
(a) 1.2 cm (b) 0.6 cm
(c) 0.3 cm (d) 0.15 cm

9. The length of a wire is increased by 1 mm on the application of a given load. In a wire of the same material, but of length and radius twice that of the first, on application of the same load, extension is
(a) 0.25 mm (b) 0.5 mm
(c) 2 mm (d) 4 mm

10. A cube is shifted to a depth of 100 m is a lake. The change in volume is 0.1%. The bulk modulus of the material is nearly
(a) 10 Pa (b) 10^4 Pa
(c) 10^7 Pa (d) 10^9 Pa

11. Young's modulus of rubber is 10^4 N/m^2 and area of cross section is 2 cm^{-2}. If force of 2×10^5 dyn is applied along its length, then its initial l becomes
(a) $3l$ (b) $4l$
(c) $2l$ (d) None of these

12. When a certain weight is suspended from a long uniform wire, its length increases by 1 cm. If the same weight is suspended from another wire of the same material and length but having a diameter half of the first one, the increases in length will be
(a) 0.5 cm (b) 2 cm
(c) 4 cm (d) 8 cm

13. Two wires of the same material have lengths in the ratio 1:2 and their radii are in the ratio $1:\sqrt{2}$. If they are stretched by applying equal forces, the increase in their lengths will be in the ratio
(a) $\sqrt{2}:2$ (b) $2:\sqrt{2}$
(c) 1:1 (d) 1:2

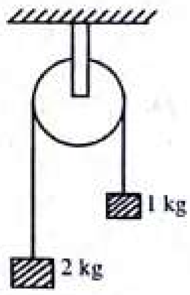
14. Two identical wires of iron and copper with their Young's modulus in the ratio 3:1 are suspended at same level. They are to be loaded so as to have the same extension and hence level. Ratio of the weight is
(a) 1:3 (b) 2:1
(c) 3:1 (d) 4:1

15. One end of uniform wire of length L and of weight W is attached rigidly to a point in the roof and a weight W_1 is suspended from its lower end. If s is the area of cross section of the wire, the stress in the wire at a height $(3L/4)$ from its lower end is
(a) $\dfrac{W_1}{s}$ (b) $\left[W_1 + \dfrac{W}{4}\right]/s$
(c) $\left[W_1 + \dfrac{3W}{4}\right]/s$ (d) $\dfrac{W_1 + W}{s}$

16. A wire is stretched 1 mm by a force of 1 kN. How far would a wire of the same material and length but of four times that diameter be stretched by the same force?
(a) $\dfrac{1}{2}$ mm (b) $\dfrac{1}{4}$ mm
(c) $\dfrac{1}{8}$ mm (d) $\dfrac{1}{16}$ mm

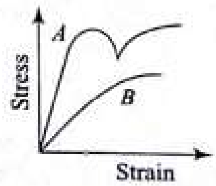
17. A copper bar of length L and area of cross section A is placed in a chamber at atmospheric pressure. If the chamber is evacuated, the percentage change in its volume will be (compressibility of copper is 8×10^{-12} m^2/N and 1 atm = 10^5 N/m)
(a) 8×10^{-7} (b) 8×10^{-5}
(c) 1.25×10^{-4} (d) 1.25×10^{-5}

18. Two blocks of masses 1 kg and 2 kg are connected by a metal wire going over a smooth pulley as shown in the figure. The breaking stress of the metal is $(40/3\pi) \times 10^6$ N/m^2. If $g = 10$ m s^{-12}, then what should be the minimum radius of the wire used if it is not to break?



(a) 0.5 mm (b) 1 mm
(c) 1.5 mm (d) 2 mm

19. The diagram shows stress vs. strain curve for the materials A and B. From the curves we infer that



(a) A is brittle but B is ductile
(b) A is ductile and B is brittle
(c) Both A and B are ductile
(d) Both A and B are brittle

20. A 900 kg elevator hangs by a steel cable for which the allowable stress is 1.15×10^8 N/m^2. What is the minimum diameter required if the elevator accelerates upward at 1.5 m/s^2. Take $g = 10$ m/s^2
(a) $\dfrac{6\times10^{-2}}{\sqrt{5\,\pi}}$ m (b) $\dfrac{6\times10^{-2}}{\sqrt{10\,\pi}}$ m
(c) $\dfrac{3\times10^{-2}}{\sqrt{10\,\pi}}$ m (d) $\dfrac{3\times10^{-2}}{\sqrt{5\,\pi}}$ m

Energy Stored in a Deformed Body

21. Two wires of the same material and length but diameters in the ratio 1:2 are stretched by the same force. The potential energy per unit volume for the two wires when stretched will be in the ratio

(a) 16:1 (b) 4:1
(c) 2:1 (d) 1:1.

22. An elastic material of Young's modulus Y is subjected to a stress S. The elastic energy stored per unit volume of the material is

(a) $\frac{SY}{2}$ (b) $\frac{S^2}{2Y}$
(c $\frac{S}{2Y}$ (d) $\frac{2S}{Y}$

23. What amount of work is done in increasing the length of a wire through unity?

(a) $\frac{YL}{2A}$ (b) $\frac{YL^2}{2A}$
(c) $\frac{YA}{2L}$ (d) $\frac{YL}{A}$

24. When the load on a wire is slowly increased from 3 to 5 kg wt, the elongation increases from 0.61 to 1.02 mm. The work done during the extension of wire is

(a) 0.16 J (b) 0.016 J
(c) 1.6 J (d) 16 J

25. A long wire hangs vertically with its upper end clamped. A torque of 8 Nm applied to the free end twists it through 45°. The potential energy of the twisted wire is

(a) π J (b) $\frac{\pi}{2}$ J
(c) $\frac{\pi}{4}$ J (d) $\frac{\pi}{8}$ J

26. A long elastic spring is stretched by 2 cm and its potential energy is U. If the spring is stretched by 10 cm, the P.E., will be

(a) $5U$ (b) $25U$
(c) $U/5$ (d) $U/20$

27. If the work done by stretching a wire by 1 mm is 2 J, the work necessary for stretching another wire of the same material but with the radius of cross section and half the length by 1 mm is

(a) $\frac{1}{4}$ J (b) 4 J
(c) 8 J (d) 16 J

28. If the potential energy of a spring is V on stretching it by 2 cm, then its potential energy when it is stretched by 10 cm will be

(a) $V/25$ (b) $5V$
(c) $V/5$ (d) $25V$

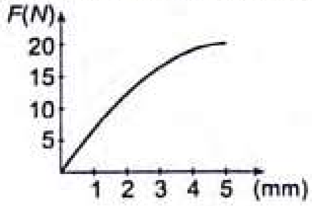
29. Two wires of the same diameter and of the same material have the length l and $2l$. If the force F is applied on each, the ratio of the work done in the two wires will be

(a) 1 : 2 (b) 1 : 4
(c) 2 : 1 (d) 1 : 1

30. When a 4 kg mass is hung vertically on a light spring that obeys Hooke's law, the spring stretches by 2 cm. The work required to be done by an external agent in stretching this spring by 5 cm will be ($g = 9.8$ metres/sec^2)

(a) 4.900 J (b) 2.450 J
(c) 0.495 J (d) 0.245 J

31. The force (F)-extension (Δl), graph shows that the strain energy stored in the material under test, for an extension of 4 mm, is greater than which of the following values?



(a) 80 mJ (b) 60 mJ
(c) 40 mJ (d) None of these

32. The length of a rod is 20 cm and area of cross-section 2 cm^2. The Young's modulus of the material of wire is 1.4×10^{11} N/m^2. If the rod is compressed by 5 kg-wt along its length, then increase in the energy of the rod in joules will be

(a) 8.57×10^{-6} (b) 22.5×10^{-4}
(c) 9.8×10^{-5} (d) 45.0×10^{-5}

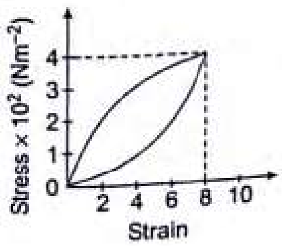
33. When a force is applied on a wire of uniform cross-sectional area 3×10^{-6} m^2 and length 4 m, the increase in length is 1 mm. Energy stored in it will be ($Y = 2 \times 10^{11}$ N/m^2)

(a) 6250 J (b) 0.177 J
(c) 0.075 J (d) 0.150 J

34. The work per unit volume to stretch the length by 1% of a wire with cross sectional area of 1 mm^2 will be. [$Y = 9 \times 10^{11}$ N/m^2]

(a) 9×10^{11} J (b) 4.5×10^{7} J
(c) 9×10^{7} J (d) 4.5×10^{11} J

35. A rubber of volume 2000 cc is alternately subjected to tension and released. The figure shows the stress-strain curve of rubber. Each curve is a quadrant of an ellipse. The amount of energy lost as heat per cycle per unit volume will be



(a) $\left(\frac{\pi}{2}-1\right)\times 16\times 10^2$ J (b) $\left(\frac{\pi}{4}-1\right)\times 8\times 10^2$ J

(c) $\left(\frac{\pi}{4}-1\right)\times 32\times 10^2$ J (d) $\left(\frac{\pi}{2}-1\right)\times 32\times 10^2$ J

Problems Based on Mixed Concepts

36. A wire of cross section A is stretched horizontally between two clamps located $2l$ m apart. A weight W kg is suspended from the mid-point of the wire. If the mid-point sags vertically through a distance $x < 1$ the strain produced is

(a) $\frac{2x^2}{l^2}$ (b) $\frac{x^2}{l^2}$

(c) $\frac{x^2}{2l^2}$ (d) None of these

37. If in the above question, the Young's modulus of the material is Y, the value of extension x is

(a) $\left(\frac{Wl}{YA}\right)^{1/3}$ (b) $\left(\frac{YA}{Wl}\right)^{1/3}$

(c) $\frac{1}{l}\left[\frac{WA}{Y}\right]^{1/3}$ (d) $l\left[\frac{W}{YA}\right]^{1/3}$

38. Two rods of different materials having coefficients of linear expansion α_1 and α_2 and Young's moduli, Y_1 and Y_2, respectively, are fixed between two rigid massive walls. The rods are heated such that they undergo the same increase in temperature. There is no bending of rods. If $\alpha_1/\alpha_2 = 2/3$, then the thermal stresses developed in the two rods are equal, provided Y_1/Y_2 is equal to

(a) 2:3 (b) 1:1

(c) 3:2 (d) 4:9

39. When the tension in a metal wire is T_1, its length is l_1. When the tension is T_2, its length is l_2. The natural length of wire is

(a) $\frac{T_2}{T_1}(l_1+l_2)$ (b) $T_1l_1 + T_2l_2$

(c) $\frac{l_1T_2 - l_2T_1}{T_2 - T_1}$ (d) $\frac{l_1T_2 + l_2T_1}{T_2 + T_1}$

40. A small but heavy block of mass 10 kg is attached to a wire 0.3 m long. Its breaking stress is 4.8×10^7 N/m^2. The area of the cross section of the wire is 10^{-6} m^2. The maximum angular velocity with which the block can be rotated in the horizontal circle is

(a) 4 rad/s (b) 8 rad/s

(c) 10 rad/s (d) 32 rad/s

41. A ball falling in a lake of depth 200 m shows a decrease of 0.1% in its volume at the bottom. The bulk modulus of the elasticity of the material of the ball is (take $g = 10$ m s^{-12})

(a) 10^9 N/m^2 (b) 2×10^9 N/m^2

(c) 3×10^9 N/m^2 (d) 4×10^9 N/m^2

42. A wire is suspended vertically from a rigid support. When loaded with a steel weight in air, the wire extends by 16 cm. When the weight is completely immersed in water, the extension is reduced to 14 cm. The relative density of the material of the weight is

(a) 2 g/cm^3 (b) 6 g/cm^3

(c) 8 g/cm^3 (d) 16 g/cm^3

43. Two bars A and B of circular cross section, same volume and made of the same material, are subjected to tension. If the diameter of A is half that of B and if the force applied to both the rod is the same and it is in the elastic limit, the ratio of extension of A to that of B will be

(a) 16 (b) 8

(c) 4 (d) 2

44. A uniform cylindrical wire is subjected to a longitudinal tensile stress of 5×10^7 N/m^2. Young's modulus of the material of the wire is 2×10^{11} N/m^2. The volume change in the wire is 0.02%. The fractional change in the radius is

(a) 0.25×10^{-4} (b) 0.5×10^{-4}

(c) 1.0×10^{-4} (d) 1.5×10^{-4}

45. A material has normal density ρ and bulk modulus K. The increase in the density of the material when it is subjected to an external pressure P from all sides is

(a) $P/\rho K$ (b) $K/\rho P$

(c) $\rho P/K$ (d) $\rho K/P$

46. The length of a steel cylinder is kept constant by applying pressure at its two ends. When the temperature of rod is increased by 100°C from its initial temperature, the increase in pressure to be applied at its ends is

($Y_{steel} = 2 \times 10^{11}$ N/m^2,
$\alpha_{steel} = 11 \times 10^{-6}$/°C, 1 atm = 10^5 N/m^2.)

(a) 22×10^7 atm (b) 2.2×10^3 atm

(c) zero (d) 4.3×10^3 atm

47. Maximum excess pressure inside a thin-walled steel tube of radius r and thickness Δr ($<< r$), so that the tube would not rupture would be (breaking stress of steel is σ_{max})

(a) $\sigma_{max} \times \frac{r}{\Delta r}$ (b) $\sigma_{max} \times \frac{\Delta r}{r}$

(c) σ_{max} (d) $\sigma_{max} \times \frac{\Delta 2r}{r}$

48. A 5-kg rod of square cross section 5 cm on a side and 1 m long is pulled along a smooth horizontal surface by a force applied at one end. The rod has a constant acceleration of 2 m s^{-12}. Determine the elongation in the rod. (Young's modulus of the material of the rod is 5×10^3 N/m^9).

(a) Zero, as for elongation to be there, equal and opposite forces must act on the rod

(b) Non-zero but cannot be determine from the given situation

(c) 0.4 μm

(d) 16 μm

49. The elastic limit of an elevator cable is 2×10^9 N/m^2. The maximum upward acceleration that an elevator of mass 2×10^3 kg can have when supported by a cable whose cross-sectional area is 10^{-4} m^2, provided the stress in cable would not exceed half of the elastic limit would be

(a) $10\ \text{m s}^{-12}$ (b) $50\ \text{m s}^{-12}$
(c) $40\ \text{m s}^{-12}$ (d) Not possible to move up

50. A wire can sustain the weight of 20 kg before breaking. If the wire is cut into two equal parts, each part can sustain a weight of

(a) 10 kg (b) 20 kg
(c) 40 kg (d) 35 kg

51. A mass m is hanging from a wire of cross-sectional area A and length L. Y is Young's modulus of wire. An external force F is applied on the wire which is then slowly further pulled down by Δx from its equilibrium position. Find the work done by the force F the wire exerts on the mass.

(a) $mg\Delta x + \frac{YA}{2L}(\Delta x)^2$ (b) $mg\Delta x + \frac{YA(\Delta X)^2}{L}$

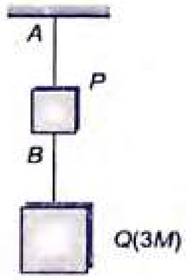
(c) $mg\frac{\Delta x}{2} + \frac{YA(\Delta x)^2}{L}$ (d) $mg\frac{\Delta x}{2} + \frac{YA(\Delta x)^2}{2L}$

52. In the previous problem, find the work done by the gravity, if Δl is the elongation.

(a) $mg\Delta l$ (b) $mg\Delta x$

(c) $\frac{mg(\Delta l)^2}{\Delta x}$ (d) $\frac{mg(\Delta x)^2}{\Delta l}$

53. Wires A and B are connected with blocks P and Q, as shown. The ratio of lengths, radii and Young's modulus of wires A and B are r, $2r$ and $3r$ respectively (r is a constant). Find the mass of block P if ratio of increase in their corresponding lengths is $\frac{1}{6r^2}$. The mass of the block Q is $3M$.



(a) M (b) $3M$
(c) $6M$ (d) $9M$

ARCHIVES

1. A wire is suspended vertically. One of its ends is stretched by attaching a weight of 200 N to the lower end. The weight stretches the wire by 1 mm. Then the elastic energy stored in the wire is

(a) 0.1 J (b) 0.2 J
(c) 10 J (d) 20 J **(AIEEE 2003)**

2. A spring of spring constant 5×10^3 N/m is stretched initially by 5 cm from the unstretched position. Then the work required to stretch it further by another 5 cm is

(a) 6.25 N-m (b) 12.50 N-m
(c) 18.75 N-m (d) 25.00 N-m

(AIEEE 2003)

3. A wire fixed at the upper end stretches by length l when a force F is applied. The work done in stretching is

(a) $\frac{F}{2l}$ (b) Fl

(c) $\frac{2F}{l}$ (d) $\frac{Fl}{2}$ **(AIEEE 2004)**

4. If S is stress and Y is Young's modulus of the material of a wire, the energy stored in the wire per unit volume is

(a) $\frac{S}{2Y}$ (b) $\frac{2Y}{S^2}$

(c) $\frac{S^2}{2Y}$ (d) $2S^2Y$ **(AIEEE 2005)**

5. A wire is elongated by l millimetre when a load W is hung from it. If the wire goes over a pulley and two weights (W each) are hung at the two ends, the elongation of the wire will be (in mm)

(a) zero (b) $\frac{l}{2}$

(c) l (d) $2l$ **(AIEEE 2006)**

6. Two wires are made of the same material and have the same volume. However, wire 1 has cross-sectional area A and wire 2 has cross-sectional area $3A$. If the length of wire 1 increases by Δx on applying a force F, how much force is needed to stretch wire 2 by the same amount?

(a) F (b) $4F$
(c) $6F$ (d) $9F$ **(AIEEE 2009)**

7. The pressure that has to be applied to the ends of a steel wire of length 10 cm to keep its length constant when its temperature is raised by 100°C is

(For steel Young's modulus is 2×10^{11} N m^{-2} and coefficient of thermal expansion is 1.1×10^{-5} K^{-1})

(a) 2.2×10^7 Pa (b) 2.2×10^6 Pa
(c) 2.2×10^8 Pa (d) 2.2×10^9 Pa

(JEE Main 2014)

8. A pendulum made of a uniform wire of cross sectional area A has time period T. When an additional mass M is added to its bob, the time period changes to T_M. If the Young's

modulus of the material of the wire is Y, then $1/Y$ is equal to (g = gravitational acceleration)

(a) $\left[\left(\frac{T_M}{T}\right)^2-1\right]\frac{A}{Mg}$ (b) $\left[\left(\frac{T_M}{T}\right)^2-1\right]\frac{Mg}{A}$

Chapter 12

Fluid Mechanics, Surface Tension and Viscosity

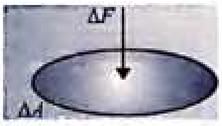
PRESSURE

While considering the equilibrium of solids we usually think in terms of forces exerted by one body on another body. But in case of liquids, we usually speak in terms of pressure instead of forces. If a uniform force F is exerted normal to an area A, then the pressure P is defined as

$$P = \frac{F}{A}$$

NOTE: The area A in the above expression is the actual area of contact. In case of solids, the actual area of contact between two surfaces is less than the apparent area of contact. Therefore, the concept of pressure is of no use in case of solids. On the contrary, the contact between a liquid and a solid surface or between two liquid surfaces is rather a smoother one, that is, the actual area of contact is equal to the apparent area of contact. Therefore, one can easily use the concept of pressure.

If the applied force F is not uniform, then the pressure at a point is defined as the intensity of force at that point. That is,



$$P = \lim_{\Delta A \to 0} \frac{\Delta F}{\Delta A}$$

Pressure is a scalar quantity. Pressure acts normal to a surface and it is always compressive in nature. Therefore, only its magnitude is required for its complete description. The SI unit of pressure is N/m^2 and is also called pascal (Pa). The other common units of pressure are atmosphere and bar.

$$1 \text{ atm} = 1.013 \times 10^5 \text{ Pa} \Rightarrow 1 \text{ bar} = 10^5 \text{ Pa}$$

NOTE:

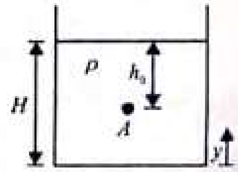
- The liquid pressure is the same on all points at the same depth.
- The total (or absolute) pressure at a depth h below the free liquid surface is more than the outside atmospheric pressure by an amount $\rho g h$.
- The pressure at the bottom of the container will not depend upon the shape or size of the container.
- **Pressure increases with depth linearly:** The rate of increase of pressure with depth is equal to the specific weight of the liquid at that point.

  The specific weight is defined as the weight per unit volume, i.e., ρg. Thus,

  $$\frac{dp}{dy} = \rho g$$

- **Pressure decreases with height linearly:** The rate of decrease of pressure with height is constant and is given by

  $$\frac{dp}{dy} = -\rho g$$



The pressure at the point A is obtained as follows.

$$dp = -\rho g\, dy$$

$$\Rightarrow \quad \int dp = -\rho g \int dy$$

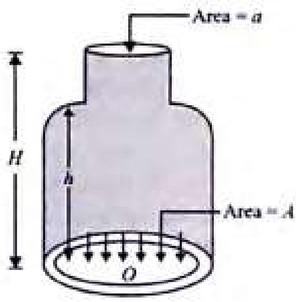
$$\Rightarrow \quad p = -\rho g y + c$$

Now, at $y = H$, $p = p_0$. Therefore, $c = p_0 + \rho g H$

Thus, $p = \rho g(H - y) + p_0$

From the figure, since $H - y = h_0$ $\therefore$ $p = \rho g H + p_0$

A liquid may exert thrust greater than its weight: Consider a cylindrical vessel of base area A and height h, with a thin cylindrical stem of cross-sectional area 'a'. If a liquid of density ρ is poured in it to a height $H(H > h)$, the thrust exerted by the liquid on the base of the vessel = pressure at the base due to liquid column × base area.



$$F_{\text{base}} = (\rho g H)A \tag{i}$$

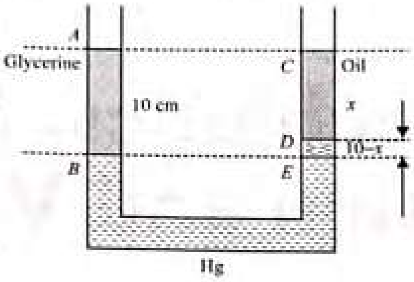
The weight of the liquid contained in the vessel is given by

$$\text{Volume} \times \text{density} \times g = [AH - (A - a)(H - h)]\rho g \tag{ii}$$

$$W_{\text{liquid}} = [Ah - a(H - h)]\rho g \tag{iii}$$

Comparing Eqs. (i) and (ii) it is evident that the force exerted by the liquid on the base of the vessel exceeds the weight of the liquid.

ILLUSTRATION 12.1 A vertical U tube of uniform cross section contains mercury in both of its arms. A glycerine (d = 1.3 g/cm^3) column of length 10 cm is introduced into one of the arms. Oil of density 0.8 g/cm^3 is poured in the other arm until the upper surfaces of the oil and glycerine are in the same horizontal level. Find the length of oil column. Density of mercury is 13.6 g/cm^3.



Solution. Let the length of oil column = $CD = x$ cm.
Length of glycerine = AB = 10 cm

$\therefore \quad DE = (10 - x)$ cm

Equating pressure at horizontal level BE in both arms, we have

$$P_{\text{oil}} + P_{\text{Hg}} = P_{\text{glycerine}}$$

$$xd_{\text{oil}}g + (10 - x)\rho_{\text{Hg}}g = 10d_{\text{glycerine}}g$$

or $$x(0.8) + (10 - x)13.6 = 10(1.3) \Rightarrow x = \frac{136 - 13}{12.8} = 9.6 \text{ cm}$$

PASCAL'S LAW

Pressure applied to a confined liquid is transmitted equally undiminished to every part of the liquid and to all the walls of the containing vessel, and is always exerted at right angles to the walls.

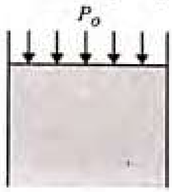


Figure shows a liquid confined by solid boundaries from the four sides and the base. At the free surface the atmosphere is exerting a pressure p_0 on this confined liquid which is transmitted to every part of the liquid.

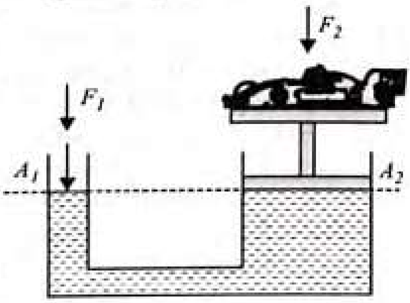
This principle is used in a hydraulic jack or a lift where a heavy load can be lifted up by a small force. In the figure, the pressure due to a small force F_1 applied to a piston of area A_1 is transmitted to the larger piston of area A_2. The pressure at the two pistons is the same because they are at the same level.

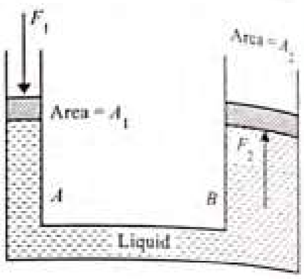


$$p = \frac{F_1}{A_1} = \frac{F_2}{A_2} \Rightarrow F_2 = \left(\frac{A_2}{A_1}\right)F_1$$

Thus, a small force F_1 acting on a small area A_1 results in a larger force F_2 acting on a larger area A_2.

ILLUSTRATION 12.2 In a simple hydraulic press, the cross-sectional area of the two cylinders is 5×10^{-4} m^2 and 10^{-2} m^2, respectively. A force of 20 N is applied at the small plunger.

(a) What is the pressure produced in the cylinders?
(b) What is the thrust exerted on the large plunger?
(c) How much work is done by the operator, if the smaller plunger moves down 0.1 m?



Solution. In a hydraulic press, a force F_1 applied to the smaller plunger creates a pressure F_1/A_1 in the liquid and this pressure is transmitted equally throughout the liquid and acts on the larger plunger. The thrust acting on the larger plunger upwards due to this pressure is

$$F_2 = A_2\left(\frac{F_1}{A_1}\right)$$

Hence, the thrust on A_2 is magnified by A_2/A_1 times

(a) $\dfrac{F_1}{A_1} = \dfrac{20}{5 \times 10^{-4}} = 40000 \text{ N/m}^2$

(b) $F_2 = F_1 \times \left(\dfrac{A_2}{A_1}\right) = 20 \times \dfrac{10^{-2}}{5 \times 10^{-4}} = 400 \text{ N}$

(c) Work done by force $F_1 = F_1 d_1 = 20 \times 0.1 = 2$ J

NOTE: The displacement d_2 of the larger plunger = $d_1 A_1/A_2$. The displacement of the larger plunger is less.

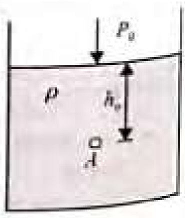
Measurement of Pressure

Absolute Pressure and Gauge Pressure

Absolute pressure is the total pressure at a point including the contribution of the liquid as well as that of the atmosphere. Gauge pressure is the pressure measured at a point relative to the local atmospheric pressure. In other words, it does not include the contribution of atmospheric pressure. Absolute pressure and gauge pressure are related as

$$p_{\text{absolute}} = p_{\text{gauge}} + p_{\text{atm}}$$

Consider a point A at a depth h from the free surface of a liquid of density ρ, as shown in the figure. The gauge pressure at the point A is $p_{\text{gauge}} = \rho gh$ and the absolute pressure is $p_{\text{absolute}} = \rho gh + p_0$.



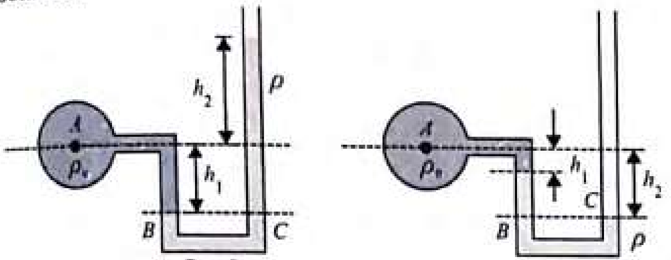
NOTE:

- Absolute pressure is always positive and is never equal to zero.

- Gauge pressure may be positive, zero or negative.
- Positive gauge pressure means that pressure at a point is more than the atmospheric pressure.
- Negative gauge pressure means that pressure at a point is less than the atmospheric pressure.
- Practically, the exact value of absolute pressure cannot be measured due to the uncertainty in the value of atmospheric pressure. The atmospheric pressure varies from place to place and at a place from time to time.

ILLUSTRATION 12.3 A container A is having some fluid of density θ_0. It is connected with a U-tube manometer shown in the figure. Find the pressure of the container in both the cases given in the figure.

Solution.



Case I Case II

Case I

Let the gauge pressure at A be p_A. Starting from container move along the manometer by a height h_1 downwards. The change in pressure will be $+\rho_0 g h_1$. The pressure at B and C will be the same. To move to the open end, we have to move by a distance $(h_1 + h_2)$ upward. Hence, change in pressure will be $-\rho g(h_1 + h_2)$. Finally, we reach the top, i.e., open to atmosphere. Hence, the manometric equation of the gauge pressure will be

$$p_A + \rho_0 gh_1 - \rho g\,(h_1 + h_2) = 0$$

$$\Rightarrow \quad p_A = \rho g(h_1 + h_2) - \rho_0 gh_1$$

In terms of absolute pressure at A, the manometric equation will be

$$p'_A + \rho_0\, gh_1 - \rho g(h_1 + h_2) = p_0$$

$$p'_A = (h_1 + h_2) - \rho_0\, gh_1 + p_0$$

Case II

Gauge pressure at A, $\quad p_A + \rho_0\, gh_1 + \rho g(h_2 - h_1) = 0$

Absolute pressure at A, $p'_A + \rho_0\, gh_1 + \rho g(h_2 - h_1) = p_0$

NOTE:

- Pressures at B and C are equal.
- Absolute pressure is always greater than or equal to zero, while gauge pressure can be negative also.
- In the same liquid, pressure will be same at all points at the same level. For example, in the figure, $P_1 \neq P_2$, $P_3 = P_4$, $P_5 = P_6$.

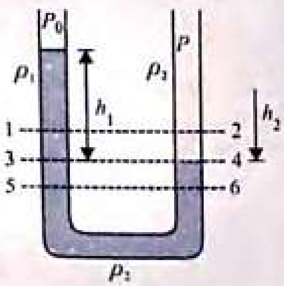


ILLUSTRATION 12.4 In a given U-tube open at left end and closed at right end, if the pressure above the liquid in the right arm is p, find the value of p. Given $d_2 = 2 \times 13.6$ g/cm^3, $d_1 = 13.6$ g/cm^3. Atmospheric pressure $p_a = 76$ cm of Hg.

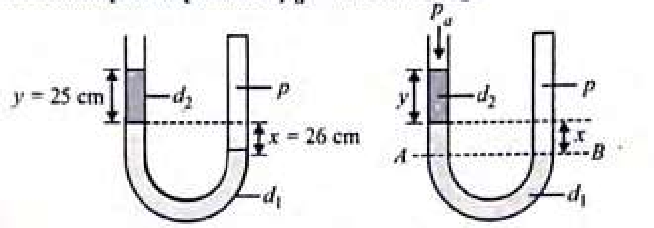


Solution. The line AB is passing through the same liquid; hence, the pressure in the liquid at the same level is the same, i.e., at A and B, the pressures will be equal. The manometric equation is

$$p_a + d_2 yg + d_1 xg = p$$

$$\Rightarrow \quad p_a + 13.6 \times 2 \times 0.25 \times g + 13.6 \times 26 \times g = p$$

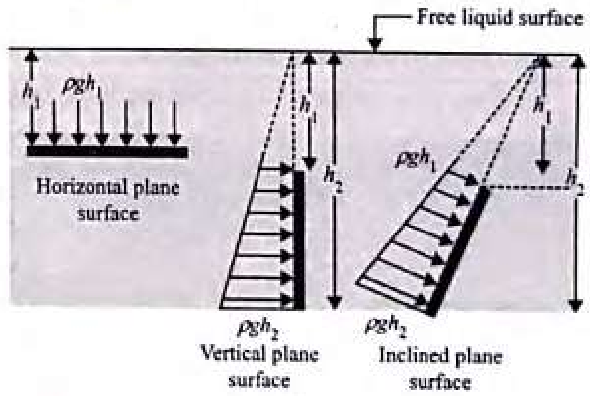
$$p_a + 13.6 \times g/100[50 + 26] = p$$

$$\Rightarrow \quad p = 2 \times 13.6 \times g \times \frac{76}{100} \qquad [\because p_a = 13.6 \times g \times 76/100]$$

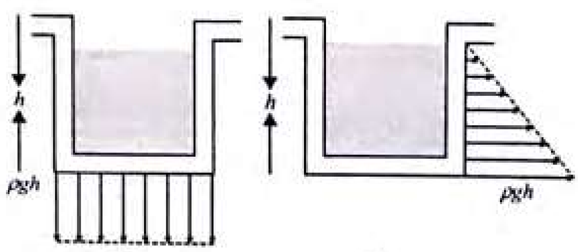
$$= 2p_a$$

Pressure Diagrams and Force on Boundaries

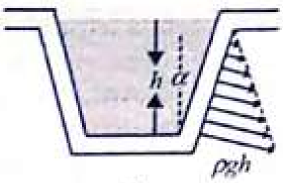
A pressure diagram is a graphical representation of the variation of the pressure intensity over a surface. Such a diagram may be prepared by plotting to some convenient scale the pressure intensities at various points on the surface. Net force (total pressure) as well as point of application of force (centre of pressure) for a plane surface wholly submerged in a static liquid, either vertically or inclined, may also be determined by drawing a pressure diagram.



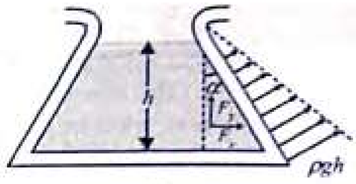
(a)



(b) (c)

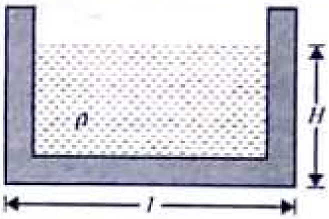


(d)

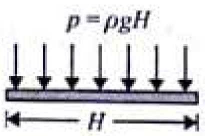


(e)

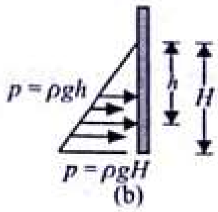
ILLUSTRATION 12.5 Consider a regular tank of size $(l \times b)$ filled with a liquid of density ρ to a height H as shown in the figure. Find the force at the base and on the walls of the tank.



Solution. Whenever a liquid comes in contact with solid boundaries it exerts a force on it. The force on the boundary may be obtained by integrating the pressure over the entire area of the boundary. The variations of liquid pressure acting at the base and at the wall are shown in Figs. (a) and (b), respectively.



(a)



(b)

1. **Force at the base:** Since the pressure is uniform at the base, force acting at the base is given by

   $F = p \times$ (area of the base)

   Since $p = \rho gH$, therefore

   $F = \rho gH(lb) = \rho g(lbH)$

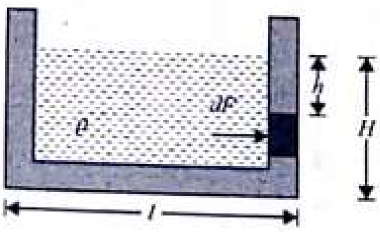
   Since $lbH = V$ (volume of the liquid), so

   $F = \rho gV =$ weight of the liquid inside the tank

NOTE: The force acting at the base per unit width (F/b) is equal to the area of the pressure diagram. That is,

$$\frac{F}{b} = pl = \rho gHl$$

2. **Force acting on the vertical wall:** Pressure acting on the vertical wall is not uniform but increases linearly with depth. Pressure at a depth h from the free surface is $p = \rho gh$.



Force dF acting on a differential element of height dh is

$$dF = p(bdh) = (\rho gh)(bdh) = \rho gbhdh$$

The total force is

$$F = \rho gb\int_0^H hdh = \frac{1}{2}\rho gbH^2$$

The total force acting per unit width of the vertical wall is

$$\frac{F}{b} = \frac{1}{2}\rho gH^2$$

NOTE: The force acting per unit width is equal to the area of the pressure diagram shown in the figure.

$$\frac{F}{b} = \frac{1}{2}\text{(base)(height)} = \frac{1}{2}(\rho gH)(H) = \frac{1}{2}\rho gH^2$$

Hence, force per unit width of an immersed surface is equal to the area of the pressure diagram on the surface.

The point of application (or the centre of force) of the total force from the free surface is given by $h_C = \frac{1}{F}\int_0^H hF$.

Here, $\int_0^H h\,dF = \int_0^H h(\rho gbh\,dh) = \rho gb\int_0^H h^2\,dh = \frac{1}{3}\rho gbH^3$

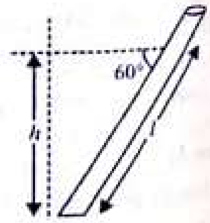
$$F = \frac{1}{2}\rho gbH^2 \Rightarrow h_C = \frac{2}{3}H$$

The total force acts at a depth $(2/3)H$ from the force diagram.

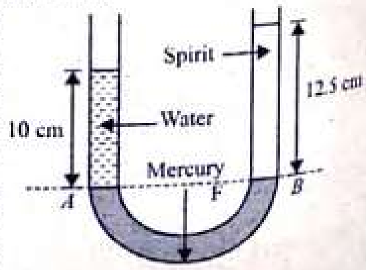
NOTE: The total force acts through the centroid of the pressure diagram, at a depth $2H/3$ from the top of the liquid level.

CONCEPT APPLICATION EXERCISE 12.1

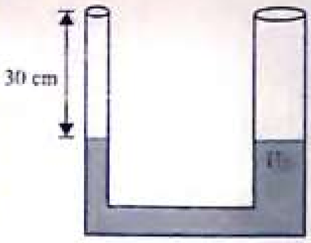
1. What is the absolute pressure on a swimmer 10 m below the surface of a lake? Take atmospheric pressure 1×10^5 N/m^2.
2. What will be the length of mercury column in a barometer tube when the atmospheric pressure is 75 cm of mercury and the tube is inclined at an angle of 60° with the horizontal direction?



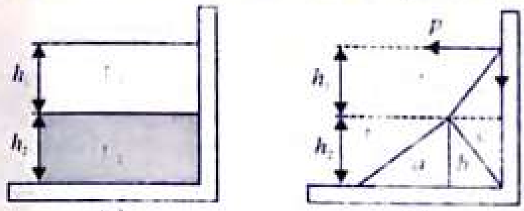
3. A U-tube contains water and methylated spirit separated by mercury. The mercury columns in the two arms are in the same level with 10 cm of water in one arm and 12.5 cm of spirit in the other. What is the specific gravity of spirit?



4. A U-tube in which the cross-sectional area of the limb on the left is one-third of the limb on the right contains mercury (density 13.6 g/cm^3). The level of mercury in the narrow limb extends to a distance of 30 cm from the upper end of the tube. What will be the rise in the level of mercury in the right limb, if the left limb is filled to the top with water (neglect surface tension effects)?

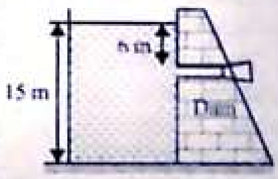


5. Figure (b) shows the variation of pressure (p) with depth (h) along a vertical wall supporting two liquids of different densities as shown in Fig. (a). Identify the correct variation of pressure in the liquid of density ρ_2.



(a) (b)

6. Water stands at a depth of 15 m behind a reservoir dam. A horizontal pipe 4 cm in diameter passes through the dam 6 m below the surface of water as shown. There is a plug which secures the pipe opening. Then find the friction between the plug and pipe wall.



FLUID IN UNIFORMLY ACCELERATING MOTION

Liquid Subjected to Constant Horizontal Acceleration

Consider a liquid in a tank which is moving on a horizontal surface with constant acceleration a. The free surface of the liquid takes the shape as shown in the figure. Consider a cylinder of liquid of length l and area of cross section A. The force on the left face of the cylinder is $F_1 = P_1A$ and force on the right face of the cylinder is $F_2 = P_2A$. Here $P_1 = \rho g y_1$ and $P_2 = \rho g y_2$. Mass of the liquid cylinder is $m = A\,l\rho$. Using Newton's second law for the liquid cylinder,

$$F_1 - F_2 = ma$$

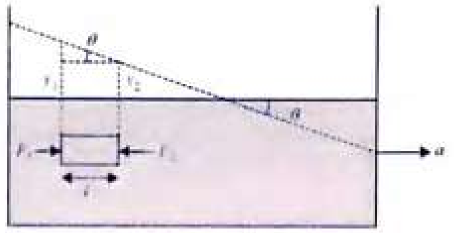
or $$P_1A - P_2A = ma \text{ or } (\rho g y_1 - \rho g y_2)A = Al\rho a$$

or $$\frac{y_1 - y_2}{l} = \frac{a}{g}$$

From the figure,

$$\frac{y_1 - y_1}{l} = \tan\theta$$

$$\therefore \quad \tan\theta = \frac{a}{g}$$

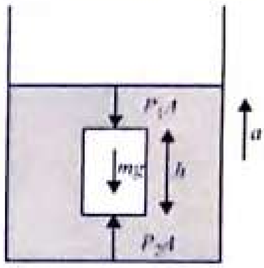


The negative sign shows that *pressure increases in a direction opposite to the direction of acceleration.*

Fluid Subjected to Constant Vertical Acceleration

Pressure difference when liquid is accelerating in vertical direction

Consider a cylindrical element of height h and area A. The force on the top face of the element is P_1A and force on the bottom face is P_2A. If a is the acceleration of the liquid, then



$P_2A - (mg + P_1A) = ma$

Here m is the mass of the element of the liquid which is equal to $hA\rho$.

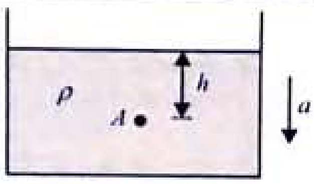
Thus, we have $P_2A - (hA\rho g + P_1A) = (hA\rho)\,a$

After simplification, we get $P_2 - P_1 = \rho(g + a)h = \rho g_{eff}h$.

COMPARISON OF AN ACCELERATED FLUID WITH AN ACCELERATED PENDULUM

Constant downward acceleration ($a < g$)

The free surface remains horizontal (see figure). Pressure decreases at every point below the surface. At the point A,

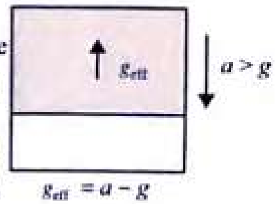


$$P = \rho(g - a)h\ \rho g_{eff}h$$

Pressure becomes zero everywhere

Constant downward acceleration ($a > g$)

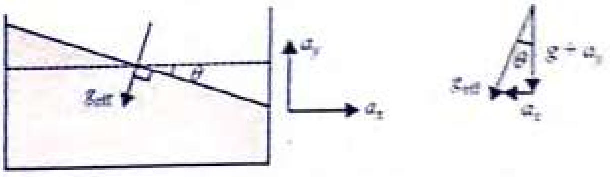
In this case, the fluid occupies the upper part of the container as shown in the figure.



Fluid Subjected to Combined Horizontal and Vertical Acceleration

In general, when the fluid has both horizontal and vertical acceleration, the inclination of the free surface with the horizontal may be obtained as

$$\tan\theta = \frac{dy}{dx} = \frac{dp/dx}{dp/dy} = \frac{a_x}{g+a_y}$$



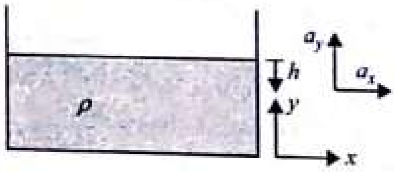
NOTE: In a non-accelerating fluid, pressure increases with depth and decreases with height:

$$\frac{dp}{dh} = \rho g \Rightarrow \frac{dp}{dy} = -\rho g$$

But when a fluid is subjected to a vertical acceleration, the above two equations may be modified as

Variation with depth: $\dfrac{dp}{dh} = \rho(g+a_y)$

Variation with height: $\dfrac{dp}{dy} = -\rho(g+a_y)$



A container accelerated in the vertical direction.

a_y is positive for upward acceleration and a_y is negative for downward acceleration.

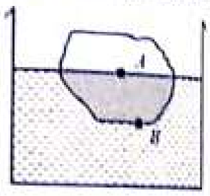
3. A barometer kept in an elevator accelerating upwards reads 76 cm of Hg. What will be the possible air pressure inside the elevator?

4. A barometer kept in an elevator reads 76 cm when it is at rest. What will be the barometric reading when the elevator accelerates upwards?

5. A container shown in the figure is accelerated horizontally with acceleration a. Find the minimum value of a at which liquid just starts spilling out.

ARCHIMEDES' PRINCIPLE

Consider an irregularly shaped object at rest within a fluid. Liquid exerts a thrust on sides of the solid surface in contact with it due to its pressure. Because the liquid pressure increases with depth, the force exerted by the liquid on the surface of the object is greater for those portions which are more deeply immersed. In the figure, liquid thrust at point B is greater than that at A. The net effect on the entire body is an upward or lifting force which is called the buoyant force.



The magnitude of this upward buoyant force (B) is given by Archimedes' principle. We have $B = v\rho g$, where v is the volume occupied by the solid inside the liquid and ρ is the density of the liquid.

ILLUSTRATION 12.6 A piece of ice is floating in water. What will happen to the level of water when all ice melts? What will happen if the beaker is filled not with water but with liquid (a) denser than water, and (b) lighter than water?

Solution. If M grams of ice is floating in a liquid of density σ_L, then for its equilibrium, weight of the ice = thrust

or $\quad Mg = V_D\sigma_L g$

So the volume of the liquid displaced by the floating ice is

$$V_D = (M/\sigma_L) \qquad \text{(i)}$$

Now if M grams of ice melts completely, water formed will have mass M grams (as mass is conserved). Now if σ_W is the density of water, the volume of water formed will be

$$V_F = (M/\sigma_W) \qquad \text{(ii)}$$

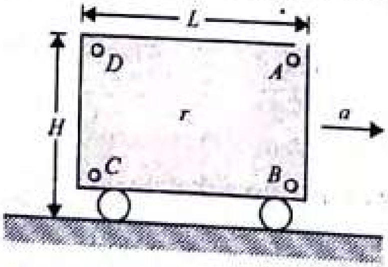
Here the liquid is water, i.e., $\sigma_L = \sigma_W$; so water displaced by floating ice is equal to the water formed by melting of the whole ice, and hence the level of water will remain unchanged.

The following two points may be noted:

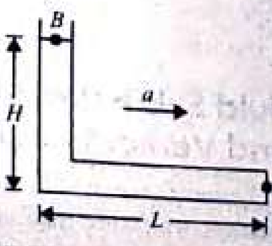
(a) If $\sigma_L > \sigma_W$, then $M/\sigma_L < M/\sigma_W$, i.e., $V_D < V_F$
i.e., water displaced by the floating ice will be lesser than water formed and so the level of the liquid in the beaker will rise.

CONCEPT APPLICATION EXERCISE 12.2

1. A rectangular box is completely filled with a liquid of density ρ, as shown in the figure. The box is accelerated horizontally with a constant acceleration a. Determine the gauge pressures at the four points A, B, C and D.

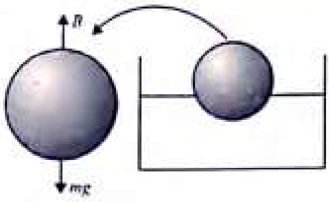


2. Figure shows an L-shaped tube filled with a liquid to a height H. What should be the horizontal acceleration a of the tube so that the pressure at the point A becomes atmospheric.



(b) If $\sigma_L < \sigma_W$, $M/\sigma_L > M/\sigma_W$, i.e., $V_D > V_F$
i.e., water displaced by the floating ice will be more than water formed and so the level of the liquid in the beaker will fall.

FLOATING BODY



Whenever the buoyant force on a body equals its weight, the net force acting on the body becomes zero. Hence, the body floats in equilibrium. Let a body of total volume V and density d be floating on a liquid of density ρ. Let v be the volume of the body inside the liquid.

Then $B = mg$ (for a floating body)

or $\quad v\rho g = Vdg$

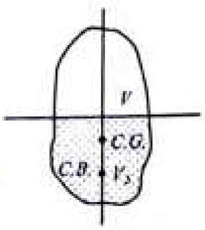
NOTE:

- When a body is in air, the net downward force on it is due to earth's gravity only. This net force $= mg = Vdg$. This force is known as weight of the body.
- When the same body is immersed in a liquid of density σ, the net downward force on it is $= mg - B$.
- Buoyant force $= Vdg - v\rho g$.
- This downward force is also known as apparent weight in the liquid.
- When a body is immersed in a liquid, it feels lighter due to buoyant force. Hence, the buoyant force is also known as loss in weight ($= v\rho g$).
- Buoyant force in accelerating fluids: Suppose a body is dipped inside a liquid of density ρ_L placed in an elevator moving with an acceleration. The buoyant force F in this case becomes $F = V\rho_L g_{\text{eff}}$. Here, $g_{\text{eff}} = |\vec{g} - \vec{a}|$.

CENTRE OF BUOYANCY

Centre of gravity of the displaced fluid is called buoyant centre or centre of buoyancy. Buoyant force is applied on buoyant centre.

Important Results Regarding Floating Bodies



- The net force on the floating object should be zero, i.e., weight of the object is same as the buoyant force on it.
- Let density of the solid be ρ_s, density of the fluid be ρ_l, submersed volume of the floating object be V_s and total volume of the object be V. Then

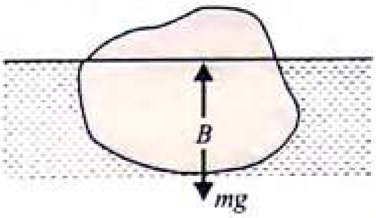
$$W = B \Rightarrow V\rho_s g = V_s\rho_l g \Rightarrow \frac{V_s}{V} = \frac{\rho_s}{\rho_l}$$

- The net torque on the floating object should be zero, i.e., centre of gravity of the object and buoyant centre should lie on the same vertical line.

ILLUSTRATION 12.7 What fraction of an iceberg lies beneath the surface of the sea? Density of sea water (ρ) = 1.028 $\times 10^3$ kg/m^3, density of ice (d) = 0.917 $\times 10^3$ kg/m^3.

Solution. For floating conditions, we know

Weight of the iceberg = Buoyant force



Let V be the total volume of the iceberg and v be the volume inside the sea water. Then

$Vdg = v\rho g$

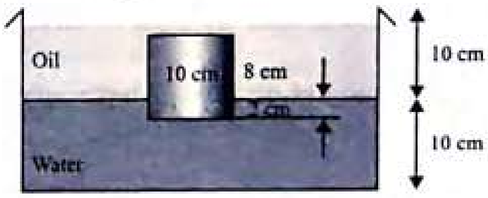
$$\frac{v}{V} = \frac{d}{\rho} \Rightarrow \frac{v}{V} = \frac{0.917\times10^3}{1.028\times10^3} \Rightarrow \frac{v}{V} = 0.892$$

About 89.2% of the iceberg remains inside.

ILLUSTRATION 12.8 A cubical block of wood 10 cm along each side floats at the interface between an oil and water with its lowest surface 2 cm below the interface. If the heights of oil and water columns are 10 cm each and $\rho_{\text{oil}} = 0.8$ g/cc, find (a) the mass of the block, (b) the liquid pressure at the lower surface of the block.

Solution.

(a) For the floating cube,



Weight of the cube = Buoyant force

$$\Rightarrow \quad mg = B_{\text{oil}} + B_{\text{water}}$$

$$= 8\times10^2 \times \rho_{\text{oil}} g + 2\times10^2 \rho_w \times g$$

$$\Rightarrow \quad m = 800\times0.8 + 200\times1$$

$$= 640 + 200 = 840 \text{ g}$$

(b) The pressure at the lower surface of the cube is

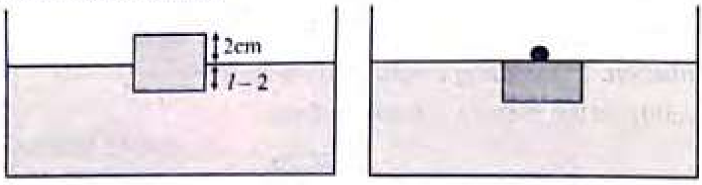
$$P_{\text{oil}} + P_w = \frac{10}{100}\times(0.8\times10^3)9.8 + \frac{2}{100}\times(1+10^3)9.8$$

$$= 980 \text{ N/m}^2$$

(Here we have used $h_{\text{oil}} = 10$ cm and $h_w = 2$ cm above the lower surface.)

ILLUSTRATION 12.9 A cube of wood supporting a 200 g mass just floats in the water. When the mass is removed, the cube rises by 2 cm. What is the size of the cube?

Solution. The cube 'just floats' means that it is fully under water while floating.



Let m be the mass of the cube. Then

$$(m+200)g = l^3 \rho g \quad \text{(i)}$$

When the mass is removed,

$$mg = (l-2)l^2 \rho g \quad \text{(ii)}$$

Subtracting Eq. (ii) from Eq. (i), we have

$$200 = \rho\,[l^3 - (l-2)\,l^2]$$

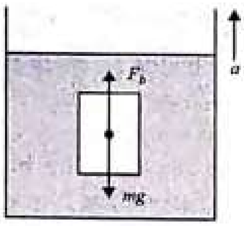
$\Rightarrow$ $l = 10$ cm (using $\rho = 1$ g/cc of water)

Buoyant Force in Accelerating Fluid

Suppose the body is submerged into a liquid of density ρ, which is accelerating upwards. If a is the acceleration of the liquid, then

$$F_b - mg = ma$$

or $\quad F_b = m(g+a)$



Here m is the mass of the displaced liquid, which is equal to $V\rho$. Therefore,

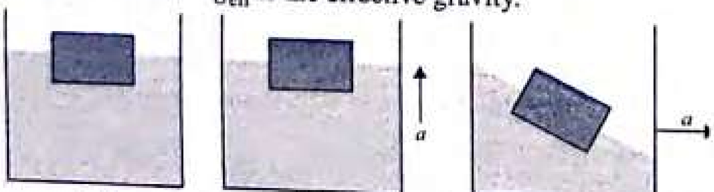
$$F_b = \rho V(g+a)$$

Expression for the Buoyant Force for an Accelerated Fluid

Instead of taking gravity 'g', we take the effective gravity g_{eff}. Then

$$F_B = \rho V g_{\text{eff}}$$

where ρ is the density of the fluid, V is the volume of the displaced fluid and g_{eff} is the effective gravity.



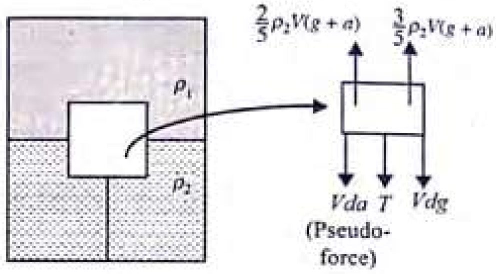
(a) (b) (c)

Figure (a) shows that a body floats on the surface of a stationary liquid. In a vertically accelerated liquid, the depth of submergence remains constant. In a horizontally accelerated liquid, the body aligns itself along the free surface or normal to the effective gravity. The depth of submergence remains constant.

ILLUSTRATION 12.10 A vessel contains two immiscible liquids of density $\rho_1 = 1000$ kg/m^3 and $\rho_2 = 1500$ kg/m^3. A solid block of volume $V = 10^{-3}$ m^3 and density $d = 800$ kg/m^3 is tied to one end of a string and the other end is tied to the bottom of the vessel. The block is immersed with two-fifths of its volume in the liquid of lower density. The entire system is kept in an elevator which is moving upwards with an acceleration of $a = g/2$. Find the tension in the string.

Solution. We will analyse this problem from the reference frame of elevator. Total buoyant force on the block is

$$F_B = \left(\frac{2}{5}V\rho_2 + \frac{3}{5}V\rho_1\right)(g+a)$$



(a) (b)

From the condition of equilibrium,

$$F_B = T + Vd(g+a)$$

$$\Rightarrow T = F_B - Vd(g+a) = (g+a)V\left[\frac{2}{5}\rho_2 + \frac{3}{5}\rho_1 - d\right]$$

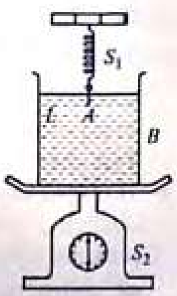
$$= 15\times10^{-3}\left[\frac{2}{5}\times1500 + \frac{3}{5}\times1000 - 800\right] = 6\text{ N}$$

CONCEPT APPLICATION EXERCISE 12.3

1. A beaker exactly full of water has an ice piece floating on it. As the cube melts what happens to the water level if (a) the cube contains an air bubble, (b) the cube contains (i) a lead piece and (ii) a cork piece.
2. A boat containing some piece of material is floating in a pond. What will happen to the level of water in the pond if on unloading the pieces in the pond, the piece (a) floats, (b) sinks?
3. A body of density ρ floats with volume V_1 of its total volume V immersed in a liquid of density ρ_1 and with the remainder of volume V_2 immersed in another liquid of density ρ_2, where $\rho_1 > \rho_2$. Find the volume immersed in two liquids (V_1 and V_2).
4. An iron casting has a number of cavities in it. It weighs 6000 N in air and 4000 N in water. Determine the total volume of all the cavities in the casting. The density of iron (without cavities) is 8.0 g/cm^3, $\rho_w = 1$ g/cm^3.
5. A necklace weighs 50 g in air, but it weighs 46 g in water. Assume that copper is mixed with gold to prepare the necklace. Find how much copper is present in it. (Specific gravity of gold is 20 and that of copper is 10.)
6. A block of ice of area A and thickness 0.5 m is floating in fresh water. In order to just support a man of 100 kg,

find the area A. (The specific gravity of ice is 0.917 and density of water is 1000 kg/m^3.)

7. As the figure shows, S_1 and S_2 are spring balances. Block A is hanging from spring balance S_1 and immersed in liquid L which is contained in beaker B. The mass of beaker B is 1 kg and mass of liquid L is 1.5 kg. Balances S_1 and S_2 reads 2.5 kg and 7.5 kg, respectively. What will be the readings of S_1 and S_2 when block A is pulled up out of the liquid. Find the reading of S_1 and S_2?



HYDRODYNAMICS

Types of Flow

Steady and Unsteady Flow

A flow is said to be steady if the velocity, pressure and density at any point in the flow do not change with time, i.e.,

$$\frac{dv}{dt}=0,\ \frac{dp}{dt}=0 \text{ and } \frac{d\rho}{dt}=0$$

In an unsteady flow, the velocity at a point in the flow varies with time, i.e., $\frac{dv}{dt}\neq 0$.

Uniform and Non-uniform Flow

A flow is said to be *uniform* at any instant of time if the velocity (both in magnitude and in direction) does not vary along the direction of flow. In a non-uniform flow, velocity varies in the direction of flow.

Visualization of Flow

The fluid flow pattern may be visualized in terms of pathlines and streamlines.

Pathline: It is a line drawn such that it describes the trajectory of a given fluid particle as it moves with the passage of time. The concept of the pathline in fluids is identical to the trajectory of a solid body. Tangent drawn at a point on a pathline gives the direction of velocity at that point at the time when the particle passes that point.

Important properties of a pathline:

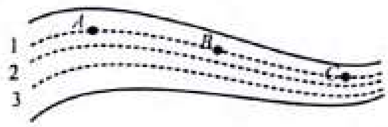
- A pathline can intersect itself at different times.
- Pathlines are the history lines of individual fluid particles over a period of time.

Streamline: It is the most common graphical concept of flow visualization. It is a line drawn such that a tangent at every point of it is in the direction of velocity at that instant.

Unlike pathlines, a streamline cannot intersect itself; furthermore, two streamlines cannot meet or intersect at a point. This is because instantaneously fluid can have a unique velocity at a point.

Streamline Flow

If every point of a steadily flowing liquid follows exactly the same path that has been followed by the particles preceding it, the flow is said to be streamlined. The path is known as 'streamline'. In the figure, the paths 1, 2, 3 are streamlines. If a liquid follows the path ABC, particles following it move along the same path.



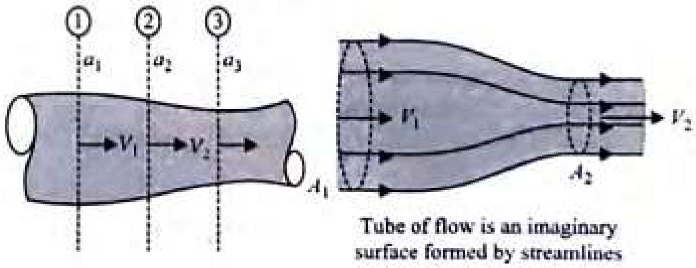
Turbulent Flow

When the velocity exceeds a certain critical value, the nature of flow becomes complicated. Random, irregular, local currents (called vortices) develop throughout the fluids. The resistance to the flow increases tremendously. This type of flow is called 'turbulent flow'.

PRINCIPLE OF CONTINUITY: THE CONTINUITY EQUATION

The continuity equation is a mathematical expression of the law of conservation of mass in fluid dynamics.

It states that 'in a steady flow, the amount (mass) of liquid entering a section is the same as that leaving another section in a given time interval'. If a_1, a_2, a_3, etc., are the cross-sectional areas of a pipe (carrying a liquid in a steady flow) at various sections, and v_1, v_2, v_3, etc., are the corresponding velocities (average), with ρ_1, ρ_2, ρ_3, etc., as the densities, then the mass of liquid flowing past these sections in time Δt would be $\rho_1 v_1 a_1 \Delta t$, $\rho_2 v_2 a_2 \Delta t$, $\rho_3 v_3 a_3 \Delta t$, etc. Since there is no accumulation of the liquid within the pipe, so



Tube of flow is an imaginary surface formed by streamlines

$$\rho_1 v_1 a_1 \Delta t = \rho_2 v_2 a_2 \Delta t = \rho_3 v_3 a_3 \Delta t = \cdots$$

$$\Rightarrow \quad \rho_1 v_1 a_1 = \rho_2 v_2 a_2 = \rho_3 v_3 a_3 = \cdots$$

In case of incompressible liquids, $\rho_1 = \rho_2 = \rho_3 = \cdots$

$$\therefore \quad v_1 a_1 = v_2 a_2 = v_3 a_3 = \cdots$$

The above equation is known as the 'equation of continuity',

$$A_1 v_1 = A_2 v_2$$

ILLUSTRATION 12.11 A broad pipe having a radius 10 cm branches into two pipes of radii 5 cm and 3 cm. If the velocity of flowing water in the pipe of radius 3 cm is 5 cm/s, determine the velocities of water in the remaining two pipes. Given that the rate of discharge through the main branch is 600π cm^3/s.

Solution. Consider any three sections (1), (2) and (3) in the three pipes of different radii as shown in the figure. If v_1 and v_2 be the velocities of water at sections (1) and (2), respectively, then

$$a_1 = \pi(10)^2 \text{ cm}^2,\ a_2 = \pi(5)^2 \text{ cm}^2 \text{ and } a_3 = \pi(3^2) \text{ cm}^2$$

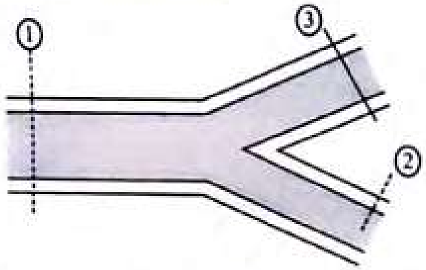
$$v_1 = ?,\ v_2 = ?,\ v_3 = 5 \text{ cm/s}$$

The rates of discharge through the three pipes are

$$a_1 v_1 = 100\pi v_1 \text{ cm}^3/\text{s}$$

$$a_2 v_2 = 25\pi v_2 \text{ cm}^3/\text{s}$$

$$a_3 v_3 = 9\pi \times 5 = 45\pi \text{ cm}^3/\text{s}$$



Now, $Q = a_1 v_1 = a_2 v_2 + a_3 v_3 \Rightarrow 600\pi = 100\pi v_1 = 25\pi v_2 + 45\pi$

Solving, we get $v_1 = 6$ cm/s and $v_2 = 22.2$ cm/s

BERNOULLI'S EQUATION

According to Bernoulli's theorem, the sum total of these three kinds of energies, kinetic energy, potential energy and pressure energy remains constant along a streamline in a steady flow of an ideal fluid. That is,

$$\frac{1}{2}\rho v^2 + \rho g y + p = \text{constant}$$

An ideal fluid is inviscous and incompressible. In other words, there is no dissipation of energy due to internal friction between adjacent layers of the fluid and density of this fluid remains constant. In other words, the sum of total energy per unit volume (pressure + kinetic + potential) is constant for an ideal fluid.

Other Forms of Bernoulli's Equation

If the kinetic, potential and pressure energies are expressed in terms of per unit mass or per unit weight, then the Bernoulli's equation may be written as

$$\frac{p}{\rho} + \frac{v^2}{2} + gy = \text{constant} \qquad \text{(per unit mass)}$$

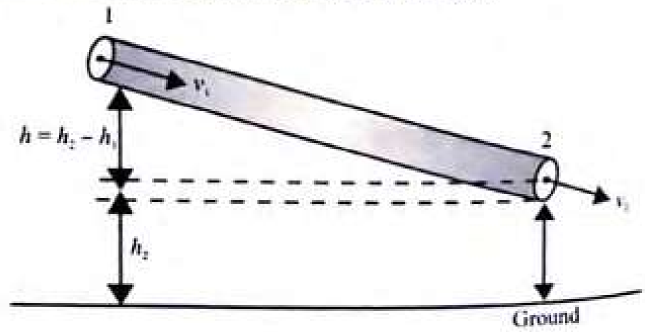
$$\frac{p}{\rho g} + \frac{v^2}{2g} + y = \text{constant} \qquad \text{(per unit weight)}$$

The Bernoulli's equation in the per unit weight form is the most commonly used expression. Each term in this equation has the dimensions of length. The term $v^2/2g$ is known as the velocity head, $p/\rho g$ is known as the pressure head and y is known as the potential head.

Applications and Limitations of Bernoulli's Equation

- The flow is assumed to be steady, i.e., there is no change in pressure, velocity and density of the fluid at any point with respect to time.
- However, in the problems of unsteady flow with gradually changing conditions, Bernoulli's equation can be applied without appreciable error. For example, a problem of emptying a large tank can be solved by applying Bernoulli's equation.
- The flow is assumed to be incompressible. Since liquids are incompressible, Bernoulli's equation can be applied to all liquids. However, it can be applied to the problems of gas flow when there is little variation in pressure, velocity and temperature so that density of gas can be assumed to be constant.
- The flow is assumed to be irrotational. The irrotationality means the net angular momentum at any point in the fluid flow is zero.
- The fluid is assumed to be ideal, i.e., the energy loss due to friction is assumed to be absent.

ILLUSTRATION 12.12 A liquid moves in a smooth tube of uniform cross section. Find the pressure P_2 at point 2 of the tube if the pressure at point 1 of the extended tube is P_1 and the vertical distance between points 1 and 2 is h.



Solution. Since the cross section of the tube is uniform,

$$A_1 = A_2 = A$$

Then, applying equation of continuity at points 1 and 2, we have

$$v_1 = v_2 \qquad (i)$$

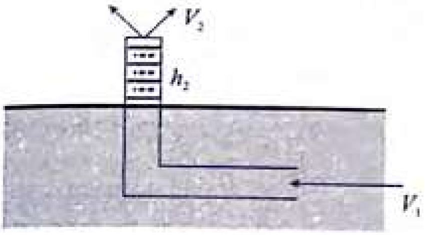
Substituting $v_1 = v_2 (= v)$ in Bernoulli's equation, we have

$$P_1 + \frac{1}{2}\rho v^2 + \rho g h_1 = P_2 + \frac{1}{2}\rho v^2 + \rho g h_2$$

This gives $P_1 + \rho g h_1 = P_2 + \rho g h_2$

Since $h_1 - h_2 = h$, we have $P_2 = P_1 + \rho g h$

ILLUSTRATION 12.13 A bent tube is lowered into a water stream as shown in the figure. The velocity of the stream is V_1. The closed upper end is located at a height h_0 and has a small orifice. To what height h will the liquid get spurt?



Solution. $\frac{1}{2}\rho V_1^2 + P_0 + 0 = \frac{1}{2}\rho V_2^2 + P_0 + \rho g h_0$

$\Rightarrow \quad V_2^2 = V_1^2 - 2gh_0$

If the liquid reaches a height h, then $V_2^2 = 2gh$,

$\Rightarrow \quad 2gh = V_1^2 - 2gh_0 \Rightarrow h = \frac{V_1^2}{2g} - h_0$

VENTURI METER

This is an instrument for measuring the rate of flow of liquids and gases (fluids). The instrument is connected horizontally in the tube in which the rate of flow is to be measured. We have

$$P_A - P_B = h\rho g$$

where h is the difference of heights of liquids of density r in vertical tubes. The velocities of fluid at A and B are v_1 and v_2, respectively.

For liquids:

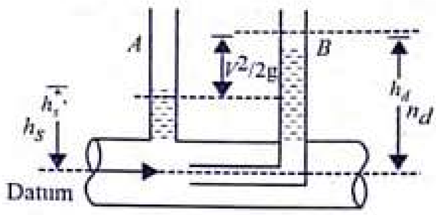
$$P_A + \rho\frac{v_1^2}{2} = P_B + \rho\frac{v_2^2}{2}$$

$$\Rightarrow \quad v_2^2 - v_1^2 = \frac{2}{\rho}(P_A - P_B) = \frac{2}{\rho}h\rho g \quad \Rightarrow v_2^2 - v_1^2 = 2hg$$

$$\Rightarrow \quad \frac{Q^2}{A_2^2} - \frac{Q^2}{A_1^2} = 2hg \quad (\because Q = Av) \quad \Rightarrow Q = A_1A_2\sqrt{\frac{2hg}{A_1^2 - A_2^2}}$$

STATIC PRESSURE AND DYNAMIC PRESSURE

The static pressure at a point in a fluid flow may be obtained by connecting a single-tube manometer perpendicular to the direction of the fluid flow as shown by tube A in the figure. The height h_s to which the liquid rises in it with respect to the reference level (datum) is a measure of the static pressure in the fluid at a point on the axis. That is,



$$p_s = \rho g h_s \quad \text{or} \quad \frac{p_s}{\rho g} = h_s$$

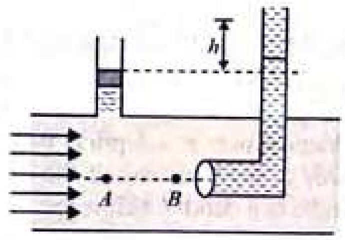
The height h_s is also called the static pressure head. When a tube bent at right angle is inserted in the fluid flow such that the open end faces against the direction of fluid flow as shown by tube B in the figure. At the open end of the tube the velocity of the fluid suddenly reduces to zero and the kinetic energy gets converted into pressure energy. The liquid in tube B rises to a higher level than that in tube A. The difference in the levels of liquid is a measure of velocity of the fluid. Tube B measures the dynamic pressure and the height h_d of the liquid in the tube is called the dynamic head, which is equal to the sum total of the static pressure head and velocity head.

That is, $h_d = h_s + \frac{v^2}{2g}$.

PITOT TUBE

Pitot tube is used to measure the speed of flow of a fluid. The cross section of tube at B is perpendicular to the direction of flow and tube is at rest, so that at B, velocity of fluid becomes zero, i.e., $V_B = 0$. Let V be the velocity of fluid at A and P_A and P_B are pressures at A and B. Then $P_B - P_A = h\rho g$, where ρ is density of liquid in vertical tubes.

For liquids: If points A and B are in the same horizontal line and area of is the same at A and B, gravitational head is the same and the pressure difference is due to difference in velocity. Applying Bernoulli's theorem at A and B, we have



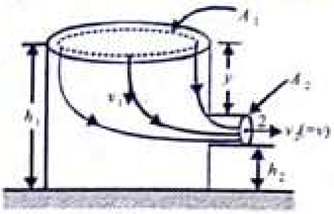
$$P_A + \frac{1}{2}\rho V^2 = P_B + 0$$

$$\Rightarrow \quad \frac{2(P_B - P_A)}{\rho} = V^2 \Rightarrow V = \sqrt{\frac{2(P_B - P_A)}{\rho}} \quad \Rightarrow V = \sqrt{2gh}$$

VELOCITY OF EFFLUX: TORRICELLI'S THEOREM

The liquid comes out of a hole made at a depth y. The areas of the base and hole are A_1 and A_2, respectively. Let us calculate the velocity of efflux.

Choose two points 1 and 2 at the free surface of liquid and at just outside the hole, respectively. Since the points 1 and 2 are exposed to atmosphere, $P_1 = P_2 = P_{atm}$. We have done this to get a mathematical advantage. However, you can take any other point inside the tube instead of taking at the free surface of the liquid. Equation of continuity gives



$$A_1 v_1 = A_2 v_2 \qquad \text{(i)}$$

$$P_{atm} + \frac{\rho v_1^2}{2} + \rho g h_1 = P_{atm} + \frac{\rho v_2^2}{2} + \rho g h_2$$

Substituting $h_1 - h_2 = y$, we have

$$v_2 = \sqrt{v_1^2 + 2gy} \qquad \text{(ii)}$$

Substituting $v_1 = (A_2/A_1)v_2$ from Eq. (i) in Eq. (ii), we have

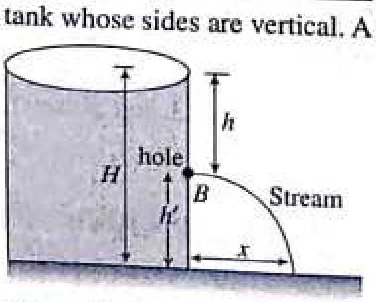
$$v_2 = \sqrt{\frac{2gy}{1-\left(\frac{A_2}{A_1}\right)^2}}$$

NOTE:

- If area of opening is much lesser than area of cross section of tank ($A_2 << A_1$), then velocity of efflux
  $$v = \sqrt{2gh}$$
- which is the same speed that an object would acquire in falling from rest through a distance h under gravity.
- The velocity of efflux is the velocity of escaping liquid relative to the container (but not necessarily relative to ground when the container moves).

HORIZONTAL RANGE OF THE ESCAPING LIQUID

Water stands at a depth H in a tank whose sides are vertical. A hole is made in one of the walls at a depth h below the water surface. Let container remains at rest.



When the liquid stream emerges out of the hole, it goes along a parabolic path. So time taken by water to fall through a height of $H - h$ is given as

$$H - h = 0 \times t + 1/2\, gt^2 \Rightarrow t = \sqrt{\frac{2(H-h)}{g}}$$

Horizontal range is given by

$$V \times t = \sqrt{2gh}\sqrt{\frac{2(H-h)}{g}} = \sqrt{4h(H-h)} = 2\sqrt{hh'}$$

Horizontal range is given by

$$x = \sqrt{4h(H-h)}$$

$$= \sqrt{4hH - 4h^2 + H^2 - H^2} = \sqrt{H^2 - (H^2 - 4hH + 4h^2)}$$

$$= \sqrt{H^2 - (2h - H)^2}$$

For the range to be maximum, $(2h - H)^2 = 0$

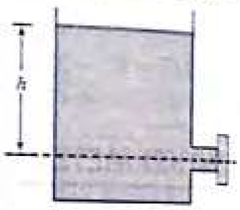
$\Rightarrow \quad 2h - H = 0 \Rightarrow h = H/2$

So the maximum range $x = 2\sqrt{hh'}$.

The formula $= 2\sqrt{hh'}$ tells us if we make two holes at equal vertical distances from top and bottom, both liquids jets will strike the same spot (but not simultaneously).

FORCE OF REACTION DUE TO EJECTION OF LIQUID

A cylindrical vessel has an opening of cross-sectional area 'a' near the bottom. A disc is held against the opening to prevent liquid of density ρ from coming out. If the height of the liquid above opening is h. Let us analyse the force on the disc in this situation.



The disc experiences a hydrostatic pressure from the liquid inside the vessel. Pressure at the level of the disc is

$$P_1 = P_{atm} + \rho g h$$

The air pressure on the outside of disc is $P_2 = P_{atm}$.

The net outward force $= (p_2 - p_1)a = \rho g h a$.

Now the disc is moved a short distance away in horizontal direction. The liquid comes out, strikes the disc inelastically and drops vertically downward. The water in this case will impart impulsive (inpact) force on the disc.

When the disc is moved away, the liquid moves out with speed $v = \sqrt{2gh}$.

The (mass per second), i.e, the rate of mass coming out of the opening is given by $dm/dt = \rho a v = \rho a\sqrt{2gh}$.

Momentum per second imparted by water rightward is given by

$$\frac{dm}{dt}v = (\rho a v)v = \rho a v^2 = 2\rho g h a$$

The change in momentum per second after striking the disc is

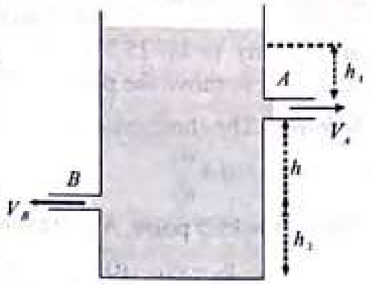
$$\Delta \vec{P} = \vec{P}_f - \vec{P}_i \Rightarrow 0 - (\rho a v^2) = -\rho a v^2 = -2\rho g h a$$

Taking the rightward direction as positive, the force on the liquid is towards the left and its reaction with disc is towards the right. The force obtained is twice the hydrostatic force. The force due to atmospheric pressure is cancelled out on the both sides.

NOTE: If the velocity of a liquid (or gas) of density ρ coming out through an opening of area of cross section a is v, then there will be a thrust force $F = \rho a v^2$ due to liquid coming out the opening. The direction of the thrust force will be just opposite to the velocity direction.

ILLUSTRATION 12.14 On the opposite sides of a wide vertical vessel filled with water, two identical holes are opened, each having cross-sectional area 'a'. The height difference between them is equal to h. Find the resultant force of reaction of water flowing out of vessel.

Solution. Let A and B be two openings, each of area 'a' the velocity of water coming out of opening are V_A and V_B, respectively. Volume of water emerging per second through A is aV_A.



Volume of water emerging per second through B is aV_B. Force of reaction due to water coming out at A is given by

F_A = Rate of change of momentum per second at A

$$(aVA\rho)V_A = a\rho V_A^2$$

Similarly, force of reaction at B is given by $F_B = a\rho V_B^2$

Therefore, net force on vessel is

$$F = F_B - F_A = a\rho\left(V_B^2 - V_A^2\right) \quad \text{(i)}$$

Now, applying Bernoulli's theorem at A and B, we get

$$p_a + \frac{1}{2}\rho V_A^2 + (h_2 + h)\rho g = p_0 + \frac{1}{2}\rho V_B^2 + \rho g h_2 \quad \text{(ii)}$$

where p_a is atmospheric pressure.

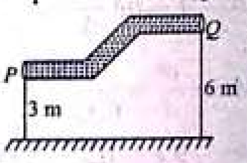
$$\therefore \quad V_B^2 - V_A^2 = 2gh$$

Substituting this value in Eq. (i), we get $F = a\rho 2gh$

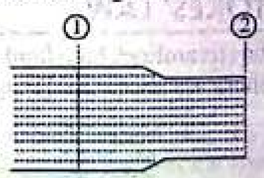
or $F = 2\rho gah$

CONCEPT APPLICATION EXERCISE 12.4

1. A non-viscous liquid of constant density 500 kg/m^3 flows in a variable cross-sectional tube. The area of cross section of the tube at two points P and Q at heights of 3 m and 6 m are 2×10^{-3} m^3 and 4×10^{-3} m^3, respectively. Find the work done per unit volume by the forces of gravity as the fluid flows from point P to Q.



2. A horizontal pipe of varying cross-sectional area carries water flowing at a constant rate. The pressure at sections (1) and (2) are 50 cm and 20 cm of Hg. If the velocity of section (1) is 5 m/s, what is the velocity of section (2). Also determine the ratio of areas at sections (1) and (2) (as shown in the figure.



3. The speed of flow past the lower surface of a wing of an aeroplane is 50 ms^{-1}. What speed of flow over the upper surface will give a dynamic lift of 1000 Pa? Density of air = 1.3 kg m^{-3}.
4. A gardener holds a pipe of inside cross-sectional area 3.60 cm^2 at a height of 1.50 m from ground. The opening at the nozzle of pipe has cross-sectional area 0.250 cm^2. Water velocity in the segment of the hose that lies on the ground is 50.0 cm/s.
   (a) What is the velocity of water leaving the nozzle?
   (b) What is the thrust force experienced by the gardener due to flow of water through nozzle.
   (c) What is the water pressure in the hose on the ground?
5. If water flows horizontally through a pipe of varying cross section and the pressure of water equals 10 cm of Hg at a point where the velocity of flow is 40 cm/s, what is the pressure at another point where the velocity of flow is 50 cm/s?

VISCOSITY

When a solid body slides over another solid body, a frictional force begins to act between them. This force opposes the relative motion of the bodies. Similarly, when a layer of a liquid slides over another layer of the same liquid, a frictional force acts between them which opposes the relative motion between the layers. This force is called 'internal frictional force'.

The property of the liquid by virtue of which it opposes the relative motion between its adjacent layers is known as 'viscosity'.

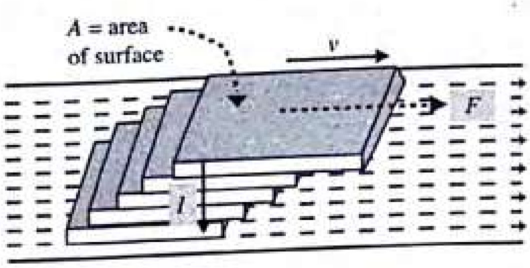
If we pour water and honey in separate funnels, water comes out readily from the hole in the funnel while honey takes enough time to do so. This is because honey is much more viscous than water. As honey tends to flow down due to gravity, the relative motion between its layers is opposed strongly.

Newton's Formula

The basic formula for the frictional (or viscous force) F in a liquid was first suggested by Newton. He observed that larger the area A of the surface of liquid considered, larger was the frictional force F; larger the gradient of velocity dv/dy across the layers of liquid, larger was the frictional force F. That is,

$$F \propto A\frac{dv}{dy}$$

Consider a fluid confined between two parallel plates, with the lower plate stationary and the upper plate moving with a velocity v_0, as shown in the figure. It has been proved experimentally that for all real fluids possessing any viscosity, the fluid particles in immediate contact with any solid surface move with the velocity of the surface itself. Thus, the topmost layer of the liquid moves with velocity v_0 and the bottommost layer remains stationary. And all the intermediate layers acquire velocities $0 < v < v_0$ as indicated by the lengths of the arrows in the figure.



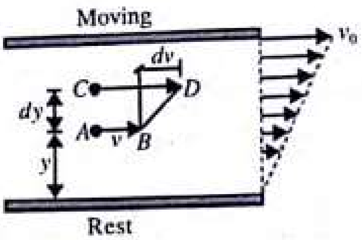


Figure shows a layer AB of the liquid at a distance y from stationary plate which is moving with a velocity v parallel to the plate. An adjacent layer CD at a distance $y + dy$ moves with a velocity $v + dv$. The velocity gradient between the two layers is $dv{\cdot}dy$. Due to relative motion between the adjacent layers of the liquid there exists a frictional resistance, which according to Newton is given by

$$F \propto A\frac{dv}{dy} \quad \text{or} \quad F = -\eta A\frac{dv}{dy} \qquad \text{(i)}$$

η is called coefficient of viscosity. Negative sign shows that the direction of viscous drag (F) is just opposite to the direction of the motion of the liquid.

It is important to note that solids resist relative motion between its adjacent layers to maintain their shapes. The resistance offered by solids in maintaining their shapes is measured in terms of their modulus of rigidity G.

NOTE: The coefficient of viscosity g is analogous to the modulus of rigidity of solids. The shear stress of fluids is proportional to the rate of shear strain and that in case of solids is proportional to the shear strain.

Units of Coefficient of Viscosity

From the definition, we have $\eta = \dfrac{F}{A(\Delta v_x/\Delta y)}$

$\therefore$ Dimensions of $\eta = \dfrac{[MLT^{-2}]}{[L^2][LT^{-1}/L]} = \dfrac{[MLT^{-2}]}{[L^2T^{-1}]} = [ML^{-1}T^{-1}]$

Its unit is kg/(m s).

In CGS system, the unit of coefficient of viscosity is dyn s cm^{-2} and is called poise. In SI the unit of coefficient of viscosity is N s m^{-2} and is called decapoise.

$$1 \text{ decapoise} = 1 \text{ N s m}^{-2} = (10^5 \text{ dyn}) \times \text{s} \times (10^2 \text{ cm})^{-2}$$
$$= 10 \text{ dyn s cm}^{-2} = 10 \text{ poise}$$

Effect of Temperature on Viscosity

Experiments show that η of a liquid decreases sharply with increase in its temperature and becomes zero at its boiling point. On the other hand, η of gases increase with temperature.

The viscosity of liquids decreases with increase in temperature and increases with the decrease in temperature. That is, $\eta \propto 1/\sqrt{T}$. On the other hand, the value of viscosity of gases increases with the increase in temperature and vice versa. That is, $\eta \propto \sqrt{T}$.

ILLUSTRATION 12.15 A plate of area 100 cm^2 is placed on the upper surface of castor oil, 2 mm thick. Taking the coefficient of viscosity to be 15.5 poise, calculate the horizontal force necessary to move the plate with a velocity 3 cm s^{-1}.

Solution. The (horizontal tangential) viscous force is given by

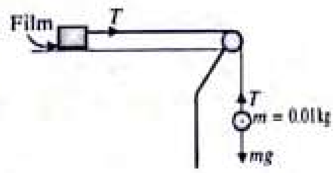
$$F = -\eta A\frac{dv}{dy}$$

Given η = 15.5 poise, A = 100 cm^2

$$\frac{dv}{dx} = \frac{v_2 - v_1}{x_2 - x_1} = \frac{(0-3)\text{cm/s}}{(2-0)\text{ mm}} = -\frac{3}{0.2}\text{s}^{-1} = -15\text{ s}^{-1}$$

$$F = -15.5 \times 100 \times (-15) = 2.235 \times 10^4 \text{ dyn} = 0.2325 \text{ N}$$

ILLUSTRATION 12.16 A metal plate of area 0.10 m^2 is connected to a 0.01 kg mass via a string that passes over an ideal pulley (considered to be frictionless), as shown in the figure. A liquid with a film thickness of 3.0 mm is placed between the plate and the table. When released, the plate moves to the right with a constant speed of 0.085 m s^{-1}. Find the coefficient of viscosity of the liquid.



Solution. As the metal plate moves with constant velocity,

$$mg - T = 0 \quad \Rightarrow T = mg$$

If F is the viscous force on the plate, then

$$F = T = mg = 0.01 \times 9.8 = 9.8 \times 10^{-2} \text{ N}$$

By Newton's law of viscosity,

$$F = \eta A\frac{dv}{dy}$$

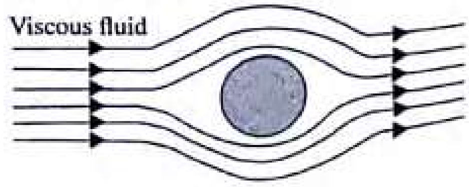
where $\dfrac{dv}{dy} = \dfrac{0.085}{0.3\times10^{-3}} = 28.3$ s

$$\Rightarrow \quad 9.8\times10^{-2} = \eta\times0.10\times28.3$$

$$\Rightarrow \quad \eta = 3.4\times10^{-3} \text{ N s/m}^2$$

STOKES' LAW

The streamlines for a fluid flowing slowly past a stationary solid sphere are shown in the figure.



When the sphere moves slowly as compared to the fluid, the pattern is similar but the streamlines then flow in such a way that the apparent motion of the fluid particles is as seen by someone on the moving sphere. In this latter case, it is known that the layer of fluid in contact with the sphere moves with it, thus creating a velocity gradient between this layer and other layers of fluid. Viscous forces are thereby brought into play and constitute the resistance experienced by the moving sphere. If we make the plausible assumption that the viscous retarding force F depends on the size of the body, the velocity with which it moves, the viscosity of the fluid and mass density of the fluid, then an expression can be derived for F by the method of dimensions. Thus,

$$F = k\eta^x v^y r^z$$

where x, y and z are the indices to be found and k is a dimensionless constant. The dimensional equation is

$$[MLT^{-2}] = [ML^{-1}T^{-1}]^x\,[LT^{-1}]^y[L]^z$$

Equating indices of M, L and T on both sides, we have

$$1 = x$$

$$1 = -x + y + z$$

$$-2 = -x - y$$

Solving, we get $x = 1$, $y = 1$ and $z = 1$. Hence $F = k\eta vr$

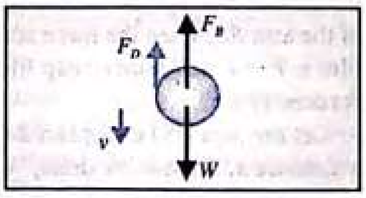
A detailed treatment, first done by Stokes, gives $k = 6\pi$ and so $F = 6\pi\eta vr$.

This expression, called Stokes' law, only holds for steady motion in a fluid of infinite extent (otherwise the walls and bottom of the vessel affect the resisting force).

TERMINAL VELOCITY

When a body is dropped in a viscous fluid, it is first accelerated and then its acceleration becomes zero and it attains a constant velocity called terminal velocity. Consider a small ball of radius r, which is gently dropped into the liquid of infinite extent. As the steel ball falls, it experiences three forces: the force of gravity W; the buoyant force F_B; the drag force F_D.

The free-body diagram of the ball is shown in the figure. If ρ_0 be the density of the body and ρ be the density of the liquid, then



Free-body diagram of a ball falling under gravity in a viscous liquid.

$$W = \frac{4}{3}\pi r^3 \rho_0 g$$

and $$F_B = \frac{4}{3}\pi r^3 \rho g$$

The magnitude of the drag force is $F_D = 6\pi\eta rv$.

As the ball falls under gravity, its net weight $W - F_B$ is opposed by liquid resistance F_D. Initially, the drag force is small and as the body gains velocity the drag force also increases and at a particular velocity, called the terminal velocity, the magnitude of drag force becomes equal to the effective weight of the body. At this moment, the net force on the ball becomes zero and it moves with a constant velocity. That is,

$$F_D = W - F_B$$

or $$6\pi\eta rv = \frac{4}{3}\pi r^3(\rho_0 - \rho)g$$

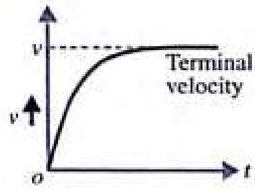
$$\Rightarrow \quad v = \frac{2}{9}\frac{r^2}{\eta}(\rho_0 - \rho)g \qquad \text{(i)}$$

If we plot the variation of velocity of the falling sphere with time, we obtain a graph as shown in the figure. Following points can be noted:

(1) Initially the velocity of the ball increases at a fast rate.

(2) The rate of increase of velocity decreases with time.

(3) Finally, the rate of increase of velocity becomes zero and the sphere acquires a terminal velocity.



Variation of velocity of sphere with time.

Important Results

Air bubble in water always goes up. It is because density of air (ρ) is less than the density of water (σ). So the terminal velocity for air bubble is negative, which implies that the air bubble will go up. Positive terminal velocity means the body will fall down.

ILLUSTRATION 12.17 Spherical particles of pollen are shaken up in water and allowed to settle. The depth of water is 2×10^{-2} m. What is the diameter of the largest particles remaining in suspension one hour later? Density of pollen $= 1.8 \times 10^3$ kg m^{-3}, viscosity of water $= 1 \times 10^{-2}$ poise and density of water $= 1 \times 10^{-5}$ kg m^{-3}.

Solution. Terminal velocity, $v = \dfrac{2r^2}{9}\dfrac{(\rho - \sigma)g}{\eta}$ (i)

But we know $v = \dfrac{s}{t}$

$$\therefore \quad \frac{s}{t} = \frac{2}{9}\frac{r^2(\rho - \sigma)g}{\eta} \Rightarrow r^2 = \frac{9s}{2t}\frac{\eta}{(\rho - \sigma)g}$$

Given $s = 2 \times 10^{-2}$ m, $t = 1$ h $= 3600$ s

$$\therefore \quad \eta = 1 \times 10^{-2}\ \text{poise} = 1 \times 10^{-3}\ \text{kg m}^{-1}\text{s}^{-1}$$

Substituting given values, we get

$$r^2 = \frac{9}{2} \times \frac{2 \times 10^{-2}}{3600} \times \frac{1 \times 10^{-3}}{(1.8 \times 10^3 - 1 \times 10^3) \times 10}$$

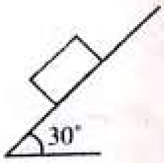
$$= \frac{9}{36} \times \frac{1}{8} \times 10^{-10} = \frac{1}{32} \times 10^{-10}$$

$$\therefore \quad r = \sqrt{\frac{100}{32}} \times 10^{-6}\ \text{m} = 1.77 \times 10^{-6}\ \text{m}$$

Diameter, $D = 2r = 2 \times 1.77\ \mu\text{m} = 3.54\ \mu\text{m}$

CONCEPT APPLICATION EXERCISE 12.5

1. A man is rowing a boat with a constant velocity 'v_0' in a river. The contact area of boat is 'A' and coefficient of viscosity is η. The depth of river is 'D'. Find the force required to row the boat.
2. A cubical block (of side 2 m) of mass 20 kg slides on inclined plane lubricated with the oil of viscosity $\eta = 10^{-1}$ poise with constant velocity of 10 m s^{-1}. Find out the thickness of the layer of liquid (take $g = 10 \text{ m s}^{-2}$).

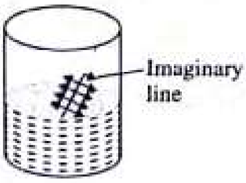


3. A drop of water of radius 0.0015 mm is falling in air. If the coefficient of viscosity of air is 1.8×10^{-5} kg/(m s), what will be the terminal velocity of the drop? Density of water = $1.0 \times 10^3 \text{ kg/m}^2$ and $g = 9.8$ N/kg. Density of air can be neglected.
4. A metallic sphere of radius 1.0×10^{-3} m and density $1.0 \times 10^4 \text{ kg/m}^3$ enters a tank of water, after a free fall through a distance of h in the earth's gravitational field. If its velocity remains unchanged after entering water, determine the value of h. Given: coefficient of viscosity of water = $1.0 \times 10^{-3} \text{ N s/m}^2$, $g = 10 \text{ m s}^{-12}$ and density of water = $1.0 \times 10^3 \text{ kg/m}^3$.
5. Find the minimum force required to drag a hard polythene plate of area 2 m^2 on a thin film of oil of thickness 0.25 cm and $\eta = 15$ poise. Assume the speed of the plate is 10 cm s^{-1}.
6. A force of 3.14 N is required to drag a sphere of radius 4 cm with a speed of 5 m s^{-1} in a medium in gravity free space. Find the coefficient of the viscosity of the medium.

SURFACE TENSION

Surface tension is a property of liquid at rest by virtue of which a liquid surface gets contracted to a minimum area and behaves like a stretched membrane.

Surface tension of a liquid is measured by force per unit length on either side of any imaginary line drawn tangentially over the liquid surface, force being normal to the imaginary line as shown in the figure. Mathematically, surface tension is defined as

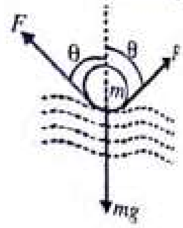


$$T = \frac{\text{Total force on either side of the imaginary line } (F)}{\text{Length of the line } (l)}$$

In CGS system the unit of surface tension is dyn/cm (dyn cm^{-1}) and in SI system its units is Nm^{-1}.

ILLUSTRATION 12.18 Find the maximum possible mass of a greased needle floating on water surface.

Solution. Let the mass of the needle be m. As the liquid surface is distorted, the surface tension forces acing on both sides of the needle make an angle θ, say, with vertical. Since the forces acting on the needle are F, F and mg, resolving the forces vertically for its equilibrium, we have



$$\sum F_y = F\cos\theta + F\cos\theta - mg = 0$$

This gives $m = \dfrac{2F\cos\theta}{g}$

where $F = Tl$

Then $m = \dfrac{2Tl\cos\theta}{g}$

For m to be maximum, $\cos\theta = 1$

Hence, $m_{\max} = \dfrac{2Tl}{g}$

Surface Energy

We know that the molecules on the liquid surface experience net downward force. So to bring a molecule from the interior of the liquid to the free surface, some work is required to be done against the intermolecular force of attraction, which will be stored as potential energy of the molecule on the surface. The potential energy of surface molecules per unit area of the surface is called surface energy.

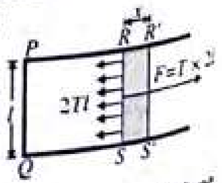
Unit of surface energy is erg cm^{-2} in CGS system and J m^{-2} in SI system. Dimensional formula of surface energy is $[ML^0T^{-2}]$. Surface energy depends on number of surfaces, e.g., a liquid drop is having one liquid air surface while bubble is having two liquid air surfaces.

Relation Between Surface Tension and Surface Energy

Consider a rectangular frame $PQSR$ of wire, whose arm RS can slide on the arms PR and QS. If this frame is dipped in a soap solution, then a soap film is produced in the frame $PQSR$ in the figure. Due to surface tension (T), the film exerts a force on the frame (towards the interior of the film). Let l be the length of the arm RS. Then the force acting on the arm RS towards the film is $F = T \times 2l$ (since soap film has two surfaces, the length is taken twice).

Let the arm RS be displaced to a new position $R'S'$ through a distance x. Then work done, $W = Fx = 2Tlx$

Increase in potential energy of the soap film is give by



$EA = 2Elx$ = work done in increasing the area (ΔW)

where E = surface energy of the soap film per unit area.

According to the law of conservation of energy, the work done must be equal to the increase in the potential energy.

i.e., $2Tlx = 2Elx$

or $T = E = \dfrac{\Delta W}{A}$

Thus, surface tension is numerically equal to surface energy or work done per unit increase of surface area.

ILLUSTRATION 12.19 A film of water is formed between two straight parallel wires each 10 cm long and at separation 0.5 cm. Calculate the work required to increase 1 mm distance between the wires. Surface tension of water = 72×10^{-3} N/m.

Solution. Initial surface area = 2 × length × separation

$$= 2 \times 10 \text{ cm} \times 0.5 \text{ cm}$$

$$= 10 \text{ cm}^2 = 10 \times 10^{-4} \text{ m}^2$$

Final surface area = $2 \times 10 \text{ cm} \times (0.5 + 0.1)$ cm

$$= 2 \times 10 \times 0.6 \text{ cm}^2 = 12 \times 10^{-4} \text{ m}^2$$

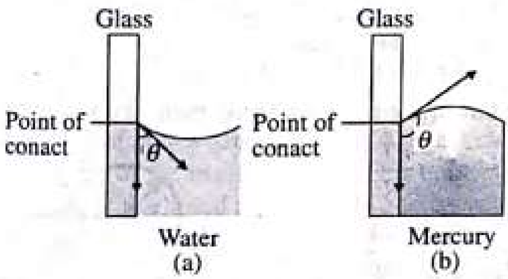
The required work,

$$W = T\,\Delta A = 72 \times 10^{-3} \times (12 \times 10^{-4} - 10 \times 10^{-4}) \text{ J}$$

$$= 72 \times 10^{-3} \times 2 \times 10^{-4} = 144 \times 10^{-7} \text{ J}$$

Angle of Contact

The angle which the tangent to the liquid surface at the point of contact makes with the solid surface inside the liquid is called angle of contact. Those liquids, which wet the walls of the container (say in case of water and glass), have meniscus concave upwards and their value of angle of contact is less than 90° (also called acute angle). However, those liquids, which do not wet the walls of the container (say in case of mercury and glass), have meniscus convex upwards and their value of angle of contact is greater than 90° (also called obtuse angle). The angle of contact of mercury with glass is about 140°, whereas the angle of contact of water with glass is about 8°. But, for pure water, the angle of contact θ with glass is taken as 0°.



Since the weight of the molecule is negligible as compared to F_1 and F_2, so it can be neglected. Thus, there are only two forces (F_1 and F_2) acting on the liquid molecules. These forces are inclined at an angle of 135°.

The resultant force represented by AC will depend upon the values of F_1 and F_2. Let the resultant force make an angle α with F_1.

EXCESS PRESSURE INSIDE A LIQUID DROP AND A BUBBLE

On the concave face of a curved surface there is always an excess pressure over the convex face of the surface. The magnitude of excess pressure can be obtained by studying the formation of air and soap bubbles.

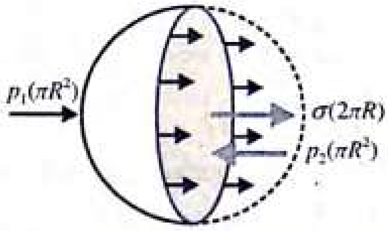
Excess Pressure in an Air Bubble in Liquid

Figure shows one-half cross section of an air bubble formed inside liquid. It is in equilibrium under the action of three forces:

(1) due to external pressure p_1

(2) due to internal pressure p_2

(3) due to surface tension of the liquid σ



The cross section of an air bubble of radius R.

If R is the radius of the air bubble, then the forces due to external and internal pressures are $p_1(\pi R^2)$ and $p_2(\pi R^2)$, respectively. Since the surface tension acts around the circumference of the bubble, therefore, the force of surface tension is $\sigma(2\pi R)$.

Thus, from the condition of equilibrium,

$$p_2(\pi R^2) = p_1(\pi R^2) + T(2\pi R)$$

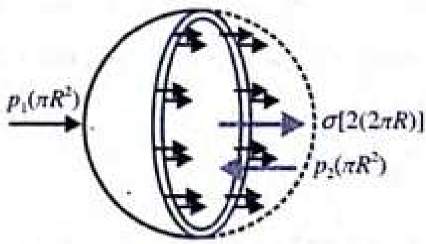
or $$p_2 - p_1 = \frac{2T}{R}$$

NOTE:

- A curved surface always maintains a pressure difference, which depends on the radius of the curved surface and surface tension of the liquid.
- The concave side of the surface always possesses greater pressure. If the angle of contact is zero, then the excess pressure is given by $\Delta p = 2T/R$.

Excess Pressure in a Soap Bubble

A soap bubble forms two liquid surfaces in contact with air, one inside the bubble and the other outside the bubble. Figure shows one-half cross section of the soap bubble. By considering its equilibrium, we get



The cross section of an air bubble of radius R

$$p_2(\pi R^2) = p_1(\pi R^2) + T[2(2\pi R)]$$

$$\Rightarrow \quad p_2 - p_1 = \frac{4T}{R}$$

Excess Pressure on Curved Surfaces in General

The pressure on the concave side (whatever be on its left or right) is always greater than the pressure on the convex side, such that

$$p_{\text{concave}} - p_{\text{convex}} = T\left(\frac{1}{R_1}+\frac{1}{R_2}\right)$$

where σ = surface tension.

This formula is same as what we derived earlier, i.e.,

$$p_i - p_0 = \frac{2T}{R} = T\left(\frac{1}{R}+\frac{1}{R}\right)$$

(1) For a single spherical surface, e.g. drops, cavities, etc.,

$R_1 = R_2 = R$(say)

Then $p_i - p_0 = T\left(\frac{1}{R}+\frac{1}{R}\right) = \frac{2T}{R}$

(2) For spherical film, e.g., soap bubble,

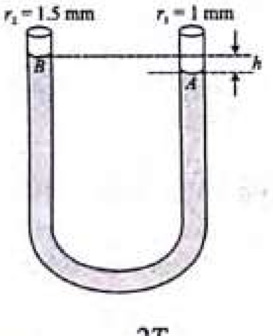
$$p_i - p_0 = (2T)\left(\frac{1}{R}+\frac{1}{R}\right) = \frac{4T}{R}$$

because it has two free surfaces.

(3) For a single cylindrical surface, $R_1 = R$, $R_2 = \infty$

$$\therefore \quad p_i - p_0 = (T)\left(\frac{1}{R}+\frac{1}{\infty}\right) = \frac{T}{R}$$

ILLUSTRATION 12.20 Calculate the difference (h) in water levels in two communicating capillary tubes of radius 1 mm and 1.5 mm. Surface tension of water = 0.07 Nm^{-1}.



Solution. Pressure at $A = p_0 + \frac{2T}{r_1}$

(Since pressure on concave side is greater than that on convex side)

Pressure at $B = p_0 - \frac{2T}{r_2}$

Therefore, pressure difference $= 2T\left(\frac{1}{r_1}-\frac{1}{r_2}\right)$

Let this pressure difference correspond to h units of the liquid. Then,

$$2T\left(\frac{1}{r_1}-\frac{1}{r_2}\right) = \rho g h \quad \Rightarrow h = \frac{2T}{\rho g}\left(\frac{1}{r_1}-\frac{1}{r_2}\right)$$

$$\therefore \quad h = \frac{2\times 0.07}{1000\times 9.8}\left(\frac{1}{1\times 10^{-3}}-\frac{1}{1.5\times 10^{-3}}\right) = 4.76\,\text{mm}$$

ILLUSTRATION 12.21 A vessel filled with air under pressure p_0 contains a soap bubble of diameter d. The air pressure have been reduced n-fold, and the bubble diameter increased r-fold isothermally. Find the surface tension of the soap-water solution.

Solution. For the air enclosed in the bubble we have

$$pV = nRT$$

$$\Rightarrow \quad \left(p_0 + \frac{8T}{d}\right)\frac{\pi}{6}d^3 = \left(\frac{p_0}{n}+\frac{8T}{rd}\right)\frac{\pi}{6}r^3 d^3$$

$$\Rightarrow \quad p_0 + \frac{8T}{d} = \frac{p_0 r^3}{n} + \frac{8Tr^2}{d}$$

$$\Rightarrow \quad p_0\left(1-\frac{r^3}{n}\right) = \frac{8T}{d}\left(r^2-1\right) \Rightarrow T = \frac{1}{8}p_0 d \times \frac{\left(1-\frac{r^3}{n}\right)}{(r^2-1)}$$

ILLUSTRATION 12.22 Two separate air bubbles (radii 0.002 cm and 0.004 m) formed of the same liquid (surface tension 0.07 N/m) come together to form a double bubble. Find the radius and the sense of curvature of the internal film surface common to both the bubbles.

Solution. Let R be the radius of curvature of common surface when bubbles A and B of radii R_A and R_B coalesce. The excess pressure in A and B are $4T{\cdot}R_A$ and $4T{\cdot}R_B$, respectively.

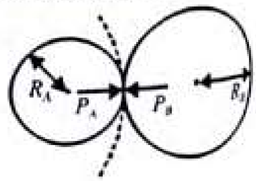
$$\therefore \quad p_A = \frac{4T}{R_A} \quad \text{and} \quad p_B = \frac{4T}{R_B}$$

If R is radius of common interface, then we must have

$$p_A - p_B = \frac{4T}{R}$$

or

$$\frac{4T}{R_A} - \frac{4T}{R_B} = \frac{4T}{R}$$



This gives

$$R = \frac{R_A R_B}{R_B - R_A} = \frac{0.002\times 0.004}{0.004-0.002} = 0.004\text{ m}$$

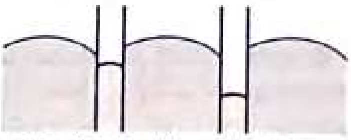
As the excess pressure is always towards concave surface and pressure in smaller bubble is greater than that in larger bubble, the common surface is concave towards the centre of the smaller bubble.

CAPILLARITY

If a narrow glass tube open at both ends is pushed in water as shown in the figure, water rises in the tube to a height above its surface. The narrower the tube, the greater is the height to which water rises. This phenomenon is known as capillarity.

When the same capillary tubes are placed in mercury, the liquid is depressed below the outside level. The depression increases as the diameter of the capillary tube decreases. A close observation of the capillary phenomenon reveals the following facts.

Capillary action with water. Narrower the tube, greater the height.



Capillary action with mercury. Narrower the tube, greater the depression in the tube.

The free surface (meniscus) of the liquid which rises in the capillary tube is concave upward. The meniscus of liquid which falls in the capillary tube is convex upward.

Wetting and Non-Wetting Liquids

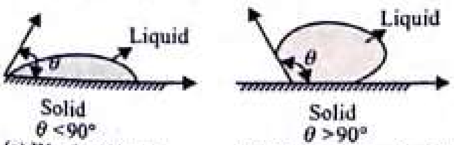
The liquids which rise in a capillary are called wetting liquids; and the liquids which fall in the capillary are called non-wetting liquids. The wetting and non-wetting action of a liquid can be explained in terms of the cohesive and adhesive forces.

Adhesion is the attractive force between the molecules of solids and liquids or between the molecules of two different liquids.

Cohesion is the attractive force among the molecules of the same liquid.

If the adhesive forces are stronger than the cohesive forces then the liquids wet the solid surface, as water wets the surface of glass. If the cohesive forces are stronger than the adhesive forces, then the liquids do not wet the solid surface, as mercury does not wet the surface of glass.

The wetting and non-wetting action of a liquid can also be explained in terms of the angle of contact. If a tangent is drawn on the meniscus of the liquid at the line of contact between the liquid and the surface, as shown in the figure, then the angle of contact is defined as the angle between the tangent and the solid surface measured through the liquid.

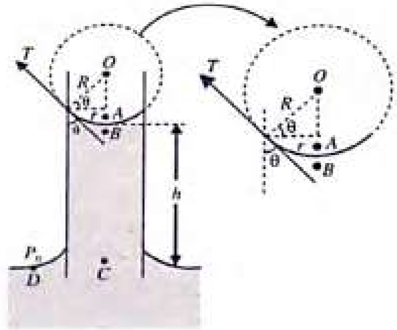


(a) Wetting liquid (b) Non-wetting liquid

If the angle of contact is acute, i.e., $\theta < 90°$, then the liquid wets the surface. If the angle of contact is obtuse, i.e., $\theta > 90°$, then the liquid does not wet the surface. The angle of contact between water and clean glass is zero, but when the glass is not clean the angle of contact may be about 8°.

Alternative method:

Let us take four points A, B, C and D as shown in the figure. A and B are the points just above and just below the meniscus, respectively.



Now, we have $P_A = P_B + \dfrac{2T}{R}$

where R = radius of curvature of liquid meniscus. Substituting $P_A = P_0$, we have

$$P_B = P_0 - \frac{2T}{R} \quad \text{(i)}$$

If C is the point at the bottom of the excess liquid column, we have

$$P_C = P_B + \rho g h$$

where h = height of the excess liquid column.

Substituting $P_C = P_D = P_0$, we have

$$P_B = P_0 - \rho g h \quad \text{(ii)}$$

Using Eqs. (i) and (ii), we have

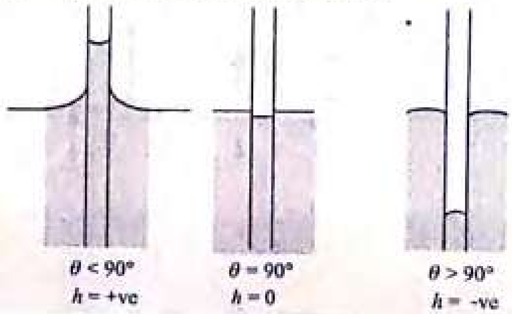
$$P_0 - \rho g h = P_0 - \frac{2T}{R}$$

This gives $h = \dfrac{2T}{\rho g R}$ where $R = \dfrac{r}{\cos\theta}$

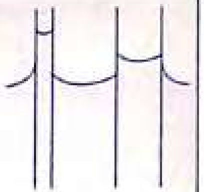
Then $h = \dfrac{2T\cos\theta}{\rho g r}$

Important Results

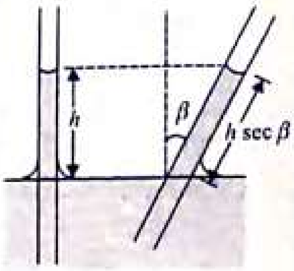
- h depends on surface tension T, angle of contact θ, radius of the tube, density ρ of liquid and acceleration due to gravity (or effective g). Hence the capillary action depends on the nature of liquid and solid (capillary tube) in contact, temperature of the surroundings.
- If $\theta < 90°$, h is positive (wetting) which signifies capillary rise and concave meniscus; if $\theta = 90°$, $h = 0$ (neither wetting nor non-wetting): plane meniscus; if $\theta > 90°$, h = negative (non-wetting) which signifies capillary fall and convex meniscus.



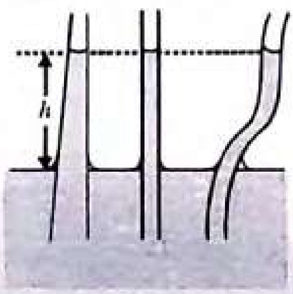
- Since T, ρ and θ are constant at a given temperature, for any given liquid and capillary tube, $hr = c$; this tells us that capillary rise (or fall) will be greater in thinner tubes and vice versa.



- Since T, ρ, θ, g and R are constant for a given set of capillary and liquid, we have h = constant. It means that if we change the angle β of orientation from vertical, the capillary rise h (or capillary fall) remains constant even though the length of the excess liquid in the tube increases from h to $h \sec \beta$.



- If the radius of the liquid meniscus remains constant, the weight (but not length) of the liquid column remains the same in capillary tubes of different shapes and sizes.



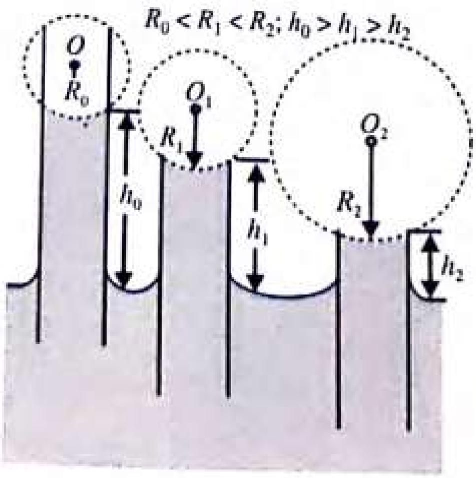
Rise of Liquid in a Capillary of Insufficient Length

The expression of capillary rise is given as

$$h = \frac{2T\cos\theta}{\rho g r}$$

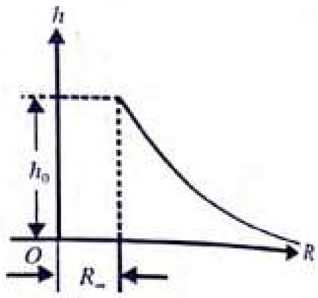
Substituting $r/\cos\theta = R$ (radius of curvature of the liquid meniscus), we have

$$hR = \frac{2T}{\rho g} = \text{Constant}$$



Since T, ρ and g are constant, we have $hR = C$ (constant) $= h_0R_0$ (say), where h = free height of the liquid and R = radius of curvature of free meniscus of liquid.

If we slowly push the capillary tube vertically down (into) the liquid, the height of the liquid column remains the same till the length of the tube above the liquid surface is equal to $2T \cos\theta/(\rho g r)(= h)$. Therefore, the liquid meniscus gets flatt-ened gradually by increasing its radius of curvature to obey the law hR = constant.



$h \propto \frac{1}{R}$ where R = radius of curvature of the liquid meniscus

It means that $hr = h_1r_1 = h_2r_2 = \cdots$

When the capillary tube just sinks, i.e., $h = 0$, we can see that the meniscus becomes flat, radius of curvature $r \to \infty$.

ILLUSTRATION 12.23 A vertical capillary with inside diameter 0.50 mm is submerged into water so that the length of its part emerging outside the water surface is equal to 25 mm. Find the radius of curvature of the meniscus. Surface tension of water is 73×10^{-3} N/m.

Solution. In the capillary tube, the water should rise to a height

$$h = \frac{2T}{r\rho g}$$

Here $T = 73 \times 10^{-3}$ N·m

$$r = \frac{0.50 \text{ mm}}{2} = 0.25 \times 10^{-3} \text{ m}$$

$$\rho = 10^3 \text{ kg/m}^3$$

$$\therefore \quad h = \frac{2 \times 73 \times 10^{-3}}{0.25 \times 10^{-3} \times 10^3 \times 9.8} = 59 \times 10^{-3} \text{ m} = 59 \text{ mm}$$

Now $h > h'$, i.e., length is outside water surface.
Therefore, radius of meniscus > radius of capillary r.
If R is the radius of meniscus, then we have

$$\frac{2T}{R} = h'\rho g$$

or $$R = \frac{2T}{h'\rho g}$$

Here $h' = 25 \text{ mm} = 25 \times 10^{-3}$ m

$$\therefore \quad R = \frac{2 \times 73 \times 10^{-3}}{25 \times 10^{-3} \times 10^3 \times 9.8} = 0.6 \times 10^{-3} \text{ m} = 0.6 \text{ mm}$$

CONCEPT APPLICATION EXERCISE 12.6

1. A mercury drop of radius R is sprayed into n droplets of equal size. Calculate the energy expanded if surface tension of mercury is T.

2. If a number of little droplets of water, each of radius r, coalesce to form a single drop of radius R, show that the rise in temperature will be given by

$$\frac{3T}{J}\left(\frac{1}{r}-\frac{1}{R}\right)$$

where T is the surface tension of water and J is the mechanical equivalent of heat.

3. A liquid of specific gravity 1.5 is observed to rise 3.0 cm in a capillary tube of diameter 0.50 mm and the liquid wets the surface of the tube. Calculate the excess pressure inside a spherical bubble of 1.0 cm diameter blown from the same liquid.

4. A drop of water of volume 0.05 cm^3 is pressed between two glass plates, as a consequence of which it spreads and occupies an area of 40 cm^2. If the surface tension of water is 70 dyn/cm, find the normal force required to separate out the two glass plates in newton.

5. A glass tube of circular cross section is closed at one end. This end is weighted and the tube floats vertically in water, heavy end down. How far below the water surface is the end of the tube? Given: outer radius of the tube is 0.14 cm, mass of weighted tube is 0.2 g, surface tension of water 73 dyn/cm and $g = 980$ cm s^{-2}.

6. If a 5 cm long capillary tube with 0.1 mm internal diameter, open at both ends, is slightly dipped in water having surface tension 75 dyn/cm, state whether: (i) water will rise halfway in the capillary, (ii) water will rise up to the upper end of capillary, (iii) water will overflow out of the upper end of capillary. Explain your answer.

SOLVED EXAMPLES

1. A hemispherical bowl just floats without sinking in a liquid of density 1.2 × 10^{3}kg/m^3. If the outer diameter and the density of the bowl are 1 m and 2 × 10^4 kg/m^3, respectively, then the inner diameter of the bowl will be
(a) 0.94 m (b) 0.97 m
(c) 0.98 m (d) 0.99 m

Sol. (c) Weight of the bowl = mg

$$= V\rho g = \frac{4}{3}\pi\left[\left(\frac{D}{2}\right)^3-\left(\frac{d}{2}\right)^3\right]\rho g$$

where D = Outer diameter
d = Inner diameter
ρ = Density of bowl

Weight of the liquid displaced by the bowl

$$V\sigma g = \frac{4}{3}\pi\left(\frac{D}{2}\right)^3\sigma g$$

where σ is the density of the liquid.

For floatation: $\frac{4}{3}\pi\left(\frac{D}{2}\right)^3\sigma g = \frac{4}{3}\pi\left[\left(\frac{D}{2}\right)^3-\left(\frac{d}{2}\right)^3\right]\rho g$

$$\Rightarrow \left(\frac{1}{2}\right)^3\times 1.2\times 10^3 = \left[\left(\frac{1}{2}\right)^3-\left(\frac{d}{2}\right)^3\right]2\times 10^4$$

By solving, we get $d = 0.98$ m.

2. A concrete sphere of radius R has a cavity of radius r which is packed with sawdust. The specific gravities of concrete and sawdust are respectively 2.4 and 0.3 for this sphere to float with its entire volume submerged under water. Ratio of mass of concrete to mass of sawdust will be
(a) 8 (b) 4
(c) 3 (d) Zero

Sol. (b) Let specific gravities of concrete and saw dust are ρ_1 and ρ_2, respectively.
According to principle of floatation weight of whole sphere = upthrust on the sphere

$$\frac{4}{3}\pi(R^3-r^3)\rho_1 g+\frac{4}{3}\pi r^3\rho_2 g = \frac{4}{3}\pi R^3\times 1\times g$$

$$\Rightarrow R^3\rho_1 - r^3\rho_1 + r^3\rho_2 = R^3$$

$$\Rightarrow R^3(\rho_1-1) = r^3(\rho_1-\rho_1)$$

$$\Rightarrow \frac{R^3}{r^3} = \frac{\rho_1-\rho_2}{\rho_1-1}$$

$$\Rightarrow \frac{R^3-r^3}{r^3} = \frac{\rho_1-\rho_2-\rho_1+1}{\rho_1-1}$$

$$\Rightarrow \frac{(R^3-r^3)\rho_1}{r^3\rho_2} = \left(\frac{1-\rho_2}{\rho_1-1}\right)\frac{\rho_1}{\rho_2}$$

$$\Rightarrow \frac{\text{Mass of concrete}}{\text{Mass of saw dust}} = \left(\frac{1-0.3}{2.4-1}\right)\times\frac{2.4}{0.3} = 4$$

3. A hollow sphere of volume V is floating on water surface with *half* immersed in it. What should be the minimum volume of water poured inside the sphere so that the sphere now sinks into the water
(a) $V/2$ (b) $V/3$ (c) $V/4$ (d) V

Sol. (a) When body (sphere) is half immersed, then
Upthrust = Weight of sphere

$$\Rightarrow \frac{V}{2}\times\rho_{\text{liq}}\times g = V\times\rho\times g \;\therefore\; \rho = \frac{\rho_{\text{liq}}}{2}$$

When body (sphere) is fully immersed then,
Upthrust = Wt. of sphere + Wt. of water poured in sphere

$$\Rightarrow V\times\rho_{\text{liq}}\times g = V\times\rho\times g + V'\times\rho_{\text{liq}}\times g$$

$$\Rightarrow V\times\rho_{\text{liq}} = \frac{V\times\rho_{\text{liq}}}{2}+V\times\rho_{\text{liq}} \;\Rightarrow V' = \frac{V}{2}$$

4. A ball whose density is 0.4 × 10^3 kg/m^3 falls into water from a height of 9 cm. To what depth does the ball sink?
(a) 9 cm (b) 6 cm
(c) 4.5 cm (d) 2.25 cm

Sol. (b) The velocity of ball before entering the water surface:

$v=\sqrt{2gh}=\sqrt{2g\times 9}$

When ball enters into water, due to the upthrust of water, the velocity of ball decreases (or retarded).

$$\text{Retardation, } a=\frac{\text{Apparent weight}}{\text{Mass of ball}}$$

$$=\frac{V(\rho-\sigma)g}{V\rho}=\left(\frac{\rho-\sigma}{\rho}\right)g=\left(\frac{0.4-1}{0.4}\right)\times g=-\frac{3}{2}g$$

If h be the depth upto which the ball sinks. Then

$$0-v^2=2\times\left(-\frac{3}{2}g\right)\times h\Rightarrow 2g\times 9=3gh$$

$\therefore h=6\text{ cm}$

5. A cylindrical tank has a hole of 1 cm^2 in its bottom. If the water is allowed to flow into the tank from a tube above it at the rate of 70 cm^3/s, then the maximum height up to which water can rise in the tank is

(a) 2.5 cm (b) 5 cm
(c) 10 cm (d) 0.25 cm

Sol. (a) The height of water in the tank becomes maximum when the volume of water flowing into the tank per second becomes equal to the volume flowing out per second.

Volume of water flowing out per second $=Av=A\sqrt{2gh}$ ...(i)
Volume of water flowing in per second = 70 cm^3/sec ...(ii)
From (i) and (ii), we get

$$A\sqrt{2gh}=70\Rightarrow 1\times\sqrt{2gh}=70$$

$$\Rightarrow 1\times\sqrt{2\times 980\times h}=70$$

$$\therefore\ h=\frac{4900}{1960}=2.5\text{cm}.$$

6. A square plate of 0.1 m side moves parallel to a second plate with a velocity of 0.1 m/s, both plates being immersed in water. If the viscous force is 0.002 N and the coefficient of viscosity is 0.01 poise, distance between the plates in m is

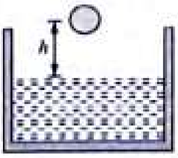
(a) 0.1 (b) 0.05
(c) 0.005 (d) 0.0005

Sol. (d) $A=(0.1)^2=0.01\text{m}^2$, $\eta=0.01$ poise $=0.001$ decapoise (M.K.S. unit), $dv=0.1$ m/s and $F=0.002$ N

$$F=\eta A\frac{dv}{dx}$$

$$\therefore\ dx=\frac{\eta A dv}{F}=\frac{0.001\times 0.01\times 0.1}{0.002}=0.0005\text{m}$$

7. A ball of radius r and density ρ falls freely under gravity through a distance h before entering water. Velocity of ball does not change even on entering water. If viscosity of water is η, the value of h is given by



(a) $\frac{2}{9}r^2\left(\frac{1-\rho}{\eta}\right)g$ (b) $\frac{2}{81}r^2\left(\frac{\rho-1}{\eta}\right)g$

(c) $\frac{2}{81}r^4\left(\frac{\rho-1}{\eta}\right)^2g$ (d) $\frac{2}{9}r^4\left(\frac{\rho-1}{\eta}\right)^2g$

Sol. (c) Velocity of ball when it strikes the water surface

$$v=\sqrt{2gh} \quad\text{...(i)}$$

Terminal velocity of ball inside the water

$$v=\frac{2}{9}r^2g\frac{(\rho-1)}{\eta} \quad\text{...(ii)}$$

Equating (i) and (ii), we get $\sqrt{2gh}=\frac{2}{9}\frac{r^2g}{\eta}(\rho-1)$

$$\Rightarrow h=\frac{2}{81}r^4\left(\frac{\rho-1}{\eta}\right)^2g$$

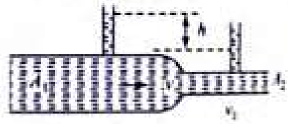
8. A liquid flows through a horizontal tube. The velocities of the liquid in the two sections, which have areas of cross-section A_1 and A_2, are v_1 and v_2 respectively. The difference in the levels of the liquid in the two vertical tubes is h. Following observations are taken

(i) The volume of the liquid flowing through the tube in unit time is A_1v_1

(ii) $v_2-v_1=\sqrt{2gh}$

(iii) $v_2^2-v_1^2=2gh$

(iv) The energy per unit mass of the liquid is the same in both sections of the tube



The correct observations is/are

(a) (i) and (ii) (b) (i), (ii) and (iii)
(c) (i) and (iv) (d) (i), (iii) and (iv)

Sol. (d) According to the equation of continuity, the volume of liquid flowing through the tube in unit time remains constant. i.e., $A_1v_1=A_2v_2$. Hence, option (a) is correct.
According to Bernoulli's theorem,

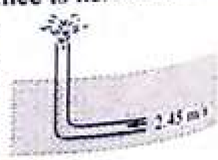
$$P_1+\frac{1}{2}\rho v_1^2=P_2+\frac{1}{2}\rho v_2^2$$

$$\Rightarrow P_1-P_2=\frac{1}{2}\rho\left(v_2^2-v_1^2\right)\Rightarrow h\rho g=\frac{1}{2}\rho\left(v_2^2-v_1^2\right)$$

$$\therefore\ v_2^2-v_1^2=2gh$$

Hence, option (c) is correct.
Also, according to Bernoulli's theorem, option (d) is correct.

9. An L-shaped tube with a small orifice is held in a water stream as shown in the figure. The upper end of the tube is 10.6 cm above the surface of water. What will be the height of the jet of water coming from the orifice? Velocity of water stream is 2.45 m/s.



(a) Zero (b) 20.0 cm
(c) 10.6 cm (d) 40.0 cm

Sol. (b) According to Bernoulli's theorem, $h = \frac{v^2}{2g}$

$$\Rightarrow h = \frac{(2.45)^2}{2\times10} = 0.314 = 31.4 \text{ cm}$$

$\therefore$ Height of jet coming from orifice $= 31.4 - 10.6$
$= 20.8$ cm

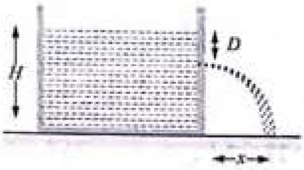
10. A tank is filled with water up to a height H. Water is allowed to come out of a hole P in one of the walls at a depth D below the surface of water. Express the horizontal distance x in terms of H and D

(a) $x = \sqrt{D(H-D)}$

(b) $x = \sqrt{\frac{D(H-D)}{2}}$

(c) $x = 2\sqrt{D(H-D)}$

(d) $x = 4\sqrt{D(H-D)}$



Sol. (c) Time taken by water to reach the bottom

$$t = \sqrt{\frac{2(H-D)}{g}}$$

and velocity of water coming out of hole, $v = \sqrt{2gD}$

$\therefore$ Horizontal distance covered $x = v \times t$

$$= \sqrt{2gD} \times \sqrt{\frac{2(H-D)}{g}} = 2\sqrt{D(H-D)}$$

11. A streamlined body falls through air from a height h on the surface of a liquid. If d and $D(D > d)$ represents the densities of the material of the body and liquid respectively, then the time after which the body will be instantaneously at rest, is

(a) $\sqrt{\frac{2h}{g}}$ (b) $\sqrt{\frac{2h}{g}\cdot\frac{D}{d}}$

(c) $\sqrt{\frac{2h}{g}\cdot\frac{d}{D}}$ (d) $\sqrt{\frac{2h}{g}}\left(\frac{d}{D-d}\right)$

Sol. (d) Upthrust – weight of body = apparent weight

$VDg - Vdg = Vda,$

where a = retardation of body

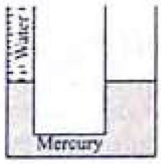
$$\therefore a = \left(\frac{D-d}{d}\right)g$$

The velocity gained after fall from h height in air, $v = \sqrt{2gh}$

Hence, time to come in rest,

$$t = \frac{v}{a} = \frac{\sqrt{2gh}\times d}{(D-d)g} = \sqrt{\frac{2h}{g}} \times \frac{d}{(D-d)}$$

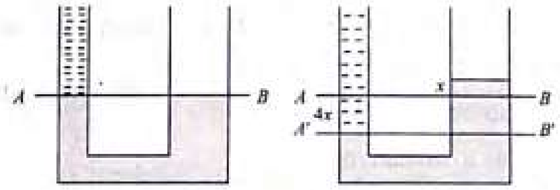
12. A U-tube in which the cross-sectional area of the limb on the left is one quarter, the limb on the right contains mercury (density 13.6 g/cm^3). The level of mercury in the narrow limb is at a distance of 36 cm from the upper end of the tube. What will be the rise in the level of mercury in the right limb if the left limb is filled to the top with water?



(a) 1.2 cm (b) 2.35 cm
(c) 0.56 cm (d) 0.8 cm

Sol. (c) If the rise of level in the right limb be x cm. the fall of level of mercury in left limb be $4x$ cm because the area of cross section of right limb is 4 times as that of left limb.

$\therefore$ Level of water in left limb is $(36 + 4x)$ cm.

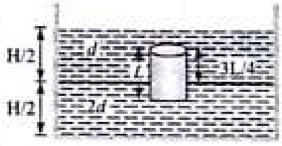


Now equating pressure at interface of Hg and water (at $A'B'$)

$$(36 + 4x) \times 1 \times g = 5x \times 13.6 \times g$$

By solving, we get $x = 0.56$ cm.

13. A homogeneous solid cylinder of length $L(L > H/2)$. Cross-sectional area $A/5$ is immersed such that it floats with its axis vertical at the liquid-liquid interface with length $L/4$ in the denser liquid as shown in the figure. The lower density liquid is open to atmosphere having pressure P_0. Then density D of solid is given by



(a) $\frac{5}{4}d$ (b) $\frac{4}{5}d$

(c) d (d) $\frac{d}{5}$

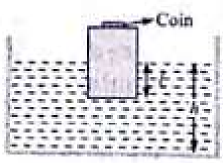
Sol. (a) Weight of cylinder = Upthrust due to both liquids

$$V \times D \times g = \left(\frac{A}{5}\times\frac{3}{4}L\right)\times d \times g + \left(\frac{A}{5}\times\frac{L}{4}\right)\times 2d \times g$$

$$\Rightarrow \left(\frac{A}{5}\times L\right)\times D \times g = \frac{A\times L\times d\times g}{4} \Rightarrow \frac{D}{5} = \frac{d}{4}$$

$$\therefore D = \frac{5}{4}d$$

14. A wooden block, with a coin placed on its top, floats in water as shown in the figure. the distance l and h are shown there. After some time, the coin falls into the water. Then



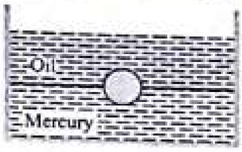
(a) l decreases and h increases
(b) l increases and h decreases
(c) Both l and h increase
(d) Both l and h decrease

Sol. (d) As the block moves up with the fall of coin, l decreases. Similarly, h will also decrease because when the coin is in water, it displaces water equal to its own volume only.

15. A vessel contains oil (density = 0.8 gm/cm^3) over mercury (density = 13.6 gm/cm^3). A homogeneous sphere floats with half of its volume immersed in mercury and the other half in oil. The density of the material of the sphere in gm/cm^3 is

(a) 3.3 (b) 6.4 (c) 7.2 (d) 12.8

Sol. (c) As the sphere floats in the liquid. Therefore, its weight will be equal to the upthrust force on it.



Weight of sphere $= \frac{4}{3}\pi R^3 \rho g$ (i)

Upthrust due to oil and mercury

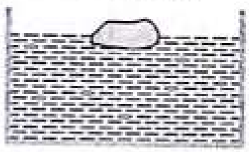
$$= \frac{2}{3}\pi R^3 \times \sigma_{oil} g + \frac{2}{3}\pi R^3 \sigma_{Hg} g \quad \text{(ii)}$$

Equating (i) and (ii)

$$\frac{4}{3}\pi R^3 \rho g = \frac{2}{3}\pi R^3 \times 0.8g + \frac{2}{3}\pi R^3 \times 13.6\, g$$

$$\Rightarrow 2\rho = 0.8 + 13.6 = 14.4 \Rightarrow \rho = 7.2$$

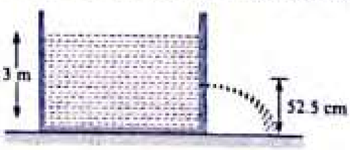
16. A body floats in a liquid contained in a beaker. The whole system as shown falls freely under gravity. The upthrust on the body due to the liquid is



(a) Zero
(b) Equal to the weight of the liquid displaced
(c) Equal to the weight of the body in air
(d) Equal to the weight of the immersed position of the body

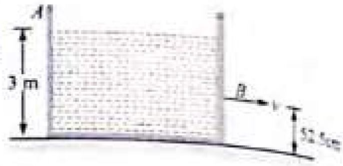
Sol. (a) Upthrust $= V\rho_{\text{liquid}}(g - a)$
where a = downward acceleration and
V = volume of liquid displaced
But for free fall, $a = g \Rightarrow$ Upthrust = 0

17. Water is filled in a cylindrical container to a height of 3 m. The ratio of the cross-sectional area of the orifice and the beaker is 0.1. The square of the speed of the liquid coming out from the orifice is (g = 10 m/s^2)



(a) 50 m^2/s^2 (b) 50.5 m^2/s^2
(c) 51 m^2/s^2 (d) 52 m^2/s^2

Sol. (a) Let A = cross-section of tank
a = cross-section hole
V = velocity with which level decreases
v = velocity of efflux



From equation of continuity,

$$av = AV \Rightarrow V = \frac{av}{A}$$

By using Bernoulli's theorem for energy per unit volume
Energy per unit volume at point A = Energy per unit volume at point B

$$P + \rho gh + \frac{1}{2}\rho V^2 = P + 0 + \frac{1}{2}\rho v^2$$

$$\Rightarrow v^2 = \frac{2gh}{1-\left(\frac{a}{A}\right)^2} = \frac{2\times 10\times(3-0.525)}{1-(0.1)^2} = 50(\text{m/s})^2$$

18. A large open tank has two holes in the wall. One is a square hole of side L at a depth y from the top and the other is a circular hole of radius R at a depth $4y$ from the top. When the tank is completely filled with water, the quantities of water flowing out per second from both the holes are the same. Then R is equal to

(a) $2\pi L$ (b) $\frac{L}{\sqrt{2\pi}}$
(c) L (d) $\frac{L}{2\pi}$

Sol. (b) Velocity of efflux when the hole is at depth h,

$$v = \sqrt{2gh}$$

Rate of flow of water from square hole

$$Q_1 = a_1 v_1 = L^2\sqrt{2gy}$$

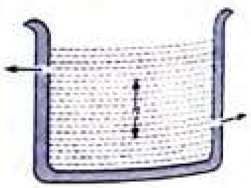
Rate of flow of water from circular hole

$$Q_2 = a_2 v_2 = \pi R^2 \sqrt{2g(4y)}$$

According to problem, $Q_1 = Q_2$

$$\Rightarrow L^2\sqrt{2gy} = \pi R^2\sqrt{2g(4y)} \Rightarrow R = \frac{L}{\sqrt{2\pi}}$$

19. There are two identical small holes of area of cross-section a on the opposite sides of a tank containing a liquid of density ρ. The difference in height between the holes is h. Tank is resting on a smooth horizontal surface. Horizontal force which will has to be applied on the tank to keep it in equilibrium is

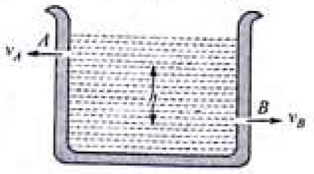


(a) $gh\rho a$ (b) $\frac{2gh}{\rho a}$
(c) $2\rho agh$ (d) $\frac{\rho gh}{a}$

Sol. (c) Net force (reaction) $= F = F_B - F_A = \dfrac{dp_B}{dt} - \dfrac{dp_A}{dt}$

$= av_B\rho \times v_B - av_A\rho \times v_A$

$\therefore\ F = a\rho\left(v_B^2 - v_A^2\right)$ ...(i)



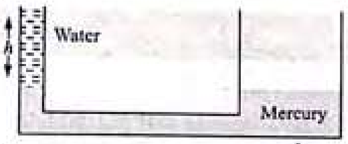
According to Bernoulli's theorem

$$p_A + \frac{1}{2}\rho v_A^2 + \rho gh = p_B + \frac{1}{2}\rho v_B^2 + 0$$

$$\Rightarrow \frac{1}{2}\rho\left(v_B^2 - v_A^2\right) = \rho gh \Rightarrow v_B^2 - v_A^2 = 2gh$$

From equation (i), $F = 2a\rho gh$

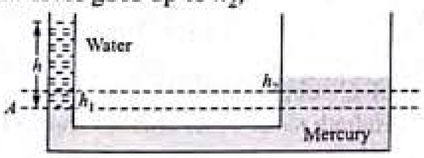
20. Two communicating vessels contain mercury. The diameter of one vessel is n times larger than the diameter of the other. A column of water of height h is poured into the left vessel. The mercury level will rise in the right-hand vessel (s = relative density of mercury and ρ = density of water) by



(a) $\dfrac{n^2h}{(n+1)^2 s}$ (b) $\dfrac{h}{(n^2+1)s}$

(c) $\dfrac{h}{(n+1)^2 s}$ (d) $\dfrac{h}{n^2 s}$

Sol. (b) If the level in narrow tube goes down by h_1, then in wider tube the level goes up to h_2,



Now, $\pi r^2 h_1 = \pi(nr)^2 h_2 \Rightarrow h_1 = n^2 h_2$

Now, pressure at point A = pressure at point B

$$h\rho g = (h_1 + h_2)\rho' g$$

$$\Rightarrow h = (n^2h_2 + h_2)sg \left(\text{As } s = \frac{\rho'}{\rho}\right) \Rightarrow h_2 = \frac{h}{(n^2+1)s}$$

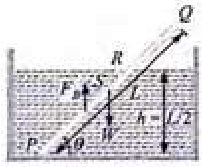
21. A uniform rod of density ρ is placed in a wide tank containing a liquid of density $\rho_0 (\rho_0 > \rho)$. The depth of liquid in the tank is half the length of the rod. The rod is in equilibrium, with its lower end resting on the bottom of the tank. In this position the rod makes an angle θ with the horizontal

(a) $\sin\theta = \dfrac{1}{2}\sqrt{\rho_0/\rho}$ (b) $\sin\theta = \dfrac{1}{2}\cdot\dfrac{\rho_0}{\rho}$

(c) $\sin\theta = \sqrt{\rho/\rho_0}$ (d) $\sin\theta = \rho_0/\rho$

Sol. (a) Let $L = PQ$ = length of rod

$\therefore\ SP = SQ = \dfrac{L}{2}$



Weight of rod, $W = Al\rho g$, acting At point S

And force of buoyancy,

$F_B = Al\rho_0 g$, $[l = PR]$

which acts at mid-point of PR.

For rotational equilibrium,

$$Al\rho_0 g \times \frac{l}{2}\cos\theta = AL\rho g \times \frac{L}{2}\cos\theta$$

$$\Rightarrow \frac{l^2}{L^2} = \frac{\rho}{\rho_0} \Rightarrow \frac{l}{L} = \sqrt{\frac{\rho}{\rho_0}}$$

From figure, $\sin\theta = \dfrac{h}{l} = \dfrac{L}{2l} = \dfrac{1}{2}\sqrt{\dfrac{\rho_0}{\rho}}$

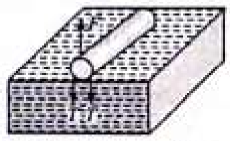
22. The maximum force, in addition to the weight required to pull a wire of 5.0 cm long from the surface of water at temperature 20°C is 728 dynes. The surface tension of water is

(a) 7.28 N/cm (b) 7.28 dyne/cm

(c) 72.8 dyne/cm (d) 7.28×10^2 dyne/cm

Sol. (c) $T = \dfrac{F}{2l} = \dfrac{728}{2 \times 5}$

$\therefore\ T = 72.8$ dyne/cm



23. A thin metal disc of radius r floats on water surface and bends the surface downwards along the perimeter making an angle θ with vertical edge of the disc. If the disc displaces a weight of water W and surface tension of water is T, then the weight of metal disc is

(a) $2\pi rT + W$ (b) $2\pi rT\cos\theta - W$

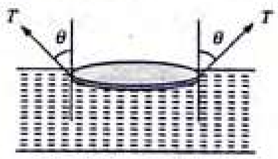
(c) $2\pi rT\cos\theta + W$ (d) $W - 2\pi rT\cos\theta$

Sol. (c) Weight of metal disc = total upward force

= upthrust force + force due to surface tension

= weight of displaced water + $T\cos\theta\,(2\pi r)$

$= W + 2\pi rT\cos\theta$

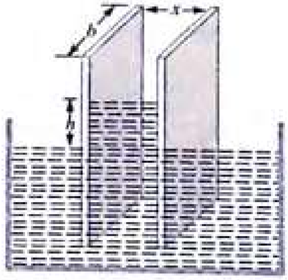


24. Two parallel glass plates are dipped partly in the liquid of density 'd' keeping them vertical. If the distance between the plates is 'x', surface tension for liquids is T and angle of contact is θ, then rise of liquid between the plates due to capillary will be

(a) $\dfrac{T\cos\theta}{xd}$ (b) $\dfrac{2T\cos\theta}{xdg}$

(c) $\dfrac{2T}{xdg\cos\theta}$ (d) $\dfrac{T\cos\theta}{xdg}$

Sol. (b) Let the width of each plate is b and due to surface tension, liquid will rise upto height h. Then upward force due to surface tension $= 2Tb\cos\theta$ ...(i)



Weight of the liquid that rises in between the plates

$= Vdg = (bxh)dg$ ...(ii)

Equating (i) and (ii), we get $2T\cos\theta = bxhdg$

$$h = \frac{2T\cos\theta}{xdg}$$

25. A soap bubble of radius R is blown. After heating the solution a second bubble of radius $2R$ is blown. The work required to blow the second bubble in comparison to that required for the first bubble is
(a) Double
(b) Slightly less than double
(c) Slightly less than four times
(d) Slightly more than four times

Sol. (c) Work done to form a bubble of radius R

$W_1 = 8\pi R^2 T_1$

Work done to form a bubble of radius $2R$

$W_2 = 8\pi(2R)^2 T_2 = 32\,\pi R^2 T_2 \;\therefore\; \frac{W_1}{W_2} = \frac{T_1}{4T_2}$

If surface tension of soap solution is same, then

$W_2 = 4W_1$

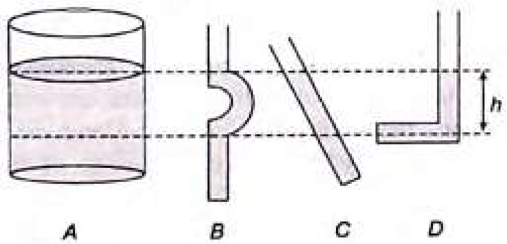
But in the problem the temperaturew of solution is increased. So its surface tension decreases.

$\therefore\; W_2 < 4W_1$

EXERCISES

Fluid Statics, Buoyancy and Floatation

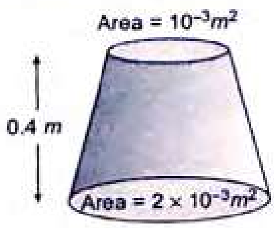
1. Figure shows four containers of olive oil. The pressure at depth h is



(a) least in B and C both (b) greatest in A
(c) greatest in D (d) equal in all the containers

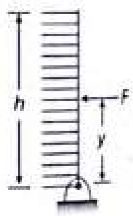
2. An isosceles triangular plates of base 3 m and altitude 3 m is immersed in oil vertically with its base coinciding with the free surface of the oil of relative density 0.8. Determine the total thrust.
(a) 24 kN (b) 48 kN
(c) 36 kN (d) None of these

3. A uniformly tapering vessel is filled with a liquid of density 900 kg/m^3. The force that acts on the base of the vessel due to the liquid is ($g = 10$ ms^{-2})



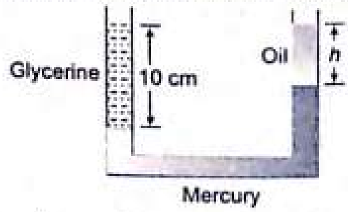
(a) 3.6 N (b) 7.2 N
(c) 9.0 N (d) 14.4 N

4. A smooth gate is kept in equilibrium by applying a horizontal force. What is the value of y so that no horizontal reaction force acts at the pivot?



(a) $\frac{h}{3}$ (b) $\frac{h}{6}$
(c) $\frac{2h}{3}$ (d) zero

5. A vertical U-tube of uniform cross-section contains mercury in both sides of its arms as shown below.

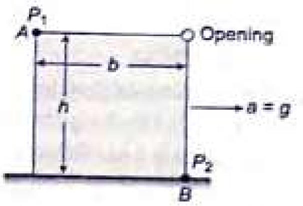


Gylcerine column of 10 cm is introduced into one of its arms. Oil of density 0.8 g/cc is poured into the other arm until the upper surface of the oil and glycerine are at the same horizontal level.

[$\rho_{Hg} = 13.6$ g/cc, $\rho_{glycerine} = 1.3$ g/cc]

The length of oil column is
(a) 10.4 cm (b) 8.2 cm
(c) 7.2 cm (d) 9.6 cm

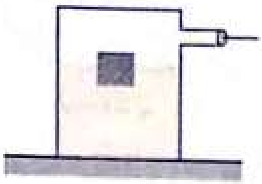
6. A closed rectangular vessel completely filled with a liquid of density ρ moves with an acceleration $a = g$. The value of the pressure difference at point A and B i.e., $(P_1 - P_2)$ is



(a) $\rho g(b-h)$ (b) $\rho gh/2$

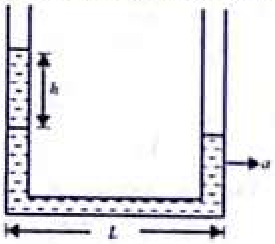
(c) ρgh (d) $\dfrac{\rho g(b+h)}{2}$

7. A block of wood is floating in water in a closed vessel as shown in the figure. The vessel is connected to an air pump. When more air is pushed into the vessel, the block of wood floats with (neglect compressibility of water)



(a) larger part in the water
(b) smaller part in the water
(c) same part in the water
(d) at some instant it will sink

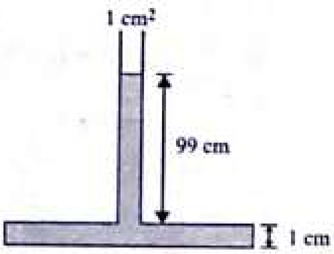
8. When at rest, a liquid stands at the same level in the tubes as shown in the figure. But as indicated, a height difference h occurs when the system is given an acceleration a towards the right. Then h is equal to



(a) $\dfrac{aL}{2g}$ (b) $\dfrac{gL}{2a}$

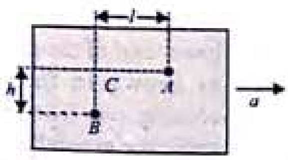
(c) $\dfrac{gL}{a}$ (d) $\dfrac{aL}{g}$

9. A tube 1 cm^2 in cross section is attached to the top of a vessel 1 cm high and of cross section 100 cm^2. Water is poured into the system filling it to a depth of 100 cm above the bottom of the vessel as shown in the figure. Take $g = 10\ m\,s^{-2}$. Find the correct statement.



(a) The force exerted by water against the bottom of the vessel is 100 N.
(b) The weight of water in the system is 1.99 N.
(c) Both (a) and (b) are correct.
(d) Neither (a) nor (b) is correct.

10. A sealed tank containing a liquid of density ρ moves with horizontal acceleration a as shown in the figure. The difference in pressure between two points A and B will be



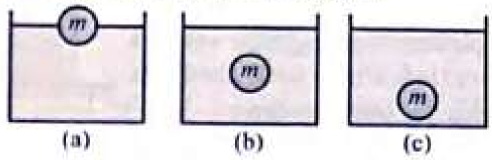
(a) $h\rho g$ (b) $l\rho g$

(c) $h\rho g - l\rho a$ (d) $h\rho g + l\rho a$

11. Water rises to a height of 2 cm in a capillary tube. If the tube is tilted 60° from the vertical, water will rise in the tube to a length of.

(a) 4.0 cm (b) 2.0 cm
(c) 1.0 cm (d) water will not rise at all

12. Three identical vessels A, B and C contain same quantity of liquid. In each vessel balls of different densities but same masses are placed. In vessel A, the ball is partly submerged; in vessel B, the ball is completely submerged but floating and in vessel C, the ball has sunk to the base. If F_A, F_B and F_C are the total forces acting on the base of vessels A, B and C, respectively, then



(a) $F_A = F_B = F_C$ (b) $F_A < F_B < F_C$
(c) $F_A = F_B < F_C$ (d) $F_A < F_B < F_C$

13. An ornament weighing 36 g in air weighs only 34 g in water. Assuming that some copper is mixed with gold to prepare the ornament, find the amount of copper in it. Specific gravity of gold is 19.3 and that of copper is 8.9.
(a) 2.2 g (b) 4.4 g (c) 1.1 g (d) 3.6 g

14. We have two different liquids A and B whose relative densities are 0.75 and 1.0, respectively. If we dip solid objects P and Q having relative densities 0.6 and 0.9 in these liquids, then
(a) P floats in A and Q sinks in B
(b) P sinks in A and Q floats in B
(c) P floats in B and Q sinks in A
(d) P sinks in B and Q floats in A

15. A solid uniform ball of volume V floats on the interface of two immiscible liquids (see the figure). The specific gravity of the upper liquid is ρ_1 and that of lower one is ρ_2 and the specific gravity of ball is ρ ($\rho_1 < \rho < \rho_2$). The fraction of the volume of the ball in the upper liquid is

(a) $\dfrac{\rho_2}{\rho_1}$ (b) $\dfrac{\rho_2-\rho}{\rho_2-\rho_1}$

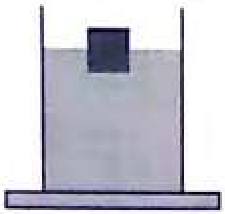
(c) $\dfrac{\rho-\rho_1}{\rho_2-\rho_1}$ (d) $\dfrac{\rho_1}{\rho_2}$

16. A beaker containing water is placed on the platform of a spring balance. The balance reads 1.5 kg. A stone of mass 0.5 kg and density $10^4\ kg/m^3$ is immersed in water without touching the walls of the beaker. What will be the balance reading now?
(a) 2 kg (b) 2.5 kg (c) 1 kg (d) 3 kg

17. A block of silver of mass 4 kg hanging from a string is immersed in a liquid of relative density 0.72. If relative density of silver is 10, then tension in the string will be
(a) 37.12 N (b) 42 N
(c) 73 N (d) 21 N

18. A vessel contains oil (density = 0.8 g/cm^3) over mercury (density = 13.6 g/cm^3). A uniform sphere floats with half its volume immersed in mercury and the other half in oil. The density of the material of sphere in g/cm^3 is
(a) 3.3 (b) 6.4 (c) 7.2 (d) 12.8

19. A cylindrical block is floating (partially submerged) in a vessel containing water. Initially, the platform on which the vessel is mounted is at rest. Now the platform along with the vessel is allowed to fall freely under gravity. As a result, the buoyancy force

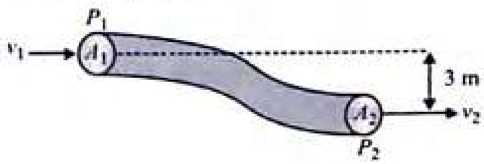


(a) becomes zero (b) decreases
(c) increases (d) information is insufficient

20. An iceberg is floating partially immersed in sea water. The density of sea water is 1.03 g cm^{-3} and that of ice is 0.92 g cm^{-3}. The approximate percentage of total volume of iceberg above the level of sea water is
(a) 8 (b) 11
(c) 34 (d) 89

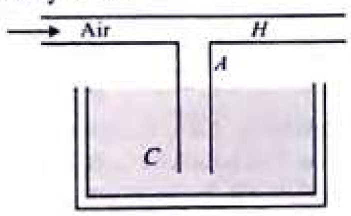
Fluid Dynamics

21. An ideal fluid flows in the pipe as shown in the figure. The pressure in the fluid at the bottom P_2 is the same as it is at the top P_1. If the velocity of the top v_1 = 2 m/s. Then the ratio of areas A_1:A_2 is



(a) 2:1 (b) 4:1
(c) 8:1 (d) 4:3

22. Figure shows a capillary tube C dipped in a liquid that wets it. The liquid rises to a point A. If we blow air through the horizontal tube H, what will happen to the liquid column in the capillary tube?

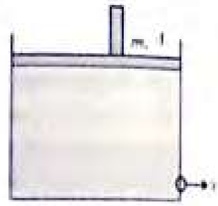


(a) Level will rise above A
(b) Level will fall below A
(c) Level will remain at A
(d) It is difficult to predict

23. A tank is filled with water of density 10^3 kg/m^3 and oil of density 9×10^3 kg/m^3. The height of water layer is 1 m and that of the oil layer is 4 m. The velocity of efflux from an opening in the bottom of the tank is
(a) $\sqrt{85}$ m/s (b) $\sqrt{88}$ m/s
(c) $\sqrt{92}$ m/s (d) $\sqrt{98}$ m/s

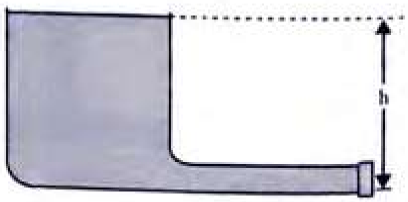
24. A hole is made at the bottom of a tank filled with water (density = 10^3 kg/m^3). If the total pressure at the bottom of the tank is 3 atm (1 atm = 10^5 N/m^2), then the velocity of efflux is
(a) $\sqrt{400}$ m/s (b) $\sqrt{200}$ m/s
(c) $\sqrt{600}$ m/s (d) $\sqrt{500}$ m/s

25. A cylindrical vessel contains a liquid of density ρ up to height h. The liquid is closed by a piston of mass m and area of cross section A. There is a small hole at the bottom of the vessel. The speed v with which the liquid comes out of the hole is



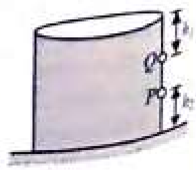
(a) $\sqrt{2gh}$ (b) $\sqrt{2\left(gh+\frac{mg}{\rho A}\right)}$
(c) $\sqrt{2\left(gh+\frac{mg}{A}\right)}$ (d) $\sqrt{2gh+\frac{mg}{A}}$

26. The opening near the bottom of the vessel shown in the figure has an area A. A disc is held against the opening to keep the liquid from running out. Let F_1 be the net force on the disc applied by liquid and air in this case. Now the disc is moved away from the opening a short distance. The liquid comes out and strikes the disc inelastically. Let F_2 be the force exerted by the liquid in this condition. Then F_1/F_2 is



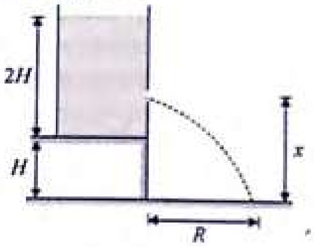
(a) $\frac{1}{2}$ (b) 1 (c) $\frac{2}{1}$ (d) $\frac{1}{4}$

27. In a cylindrical water tank there are two small holes Q and P on the wall at a depth of h_1 from the upper level of water and at a height of h_2 from the lower end of the tank, respectively, as shown in the figure. Water coming out from both the holes strike the ground at the same point. The ratio of h_1 and h_2 is



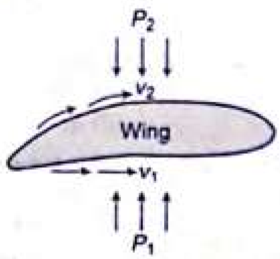
(a) 1 (b) 2
(c) >1 (d) <1

28. A tank is filled up to a height $2H$ with a liquid and is placed on a platform of height H from the ground. The distance x from the ground where a small hole is punched to get the maximum range R is



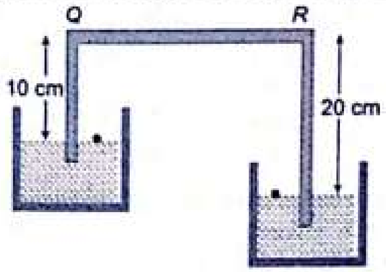
(a) H (b) $1.25H$
(c) $1.5H$ (d) $2H$

29. The speed of flow past the lower surface of a wing of an aeroplane is 50 ms^{-1}. What speed of flow over the upper surface will give a dynamic lift of 1000 Pa? Density of air = 1.3 kg m^{-3}.



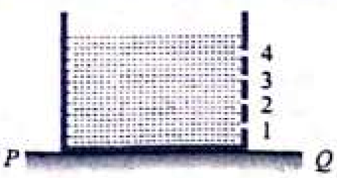
(a) 25.55 m/s (b) 63.55 m/s
(c) 13.25 m/s (d) None

30. A siphon in use is demonstrated in the following figure. The density of the liquid flowing in siphon is 1.5 gm/cc. The pressure difference between the point P and S will be



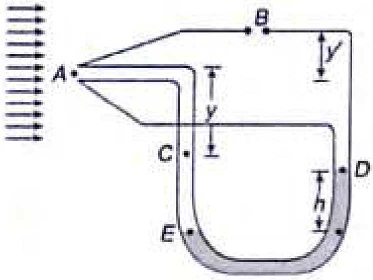
(a) 10^5 N/m (b) 2×10^5 N/m
(c) Zero (d) Infinity

31. A cylindrical vessel of 90 cm height is kept filled up to the brim. It has four holes 1, 2, 3 and 4 which are respectively at heights of 20 cm, 30 cm, 45 cm and 50 cm from the horizontal floor PQ. The water falling at the maximum horizontal distance from the vessel comes from



(a) Hole number 4 (b) Hole number 3
(c) Hole number 2 (d) Hole number 1

32. A Pitot tube is shown in figure. Wind blows in the direction shown. Air at inlet A is brought to rest, whereas its speed just outside of opening B is unchanged. The U tube contains mercury of density ρ_m. Find the speed of wind with respect to Pitot tube. Neglect the height difference between A and B and take the density of air as ρ_a.



(a) $\sqrt{\dfrac{2(\rho_m+\rho_a)gh}{\rho_a}}$ (b) $\sqrt{\dfrac{2(\rho_m-\rho_a)gh}{\rho_a}}$

(c) $\sqrt{\dfrac{(\rho_m-\rho_a)gh}{\rho_a}}$ (d) $\sqrt{\dfrac{(\rho_m+\rho_a)gh}{\rho_a}}$

33. A water tank of height 10 m, completely filled with water is placed on a level ground. It has two holes one at 3 m and the other at 7 m form its base. The water ejecting from
(a) both the holes will fall at the same spot
(b) upper hole will fall farther than that from the lower hole
(c) upper hole will fall closer then that from the lower hole
(d) more information is required.

34. Two holes are made in the side of the tank such that the jets of water flowing out of them meet at the same point on the ground. If one hole is at a height of 3 cm above the bottom, then the distance of the other hole from the top surface of water is

(a) $\dfrac{3}{2}$ cm (b) $\sqrt{6}$ cm

(c) $\sqrt{3}$ cm (d) 3 cm

Surface Tension and Viscosity

35. A spherical liquid drop of radius R is divided into eight equal droplets. If the surface tension is T, then the work done in this process will be
(a) $2\pi R^2T$ (b) $3\pi R^2T$
(c) $4\pi R^2T$ (d) $2\pi RT^2$

36. If T is surface tension of soap solution, the amount of work done in blowing a soap bubble from a diameter D to a diameter $2D$ is
(a) $2\pi D^2T$ (b) $4\pi D^2T$
(c) $6\pi D^2T$ (d) $8\pi D^2T$

37. A water drop is divided into eight equal droplets. The pressure difference between inner and outer sides of the big drop
(a) will be the same as for smaller droplet
(b) will be half of that for smaller droplet
(c) will be one-fourth of that for smaller droplet
(d) will be twice of that for smaller droplet

38. The velocity of small ball of mass M and density d_1 = when dropped a container filled with glycerine becomes constant after some time. If the density glycerine is d_2, the viscous force acting on ball is
(a) $\frac{Md_1 g}{d_2}$ (b) $Mg\left(1-\frac{d_2}{d_1}\right)$
(c) $\frac{M(d_1+d_2)}{g}$ (d) $M\, d_1 d_2$

39. Two soap bubbles, one of radius 50 mm and the other of radius 80 mm, are brought in contact so that they have a common interface. The radius of the curvature of the common interface is
(a) 0.003 m (b) 0.133 m
(c) 1.2 m (d) 8.9 m

40. A glass rod of radius r_1 is inserted symmetrically into a vertical capillary tube of radius r_2 such that their lower ends are at the same level. The arrangement is now dipped in water. The height to which water will rise into the tube will be (σ = surface tension of water, ρ = density of water)
(a) $\frac{2\sigma}{(r_2-r_1)\rho g}$ (b) $\frac{\sigma}{(r_2-r_1)\rho g}$
(c) $\frac{2\sigma}{(r_2+r_1)\rho g}$ (d) $\frac{2\sigma}{(r_2^2+r_1^2)\rho g}$

41. A large number of droplets, each of radius a, coalesce to form a bigger drop of radius b. Assume that the energy released in the process is converted into the kinetic energy of the drop. The velocity of the drop is (σ = surface tension, ρ = density)
(a) $\left[\frac{\sigma}{\rho}\left(\frac{1}{a}-\frac{1}{b}\right)\right]^{1/2}$ (b) $\left[\frac{2\sigma}{\rho}\left(\frac{1}{a}-\frac{1}{b}\right)\right]^{1/2}$
(c) $\left[\frac{3\sigma}{\rho}\left(\frac{1}{a}-\frac{1}{b}\right)\right]^{1/2}$ (d) $\left[\frac{6\sigma}{\rho}\left(\frac{1}{a}-\frac{1}{b}\right)\right]^{1/2}$

42. A straw 6 cm long floats on water. The water film on one side has surface tension of 50 dyn/cm. On the other slide, camphor reduces the surface tension to 40 dyn/cm. The resultant force acting on the straw is
(a) $(50\times 6-40\times 6)$ dyn (b) 10 dyn
(c) $\left(\frac{50}{6}-\frac{40}{6}\right)$ dyn (d) 90 dyn

43. A ring is cut from a platinum tube 8.5 cm internal and 8.7 cm external diameter. It is supported horizontally from the pan of a balance, so that it comes in contact with the water in a glass vessel. If an extra 3.103 gf is required to pull it away from water, the surface tension of water is
(a) 72 dyn/cm (b) 70.80 dyn/cm
(c) 63.35 dyn/cm (d) 60 dyn/cm

44. The angle of contact between glass and water is 0° and water (surface tension 70 dyn/cm) rises in a glass capillary up to 6 cm. Another liquid of surface tension 140 dyn/cm, angle of contact 60° and relative density 2 will rise in the same capillary up to
(a) 12 cm (b) 24 cm
(c) 3 cm (d) 6 cm

45. Work W is required to form a bubble of volume V from a given solution. What amount of work is required to be done to form a bubble of volume $2V$?
(a) W (b) $2W$
(c) $2^{1/3}W$ (d) $4^{1/3}W$

46. The surface energy of a liquid drop is E. It is sprayed into 1000 equal droplets. Then its surface energy becomes
(a) $1000E$ (b) $100E$
(c) $10E$ (d) E

47. In the previous question, the work done in spraying is
(a) $999E$ (b) $99E$
(c) $9E$ (d) E

48. A loop of 6.28 cm long thread is put gently on a soap film in a wire loop. The film is pricked with a needle inside the soap film enclosed by the thread. If the surface tension of soap solution is 0.030 N/m, then the tension in the thread is
(a) 1×10^{-4} N (b) 2×10^{-4} N
(c) 3×10^{-4} N (d) 4×10^{-4} N

49. A marble of mass x and diameter $2r$ is gently released in a tall cylinder containing honey. If the marble displaces mass y ($< x$) of the liquid, then the terminal velocity is proportional to
(a) $x+y$ (b) $x-y$
(c) $\frac{x+y}{r}$ (d) $\frac{x-y}{r}$

50. A small metal ball of diameter 4 mm and density 10.5 g/cm^3 in dropped in glycerine of density 1.5 g/cm^3. The ball attains a terminal velocity of 8/cm s^{-1}. The coefficient of viscosity of glycerine is
(a) 4.9 poise (b) 9.8 poise
(c) 98 poise (d) 980 poise

51. A capillary tube is attached horizontally to a constant pressure head arrangement. If the radius of the capillary tube is increased by 10%, then the rate of flow of the liquid shall change nearly by
(a) +10% (b) 46%
(c) −10% (d) −40%

52. A sphere of brass released in a long liquid column attains a terminal speed v_0. If the terminal speed is attained by a sphere of marble of the same radius and released in the same liquid is $n\, v_0$, then the value of n will be

(Given: The specific gravities of brass, marble and liquid are 8.5, 2.5 and 0.8, respectively)

(a) $\frac{5}{17}$ (b) $\frac{17}{77}$

(c) $\frac{11}{31}$ (d) $\frac{17}{5}$

53. Between a plate of area 100 cm^2 and another plate of area 100 m^2 there is a 1 mm, thick layer of water, if the coefficient of viscosity of water is 0.01 poise, then the force required to move the smaller plate with a velocity 10 $cm\,s^{-1}$ with reference to large plate is
(a) 100 dyn (b) 10^4 dyn
(c) 10^6 dyn (d) 10^9 dyn

54. A river 10 m deep is flowing at 5 $m\,s^{-1}$. The shearing stress between horizontal layers of the river is ($\eta = 10^{-3}$ SI units)
(a) $10^{-3}\,N/m^2$ (b) $0.8\times10^{-3}\,N/m^2$
(c) $0.5\times10^{-3}\,N/m^2$ (d) $1\,N/m^2$

55. A spherical ball falls through viscous medium with terminal velocity v. If this ball is replaced by another ball of the same mass but half the radius, then the terminal velocity will be (neglect the effect of buoyancy.)
(a) v (b) $2v$
(c) $4v$ (d) $8v$

56. A solid sphere falls with a terminal velocity of 20 $m\,s^{-1}$ in air. If it is allowed to fall in vacuum,
(a) terminal velocity will be 20 $m\,s^{-1}$
(b) terminal velocity will be less than 20 $m\,s^{-1}$
(c) terminal velocity will be greater than 20 $m\,s^{-1}$
(d) no terminal velocity will be attained

57. The density of water at the surface of ocean is ρ. If the bulk modulus of water is B, then the density of ocean water at depth, when the pressure is αp_0 and p_0 is the atmospheric pressure, is

(a) $\frac{\rho B}{B-(\alpha-1)p_0}$ (b) $\frac{\rho B}{B+(\alpha-1)p_0}$

(c) $\frac{\rho B}{B-\alpha p_0}$ (d) $\frac{\rho B}{B+\alpha p_0}$

58. Water rises to a height h in a capillary tube of cross-sectional area A. The height to which water will rise in a capillary tube of cross-sectional area $4A$ will be
(a) h (b) $h/2$
(c) $h/4$ (d) $4h$

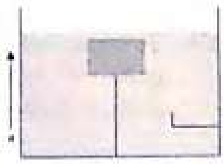
Problems Based on Mixed Concepts

59. A cubical block of wood of side a and density ρ floats in water of density 2ρ. The lower surface of the cube just touches the free end of a massless spring of force constant k fixed at the bottom of the vessel. The weight W put over the block so that it is completely immersed in water without wetting the weight is

(a) $a(a^2\rho g + k)$ (b) $a(a\rho g + 2k)$

(c) $a\left(\frac{a\rho g}{2} + 2k\right)$ (d) $a\left(a^2\rho g + \frac{k}{2}\right)$

60. The tension in a string holding a solid block below the surface of a liquid (where $\rho_{\text{liquid}} > \rho_{\text{block}}$) as in shown in the figure is T_0 when the system is at rest.



Then what will be the tension in the string if the system has upward acceleration a?

(a) $T_0\left(1-\frac{a}{g}\right)$ (b) $T_0\left(1+\frac{a}{g}\right)$

(c) $T_0\left(\frac{a}{g}-1\right)$ (d) $\frac{a}{g}T_0$

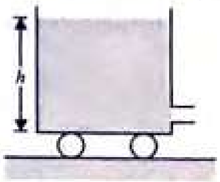
61. A wooden rod of a uniform cross section and of length 120 cm is hinged at the bottom of the tank which is filled with water to a height of 40 cm. In the equilibrium position, the rod makes an angle of 60° with the vertical. The centre of buoyancy is located on the rod at a distance (from the hinge) of
(a) 20 cm (b) 40 cm
(c) 60 cm (d) 75 cm

62. A small ball of density ρ is immersed in a liquid of density σ ($>\rho$) to a depth h and released. The height above the surface of water up to which the ball will jump is

(a) $\left(\frac{\sigma}{\rho}-1\right)h$ (b) $\left(\frac{\rho}{\sigma}-1\right)h$

(c) $\left(\frac{\rho}{\sigma}+1\right)h$ (d) $\left(\frac{\sigma}{\rho}+1\right)h$

63. A container filled with liquid up to height h is placed on a smooth horizontal surface. The container is having a small hole at the bottom. As the liquid comes out from the hole, the container moves in a backward direction with acceleration a and finally, when all the liquid is drained out, it acquires a velocity v. Neglect mass of the container. In this case



(a) both a and v depend on h
(b) only a depends on h
(c) only v depends on h
(d) neither a nor v depends on h

64. A hollow sphere has a small hole in it. On lowering the sphere in a tank of water, it is observed that water enters into the hollow sphere at a depth of 40 cm below the surface. Surface tension of water is 7×10^{-2} N/m. The diameter of the hole is

(a) $\frac{1}{28}$ mm (b) $\frac{1}{21}$ mm

(c) $\frac{1}{14}$ mm (d) $\frac{1}{7}$ mm

65. Two soap bubbles of radii a and b combine to form a single bubble of radius c. If P is the external pressure, then the surface tension of the soap solution is

(a) $\frac{P(c^3+a^3+b^3)}{4(a^2+b^2-c^2)}$ (b) $\frac{P(c^3-a^3-b^3)}{4(a^2+b^2-c^2)}$

(c) $Pc^3-4a^2-4b^2$ (d) $Pc^2-2a^2-3b^2$

66. A thin square plate of side 5 cm is suspended vertically from a balance so that lower side just dips into water with side to surface. When the plate is clean ($\theta = 0°$), it appears to weigh 0.044 N. But when the plate is greasy ($\theta = 180°$), it appears to weigh 0.03 N. The surface tension of water is

(a) 3.5×10^{-2} N/m (b) 7.0×10^{-2} N/m

(c) 14.0×10^{-2} N/m (d) 1.08 N/m

67. A 20 cm long capillary tube is dipped in water. The water rises up to 8 cm. If the entire arrangement is put in a freely falling elevator, the length of water column in the capillary tube will be

(a) 20 cm (b) 4 cm

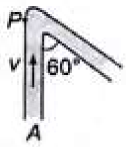
(c) 10 cm (d) 8 cm

68. Neglecting the density of air, the terminal velocity obtained by a raindrop of radius 0.3 mm falling through the air of viscosity 1.8×10^{-5} N/m^2 will be

(a) 10.9 m/s (b) 8.3 m/s

(c) 9.2 m/s (d) 7.6 m/s

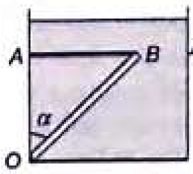
69. Water (density ρ) is flowing through the uniform tube of cross-sectional area A with a constant speed v as shown in the figure. The magnitude of force exerted by the water on the curved corner of the tube is (neglect viscous forces)



(a) $\sqrt{3}\,\rho A v^2$ (b) $2\rho A v^2$

(c) $\sqrt{2}\rho A v^2$ (d) $\frac{\rho A v^2}{\sqrt{2}}$

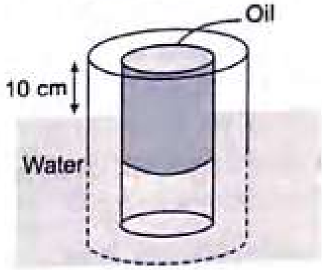
70. A uniform rod OB of length 1 m, cross-sectional area 0.012 m2 and relative density 2.0 is free to rotate about O in vertical plane. The rod is held with a horizontal string AB which can withstand a maximum tension of 45 N. The rod and string system is kept in water as shown in figure. The maximum value of angle α which the rod can make with vertical without breaking the string is

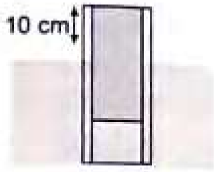


(a) 45° (b) 37°

(c) 53° (d) 60°

71. A tube with both ends open floats vertically in water. Oil with a density 800 kg/m^3 is poured into the tube. The tube is filled with oil up to the top end while in equilibrium. The portion out of the water is of length 10 cm. The length of the tube is:





(a) 50 cm (b) 60 cm

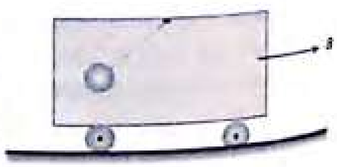
(c) 90 cm (d) 100 cm

72. One end of a long iron chain of linear mass density λ is fixed to a sphere of mass m and specific density 1/3 while the other end is free. The sphere along with the chain is immersed in a deep lake. If specific density of iron is 7, the height h above the bed of the lake at which the sphere will float in equilibrium is (Assume that the part of the chain lying on the bottom of the lake exerts negligible force on the upper part of the chain):

(a) $\frac{16}{7}\frac{m}{\lambda}$ (b) $\frac{7m}{3\lambda}$

(c) $\frac{5m}{2\lambda}$ (d) $\frac{8m}{3\lambda}$

73. Figure shows a closed container completely filled with an ideal liquid of density ρ. In the liquid there is a spherical body of volume V and density σ attached to a string whose other end is attached to the roof of the container. The container is accelerating with an acceleration 'a' towards right. The force exerted by the liquid on the spherical body when it is in equilibrium with respect to the liquid, will be:



(a) $V\rho\sqrt{a^2+g^2}+V\sigma a$ (b) $V\rho g+V\sigma a$

(c) $V\rho(g+a)$ (d) $V\rho\sqrt{a^2+g^2}$

ARCHIVES

1. A U-tube is partially filled with water. Oil, which does not mix with water, is next poured into one side, until water rises by 25 cm on the other side. If the density of the oil is 0.8 g/cc, the oil level will stand higher than the water level by
   (a) 6.25 cm (b) 18.75 cm
   (c) 12.50 cm (d) 25.00 cm **(AIEEE 2002)**

2. An object of weight W and density ρ is dipped in a fluid of density ρ_1. Its apparent weight will be
   (a) $W(\rho - \rho_1)$ (b) $W\left(1 - \frac{\rho_1}{\rho}\right)$
   (c) $\frac{(\rho - \rho_1)}{W}$ (d) $W(\rho_1 - \rho)$ **(AIEEE 2002)**

3. A cylinder of height 20 m is completely filled with water. The velocity of efflux of water (in m/s) through a small hole on the side wall of the cylinder near its bottom is
   (a) 10 (b) 20
   (c) 25.5 (d) 5 **(AIEEE 2002)**

4. If two soap bubbles of different radii are connected by a tube,
   (a) air flows from the bigger bubble to the smaller bubble till their sizes become equal.
   (b) air flows from the bigger bubble to the smaller bubble till their sizes are interchanged.
   (c) air flows from the smaller bubble to the bigger.
   (d) there is no flow of air. **(AIEEE 2004)**

5. A spherical ball of radius R is falling in a viscous fluid of viscosity η with a velocity v. The retarding viscous force acting on the ball is
   (a) directly proportional to R but inversely proportional to v.
   (b) directly proportional to both radius R and velocity v.
   (c) inversely proportional to both radius R and velocity v.
   (d) inversely proportional to R but directly proportional to velocity v. **(AIEEE 2004)**

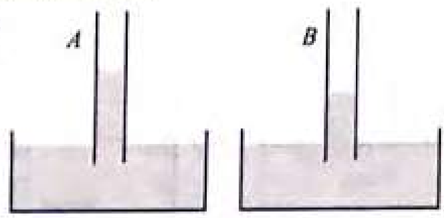
6. A 20-cm long capillary tube is dipped in water. The water rises up to 8 cm. If the entire arrangement is put in a freely falling elevator, the length of the water column in the capillary tube will be
   (a) 20 cm (b) 4 cm
   (c) 10 cm (d) 8 cm **(AIEEE 2005)**

7. If the terminal speed of a sphere of gold (of density 19.5 kg/m^3) is 0.2 m/s in a viscous liquid, find the terminal speed of a sphere of silver (of density 10.5 kg/m^3) of the same size in the same liquid.
   (a) 0.4 m/s (b) 0.133 m/s
   (c) 0.1 m/s (d) 0.2 m/s **(AIEEE 2006)**

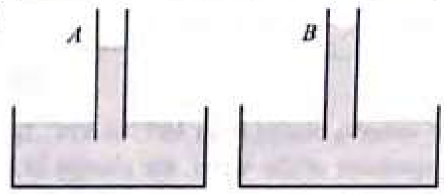
8. A spherical solid ball of volume V is made of a material of density ρ_1. It is falling through a liquid of density ρ_2 $(\rho_2 < \rho_1)$. Assume that the liquid applied a viscous force on the ball proportional to the square of its speed v, i.e., $F_{\text{viscous}} = -kv^2\ (k > 0)$. The terminal speed of the ball is
   (a) $\sqrt{\frac{Vg(\rho_1 - \rho_2)}{k}}$ (b) $\frac{Vg\rho_1}{k}$
   (c) $\sqrt{\frac{Vg\rho_1}{k}}$ (d) $\frac{Vg(\rho_1 - \rho_2)}{k}$
   (AIEEE 2008)

9. A capillary tube (A) is dipped in water. Another identical tube (B) is dipped in a soap-water solution. Which of the following shows the relative nature of the liquid columns in the two tubes?

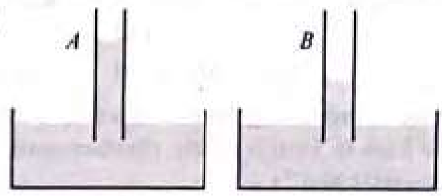
(a)



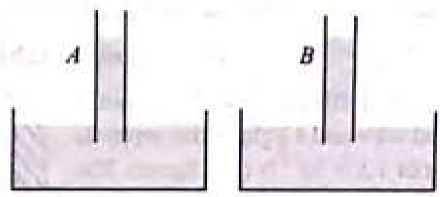
(b)



(c)

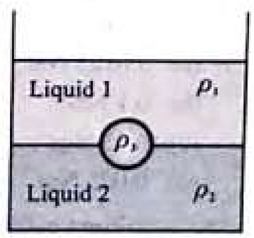


(d)



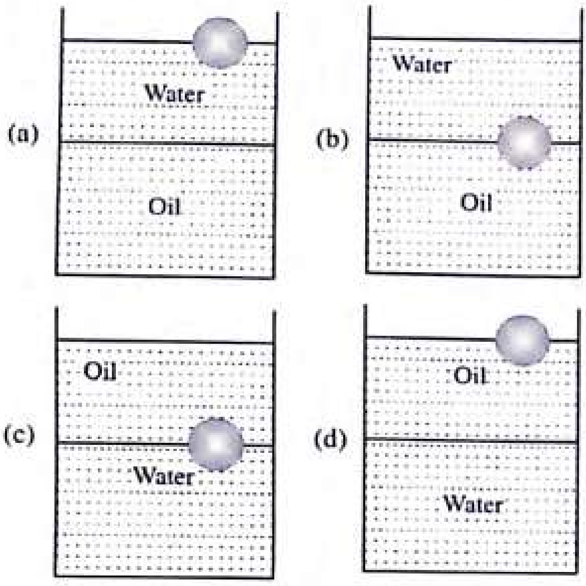
(AIEEE 2008)

10. A jar is filled with two non-mixing liquids having densities ρ_1 and ρ_2, respectively. A solid ball, made of a material of density ρ_3, is dropped in the jar. It attains equilibrium in the position as shown in the figure.



Which of the following is true for ρ_1, ρ_2, and ρ_3?
   (a) $\rho_3 < \rho_1 < \rho_2$ (b) $\rho_1 > \rho_3 > \rho_2$
   (c) $\rho_1 < \rho_2 < \rho_3$ (d) $\rho_1 < \rho_3 < \rho_2$
   (AIEEE 2008)

11. A ball is made of a material of density ρ, where $\rho_{oil} < \rho < \rho_{water}$ with ρ_{oil} and ρ_{water} representing the densities of oil and water, respectively. The oil and water are immiscible. If the above ball is in equilibrium in a mixture of this oil and water, which of the following pictures represents its equilibrium position?



(AIEEE 2010)

12. 100 g of water is heated from 30°C to 50°C. Ignoring the slight expansion of the water, the change in its internal energy is (specific heat of water is 4184 J/kg/K)

(a) 4.2 kJ (b) 8.4 kJ
(c) 84 kJ (d) 2.1 kJ **(AIEEE 2011)**

13. Work done in increasing the size of a soap bubble from a radius of 3 cm to 5 cm is nearly. (Surface tension of soap solution = 0.03 Nm^{-1})

(a) 4π mJ (b) 0.2π mJ
(c) 2π mJ (d) 0.4π mJ **(AIEEE 2011)**

14. A thin liquid film formed between a U-shaped wire and a light slider supports a weight of 1.5×10^{-2} N (see figure). The length of the slider is 30 cm and its weight negligible. The surface tension of the liquid film is

(a) 0.0125 Nm^{-1}
(b) 0.1 Nm^{-1}
(c) 0.05 Nm^{-1}
(d) 0.025 Nm^{-1} **(AIEEE 2012)**

15. A uniform cylinder of length L and mass M having cross-sectional area A is suspended, with its length vertical, from a fixed point by a massless spring, such that it is half submerged in a liquid of density σ at equilibrium position. The extension x_0 of the spring when it is in equilibrium is

(a) $\frac{Mg}{k}\left(1-\frac{LA\sigma}{M}\right)$ (b) $\frac{Mg}{k}\left(1-\frac{LA\sigma}{2M}\right)$
(c) $\frac{Mg}{k}\left(1+\frac{LA\sigma}{M}\right)$ (d) $\frac{Mg}{k}$ **(JEE Main 2013)**

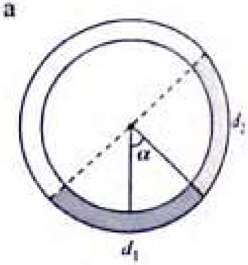
16. Assume that a drop of liquid evaporates by decrease in its surface energy, so that its temperature remains unchanged. What should be the minimum radius of the drop for this to be possible? The surface tension is T, density of liquid is ρ and L is its latent heat of vaporization.

(a) $\sqrt{\frac{T}{\rho L}}$ (b) $\frac{T}{\rho L}$
(c) $\frac{2T}{\rho L}$ (d) $\frac{\rho L}{T}$ **(JEE Main 2013)**

17. An open glass tube is immersed in mercury in such a way that a length of 8 cm extends above the mercury level. The open end of the tube is then closed and sealed and the tube is raised vertically up by additional 46 cm. What will be length of the air column above mercury in the tube now? (Atmospheric pressure = 76 cm of Hg)

(a) 38 cm (b) 6 cm
(c) 16 cm (d) 22 cm **(JEE Main 2014)**

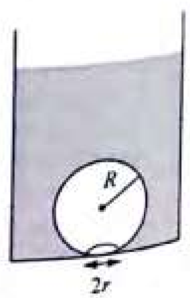
18. There is a circular tube in a vertical plane. Two liquids which do not mix and of densities d_1 and d_2 are filled in the tube. Each liquid subtends 90° angle at centre. Radius joining their interface makes an angle α with vertical. Ratio d_1/d_2 is



(a) $\frac{1+\tan\alpha}{1-\tan\alpha}$ (b) $\frac{1+\sin\alpha}{1-\cos\alpha}$
(c) $\frac{1+\sin\alpha}{1-\sin\alpha}$ (d) $\frac{1+\cos\alpha}{1-\cos\alpha}$

(JEE Main 2014)

19. On heating water, bubbles being formed at the bottom of the vessel detach and rise. Take the bubbles to be spheres of radius R and making a circular contact of radius r with the bottom of the vessel. If $r << R$ and the surface tension of water is T, the value of r just before bubbles detach is (density of water is ρ_w)



(a) $R^2\sqrt{\frac{\rho_w g}{T}}$ (b) $R^2\sqrt{\frac{3\rho_w g}{T}}$

(c) $R^2\sqrt{\frac{\rho_w g}{6T}}$ (d) $R^2\sqrt{\frac{\rho_w g}{3T}}$

(JEE Main 2014)

20. The following observations were taken for determining surface tension T of water by capillary method:

Diameter of capillary, $D = 1.25 \times 10^{-2}$ m

Rise of water, $h = 1.45 \times 10^{-2}$ m

Using $g = 9.80$ m/s^2 and the simplified relation $T = \frac{rhg}{2} \times 10^3$ N/m, the possible error in surface tension is closest to

(a) 2.4% (b) 10%

(c) 0.15% (d) 1.5%

(JEE Main 2017)

Chapter 13

Thermal Expansion, Calorimetry and Transmission of Heat

TEMPERATURE

Temperature is defined by zeroth law of thermodynamics, which states that when two bodies A and B are separately in thermal equilibrium with a third body C, then A and B are also in thermal equilibrium with each other (thermal equilibrium implies equality of temperature). Temperature is a scalar quantity which is a property of all thermodynamic systems such that the equality of temperature is necessary and sufficient for thermal equilibrium.

1. Temperature is one of the seven fundamental quantities with dimension $[\theta]$.
2. It is a scalar physical quantity with SI unit kelvin.
3. When heat is given to a body and its state does not change, the temperature of the body rises and if heat is taken from a body its temperature falls, i.e., temperature can be regarded as the effect of cause 'heat'.
4. According to the kinetic theory of gases, temperature (macroscopic physical quantity) is a measure of average translational kinetic energy of a molecule (microscopic physical quantity).
   Temperature $\propto$ kinetic energy [As $E = 3RT/2$]
5. Although the temperature of a body can be raised without limit, it cannot be lowered without limit and theoretically limiting low temperature is taken to be zero of the kelvin scale.

As temperature is measured by the value of the thermodynamic property of a substance, i.e., a property which varies *linearly* with the temperature, two fixed points are needed to define a temperature scale. These two fixed points in modern thermometry are taken as

1. Triple point of water, i.e., the state of water where the liquid, solid and vapour phases of water coexist in equilibrium. It is characterized by unique values of temperature and pressure.
2. On this scale, the other fixed point may be taken as the absolute zero.

We then need to assign some numbers to these two fixed points. The lowest temperature may be taken as zero. The triple point of water on Celsius scale is 0.01°C. Thus, the absolute temperature T for triple point of water will be given by

$$T = T_c + 273.15 = 0.01 + 273.15 = 273.16 \text{ K}$$

$\therefore$ $T = 273.16$ K (triple point of water)

Thermometry

An instrument used to measure the temperature of a body is called a thermometer.

The linear variation in some physical property of a substance with change of temperature is the basic principle of thermometry and these properties are defined as thermometric property (x) of the substance. x may be

(i) length of liquid in capillary;
(ii) pressure of gas at constant volume;
(iii) volume of gas at constant pressure and
(iv) resistance of a given platinum wire.

In old thermometry, two arbitrarily fixed points ice and steam point (freezing point and boiling point at 1 atm) are taken to define the temperature scale. In Celsius scale, freezing point of water is assumed to be 0°C while boiling point 100°C and the temperature interval between these is divided into 100 equal parts.

So, if the thermometric property at temperatures 0°C, 100°C and T_c°C is x_0, x_{100} and x, respectively, then by linear variation ($y = mx + c$) we can say that

$$0 = ax_0 + b \quad \text{(i)}$$

$$100 = ax_{100} + b \quad \text{(ii)}$$

$$T_c = ax + b \quad \text{(iii)}$$

From these equations $\dfrac{T_c - 0}{100 - 0} = \dfrac{x - x_0}{x_{100} - x_0}$

$$\therefore \quad T_c = \frac{x - x_0}{x_{100} - x_0} \times 100°\text{C}$$

In modern thermometry instead of two fixed points only one reference point is chosen (triple point of water 273.16 K at which ice, water and water vapours coexist).

So, if the values of thermometric property at 0 K, 273.16 K and T_K K are 0, x_{Tr} and x, respectively, then by linear variation ($y = mx + c$) we can say that

$$0 = a \times 0 + b \quad \text{(i)}$$

$$273.16 = a \times x_{T_r} + b \quad \text{(ii)}$$

$$T_k = a \times x + b \quad \text{(iii)}$$

From these equations $\frac{T_1}{273.16}=\frac{x}{x_{T_r}}$

$$\therefore \quad T_K = 273.16\left[\frac{x}{x_{T_r}}\right] \text{K}$$

Measurement of Temperature

There are different systems of measurement of temperature. The lower fixed point (LFP) and the upper fixed point (UFP) in any system of units are corresponding to freezing point and boiling point of water at 1 atm.

For different system of units the LFP and UFP are given as

System of units	Units	Lower fixed point (LFP)	Upper fixed point (UFP)	Different UFP − LFP
Degree celsius (centigrade)	°C	0°C	100°C	100
Kelvin scale (SI unit)	K	273.15 K	373.5 K	100
Fahrenheit	°F	32°F	212°F	180

Temperature on one scale can be converted into other scale by using the following identity.

$$\frac{\text{Reading on any scale} - \text{lower fixed point (LFP)}}{\text{Upper fixed point (UFP)} - \text{lower fixed point(LFP)}} = \text{Constant for all scales}$$

The relation between Celsius (C), Kelvin (K), Fahrenheit (F) and any other new scale θ is

$$\frac{C-0}{100}=\frac{F-32}{180}=\frac{K-273}{100}=\frac{\theta-\theta_0}{n} \quad \text{(i)}$$

where n is the number of divisions between ice point and steam point on the new scale and θ_0 is the ice point on it.

A convenient way to change one scale to another is to remember the freezing and boiling points of water in each form:

$$T_{\text{freeze}} = 32.0°\text{F} = 0°\text{C} = 273.15 \text{ K}$$

$$T_{\text{boil}} = 212°\text{F} = 100°\text{C}$$

To convert from Fahrenheit to Celsius, subtract 32 (the freezing point) and then adjust the scale by the liquid range of the water.

$$\text{Scale factor} = \frac{(100-0)°\text{C}}{(212-32)°\text{F}} = \frac{5°\text{C}}{9°\text{F}}$$

A Kelvin is the same size change as a degree celsius, but the Kelvin scale takes its zero point at absolute zero, instead of the freezing point of water. Therefore, to convert from Kelvin to Celsius, subtract 273.15 K from given Kelvin temperature.

ILLUSTRATION 13.1 Two ideal gas thermometers A and B use oxygen and hydrogen, respectively. The following observations are made:

Temperature	Pressure thermometer A	Pressure thermometer B
Triple point of water	1.250×10^5 Pa	0.200×10^5 Pa
Normal melting point of sulphur	1.797×10^5 Pa	0.287×10^5 Pa

(a) What is the absolute temperature of normal melting point of sulphur as read by thermometer A and B?

(b) What do you think is the reason for slightly different answers from A and B?

Solution.

(a) For thermometer A,

$$T_{tr} = 273 \text{ K}, \quad P_{tr} = 1.250 \times 10^5 \text{ Pa}$$

We have $$T = \frac{P}{P_{tr}} \times T_{tr} = \frac{1.797\times10^5}{1.250\times10^5}\times 273 = 392.46 \text{K}$$

For thermometer B,

$$T_{tr} = 273 \text{ K}, \quad P_{tr} = 0.200 \times 10^5 \text{ Pa}$$

We have $$T = \frac{P}{P_{tr}} \times t_{tr} = \frac{0.287\times10^5\times273}{0.200\times10^5} = 391.75 \text{K}$$

(b) The slight difference in the temperatures as read by two thermometers is due to the fact that oxygen and hydrogen do not behave like an ideal gas.

CALORIMETRY

This is the branch of heat transfer that deals with the measurement of heat. The heat is usually measured in calories or kilocalories.

One Calorie

One calorie is the quantity of heat required to raise the temperature of 1 g of water by 1°C.

Mechanical Equivalent of Heat (J)

According to Joule, work may be converted into heat and vice versa. The ratio of work done (W) to heat produced (Q) by that work without any wastage is always constant.

$$W/Q = \text{constant}$$

This constant is called *mechanical equivalent of heat* (J). The value of this constant is taken as 4.18 J/cal.

ILLUSTRATION 13.2 What is the change in potential energy (in calories) of a 10 kg mass after 41.8 m fall?

Solution. Change in potential energy

$$\Delta U = mgh = 10 \times 10 \times 41.8 = 4180 \text{ J}$$

If mechanical work/energy (W) in joule produces the same temperature change as heat (H), we write,

$$W = JH$$

where J = 4.18 is called mechanical equivalent of heat. J is expressed in joule/calorie.

Hence, equivalent calories will be

$$H = \frac{\Delta U}{J} = \frac{4180}{4.18} = 1000 \text{ cal}$$

Thermal Capacity and Water Equivalent

1. **Thermal capacity:** It is defined as the amount of heat required to raise the temperature of the whole body (mass m) through 1°C or 1 K.

$$\text{Thermal capacity} = C = \frac{Q}{\Delta T}$$

The value of thermal capacity of a body depends upon the nature of the body and its mass.

Dimension: $[ML^2T^{-2}\theta^{-1}]$; unit: cal/°C (practical) J/K (SI)

2. **Water equivalent:** Water equivalent of a body is defined as the mass of water which would absorb or evolve the same amount of heat as is done by the body in rising or falling through the same range of temperature. It is represented by W.

If m = mass of the body, c = specific heat of body,

ΔT = rise in temperature.

Then heat given to body

$$\Delta Q = mc\Delta T \quad \text{(i)}$$

If same amount of heat is given to W grams of water and its temperature also rises by ΔT.

Then heat given to water

$$\Delta Q = W \times 1 \times \Delta T \quad [\text{As } c_{water} = 1] \quad \text{(ii)}$$

From Eqs. (i) and (ii), $\Delta Q = mc\Delta T = W \times 1 \times \Delta T$

∴ Water equivalent $(W) = mc$ grams

Unit: kg (SI); dimension: $[ML^\circ T^\circ]$

NOTE:

- Unit of thermal capacity is J/kg while unit of water equivalent is kg.
- Thermal capacity of the body and its water equivalent are numerically equal.
- If thermal capacity of a body is expressed in terms of mass of water, it is called water equivalent of the body.

Specific Heat

Gram specific heat: When heat is given to a body and its temperature increases, the heat required to raise the temperature of unit mass of a body through 1°C (or K) is called specific heat of the material of the body.

If Q heat changes the temperature of mass m by ΔT

$$\text{Specific heat } c = \frac{Q}{m\Delta T}$$

Units: cal/g × °C (practical), J/kg × K (SI); dimension: $[L^2T^{-2}\theta^{-1}]$

☞ Important Points

1. Specific heat for hydrogen is maximum (3.5 cal/g × °C) and for water, it is 1 cal/g × °C.
   For all other substances, the specific heat is less than 1 cal/g × °C and it is minimum for radon and actinium (≈ 0.022 cal/g × °C).
2. Specific heat of a substance also depends on the state of the substance, i.e., solid, liquid or gas.
   For example, $C_{ice} = 0.5$ cal/g°C (solid),
   $C_{water} = 1$ cal/g × °C (liquid) and
   $C_{steam} = 0.47$ cal/g × °C (gas)
3. The specific heat of a substance when it melts or boils at constant temperature is infinite.
   As $\quad C = \dfrac{Q}{m\Delta T} = \dfrac{Q}{m \times 0} = \infty \quad$ (As $\Delta T = 0$)
4. The specific heat of a substance when it undergoes adiabatic changes is zero.
   As $\quad C = \dfrac{Q}{m\Delta T} = \dfrac{0}{m\Delta T} = 0 \quad$ (As $Q = 0$)
5. Specific heat of a substance can also be negative. Negative specific heat means that in order to raise the temperature, a certain quantity of heat is to be withdrawn from the body.
   For example, specific heat of saturated vapours.

ILLUSTRATION 13.3 A 60-kg boy running at 5.0 m/s while playing basketball falls down on the floor and skids along on his leg until he stops. How many calories of heat are generated between his leg and the floor? Assume that all this heat energy is confined to a volume of 2.0 cm³ of his flesh. What will be temperature change of the flesh? Assume c = 1.0 cal/g °C and $\rho = 950$ kg/m³ for flesh.

Solution. Kinetic energy of boy $K = \frac{1}{2}mv^2 = \frac{1}{2}(60)(5)^2 = 750$ J

Changing this energy in joule into calorie

$$Q_1 = \frac{K}{J} = \frac{750}{4.2} = 179 \text{ J} \quad \text{(i)}$$

As this kinetic energy changes into heat energy (Q_2) and this heat is confined to flesh of boy,

$$Q_2 = mc\Delta T = (\rho V)\, c\Delta T \quad \text{(ii)}$$

As $\quad Q_1 = Q_2$, hence from Eqs. (i) and (ii)

$$179 = 0.95 \times 2 \times \Delta T \Rightarrow \Delta T = 94°\text{C}$$

Latent Heat

- When a substance changes from one state to another state (say from solid to liquid or liquid to gas or from liquid to solid or gas to liquid) then energy is either absorbed or liberated. This heat energy is called latent heat.

- No change in temperature is involved when the substance changes its state. That is, phase transformation is an isothermal change. Ice at 0°C melts into water at 0°C. Water at 100°C boils to form steam at 100°C.
- The amount of heat required to change the state of the mass m of the substance is written as: $\Delta Q = mL$, where L is the latent heat. Latent heat is also called as heat of transformation.
- Unit: cal/g or J/kg and dimension: $[L^2T^{-2}]$.
- Any material has two types of latent heats.

i. Latent heat of fusion: The latent heat of fusion is the heat energy required to change 1 kg of the material in its solid state at its melting point to 1 kg of the material in its liquid state. It is also the amount of heat energy released when at melting point 1 kg of liquid changes to 1 kg of solid. For water at its normal freezing temperature or melting point (0°C), the latent heat of fusion (or latent heat of ice) is

$$L_F = L_{ice} \approx 80 \text{ cal/g} \approx 6 \text{ kJ/mol} \approx 336 \text{ kJ/kg}$$

ii. Latent heat of vapourization: The latent heat of vapourization is the heat energy required to change 1 kg of the material in its liquid state at its boiling point to 1 kg of the material in its gaseous state. It is also the amount of heat energy released when 1 kg of vapour changes into 1 kg of liquid. For water at its normal boiling point or condensation temperature (100°C), the latent heat of vapourization (latent heat of steam) is

$$L_V = L_{steam} \approx 540 \text{ cal/g} \approx 40.8 \text{ kJ/mol} \approx 2260 \text{ kJ/kg}$$

NOTE:

- In the process of melting or boiling, heat supplied is used to increase the internal potential energy of the substance and also in doing work against external pressure while internal kinetic energy remains constant. This is the reason that internal energy of steam at 100°C is more than that of water at 100°C.
- It is more painful to get burnt by steam rather than by boiling water at same temperature. This is so because when 1 g of steam at 100°C gets converted to water at 100°C, then it gives out 536 cal of heat. So, it is clear that steam at 100°C has more internal energy than water at 100°C (i.e., boiling of water).
- In case of change of state if the molecules come closer, energy is released and if the molecules move apart, energy is absorbed.
- Latent heat of vapourization is more than the latent heat of fusion. This is because when a substance gets converted from liquid to vapour, there is a large increase in volume. Hence, more amount of heat is required. But when a solid gets converted to a liquid, then the increase in volume is negligible. Hence, very less amount of heat is required. So, latent heat of vapourization is more than the latent heat of fusion.
- After snow falls, the temperature of the atmosphere becomes very low. This is because the snow absorbs the heat from the atmosphere to melt down. So, in the mountains, when snow falls, one does not feel too cold, but when ice melts, he feels too cold.
- There is more shivering effect of ice cream on teeth as compared to that of water (obtained from ice). This is because when ice cream melts down, it absorbs large amount of heat from teeth.

Principle of Calorimetry

When two bodies (one being solid and other liquid or both being liquid) at different temperatures are mixed, heat will be transferred from body at higher temperature to a body at lower temperature till both acquire same temperature. The body at higher temperature releases heat while body at lower temperature absorbs it, so that

Heat lost = Heat gained

i.e., the principle of calorimetry represents the law of conservation of heat energy.

Heat lost by A = Heat gained by B

or $\quad m_1c_1(T_1 - T) = m_2c_2(T - T_2)$

(where T = temperature of equilibrium)

$$\therefore \quad T = \frac{m_1c_1T_1 + m_2c_2T_2}{m_1c_1 + m_2c_2}$$

i. If bodies are of same material $c_1 = c_2$, then $T = \dfrac{m_1T_1 + m_2T_2}{m_1 + m_2}$

ii. If bodies are of same mass $(m_1 = m_2)$, then $T = \dfrac{T_1c_1 + T_2c_2}{c_1 + c_2}$

iii. If bodies are of same material and of equal masses $(m_1 = m_2, c_1 = c_2)$, then $T = \dfrac{T_1 + T_2}{2}$.

ILLUSTRATION 13.4 Determine the final result when 200 g of water and 20 g of ice at 0°C are in a calorimeter having a water equivalent of 30 g and 50 g of steam is passed into it at 100°C.

Solution. When steam is passed, the final temperature can be 0°C, between 0°C and 100°C, or 100°C.

We will consider all three possibilities.

Case I

Final temperature = 0°C

In this case, all the steam condenses and then cools down to 0°C.

Heat given out by steam

$$= 50 \times 540 + 50 \times 1 \times (100 - 0) = 32000 \text{ cal}$$

Mass of ice which will melt by this heat $= \dfrac{32000}{80} = 400$ g

But there is only 20 g of ice in the calorimeter.

Hence final temperature cannot be 0°C.

Case II

Final temperature = θ and $0 < \theta < 100$

Heat lost by steam = heat gained by (ice + water + calorimeter)

$\Rightarrow \quad 50 \times 540 + 50 \times 1 \times (100 - \theta)$

$$= 20 \times 80 + (20 + 200 + 30) \times 1 \times (\theta - 0)$$

$\Rightarrow \quad \theta = 101.3°C$

The assumption $(0 < \theta < 100)$ is proved to be wrong. Hence, the final temperature cannot be between 0°C and 100°C

$\Rightarrow$ The final temperature will be 100°C.

Case III

Let m = mass of steam condensed.

Heat lost by steam = heat gained by ice to melt + heat gained by (water + water + calorimeter) to reach 100°C

$\Rightarrow \quad m(540) = 20 \times 80 + (20 + 200 + 30) \times (100 - 0)$

$\Rightarrow \quad m = 26600/540 \approx 49$ g

$\Rightarrow$ 49 g of steam gets condensed and the final temperature is 100°C.

Heating Curve

If heat is supplied at constant rate to a given mass m of a solid, P and a graph is plotted between temperature and time, the graph is as shown in figure and is called heating curve. From this curve it is clear that

- In the region OA temperature of solid is changing with time, so,

  $Q = mc_s \Delta T$

  or $\quad P\Delta t = mc_s \Delta T \qquad$ (as $Q = P\Delta t$)

  But as $(\Delta T/\Delta t)$ is the slope of temperature–time curve

  $c_S \propto$ (1/slope of line OA)

  i.e., specific heat (or thermal capacity) is inversely proportional to the slope of temperature–time curve.

- In the region AB temperature is constant, so it represents change of state, i.e., melting of solid with melting point T_1. At A melting starts and at B all solid is converted into liquid. So between A and B substance is partly solid and partly liquid. If L_F is the latent heat of fusion.

  $$Q = mL_F \quad \text{or} \quad L_F = \frac{P(t_2 - t_1)}{m} \qquad [\text{as } Q = P(t_2 - t_1)]$$

  or $\quad L_F \propto$ length of line AB

  i.e., latent heat of fusion is proportional to the length of line of zero slope. (In this region specific heat $\to \infty$)

- In the region BC temperature of liquid increases so specific heat (or thermal capacity) of liquid will be inversely proportional to the slope of line BC, i.e.,

  $c_L \propto$ (1/slope of line BC)

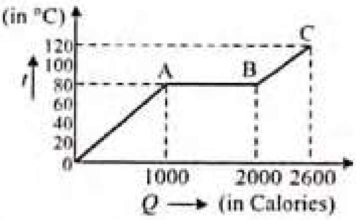
- In the region CD temperature is constant, so it represents the change of state, i.e., boiling with boiling point T_2. At C all substance is in liquid state while at D in vapour state and between C and D partly liquid and partly gas. The length of line i is proportional to latent heat of vapourization, i.e.,

  $L_V \propto$ Length of line CD

  (In this region specific heat $\to \infty$)

- The line DE represents gaseous state of substance with its temperature increasing linearly with time. The reciprocal of slope of line will be proportional to specific heat or thermal capacity of substance in vapour state.

ILLUSTRATION 13.5 A substance is in the solid form at 0°C. The amount of heat added to this substance and its temperature are plotted in the following graph.



If the relative specific heat capacity of the solid substance is 0.5, find from the graph (i) the mass of the substance; (ii) the specific latent heat of the melting process and (iii) the specific heat of the substance in the liquid state.

Specific heat capacity of water = 1000 cal/kg/K

Solution. 1000 cal of heat raises the temperature of the substance from 0°C to 80°C.

$\therefore \quad 1000 = m(1000 \times 0.5) \times 80$

($\because$ specific heat = relative sp. heat × sp. heat of water)

or $\quad m = 0.025$ kg

Latent heat = 200 × 5 = 1000 cal

($\because$ 1 div reads 200 cal) = $0.025 \times L$

$\therefore \quad L = 40000$ cal/kg

In the liquid state temperature rises from 80°C to 120°C, that is, by 40°C after absorbing 600 cal.

$\therefore \quad 0.025\, s \times 40 = 600 \quad$ or $\quad s = 600$ cal/kg/K

CONCEPT APPLICATION EXERCISE 13.1

1. Ice of mass 600 g and at a temperature of −10°C is placed in a copper vessel heated to 350°C. The resultant mixture is 550 g of ice and water. Find the mass of the vessel. The specific heat capacity of copper (c) = 100 cal/kg-K.
2. When a small ice crystal is placed in overcooled water it begins to freeze instantaneously.
   (i) What amount of ice is formed from 1 kg of water overcooled to −8°C? L of water = 336×10^3 J/kg and s of water = 4200 J/kg/K.
   (ii) What should be the temperature of the overcooled water in order that all of it be converted into ice at 0°C?
3. An electric heater whose power is 54 W is immersed in 650 cm^3 water in a calorimeter. In 3 min the water is heated by 3.4°C. What part of the energy of the heater passes out of the calorimeter in the form of radiant energy?
4. An ice cube whose mass is 50 g is taken from a refrigerator where its temperature was −10°C. If no heat is gained or lost from outside, how much water will freeze onto the cube if it is dropped into a beaker containing water at 0°C? Latent heat of fusion = 80 kcal/kg, specific heat capacity of ice = 500 cal/kg/K.

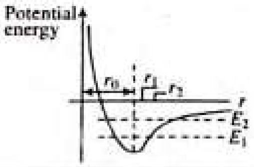
5. Equal volumes of three liquids of densities ρ_1, ρ_2 and ρ_3, specific heat capacities c_1, c_2 and c_3 and temperatures t_1, t_2 and t_3, respectively, are mixed together. What is the temperature of the mixture? Assume no changes in volume on mixing.
6. Victoria Falls in Africa is 122 m in height. Calculate the rise in temperature of the water if all the potential energy lost in the fall is converted into heat.
7. Equal masses of three liquids A, B and C are taken. Their initial temperatures are 10°C, 25°C and 40°C, respectively. When A and B are mixed the temperature of the mixture is 19°C. When B and C are mixed, the temperature of the mixture is 35°C. Find the temperature if all three are mixed.

THERMAL EXPANSION

Most materials expand when their temperature is increased. Railroad tracks, bridges all have some means of compensating for thermal expansion. When a homogeneous object expands, the distance between any two points on the object increases. Figure shows a block of metal with a hole in it. **The expanded object is like a photographic enlargement.** That is the hole expands in the same proportion as the metal; it does not get smaller.

Almost all solids and liquids expand as their temperature increases. Gases also expand if allowed. Solids can change in length, area or volume, while liquids change in their volumes.

The same steel ruler two different temperatures. When it expands, the scale, the numbers, the thickness, and the diameters of the circle and circular hole are all increased by the same factor. (The expansion has been exaggerated for clarity.)



Thermal expansion arises because the well is not symmetrical about the equilibrium position r_0. As the temperature rise the energy of the atom increases. The average position when the energy is E_2 is not the same as that when the energy is E_1

- Thermal expansion is minimum in case of solids but maximum in case of gases because intermolecular force is maximum in solids but minimum in gases.
- Solids can expand in one dimension (linear expansion), two dimension (superficial expansion) and three dimension (volume expansion) while liquids and gases usually suffers change in volume only.
- The coefficient of linear expansion of the material of a solid is defined as the increase in its length per unit length per unit rise in its temperature.

$$\alpha = \frac{\Delta L}{L} \times \frac{1}{\Delta T}$$

Similarly, the coefficient of superficial expansion

$$\beta = \frac{\Delta A}{A} \times \frac{1}{\Delta T}$$

and coefficient of volume expansion

$$\gamma = \frac{\Delta V}{V} \times \frac{1}{\Delta T}$$

The value of α, β and γ depends upon the nature of material. All have dimension $[\theta^{-1}]$ and unit per °C.

- As $\alpha = \frac{\Delta L}{L} \times \frac{1}{\Delta T}$, $\beta = \frac{\Delta A}{A} \times \frac{1}{\Delta T}$ and $\gamma = \frac{\Delta V}{V} \times \frac{1}{\Delta T}$

$\therefore \quad \Delta L = L\alpha\,\Delta T$, $\Delta A = A\beta\,\Delta T$ and $\Delta V = V\gamma\,\Delta T$

Final length $L' = L + \Delta L = L(1 + \alpha\,\Delta T)$ (i)

Final area $A' = A + \Delta A = A(1 + \beta\,\Delta T)$ (ii)

Final volume $V' = V + \Delta V = V(1 + \gamma\Delta T)$ (iii)

- If L is the side of square plate and it is heated by temperature ΔT, then its side becomes L'.

  The initial surface area $A = L^2$ and final surface area $A' = L'^2$

- $$\frac{A'}{A} = \left(\frac{L'}{L}\right)^2 = \left(\frac{L(1+\alpha\,\Delta T)}{L}\right)^2 = (1+\alpha\,\Delta T)^2 = (1+2\alpha\,\Delta T)$$

(using Binomial theorem)

or $\quad A' = A(1 + 2\alpha\Delta T)$

Comparing with Eq. (ii), we get $\beta = 2\alpha$

Similarly, for volumetric expansion

$$\frac{V'}{V} = \left(\frac{L'}{L}\right)^3 = \left(\frac{L(1+\alpha\Delta T)}{L}\right)^3 = (1+\alpha\Delta T)^3 = (1+3\alpha\Delta T)$$

(using Binomial theorem)

or $\quad V' = V(1 + \gamma\Delta T)$

Comparing with Eq. (iii), we get $\gamma = 3\alpha$

So $\quad \alpha : \beta : \gamma = 1:2:3$

ILLUSTRATION 13.6 A metal rod A of 25 cm length expands by 0.05 cm when its temperature is raised from 0°C to 100°C. Another rod B of a different metal of length 40 cm expands by 0.04 cm for the same rise in temperature. A third rod C of 50 cm length made up of pieces of rods A and B placed end to end expands by 0.03 cm on heating from 0°C to 50°C. Find the length of each portion of composite rod C.

Solution. From the given data for rod A, we have

$$\Delta L = \alpha_A L \Delta T$$

or $\quad \alpha_A = \frac{\Delta L}{L\Delta T} = \frac{0.05}{25 \times 100} = 2 \times 10^{-5}/°C$

For rod B, we have $\quad \Delta L = \alpha_B L \Delta T$

or $\alpha_B = \frac{\Delta L}{L\Delta T} = \frac{0.04}{40 \times 100} = 10^{-5}/°C$

If rod C is made of segments of rod A and B of lengths l_1 and l_2, respectively, then we have at 0°C

$l_1 + l_2 = 50$ cm (i)

At $T = 50°C$ $l'_1 + l'_2 = 50.03$ cm

Thus $\alpha_A l_1 \Delta T + \alpha_B l_2 \Delta T = 0.03$ cm

or $2 \times 10^{-5} \times l_1 \times 50 + 10^{-5} \times l_2 \times 50 = 0.03$ cm

or $2l_1 + l_2 = \frac{0.03}{50} \times 10^5 = 60$ cm (ii)

Solving Eqs. (i) and (ii), we get $l_1 = 10$ cm and $l_2 = 40$ cm.

Variation of Density with Temperature

i. Suppose ρ_0 is the density of the substance at 0°C and at any temperature t, it becomes ρ_t. As mass of the substance remains constant at any temperature, we have

$\rho_0 V_0 = \rho_t V_t$

Here V_0 and V_t are the volumes of the substance at 0°C and t°C, respectively.

Also $V_t = V_0(1 + \gamma t)$

$\therefore \rho_0 V_0 = \rho_t \{V_0(1 + \gamma t)\}$

or $\rho_t = \frac{\rho_0}{(1+\gamma t)}$

For small value of γ, we can approximate it as

$\rho_t = \rho_0(1 - \gamma t)$

ii. If ρ_1 and ρ_2 are the densities at t_1 and t_2, respectively, then we can write

$\rho_1 V_1 = \rho_2 V_2$

or $\rho_1 V_0(1 + \gamma t_1) = \rho_2 V_0(1 + \gamma t_2)$

or $\rho_1 = \rho_2 \frac{(1+\gamma t_2)}{(1+\gamma t_1)}$

$= \rho_2(1 + \gamma t_2)(1 - \gamma t_1)$

$= \rho_2[1 + \gamma(t_2 - t_1)]$

(neglecting γ_2 on being small)

$\therefore \gamma = \frac{\rho_1 - \rho_2}{\rho_2(t_2 - t_1)}$

Expansion of Liquid

Liquids also expand on heating just like solids. Since liquids have no shape of their own, they suffer only volume expansion. If the liquid of volume V is heated and its temperature is raised by $\Delta\theta$ then

$V'_L = V(1 + \gamma_L \Delta\theta)$

(γ_L = coefficient of real expansion or coefficient of volume expansion of liquid)

As liquid is always taken in a vessel for heating, if a liquid is heated, the vessel also gets heated and it also expands.

$V'_S = V(1 + \gamma_S \Delta\theta)$

(γ_S = coefficient of volume expansion for solid vessel)

So, the change in volume of liquid relative to vessel

$V'_L - V'_S = V(\gamma_L - \gamma_S)\Delta\theta$

$\Delta V_{app} = V\gamma_{app}\Delta\theta$ ($\gamma_{app} = \gamma_L - \gamma_s$ = Apparent coefficient of volume expansion for liquid)

$\gamma_L > \gamma_s$	$\gamma_{app} > 0$	ΔV_{app} = positive	Level of liquid in vessel will rise on heating.
$\gamma_L < \gamma_s$	$\gamma_{app} < 0$	ΔV_{app} = negative	Level of liquid in vessel will fall on heating.
$\gamma_L = \gamma_s$	$\gamma_{app} = 0$	$\Delta V_{app} = 0$	Level of liquid in vessel will remain same.

ILLUSTRATION 13.7 A 250 cm^3 glass bottle is completely filled with water at 50°C. The bottle and water are heated to 60°C. How much water runs over if:

(a) the expansion of the bottle is neglected;

(b) the expansion of the bottle is included? Given the coefficient of areal expansion of glass $\alpha = 1.2 \times 10^{-5}$/K and $\gamma_{water} = 60 \times 10^{-5}$/°C.

Solution. Water overflow = (Final volume of water) − (Final volume of bottle)

(a) If the expansion of bottle is neglected:

Water overflow $= 250(1 + \gamma_l\theta) - 250$

$= 250 \times 60 \times 10^{-5} \times 10$

$\Rightarrow$ Water overflow = 1.5 cm^3

(b) If the bottle (glass) expands:

Water overflow

= (final volume of water) − (final volume of glass)

$= 250(1 + \gamma_l\theta) - 250(1 + \gamma_g\theta)$

$= 250(\gamma_l - \gamma_g)\theta$, where $\gamma_g = 3/2\beta = 1.8 \times 10^{-5}/°C$

$= 250(58.2 \times 10^{-5}) \times (60 - 50)$

Water overflow = 1.455 cm^3

Effect of Temperature on Upthrust

The thrust on volume V of a body in a liquid of density σ is given by $Th = V\sigma g$

Now with rise in temperature by $\Delta\theta$ °C, due to expansion, volume of the body will increase while density of liquid will decrease according to the relations $V' = V(1 + \gamma_S\Delta\theta)]$ and $\sigma' = \sigma/(1 + \gamma_L\Delta\theta)$

So the thrust will become $Th' = V'\sigma' g$

$\therefore \frac{Th'}{Th} = \frac{V'\sigma' g}{V\sigma g} = \frac{(1+\gamma_S\Delta\theta)}{(1+\gamma_L\Delta\theta)}$

and apparent weight of the body W_{app} = actual weight − thrust

As $\gamma_1 < \gamma_2$, therefore, $Th' < Th$ with rise in temperature thrust also decreases and apparent weight of body increases.

ILLUSTRATION 13.8 A solid floats in a liquid at 20°C with 75% of it immersed. When the liquid is heated to 100°C, the same solid floats with 80% of it immersed in the liquid. Calculate the coefficient of expansion of the liquid. Assume the volume of the solid to be constant.

Solution. Let m be the mass of the solid and V its volume. By the law of flotation

Weight of floating object = Buoyant force

In Case I: $mg = \left(\frac{3}{4}V\right)\rho_{20}g$

where ρ_{20} = density of liquid at 20°C

In Case II: $mg = \left(\frac{80}{100}V\right)\rho_{100}g$.

where ρ_{100} = density of liquid at 100°C

Considering both the cases

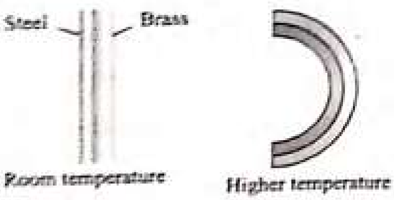
$$\Rightarrow \quad \frac{3}{4}\rho_{20} = \frac{4}{5}\rho_{100} \quad \Rightarrow \frac{3}{4}\frac{\rho_0}{1+\gamma \times 20} = \frac{4}{5}\frac{\rho_0}{1+\gamma \times 100}$$

After solving we get

$$\gamma = \frac{1}{1180} = 8.47 \times 10^{-4}/°C$$

Applications of Thermal Expansion

1. **Bi-metallic strip:** Two strips of equal lengths but of different materials (different coefficient of linear expansion) when join together, is called 'bi-metallic strip' and can be used in thermostat to break or make electrical contact. This strip has the characteristic property of bending on heating due to unequal linear expansion of the two metals. The strip will bend with metal of greater α on outer side, i.e., convex side.



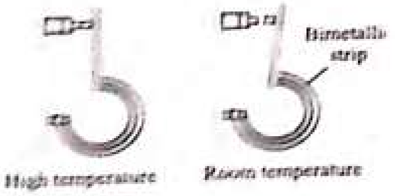


ILLUSTRATION 13.9 A copper and a tungsten plate having a thickness δ = 2 mm each are riveted together so that at 0°C they form a flat bimetallic plate. Find the average radius of curvature of this plate at t = 200°C. The coefficients of linear expansion for copper and tungsten are $\alpha_{Cu} = 1.7 \times 10^{-5}$/K and $\alpha_W = 0.4 \times 10^{-5}$ K, respectively.

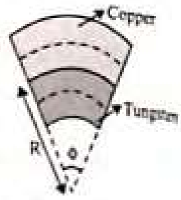
Solution. The average length of copper plate at a temperature T = 200°C is $l_C = l_0(1+\alpha_C T)$.



where l_0 is the length of copper plate at 0°C. The length of the tungsten plate is $l_t = l_0(1+\alpha_t T)$

We shall assume that the edges of plates are not displaced during deformation and that an increase in the plate thickness due to heating can be neglected.

From figure we have

$$l_C = \phi(R+\delta/2) \quad \Rightarrow \quad l_t = \phi(R-\delta/2)$$

Consequently,

$$\phi(R+\delta/2) = l_0(1+\alpha_C T) \qquad \text{(i)}$$

$$\phi(R-\delta/2) = l_0(1+\alpha_t T) \qquad \text{(ii)}$$

To eliminate the unknown quantities, ϕ and l_0, we divide Eq. (i) by Eq. (ii) term-wise:

$$\Rightarrow \quad \frac{(R+\delta/2)}{(R-\delta/2)} = \frac{(1+\alpha_C T)}{(1+\alpha_t T)}$$

$$\Rightarrow \quad R = \delta\frac{[2+(\alpha_c+\alpha_t)T]}{[2(\alpha_c-\alpha_t)T]}$$

$$\Rightarrow \quad R = \frac{\delta}{(\alpha_C-\alpha_t)T}$$

neglecting $(\alpha_C+\alpha_t)$ in numerator. Substituting the values in above relation, we get: R = 0.769 m.

2. **Effect of temperature on the time period of a simple pendulum:** A pendulum clock keeps proper time at temperature θ. If temperature is increased to θ' $(> \theta)$ then due to linear expansion, length of pendulum and hence its time period will increase.

If l_0 be the length of the pendulum, at θ°C, then its time period

$$T_0 = 2\pi\sqrt{\frac{l_0}{g}} \qquad \text{(i)}$$

At any temperature increment $\Delta\theta$, the time period of the pendulum is given by

$$T = 2\pi\sqrt{\frac{l}{g}}$$

Here, $l = l_0(1+\alpha\Delta\theta)$

$$\therefore \quad T = 2\pi\sqrt{\frac{l_0(1+\alpha\Delta\theta)}{g}} = 2\pi\sqrt{\frac{l_0}{g}}(1+\alpha\Delta\theta)^{1/2}$$

$$= T_0(1+\alpha\Delta\theta)^{1/2} \qquad \text{(ii)}$$

$$= T_0\left(1+\frac{\alpha\Delta\theta}{2}\right) \quad \text{or} \quad \frac{T}{T_0}-1=\frac{\alpha\Delta\theta}{2}$$

$$\frac{T-T_0}{T_0}=\frac{\alpha\Delta\theta}{2} \quad \text{or} \quad \frac{\Delta T}{T_0}=\frac{\alpha\Delta\theta}{2}$$

$$\therefore \quad \Delta T=\left(\frac{\alpha\Delta\theta}{2}\right)T_0$$

NOTE:

- Due to increment in its time period, a pendulum clock becomes slow in summer and will lose time.
- Loss of time in a time period $\Delta T = \frac{1}{2}\alpha\Delta\theta T_0$.
- $\therefore$ Loss of time in any given time interval t can be given by $\Delta t = \frac{1}{2}\alpha\Delta\theta t$
- The clock will lose time, i.e., it will become slow if $\theta' > \theta$ (in summer).
- It will gain time, i.e., it will become fast if $\theta' < \theta$ (in winter).
- The gain or loss in time is independent of time period T and depends on the time interval t.
- Time lost by the clock in a day (t = 86400 s)
- $\Delta t = \frac{1}{2}\alpha\Delta\theta t = \frac{1}{2}\alpha\Delta\theta\,(86400) = 43200\,\alpha\Delta\theta$ s
- Since coefficient of linear expansion (α) is very small for invar, pendulums are made of invar to show the correct time in all seasons.

ILLUSTRATION 13.10 A pendulum clock loses 12 s a day if the temperature is 40°C and goes fast by 4 s a day if the temperature is 20°C. Find the temperature at which the clock will show correct time and the coefficient of linear expansion of the metal of the pendulum shaft.

Solution. Let T be the temperature at which the clock is correct.

Time lost per day = 1/2 α (rise in temperature) × 86400

$$\Rightarrow \quad 12 = 1/2\alpha(40-T)\times 86400 \qquad \text{(i)}$$

Time gained per day = 1/2 α (drop in temperature) × 86400

$$\Rightarrow \quad 4 = 1/2\alpha(T-20)\times 86400 \qquad \text{(ii)}$$

Adding Eqs. (i) and (ii), we get

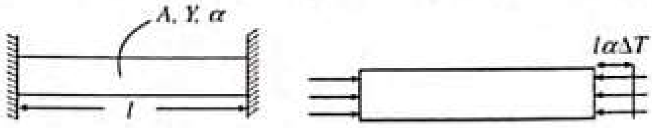
$$32 = 86400\alpha(40-20) \Rightarrow \alpha = 1.85\times 10^{-5}/°C$$

Dividing Eq. (i) by Eq. (ii), we get

$$12(T-20) = 4(40-T) \quad \Rightarrow T = 25°C$$

$\Rightarrow$ Clock shows correct time at 25°C.

3. **Thermal stress in a rigidly fixed rod:** When a rod whose ends are rigidly fixed such as to prevent expansion or contraction, undergoes a change in temperature, a compressive or tensile stress is developed in it. Due to this thermal stress the rod will exert a large force on the supports.



If temperature of rod is increased by ΔT, then change in length

$$\Delta l = l\alpha\,\Delta T$$

$$\text{strain} = \frac{\Delta l}{l} = \alpha\Delta T$$

But due to rigid support, there is no strain. Supports provide force or stresses to keep the length of rod same

$$Y = \frac{\text{stress}}{\text{strain}}$$

Thermal stress = Y (strain) = $Y\alpha\Delta T$

$$\frac{F}{A} = Y\alpha\Delta T \quad F = AY\alpha\,\Delta T$$

ILLUSTRATION 13.11 A rod of length 2 m is at a temperature of 20°C. Find the free expansion of the rod, if the temperature is increased to 50°C, then find stress produced when the rod is (i) fully prevented to expand, (ii) permitted to expand by 0.4 mm. $Y = 2\times 10^{11}$ N/m^2; $\alpha = 15\times 10^{-6}$/°C.

Solution. Free expansion of the rod = $\alpha L\Delta\theta$

$= 15\times 10^{-6}$/°C × 2 m × (50 − 20)°C

$= 9\times 10^{-4}$ m = 0.9 mm

(i) If the expansion is fully prevented,

$$\text{then strain} = \frac{9\times 10^{-4}}{2} \Rightarrow 4.5\times 10^{-4}$$

$\therefore$ Temperature stress = strain × Y

$= 4.5\times 10^{-4}\times 2\times 10^{11}$

$= 9\times 10^{7}$ N/m^2

(ii) If 0.4 mm expansion is allowed, then length restricted to expand = 0.9 − 0.4 = 0.5 mm

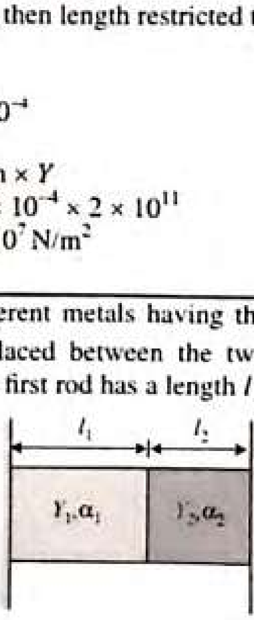
$$\therefore \quad \text{Strain} = \frac{5\times 10^{-4}}{2} = 2.5\times 10^{-4}$$

$\therefore$ Temperature stress = strain × Y

$= 2.5\times 10^{-4}\times 2\times 10^{11}$

$= 5\times 10^{7}$ N/m^2

ILLUSTRATION 13.12 Two rods of different metals having the same area of cross section A are placed between the two massive walls as shown in figure. The first rod has a length l_1, coefficient of linear expansion α_1 and Young's modulus Y_1. The corresponding quantities for second rod are l_2, α_2 and Y_2. The temperature of both the rods is now raised by t°C.



(i) Find the force with which the rods act on each other (at higher temperature) in terms of given quantities.

(ii) Also find the length of the rods at higher temperature.

Solution.

(i) Let t°C = increase in the temperature.

Increase in length of first rod = $l_1\alpha_1 t$

Increase in length of second rod = $l_2\alpha_2 t$

∴ Total extension in length due to rise in temperature

$$= l_1\alpha_1 t + l_2\alpha_2 t = (l_1\alpha_1 + l_2\alpha_2)t \quad \text{(i)}$$

Since the walls are rigid, this increase in length will not happen. This will be compensated by equal and opposite forces F. F producing decrease in the lengths of the rods due to elasticity.

∴ Decrease in length of first rod = $\dfrac{F \times l_1}{Y_1 \times A}$

And decrease in length of second rod = $\dfrac{F \times l_2}{Y_2 \times A}$

∴ Total decrease in length due to elastic force

$$= \frac{F}{A}\left(\frac{l_1}{Y_1} + \frac{l_2}{Y_2}\right) \quad \text{(ii)}$$

From Eqs. (i) and (ii), we have

$$\frac{F}{A}\left(\frac{l_1}{Y_1} + \frac{l_2}{Y_2}\right) = (l_1\alpha_1 + l_2\alpha_2)t$$

or $$F = \frac{A(l_1\alpha_1 + l_2\alpha_2)t}{\left(\dfrac{l_1}{Y_1} + \dfrac{l_2}{Y_2}\right)} \quad \text{(iii)}$$

(ii) Length of the first rod = original length + increase in length due to temperature − decrease in length due to force

$$= \left(l_1 + l_1\alpha_1 t - \frac{F}{A}\frac{l_1}{Y_1}\right)$$

and length of second rod = $l_2 + l_2\alpha_2 t - \dfrac{F}{A}\dfrac{l_2}{Y_2}$

∴ The total length is same = $l_1 + l_2$ at all temperatures.

θ = temperature at the time of measurement and θ_C = temperature at the time of calibration.

Concept Application Exercise 13.2

1. A steel rod is 3.000 cm at 25°C. A brass ring has an interior diameter of 2.992 cm at 25°C. At what common temperature will the ring just slide on to the rod?
2. A clock with a metallic pendulum gains 5 s each day at a temperature of 15°C and loses 10 s each day at a temperature of 30°C. Find the coefficient of thermal expansion of the pendulum metal.
3. The design of some physical instrument requires that there be a constant difference in length of 10 cm between an iron rod and a copper cylinder laid side by side at all temperatures. Find their lengths.
   ($\alpha_{Fe} = 11 \times 10^{-6}$ °C^{-1}, $\alpha_{Cu} = 17 \times 10^{-6}$ °C^{-1})
4. A metal rod of 30 cm length expands by 0.075 cm when its temperature is raised from 0°C to 100°C. Another rod of a different metal of length 45 cm expands by 0.045 cm for the same rise in temperature. A composite rod C made by joining A and B end to end expands by 0.040 cm when its length is 45 cm and it is heated from 0°C to 50°C. Find the length of each portion of the composite rod.
5. A brass scale is graduated at 10°C. What is the true length of a zinc rod which measures 60.00 cm on this scale at 30°C?
   Coefficient of linear expansion of brass = 18×10^{-6} K^{-1}.
6. A long horizontal glass capillary tube open at both ends contains a mercury thread 1 m long at 0°C. Find the length of the mercury thread, as read on this scale, at 100°C.
   (Given, $\gamma_{mercury} = 18.2 \times 10^{-5}$ K^{-1} and $\alpha_{glass} = 9 \times 10^{-6}$ K^{-1})

TRANSMISSION OF HEAT

Heat energy transfers from a body at higher temperature to a body at lower temperature. The transfer of heat from one body to another may take place by any of the following modes.

Conduction	Convection	Radiation
Heat flows from hot end to cold end. Particles of the medium simply oscillate but do not leave their place	Each particle absorbing heat is mobile	Heat flows without any intervening medium in the form of electromagnetic waves
Medium is necessary for conduction	Medium is necessary for convection	Medium is not necessary for radiation
It is a slow process	It is also a slow process	It is a very fast process
Path of heat flow may be zig-zag	Path may be zig-zag or curved	Path is a straight line
Conduction takes place in solids	Convection takes place in fluids	Radiation takes place in gaseous and transparent media
The temperature of the medium increases through which heat flows	In this process also the temperature of medium increases	There is no change in the temperature of the medium

Conduction

The process of transmission of heat energy in which the heat is transferred from one particle to other without dislocation of the particles from their equilibrium position is called conduction.

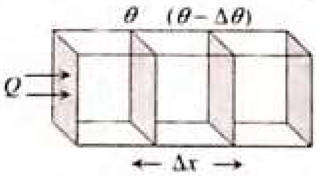
i. Conduction is a process which is possible in all states of matter.

ii. In solids only conduction takes place.

iii. In non-metallic solids and fluids the conduction takes place only due to vibrations of molecules; therefore, they are poor conductors.

iv. In metallic solids free electrons carry the heat energy; therefore, they are good conductors of heat.

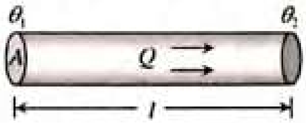
1. **Temperature gradient:** The rate of change of temperature with distance between two isothermal surfaces is called temperature gradient.
If the temperature of two isothermal surfaces be θ and $(\theta - \Delta\theta)$ and the perpendicular distance between them be Δx, then temperature gradient $= \dfrac{(\theta - \Delta\theta) - \theta}{\Delta x} = \dfrac{-\Delta\theta}{\Delta x}$



The negative sign shows that temperature θ decreases as the distance x increases in the direction of heat flow.
Unit: K/m (SI); dimension: $[L^{-1}\theta]$

2. **Coefficient of thermal conductivity:** If L be the length of the rod, A the area of cross section and θ_1 and θ_2 be the temperatures of its two faces, then the amount of heat flowing from one face to the other face in time t is

$Q \propto A$
$\propto (\theta_1 - \theta_2)$
$\propto t$
$\propto \dfrac{1}{l}$



In combined form

$$Q \propto \frac{A(\theta_1 - \theta_2)t}{l}$$

$$Q = \frac{KA(\theta_1 - \theta_2)t}{l}$$

where K is coefficient of thermal conductivity of material of rod. It is the measure of the ability of a substance to conduct heat through it.
This relation can also be expressed as

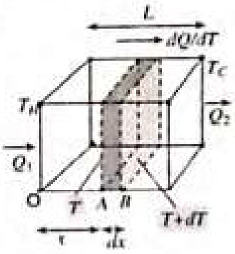
$$\frac{\Delta Q}{\Delta t} = \frac{KA(\theta_1 - \theta_2)}{l}$$

If $A = 1\ \text{m}^2$, $(\theta_1 - \theta_2) = 1°\text{C}$, $t = 1$ s and $l = 1$ m, then $Q = K$.
Thus, thermal conductivity of a material is the amount of heat flowing per second during steady state through its rod of length 1 m and cross section 1 m^2 with a unit temperature difference between the opposite faces.

i. Units: cal/cm-s°C (in CGS), kcal/m-s-K (in MKS) and W/m-K (in SI)
ii. Dimension: $[MLT^{-3}\theta^{-1}]$
iii. The magnitude of K depends only on nature of the material.
iv. For perfect conductors, $K = \infty$ and for perfect insulators, $K = 0$
v. Substances in which heat flows quickly and easily are known as good conductors of heat. They possess large thermal conductivity due to large number of free electrons. Example: silver, brass, etc.
vi. Substances which do not permit easy flow of heat are called bad conductors. They possess low thermal conductivity due to very few free electrons. Example: glass, wood, etc.
vii. The thermal conductivity of pure metals decreases with rise in temperature but for alloys thermal conductivity increases with increase of temperature.
viii. Human body is a bad conductor of heat (but it is a good conductor of electricity).

Consider a slab of face area A, lateral thickness L, whose faces have temperatures T_H and T_C $(T_H > T_C)$.

Now consider two cross sections in the slab at positions A and B separated by a lateral distance of dx. Let temperature of face A be T and that of face B be $T + dT$. Then the rate at which heat crosses the area A of the slab at position x in time t is given by



$$\frac{dQ}{dt} = -KA\frac{dT}{dx} \qquad \text{(i)}$$

Here K is a constant depending on the material of the slab and is named thermal conductivity of the material, and the quantity $\left(\dfrac{dT}{dx}\right)$ is called temperature gradient. The (−) sign in equation shows heat flows from high to low temperature (dT is a negative quantity).

ILLUSTRATION 13.13 An ordinary refrigerator is thermally equivalent to a box of corkboard 90 mm thick and 5.6 m^2 in inner surface area. When the door is closed, the inside wall is kept, on the average, 22.2°C below the temperature of the outside wall. If the motor of the refrigerator runs 15% of the time while the door is closed, at what rate must heat be taken from the interior while the motor is running? The thermal conductivity of corkboard is $k = 0.05$ W/mK.

Solution. Consider a time interval Δt during which the door is closed. As approximation, take the heat conduction to be steady over Δt.
Then the rate of heat into the box is

$$\frac{\Delta Q}{\Delta t} = kA\left(\frac{\Delta T}{\Delta x}\right) = (0.05)(5.6)\left(\frac{22.2}{0.090}\right) = 69.1\ \text{W}$$

To remove this heat, the motor must, since it runs only for a time $(0.15)\,\Delta t$, cause heat to leave at the rate $69.1/0.15 = 460$ W.

ILLUSTRATION 13.14 Water is being boiled in flat bottom kettle placed on a stove. The area of the bottom is 3000 cm^2 and the thickness is 2 mm. If the amount of steam produced is 1 g/min, calculate the difference of temperature between the inner and outer surface of the bottom. K for the material of kettle is 0.5 cal/°C/s/cm, and the latent heat of steam is 540 cal/g.

Solution. Mass of steam produced $= \dfrac{dm}{dt} = \dfrac{1}{60}$ g/s

Heat transferred per second

$$= \frac{dH}{dt} = L\frac{dm}{dt} \Rightarrow \frac{dH}{dt} = 540 \times \frac{1}{60} \text{ cal/s} = 9 \text{ cal/s}$$

Area = 3000 cm^2; K = 0.5 cal/°C/s/cm

θ = temperature difference

d = thickness = 2 mm = 0.2 cm

$$\frac{dH}{dt} = \frac{KA\theta}{d} \Rightarrow L\frac{dm}{dt} = \frac{KA\theta}{d}$$

$$\Rightarrow \quad 9 = \frac{0.5 \times 3000 \times \theta}{0.2} \Rightarrow \theta = 1.2 \times 10^{-3}\text{°C}$$

3. **Thermometric conductivity or diffusivity:** It is a measure of rate of change of temperature (with time) when the body is not in steady state (i.e., in variable state). The thermometric conductivity or diffusivity is defined as the ratio of the coefficient of thermal conductivity to the thermal capacity per unit volume of the material.

Thermal capacity per unit volume = $\frac{mc}{V} = \rho c$ (as ρ is density of substance)

$\therefore$ Diffusivity (D) = $\frac{K}{\rho c}$

Unit: m^2/s; dimension: $[L^2T^{-1}]$

4. **Thermal resistance:** The thermal resistance of a body is a measure of its opposition to the flow of heat through it. It is defined as the ratio of temperature difference to the heat current (= rate of flow of heat).
Now, temperature difference = $(\theta_1 - \theta_2)$ and heat current,

$$H = \frac{Q}{t}$$

$\therefore$ Thermal resistance

$$R = \frac{\theta_1 - \theta_2}{H} = \frac{\theta_1 - \theta_2}{Q/t} = \frac{\theta_1 - \theta_2}{KA(\theta_1 - \theta_2)/l} = \frac{l}{KA}$$

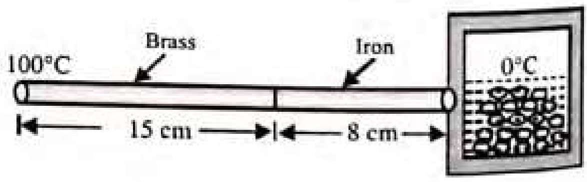
Unit: °C × s/cal or K × s/kcal; dimension: $[M^{-1}L^{-2}T^{3}\theta]$

Electrical Analogy for Thermal Conduction

It is an important fact to appreciate that there exists an exact similarity between thermal and electrical conductivities of a conductor.

Electrical conduction	Thermal conduction
Electric charge flows from higher potential to lower potential	Heat flows from higher temperature to lower temperature
The rate of flow of charge is called the electric current, i.e., $I = \frac{dq}{dt}$	The rate of flow of heat may be called heat current i.e., $H = \frac{dQ}{dt}$
The relation between the electric current and the potential difference is given by Ohm's law, i.e., $I = \frac{V_1 - V_2}{R}$ where R is the electrical resistance of the conductor	Similarly, the heat current may be related with the temperature difference as $H = \frac{\theta_1 - \theta_2}{R}$ where R is the thermal resistance of the conductor
The electrical resistance is defined as $R = \frac{\rho l}{A} = \frac{l}{\sigma A}$, where ρ = resistivity and σ = electrical conductivity	The thermal resistance may be defined as $R = \frac{l}{KA}$. where K = Thermal conductivity of conductor
$\frac{dq}{dt} = I = \frac{V_1 - V_2}{R} = \frac{\sigma A}{l}(V_1 - V_2)$	$\frac{dQ}{dt} = H = \frac{\theta_1 - \theta_2}{R} = \frac{KA}{l}(\theta_1 - \theta_2)$

ILLUSTRATION 13.15 One end of a uniform brass rod 15 cm long and 20 cm^2 cross-sectional area is kept at 100°C. The other end is at prefect contact with an iron rod of identical cross section, but length 8 cm. The lateral surface of the composite rod is surrounded by a heat insulator and the free end of the iron rod is kept in ice at 0°C. If 684 g of ice melts in 1 h, determine the thermal conductivity of iron. Thermal conductivity of brass = 0.25 cal/s-cm°C and latent heat of fusion of ice = 80 cal/g.



Solution. Let the thermal conductivity of iron be K = cal/s-cm-°C.

The thermal resistance of brass rod

$$R_1 = \frac{l_1}{K_1 A} = \frac{15\text{cm}}{\frac{0.25 \text{ cal}}{\text{s-cm°C}} \times 20 \text{ cm}^2} = 3\text{s-°C/cal}$$

And that of iron rod

$$R_2 = \frac{l_2}{K_2 A} = \frac{8 \text{ cm}}{\frac{K \text{ cal}}{\text{s-cm°C}} \times 20 \text{ cm}^2} = \frac{2}{5K} \text{ s-°C/cal}$$

Since, the two rods are arranged in series, their effective

thermal resistance is given by

$$R = R_1 + R_2 = \left(3 + \frac{2}{5K}\right)\text{s-}^\circ\text{C/cal}$$

Now, rate of heat flow through the rods $= \dfrac{\Delta Q}{\Delta t}$

But $\dfrac{\Delta Q}{\Delta t} = \dfrac{(684\ \text{g})}{3600\ \text{s}}\left(80\ \dfrac{\text{cal}}{\text{g}}\right) = 15.2\ \text{cal/s}$

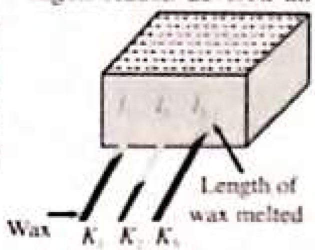
Since $\dfrac{\Delta Q}{\Delta t} = \dfrac{(T_1 - T_2)}{R}$ $\qquad R = \dfrac{(T_1 - T_2)}{(\Delta Q / \Delta t)}$

$$\left(3 + \frac{2}{5K}\right)\text{s}^\circ\text{C/cal} = \frac{(100-0)^\circ\text{C}}{15.2\ \text{cal/s}}$$

$$K = 111.8 \times 10^{-3}\ \text{cal/s-cm-}^\circ\text{C}$$

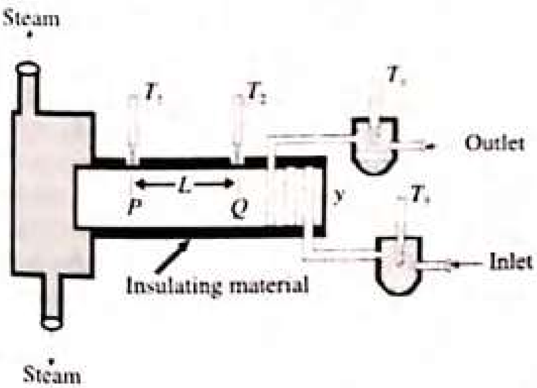
Determination of Thermal Conductivity

1. **Ingen-Hausz experiment:** Ingen-Hausz devised an experiment to compare the thermal conductivities of the metals. If l_1, l_2, …, are the lengths of wax melted on the metal rods, then the ratio of thermal conductivities is



$K_1 : K_2 : K_3 : \ldots = l_1^2 : l_2^2 : l_3^2 : \ldots$

2. **Searle's experiment:** It is a method of determination of K of a metallic rod. Here we are not much interested in the detailed description of the experimental setup. We will only understand its essence, which is the essence of solving many numerical problems.



In this experiment a temperature difference $(T_1 - T_2)$ is maintained across a rod of length L and area of cross section A. If the thermal conductivity of the material of the rod is K, then the amount of heat transmitted by the rod from the hot end to the cold end in time t is given by

$$Q = \frac{KA(T_1 - T_2)t}{L} \qquad \text{(i)}$$

In Searle's experiment, this heat reaching the other end is utilized to raise the temperature of certain amount of water flowing through pipes circulating around the other end of the rod. If temperature of the water at the inlet is T_3 and at the outlet is T_4, then the amount of heat absorbed by water is given by

$$Q = mc(T_4 - T_3) \qquad \text{(ii)}$$

where m is the mass of the water which has absorbed this heat and temperature is raised and c is the specific heat of the water

Equating (i) and (ii), K can be determined, i.e.,

$$K = \frac{mc(T_4 - T_3)l}{A(T_1 - T_2)t}$$

NOTE: In numerical problems, we may have the situation where the amount of heat travelling to the other end may be required to do some other work, e.g., it may be required to melt the given amount of ice. In that case Eq. (i) will have to be equated to mL.

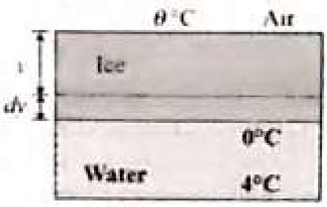
i.e., $\qquad mL = \dfrac{KA(T_1 - T_2)t}{l}$

GROWTH OF ICE ON LAKE

Water in a lake starts freezing if the atmospheric temperature drops below 0°C. Let y be the thickness of ice layer in the lake at any instant t and atmospheric temperature be $-\theta$ °C. The temperature of water in contact with lower surface of ice will be zero. If A is the area of lake, heat escaping through ice in time dt is

$$dQ_1 = \frac{KA[0 - (-\theta)]dt}{y}$$

Now, suppose the thickness of ice layer increases by dy in time dt, due to escaping of above heat. Then



$$dQ_2 = mL = \rho(dy\,A)L$$

As $dQ_1 = dQ_2$, hence, rate of growth of ice will be $(dy/dt) = (K\theta/\rho L y)$

So, the time taken by ice to grow to a thickness y is

$$t = \frac{\rho L}{K\theta}\int_0^y y\,dy = \frac{\rho L}{2K\theta}y^2$$

If the thickness is increased from y_1 to y_2, then time taken

$$t = \frac{\rho L}{K\theta}\int_{y_1}^{y_2} y\,dy = \frac{\rho L}{2K\theta}(y_2^2 - y_1^2)$$

i. Take care and do not apply a negative sign for putting values of temperature in formula and also do not convert it to absolute scale.
ii. Ice is a poor conductor of heat; therefore, the rate of increase of thickness of ice on ponds decreases with time.
iii. It follows from the above equation that time taken to double and triple the thickness, will be in the ratio of $t_1 : t_2 : t_3 :: 1^2 : 2^2 : 3^2$, ie., $t_1 : t_2 : t_3 :: 1 : 4 : 9$

iv. The time intervals to change the thickness from 0 to y, from y to $2y$ and so on will be in the ratio
$\Delta t_1 : \Delta t_2 : \Delta t_3 :: (1^2 - 0^2):(2^2 - 1^2):(3^2 : 2^2)$;
$\Delta t_1 : \Delta t_2 : \Delta t_3 :: 1 : 3 : 5$

RADIATION

The process of the transfer of heat from one place to another place without heating the intervening medium is called radiation.

Precisely it is electromagnetic energy transfer in the form of electromagnetic wave through any medium. It is possible even in vacuum.

For example, the heat from the sun reaches the earth through radiation.

Reflectance, Absorptance and Transmittance

When thermal radiations (Q) fall on a body, they are partly reflected, partly absorbed and partly transmitted.

1. **Reflectance or reflecting power (r):** It is defined as the ratio of the amount of thermal radiations reflected (Q_r) by the body in a given time to the total amount of thermal radiations incident on the body in that time.
2. **Absorptance or absorbing power (a):** It is defined as the ratio of the amount of thermal radiations absorbed (Q_a) by the body in a given time to the total amount of thermal radiatons incident on the body in that time.
3. **Transmittance or transmitting power (t):** It is defined as the ratio of the amount of thermal radiations transmitted (Q_t) by the body in a given time to the total amount of thermal radiations incident on the body in that time.

From the above definitions $r = \frac{Q_r}{Q}$, $a = \frac{Q_a}{Q}$ and $t = \frac{Q_t}{Q}$. By adding we get

$$r + a + t = \frac{Q_r}{Q} + \frac{Q_a}{Q} + \frac{Q_t}{Q} = \frac{(Q_r + Q_a + Q_t)}{Q} = 1$$

$\therefore \quad r + a + t = 1$

(a) r, a and t all are the pure ratios; so, they have no unit and dimension.
(b) For perfect reflector, $r = 1$, $a = 0$ and $t = 0$.
(c) For perfect absorber, $a = 1$, $r = 0$ and $t = 0$ (perfectly black body).
(d) For perfect transmitter, $t = 1$, $a = 0$ and $r = 0$.
(e) If body does not transmit any heat radiation, $t = 0$ $\therefore r + a = 1$ or $a = 1 - r$.
So, if r is more, a is less and vice versa. It means good reflectors are bad absorbers.

4. **Monochromatic emittance or spectral emissive power:** For a given surface it is defined as the radiant energy emitted per second per unit area of the surface with in a unit wavelength around λ.

$$\text{Spectral emissive power } (E_\lambda) = \frac{\text{Energy}}{\text{Area} \times \text{time} \times \text{wavelength}}$$

Unit: $\frac{\text{J}}{\text{m}^2 \times \text{s} \times \text{Å}}$; dimension: $[ML^{-1}T^{-3}]$

5. **Total emittance or total emissive power:** It is defined as the total amount of thermal energy emitted per unit time, per unit area of the body for all possible wavelengths.

$$E = \int_0^\infty E_\lambda d\lambda$$

Unit: $\frac{\text{J}}{\text{m}^2 \times \text{s}}$ or $\frac{\text{Watt}}{\text{m}^2}$; dimension: $[MT^{-3}]$

6. **Monochromatic absorptance or spectral absorptive power:** It is defined as the ratio of the amount of the energy absorbed in a certain time to the total heat energy incident upon it in the same time, both in the unit wavelength interval. It is dimensionless and unitless quantity. It is represented by a_λ.
7. **Total absorptance or total absorpting power:** It is defined as the total amount of thermal energy absorbed per unit time, per unit area of the body for all possible wavelengths.

$$a = \int_0^\infty a_\lambda d\lambda$$

It is also unitless and dimensionless quantity.

8. **Emissivity (e):** Emissivity of a body at a given temperature is defined as the ratio of the total emissive power of the body ($E_{\text{practical}}$) to the total emissive power of a perfect black body (E_{black}) at that temperature.

$$e = \frac{E_{\text{practical}}}{E_{\text{black}}}$$

$e = 1$ for perfectly black body but for practical bodies emissivity (e) lies between zero and one ($0 < e < 1$).

9. **Perfectly black body:** A perfectly black body is that which absorbs completely the radiations of all wavelengths incident on it. As a perfectly black body neither reflects nor transmits any radiation, the absorptance of a perfectly black body is unity, i.e., $t = 0$ and $r = 0$, therefore, $a = 1$

We know that the colour of an opaque body is the colour (wavelength) of radiation reflected by it. As a black body reflects no wavelength so, it appears black, whatever be the colour of radiations incident on it.

When perfectly black body is heated to a suitable high temperature, it emits radiation of all possible wavelengths. For example, temperature of the sun is very high (6000 K approx.). It emits all possible radiation so it is an example of black body.

PREVOST'S THEORY OF HEAT EXCHANGE

1. Everybody emits heat radiations at all finite temperatures (Except 0 K) as well as it absorbs radiations from the surroundings.
2. Exchange of energy along various bodies takes place via radiation.

3. The process of heat exchange among various bodies is a continuous phenomenon.
4. If the amount of radiation absorbed by a body is greater than that emitted by it then the temperature of body increases and it appears hotter.
5. If the amount of radiation absorbed by a body is less than that emitted by it, then the temperature of the body decreases and consequently the body appears colder.
6. If the amount of radiation absorbed by a body is equal to that emitted by the body, then the body will be in thermal equilibrium and the temperature of the body remains constant.
7. At absolute zero temperature (0 K or –273°C) this law is not applicable because at this temperature the heat exchange among various bodies ceases.

KIRCHHOFF'S LAW

The ratio of emissive power to absorptive power is same for all surfaces at the same temperature and is equal to the emissive power of a perfectly black body at that temperature.

Experimentally a very good approximation to a black body is provided by a cavity enclosed by high temperature opaque walls regardless of the composition of the material of its interior walls. Thus, if $a_{\text{practical}}$ and $E_{\text{practical}}$ represent the absorptive and emissive power of a given surface, while a_{black} and E_{black} for a perfectly black body, then according to law

$$\frac{E_{\text{practical}}}{a_{\text{practical}}}=\frac{E_{\text{black}}}{a_{\text{black}}}$$

But for a perfectly black body, $a_{\text{black}} = 1$

So $\dfrac{E_{\text{practical}}}{a_{\text{practical}}}=E_{\text{black}}$

If emissive and absorptive powers are considered for a particular wavelength λ,

$$\left(\frac{E_\lambda}{a_\lambda}\right)_{\text{practical}}=(E_\lambda)_{\text{black}}$$

Now since $(E\lambda)_{\text{black}}$ is constant at a given temperature, according to this law if a surface is a good absorber of a particular wavelength it is also a good emitter of that wavelength.

This in turn implies that a good absorber is a good emitter (or radiator).

ILLUSTRATION 13.16 An electric heater of surface area 200 cm² emits radiant energy of 60 kJ at time interval of 1 min. Determine its emissive power. If its emissivity be 0.45, what would be the radiant energy emitted by a black body in one hour, identical to the electrical heater in all respects?

Solution. Given $\Delta Q = 60$ kJ; $A = 200\times10^{-4}$ m² and $\Delta t = 60$ s

Using, emissive power $E=\left(\dfrac{\Delta Q}{\Delta t}\right)\dfrac{1}{A}$, we have

$$E=\frac{60\,\text{kJ}}{200\times10^{-4}\,\text{m}^2\times60\,\text{s}}=50\ \text{kW/m}^2$$

∴ Emissivity (of a surface)

$$e=\frac{\text{emissive power (of that surface)}}{\text{emissive power (of a black body)}}$$

∴ Emissive power of a black body

$$=\frac{50}{0.45}\,\text{kW/m}^2=111.11\ \text{kW/m}^2$$

∴ Heat radiated $\Delta Q = EA\Delta t$

$$=\left(111.11\frac{\text{kW}}{\text{m}^2}\right)(200\times10^{-4}\,\text{m}^2)(60\times60\,\text{s})=8000\,\text{kJ}$$

STEFAN'S LAW

According to it the radiant energy emitted by a perfectly black body per unit area per second (i.e. emissive power of black body) is directly proportional to the fourth power of its absolute temperature, i.e.,

$$E\propto T^4 \quad\text{or}\quad E=\sigma T^4$$

where σ is a constant called Stefan's constant having dimension $(MT^{-3}\theta^{-4})$ and value $5.67\times10^{-8}\,\text{W/m}^2\text{K}^4$.

(i) If e is the emissivity of the body then $E=e\sigma T^4$.

(ii) If Q is the total energy radiated by the body then
$$E=\frac{Q}{A\times t}=e\sigma T^4 \quad\Rightarrow Q=Ate\sigma T^4$$

(iii) If a body at temperature T is surrounded by a body at temperature T_0, then Stefan's law may be put as
$$E=e\sigma(T^4-T_0^4)$$

(iv) Cooling by radiation: If a body at temperature T is in an environment of temperature $T_0(<T)$, the body is losing as well as receiving heat; so the net rate of loss of energy
$$\frac{dQ}{dt}=eA\sigma(T^4-T_0^4) \qquad \text{(i)}$$
Now if m is the mass of body and c its specific heat, the rate of loss of heat at temperature T must be
$$\frac{dQ}{dt}=mc\frac{dT}{dt} \qquad \text{(ii)}$$
From Eqs. (i) and (ii), $mc\dfrac{dT}{dt}=eA\sigma(T^4-T_0^4)$

∴ Rate of fall of temperature or rate of cooling
$$\frac{dT}{dt}=\frac{eA\sigma}{mc}(T^4-T_0^4) \qquad \text{(iii)}$$
i.e., when a body cools by radiation the rate of cooling depends on

(a) Nature of radiating surface, i.e., greater the emissivity, faster will be the cooling.
(b) Area of radiating surface, i.e., greater the area of radiating surface, faster will be the cooling.
(c) Mass of radiating body, i.e.. greater the mass of radiating body slower will be the cooling.

(d) Specific heat of radiating body, i.e., greater the specific heat of radiating body slower will be cooling.
(e) Temperature of radiating body, i.e., greater the temperature of body faster will be cooling.
(f) Temperature of surrounding, i.e., greater the temperature of surrounding slower will be cooling.

ILLUSTRATION 13.17 The operating temperature of an incandescent bulb (with a tungsten filament) of power 60 W is 3000 K. If the surface area of the filament be 25 mm^2, find its emissivity e.

Solution. Given $T = 3000$ K; Power $= \dfrac{dQ}{dt} = 60$ W

Area $A = 25\times10^{-6}\,\text{m}^2$, $e = ?$

Using Eq. (i), we have, total radiation lost per second

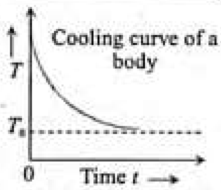
$$= \frac{dQ}{dt} = Ae\sigma T^4$$

$$60\text{ W} = (25\times10^{-6}\,\text{m}^2)e\left(5.67\times\frac{10^{-8}}{\text{m}^2-\text{K}^4}\right)(3000)^4\,\text{K}^4$$

$$60 = 114.82\,e \quad \text{or} \quad e = 0.52$$

NEWTON'S LAW OF COOLING

If in case of cooling by radiation the temperature T of body is not very different from that of surrounding



Then $\dfrac{dT}{dt} \propto \Delta T$ or $\dfrac{dT}{dt} \propto T - T_0$

i.e., if the temperature of body is not very different from surrounding, rate of cooling is proportional to temperature difference between the body and its surrounding. This law is called Newton's law of cooling.

1. Practical examples:
   i. Hot water loses equal amount of heat in smaller duration as compared to moderate warm water.
   ii. Adding milk in hot tea reduces the rate of cooling.
2. Greater the temperature difference between body and its surrounding greater will be the rate of cooling.
3. If $\theta = \theta_0, \dfrac{dQ}{dt} = 0$, i.e., a body can never be cooled to a temperature lesser than its surrounding by radiation.
4. If a body cools by radiation from θ_1°C to θ_2°C in time t, then $\dfrac{d\theta}{dt} = \dfrac{\theta_1-\theta_2}{t}$ and $\theta_{av} = \dfrac{\theta_1+\theta_2}{2}$

   Then Newton's law of cooling becomes

   $$\left[\frac{\theta_1-\theta_2}{t}\right] = K\left[\frac{\theta_1+\theta_2}{2} - \theta_0\right]$$

   This form of law helps in solving numerical problems.

5. **Cooling curves:**

Curve between temperature of body θ and time.  $\theta - \theta_0 = Ae^{-kt}$, which indicates temperature decreases exponentially with increasing time.	Curve between rate of cooling (R) and temperature difference between body (θ) and surrounding (θ_0)  $R \propto (\theta - \theta_0)$. This is a straight line passing through origin.
Curve between the rate of cooling (R) and body temperature (θ).  $R = K(\theta - \theta_0) = K\theta - K\theta_0$ This is a straight line intercept R-axis at $-K\theta_0$	Curve between $\log(\theta - \theta_0)$ and time  As $\dfrac{d\theta}{dt} \propto -(\theta-\theta_0) \Rightarrow \dfrac{d\theta}{(\theta-\theta_0)} = -Kdt$ Integrating $\log_e(\theta-\theta_0) = -Kt + C$ $\log_e(\theta-\theta_0) = -Kt + \log_e A$ This is a straight line with negative slope.

6. **Determination of specific heat of a liquid:** If volume, radiating surface area, nature of surface, initial temperature and surrounding of water and given liquid are equal and they are allowed to cool down (by radiation), then rate of loss of heat and fall in temperature of both will be same.

   i.e., $\left(\dfrac{dQ}{dt}\right)_{\text{water}} = \left(\dfrac{dQ}{dt}\right)_{\text{liquid}}$

   $$(ms+W)\frac{(\theta_1-\theta_2)}{t_1} = (m_1s_1+W)\frac{(\theta_1-\theta_2)}{t_2}$$

   or $$\left[\frac{ms+W}{t_1}\right] = \left[\frac{m_1s_1+W}{t_2}\right]$$

   (where W = waterequivalent of calorimeter)
   If densities of water and liquid are ρ and ρ', respectively, then $m = V\rho$ and $m' = V\rho'$.

ILLUSTRATION 13.18 A body cools down from 60°C to 55°C in 30 s. Using Newton's law of cooling, calculate the time taken by same body to cool down from 55°C to 50°C. Assume that the temperature of surrounding is 45°C.

Solution. Assume that a body cools down from temperature θ_i to θ_f in t seconds, and θ_c is the temperature of surroundings. Applying Newton's law of cooling,

According to Newton's law of cooling

$\dfrac{d\theta}{dt} = -K(\theta-\theta_0)$; $\theta_0 = 45$°C; Integrating both sides $\int\dfrac{d\theta}{\theta-45} = -\int dt$

(K is constant)

from $t = 0$ s to $t = 30$ s, θ changes from 60°C to 55°C.

$$\int_{60}^{55} \frac{d\theta}{\theta-45} = -K\int_{0}^{30} dt \quad \Rightarrow \ln\left(\frac{50-45}{60-45}\right) = -K(30-0) \qquad \text{(i)}$$

$$\int_{55}^{50} \frac{d\theta}{\theta-45} = -K\int_{30}^{t} dt \quad \Rightarrow \ln\left(\frac{50-45}{60-45}\right) = -K(t-30) \qquad \text{(ii)}$$

Divide Eq. (ii) by Eq. (i) to set:

$$\frac{t-30}{30} = \frac{\ln\frac{50-45}{55-45}}{\ln\frac{55-45}{60-45}} \Rightarrow \frac{t-30}{30} = \frac{\ln 2}{\ln 3/2}$$

$$\Rightarrow \quad t = 30\left(1+\frac{\ln 2}{\ln 3/2}\right) = 81.28 \text{ s}$$

time from $\theta = 55$°C to $\theta = 50$°C is $(t - 30) = (81.28 - 30)$
$= 51.28$ s.

DISTRIBUTION OF ENERGY IN THE SPECTRUM OF BLACK BODY

Langley and later on Lummer and Pringsheim investigated the distribution of energy amongst the different wavelengths in the thermal spectrum of a black body radiation. The results obtained are shown in figure. From these curves it is clear that

(1) At a given temperature energy is not uniformly distributed among different wavelengths.

(2) At a given temperature intensity of heat radiation increases with wavelength, reaches a maximum at a particular wavelength and with further increase in wavelength it decreases.

(3) With increase in temperature wavelength λ_m corresponding to most intense radiation decreases in such a way that $\lambda_m \times T$ = constant [Wien's law].

(4) For all wavelengths an increase in temperature causes an increase in intensity.

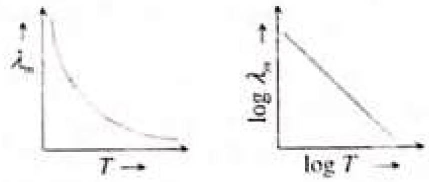
(5) The area under the curve $= \int E_\lambda d\lambda$ will represent the total intensity of radiation at a particular temperature. This area increases with rise in temperature of the body. It is found to be directly proportional to the fourth power of absolute temperature of the body, i.e.,

$$E = \int E_\lambda d\lambda \propto T^4 \quad \text{[Stefan's law]}$$

WIEN'S DISPLACEMENT LAW

When a body is heated it emits radiations of all wavelengths. However, the intensity of radiations of different wavelengths is different.

According to Wien's law the product of wavelengths corresponding to maximum intensity of radiation and temperature of body (in Kelvin) is constant, i.e., $\lambda_m T = b$ = constant where b is Wien's constant and has value 2.89×10^{-3} m-K.



This law is of great importance in 'Astrophysics' as through the analysis of radiations coming from a distant star, by finding λ_m, the temperature of the star $T(= b/\lambda_m)$ is determined.

ILLUSTRATION 13.19 A hot black body emits the energy at the rate of 16 J m^{-2} s^{-1} and its most intense radiation corresponds to 20,000 Å. When the temperature of this body is further increased and its most intense radiation corresponds to 10,000 Å, then find the value of energy radiated in Jm^{-2} s^{-1}.

Solution. Wien's displacement law is

$$\lambda_m T = b \quad \text{i.e.} \quad T \propto \frac{1}{\lambda_m}$$

Here, λ_m becomes half, so temperature doubles.

Also $\quad e = \sigma T^4$

$$\Rightarrow \quad \frac{e_1}{e_2} = \left(\frac{T_1}{T_2}\right)^4$$

$$\Rightarrow \quad e_2 = \left(\frac{T_1}{T_2}\right)^4 e_1 = (2)^4 \times 16 = 16 \times 16 = 256 \text{ J m}^{-2}\text{ s}^{-1}$$

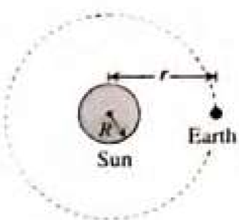
TEMPERATURE OF THE SUN AND SOLAR CONSTANT

If R is the radius of the sun and T its temperature, then the energy emitted by the sun per second through radiation in accordance with Stefan's law will be given by

$$P = eA\sigma T^4 = 4\pi R^2 \sigma T^4$$

[for sun $e = 1$]

In reaching earth, this energy will spread over a sphere of radius r (= average distance between sun and earth); so the intensity of solar radiation at the surface of earth (called solar constant S) will be given by



$$S = \frac{P}{4\pi r^2} = \frac{4\pi R^2 \sigma T^4}{4\pi r^2}$$

$$\text{i.e.,} \quad T = \left[\left(\frac{r}{R}\right)^2 \frac{S}{\sigma}\right]^{1/4} = \left[\left(\frac{1.5\times10^8}{7\times10^5}\right)^2 \times \frac{1.4\times10^3}{5.67\times10^{-8}}\right]^{1/4} = 5800 \text{ K}$$

As $\quad r = 1.5\times10^8$ km, $R = 7\times10^5$ km, $S = 2\dfrac{\text{cal}}{\text{cm}^2\text{ min}} = 1.4\dfrac{\text{kW}}{\text{m}^2}$

and $\sigma = 5.67\times10^{-8}\dfrac{W}{m^2K^4}$

This result is in good agreement with the experimental value of temperature of sun, i.e., 6000 K.

The difference in the two values is attributed to the fact that sun is not a perfectly black body.

ILLUSTRATION 13.20 The intensity of solar radiation just outside the earth's atmosphere is measured to be 1.4 kW/m^2. If the radius of the sun 7×10^8 m, while the earth–sun distance is 150×10^6 km, then find

i. the intensity of solar radiation at the surface of the sun,
ii. the temperature at the surface of the sun assuming it to be a black body,
iii. the most probable wavelength in solar radiation.

Solution. Assuming the sun to be a 'blackbody' at a temperature T_0, we can write,

W = intensity of solar radiation on the sun's surface $= \sigma T_0^4$,

where σ is the Stefan–Boltzmann constant.

i. The radiation emitted from the solar surface per unit time is spread over the surface of a sphere having a radius equal to earth–sun distance where it is received on the earth (just outside the atmosphere)

$$W\times 4\pi R_S^2 = I_0\times 4\pi D_{SE}^2$$

where D_{SE} is the distance between the sun and the earth, and I_0 is the intensity outside the earth's atmosphere.

$$I_0 = W\times\left(\frac{R_S}{D_{SE}}\right)^2$$

Now, $R_S = 7\times10^8\,\text{m}, D_{SE} = 150\times10^9\,\text{m}$

and $I_0 = 1.4\times10^3\ \text{W/m}^2$

$$\therefore\quad 1.4\times10^3 = W\times\left(\frac{7\times10^8}{150\times10^9}\right)^2 = W\times\frac{49}{225}\times10^{-4}$$

or $W = 6.4\times10^7\ \text{W/m}^2$

ii. Assuming the sun to be a black body,

$$6.4\times10^7 = \sigma T_0^4 = (5.67\times10^{-8})T_0^4$$

$$\therefore\quad T_0^4 = \frac{6.4}{5.67}\times10^{15}$$

or $T_0 = 0.58\times10^4\,\text{K} = 5800\ \text{K}$

iii. Using Wien's displacement law,

$$\lambda_{mp}T_0 = 0.29\ \text{cm-K} = 2.9\times10^{-3}\,\text{m-K}$$

or $\lambda_{mp} = \dfrac{2.0\times10^{-3}}{5800} = 5\times10^{-7}\,\text{m} = 5000\ \text{Å}$

CONCEPT APPLICATION EXERCISE 13.3

1. An electric heater is used in a room of total wall area 137 m^2 to maintain a temperature of +20°C inside it, when the outside temperature is −10°C. The walls have three different layers of materials. The innermost layer is of wood of thickness 2.5 cm, the middle layer is of cement of thickness 1.0 cm and the outermost layer is of brick of thickness 25.0 cm. Find the power of electric heater. Assume that there is no heat loss through the floor and the ceiling. The thermal conductivities of wood, cement and brick are 0.125, 1.5 and 1.0 W/m-°C, respectively.

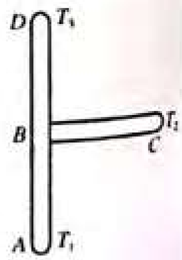
2. Two rods A and B of same length and cross-sectional area are connected in series and a temperature difference of 100°C is maintained across the combination as shown in figure. If the thermal conductivity of the rod A is $3k$ and that of rod B is k, then

   (i) determine the thermal resistance of each rod.
   (ii) determine the heat current flowing through each rod.
   (iii) determine the heat current flowing through each rod.
   (iv) plot the variation of temperature along the length of the rod.

3. Two conductors A and B given in previous problem are connected in parallel as shown in figure.

   (i) Determine the equivalent thermal resistance.
   (ii) Determine the heat current in each rod.

4. Three rods AB, BC and BD having thermal conductivities in the ratio 1 : 2 : 3 and lengths in the ratio 2 : 1 :1 are joined as shown in figure. The ends A, C and D are at temperatures T_1, T_2 and T_3, respectively. Find the temperature of the junction B. Assume steady state.



5. A cube and a sphere of equal edge and radius, made of the same substance are allowed to cool under identical conditions. Determine which of the two will cool at a faster rate.

6. A spherical ball of radius 1 cm coated with a metal having emissivity 0.3 is maintained at 1000 K temperature and suspended in a vacuum chamber whose walls are maintained at 300 K temperature. Find rate at which electrical energy is to be supplied to the ball to keep its temperature constant.

SOLVED EXAMPLES

1. If there are no heat losses, the heat released by the condensation of x gm of steam at 100°C into water at 100°C can be used to convert y gm of ice at 0°C into water at 100°C. Then the ratio $y : x$ is nearly

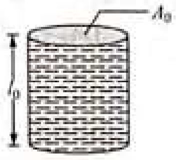
(a) 1 : 1 (b) 2.5 : 1
(c) 2 : 1 (d) 3 : 1

Sol. (d) Heat released to convert x gm of steam at 100°C to water at 100°C is $x \times 540$ cals.

If y gm of ice is converted from 0°C to water at 100°C it requires heat $y \times 80 + y \times 1 \times 100 = 180\,y$

$\therefore x \times 540 = 180y$ or $\frac{y}{x} = \frac{540}{180} = \frac{3}{1}$

2. The figure shows a glass tube (linear co-efficient of expansion is α) completely filled with a liquid of volume expansion co-efficient γ. On heating length of the liquid column does not change. Choose the correct relation between γ and α



(a) $\gamma = \alpha$ (b) $\gamma = 2\alpha$
(c) $\gamma = 3\alpha$ (d) $\gamma = \frac{\alpha}{3}$

Sol. (b) When length of the liquid column remains constant, then the level of liquid moves down with respect to the container, thus γ must be less than 3α.

Now we can write $V = V_0(1 + \gamma\Delta T)$

Since $V = Al_0 = [A_0(1 + 2\alpha\Delta T)]l_0 = V_0(1 + 2\alpha\Delta T)$

Hence $V_0(1 + \gamma\Delta T) = V_0(1 + 2\alpha\Delta T) \Rightarrow \gamma = 2\alpha$.

3. A piece of metal weight 46 gm in air, when it is immersed in the liquid of specific gravity 1.24 at 27°C it weighs 30 gm. When the temperature of liquid is raised to 42°C the metal piece weight 30.5 gm, specific gravity of the liquid at 42°C is 1.20, then the linear expansion of the metal will be

(a) 3.316×10^{-5}/°C (b) 2.316×10^{-5}/°C
(c) 4.316×10^{-5}/°C (d) None of these

Sol. (b) Loss of weight at 27°C is

$= 46 - 30 = 16 = V_1 \times 1.24\,\rho_l \times g$ ...(i)

Loss of weight at 42°C is

$= 46 - 30.5 = 15.5 = V_2 \times 1.2\,\rho_l \times g$ ...(ii)

Now dividing (i) by (ii), we get $\frac{16}{15.5} = \frac{V_1}{V_2} \times \frac{1.24}{1.2}$

But $\frac{V_1}{V_2} = 1 + 3\alpha(t_2 - t_1) = \frac{15.5 \times 1.24}{16 \times 1.2} = 1.001042$

$\Rightarrow 3\alpha(42° - 27°) = 0.001042 \Rightarrow \alpha = 2.316 \times 10^{-5}$/°C.

4. Steam at 100°C is passed into 1.1 kg of water contained in a calorimeter of water equivalent 0.02 kg at 15°C till the temperature of the calorimeter and its contents rises to 80°C. The mass of the steam condensed in kg is

(a) 0.130 (b) 0.065
(c) 0.260 (d) 0.135

Sol. (a) Heat is lost by steam in two stages: (i) for change of state from steam at 100°C to water at 100°C is $m \times 540$ (ii) to change water at 100°C to water at 80°C is $m \times 1 \times (100 - 80)$, where m is the mass of steam condensed. Total heat lost by steam is $m \times 540 + m \times 20 = 560m$ (cals) Heat gained by calorimeter and its contents is

$= (1.1 + 0.02) \times (80 - 15) = 1.12 \times 65$ cals.

using Principle of calorimetery, Heat gained = heat lost

$\therefore 560\,m = 1.12 \times 65\ m = 0.130$ gm

5. 2 kg of ice at –20°C is mixed with 5 kg of water at 20°C in an insulating vessel having a negligible heat capacity. Calculate the final mass of water remaining in the container. It is given that the specific heats of water and ice are 1 kcal/kg per °C and 0.5 kcal/kg/°C while the latent heat of fusion of ice is 80 kcal/kg.

(a) 7 kg (b) 6 kg
(c) 4 kg (d) 2 kg

Sol. (b) Initially ice will absorb heat to raise its temperature to 0°C. then its melting takes place.

If m_i = initial mass of ice, m_i' = Mass of ice that melts and m_W = Initial mass of water

By law of mixture, heat gained by ice = heat lost by water

$\Rightarrow \quad m_i \times c \times (20) + m_i' \times L = m_W C_W[20]$

$\Rightarrow \quad 2 \times 0.5(20) + mi' \times 80 = 5 \times 1 \times 20 \Rightarrow mi' = 1$ kg

So final mass of water = Initial mass of water + Mass of ice that melts = 5 + 1 = 6 kg.

6. A lead bullet at 27°C just melts when stopped by an obstacle. Assuming that 25% of heat is absorbed by the obstacle, then the velocity of the bullet at the time of striking (M.P. of lead = 327°C, specific heat of lead = 0.03 cal/gm°C, latent heat of fusion of lead = 6 cal/gm and J = 4.2 J/cal)

(a) 410 m/s (b) 1230 m/s
(c) 307.5 m/s (d) None of the above

Sol. (a) If mass of the bullet is m gm, then total heat required for bullet to just melt down

$Q_1 = m\,c\,\Delta\theta + m\,L = m \times 0.03\,(327 - 27) + m \times 6$

$= 15\,m$ cal $= (15m \times 4.2)$J

Now when bullet is stopped by the obstacle, the loss in its mechanical energy $= \frac{1}{2}(m \times 10^{-3})v^2$ J

(As m gm $= m \times 10^{-3}$ kg)

As 25% of this energy is absorbed by the obstacle,

The energy absorbed by the bullet

$$Q_2 = \frac{75}{100} \times \frac{1}{2}mv^2 \times 10^{-3} = \frac{3}{8}mv^2 \times 10^{-3}\text{ J}$$

Now the bullet will melt if $Q_2 \geq Q_1$

i.e. $\frac{3}{8}mv^2 \times 10^{-3} \geq 15m \times 4.2 \Rightarrow v_{min} = 410$ m/s

7. The temperature of equal masses of three different liquids A, B and C are 12°C, 19°C and 28°C respectively. The temperature when A and B are mixed is 16°C and when B and C are mixed is 23°C. The temperature when A and C are mixed is
(a) 18.2°C (b) 22°C
(c) 20.2°C (d) 25.2°C

Sol. (c) Heat gain = heat lost

$$C_A(16-12)=C_B(19-16) \Rightarrow \frac{C_A}{C_C}=\frac{15}{16}=\frac{5}{4}$$

and $C_B(23-19)=C_C(28-23) \Rightarrow \frac{C_A}{C_C}=\frac{5}{4}$

$$\Rightarrow \frac{C_A}{C_C}=\frac{15}{16} \qquad ...(i)$$

If θ is the temperature when A and C are mixed then,

$$C_A(\theta-12)=C_C(28-\theta) \Rightarrow \frac{C_A}{C_C}=\frac{28-\theta}{\theta-12} \qquad ...(ii)$$

On solving equation (i) and (ii), $\theta = 20.2$°C.

8. In an industrial process 10 kg of water per hour is to be heated from 20°C to 80°C. To do this steam at 150°C is passed from a boiler into a copper coil immersed in water. The steam condenses in the coil and is returned to the boiler as water at 90°C. How many kg of steam is required per hour?
(Specific heat of steam = 1 calorie per gm°C, Latent heat of vaporisation = 540 cal/gm)
(a) 1 gm (b) 1 kg
(c) 10 gm (d) 10 kg

Sol. (b) Suppose m kg steam required per hour
Heat released by steam in following three steps

(i) When 150°C steam $\xrightarrow[Q_1]{}$ 100°C steam

$$Q_1 = mc_{Steam}\,\Delta\theta = m \times 1\,(150-100) = 50\,m \text{ cal}$$

(ii) When 100°C steam $\xrightarrow[Q_2]{}$ 100°C water

$$Q_2 = mL_V = m \times 540 = 540\,m \text{ cal}$$

(iii) When 100°C water $\xrightarrow[Q_3]{}$ 90°C water

$$Q_3 = mc_W\,\Delta\theta = m \times 1 \times (100-90) = 10\,m \text{ cal}$$

Hence total heat given by the steam $Q = Q_1 + Q_2 + Q_3$ = 600 mcal ... (i)

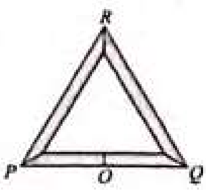
Heat taken by 10 kg water

$$Q' = mc_W\Delta\theta = 10 \times 10^3 \times 1 \times (80-20) = 600 \times 10^3 \text{ cal}$$

Hence $Q = Q' \Rightarrow 600\text{ m} = 600 \times 10^3$

$$\Rightarrow m = 10^3 \text{ gm} = 1\text{kg}.$$

9. Three rods of equal length l are joined to form an equilateral triangle PQR. O is the mid point of PQ. Distance OR remains same for small change in temperature. Coefficient of linear expansion for PR and RQ is same i.e. α_2 but that for PQ is α_1. Then



(a) $\alpha_2 = 3\alpha_1$
(b) $\alpha_2 = 4\alpha_1$
(c) $\alpha_1 = 3\alpha_2$
(d) $\alpha_1 = 4\alpha_2$

Sol. (d) $(OR)^2 = (PR)^2 - (PO)^2 = l^2 - \left(\frac{l}{2}\right)^2$

$$[l(1+\alpha_2 t)]^2 - \left[\frac{1}{2}(1+\alpha_1 t)\right]^2$$

$$l^2 - \frac{l^2}{4} = l^2(1+a_2^2 t^2 + 2\alpha_2 t) - \frac{l^2}{4}(1+a_1^2 t^2 + 2\alpha_1 t)$$

Neglecting $\alpha_2^2 t^2$ and $\alpha_1^2 t^2$

$$0 = l^2(2\alpha_2 t) - \frac{l^2}{4}(2\alpha_1 t) \Rightarrow 2\alpha_2 = \frac{2\alpha_1}{4} \Rightarrow ; \alpha_1 = 4\alpha_2$$

10. A rod of length 20 cm is made of metal. It expands by 0.075cm when its temperature is raised from 0°C to 100°C. Another rod of a different metal B having the same length expands by 0.045 cm for the same change in temperature. A third rod of the same length is composed of two parts, one of metal A and the other of metal B. This rod expands by 0.060 cm for the same change in temperature. The portion made of metal A has the length
(a) 20 cm (b) 10 cm
(c) 15 cm (d) 18 cm

Sol. (b) $\Delta L = L_0\,\alpha\Delta\theta$

$$\text{Rod } A\text{: } 0.075 = 20 \times \alpha_A \times 100 \Rightarrow \alpha_A = \frac{75}{2} \times 10^{-6}/°C$$

$$\text{rod } B\text{: } 0.045 = 20 \times \alpha_B \times 100 \Rightarrow \alpha_B = \frac{45}{2} \times 10^{-6}/°C$$

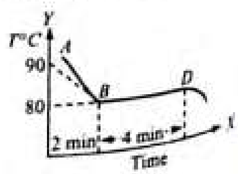
For composite rod: x cm of A and $(20-x)$ cm of B, we have

$$0.060 = x\,\alpha_A \times 100 + (20-x)\,\alpha_B \times 100$$

$$= x\left[\frac{75}{2}\times 10^{-6} \times 100 + (20-x) \times \frac{45}{2} \times 10^{-6} \times 100\right]$$

On solving, we get $x = 10$ cm.

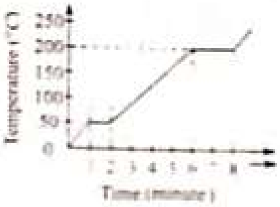
11. The figure given below shows the cooling curve of pure wax material after heating. It cools from A to B and solidifies along BD. If L and C are respective values of latent heat and the specific heat of the liquid wax, the ratio L/C is
(a) 40
(b) 80
(c) 100
(d) 20



Sol. (d) Let the quantity of heat supplied per minute be Q.
Then quantity of heat supplied in 2 min = $mC(90-80)$
In 4 min, heat supplied = $2m\,C(90-80)$

$$2mC(90-80) = mL \Rightarrow \frac{L}{C} = 20$$

12. A student takes 50gm wax (specific heat = 0.6 kcal/kg°C) and heats it till it boils. The graph between temperature and time is as follows. Heat supplied to the wax per minute and boiling point are, respectively



(a) 500 cal, 50°C
(b) 1000 cal, 100°C
(c) 1500 cal, 200°C
(d) 1000 cal, 200°C

Sol. (c) Since specific heat = 0.6 kcal/gm × °C
= 0.6 cal/gm ×°C

From graph it is clear that in a minute, the temperature is raised from 0°C to 50°C.

⇒ Heat required for a minute = 50 × 0.6 × 50 = 1500 cal

Also from graph, Boiling point of wax is 200°C.

13. Hot water cools from 60°C to 50°C in the first 10 minutes and to 42°C in the next 10 minutes. The temperature of the surrounding is

(a) 5°C (b) 10°C
(c) 15°C (d) 20°C

Sol. (b) According to Newton's law of cooling,

$$\frac{\theta_1-\theta_2}{t} = K\left[\frac{\theta_1+\theta_2}{2}-\theta_0\right]$$

In the first case, $\dfrac{(60-50)}{10} = K\left[\dfrac{60+50}{2}-\theta_0\right]$

$1 = K(55-\theta)$ ...(i)

In the second case, $\dfrac{(50-42)}{10} = K\left[\dfrac{50+42}{2}-\theta_0\right]$

$0.8 = K(46-\theta_0)$ ....(ii)

Dividing (i) by (ii), we get $\dfrac{1}{0.8} = \dfrac{55-\theta}{46-\theta}$

or $46-\theta_0 = 44-0.8\,\theta_0 \Rightarrow \theta_0 = 10°C$

14. A bucket full of hot water cools from 75°C to 70°C in time T_1, from 70°C to 65°C in time T_2 and from 65°C to 60°C in time T_3, then

(a) $T_1 = T_2 = T_3$ (b) $T_1 > T_2 > T_3$
(c) $T_1 < T_2 < T_3$ (d) $T_1 > T_2 < T_3$

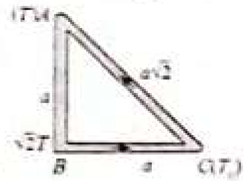
Sol. (c) According to Newton's law of cooling
Rate of cooling ∝ Mean temperature difference

$$\Rightarrow \frac{\text{Fall in temperature}}{\text{Time}} \propto \left(\frac{\theta_1+\theta_2}{2}-\theta_0\right)$$

$$\because \left(\frac{\theta_1+\theta_2}{2}\right)_1 > \left(\frac{\theta_1+\theta_2}{2}\right)_2 > \left(\frac{\theta_1+\theta_2}{2}\right)_3$$

$$\Rightarrow T_1 < T_2 < T_3$$

15. Three rods of identical area of cross-section and made from the same metal form the sides of an isosceles triangle ABC, right angled at B. The points A and B are maintained at temperatures T and $\sqrt{2}T$, respectively. In the steady state, the temperature of the point C is T_C. Assuming that only heat conduction takes place, T_C/T is equal to



(a) $\dfrac{1}{(\sqrt{2}+1)}$ (b) $\dfrac{3}{(\sqrt{2}+1)}$

(c) $\dfrac{1}{2(\sqrt{2}-1)}$ (d) $\dfrac{1}{\sqrt{3}(\sqrt{2}-1)}$

Sol. (b) $\because T_B > T_A \Rightarrow$ Heat will flow B to A via two paths (i) B to A (ii) and along BCA as shown.
Rate of flow of heat in path BCA will be same

i.e. $\left(\dfrac{Q}{t}\right)_{BC} = \left(\dfrac{Q}{t}\right)_{CA}$

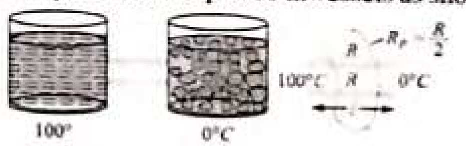
$$\Rightarrow \frac{k(\sqrt{2}T-T_C)A}{a} = \frac{k(T_C-T)A}{\sqrt{2}a}$$

$$\Rightarrow \frac{T_C}{T} = \frac{3}{1+\sqrt{2}}$$

16. Two identical conducting rods are first connected independently to two vessels, one containing water at 100°C and the other containing ice at 0°C. In the second case, the rods are joined end to end and connected to the same vessels. Let q_1 and q_2 g/s be the rate of melting of ice in two cases, respectively. The ratio of q_1/q_2 is

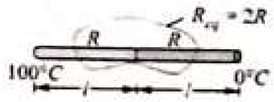
(a) $\dfrac{1}{2}$ (b) $\dfrac{2}{1}$ (c) $\dfrac{4}{1}$ (d) $\dfrac{1}{4}$

Sol. (c) Initially the rods are placed in vessels as shown below.



$$\frac{Q}{t} = \frac{(\theta_1-\theta_2)}{R} \Rightarrow \left(\frac{Q}{t}\right)_1 = \frac{mL}{t} = q_1L = \frac{(100-0)}{\frac{R}{2}} \quad \text{... (i)}$$

Finally when rods are joined end to end as shown,



$$\Rightarrow \left(\frac{Q}{t}\right)_2 = \frac{mL}{t} = q_2L = \frac{(100-0)}{2R} \quad \text{... (ii)}$$

From equations (i) and (ii), $\dfrac{q_1}{q_2} = \dfrac{4}{1}$

17. Three discs A, B and C having radii 2m, 4m, and 6m respectively are coated with carbon black on their other surfaces. The wavelengths corresponding to maximum intensity are 300 nm, 400 nm and 500 nm, respectively. The power radiated by them are Q_a, Q_b, and Q_c, respectively,

(a) Q_a is maximum (b) Q_b is maximum

(c) Q_c is maximum (d) $Q_a = Q_b = Q_c$

Sol. (b) Radiated power $P = Ae\sigma T^4 \Rightarrow P \propto AT^4$

From Wein's law, $\lambda_m T$ = constant $\Rightarrow T \propto \dfrac{1}{\lambda_m}$

$$P \propto \frac{A}{(\lambda_m)^4} \propto \frac{r^2}{(\lambda_m)^4}$$

$$\Rightarrow \quad Q_A : Q_B : Q_C = \frac{2^2}{(300)^4} : \frac{4^2}{(400)^4} : \frac{6^2}{(500)^4}$$

$\therefore$ Q_B will be maximum.

18. A solid copper sphere (density ρ and specific heat capacity c) of radius r at an initial temperature 200 K is suspended inside a chamber whose walls are at almost 0 K. The time required (in µs) for the temperature of the sphere to drop to 100 K is

(a) $\dfrac{72}{7}\dfrac{r\rho c}{\sigma}$ (b) $\dfrac{7}{72}\dfrac{r\rho c}{\sigma}$

(c) $\dfrac{27}{7}\dfrac{r\rho c}{\sigma}$ (d) $\dfrac{7}{27}\dfrac{r\rho c}{\sigma}$

Sol. (b) $\dfrac{dT}{dt} = \dfrac{\sigma A}{mcJ}(T^4 - T_0^4)$ [In the given problem, fall in temperature of body $dT = (200 - 100) = 100\ K$, temp. of surrounding $T_0 = 0$ K, Initial temperature of body $T = 200$ K]

$$\frac{100}{dt} = \frac{\sigma 4\pi r^2}{\frac{4}{3}\pi r^3 \rho c J}(200^4 - 0^4)$$

$$\Rightarrow \quad dt = \frac{r\rho c J}{48\sigma}\times 10^{-6}\,\text{s} = \frac{r\rho c}{\sigma}.\frac{4.2}{48}\times 10^{-6}$$

$$= \frac{7}{80}\frac{r\rho c}{\sigma}\,\mu\text{s} = \frac{7}{72}\frac{r\rho c}{\sigma}\,\mu\text{s} \quad [\text{As } J = 4.2]$$

19. One end of a copper rod of uniform cross-section and of length 3.1 m is kept in contact with ice and the other end with water at 100°C. At what point along it's length should a temperature of 200°C be maintained so that in steady state, the mass of ice melting be equal to that of the steam produced in the same interval of time. Assume that the whole system is insulated from the surroundings. Latent heat of fusion of ice and vaporisation of water are 80 cal/gm and 540 cal/gm respectively

(a) 40 cm from 100°C end

(b) 40 cm from 0°C end

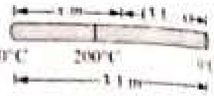
(c) 125 cm from 100°C end

(d) 125 cm from 0°C end

Sol. (a) Rate of flow of heat is given by $\dfrac{dQ}{dt} = \dfrac{\Delta\theta}{l/KA}$

also $\dfrac{dQ}{dt} = L\dfrac{dm}{dt}$ (where L = Latent heat)

$\Rightarrow \dfrac{dm}{dt} = \dfrac{KA}{l}\left(\dfrac{\Delta\theta}{L}\right)$



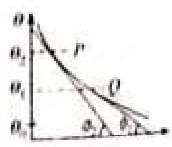
Let the desire point is at a distance x from water at 100°C

$\because$ Rate of ice melting = Rate at which steam is being produced

$$\Rightarrow \left(\frac{dm}{dt}\right)_{\text{Steam}} = \left(\frac{dm}{dt}\right)_{\text{Ice}} \Rightarrow \left(\frac{\Delta\theta}{Ll}\right)_{\text{Steam}} = \left(\frac{\Delta\theta}{Ll}\right)_{\text{Ice}}$$

$$\Rightarrow \frac{(200-100)}{540\times x} = \frac{(200-0)}{80(3.1-x)} \Rightarrow x = 0.4\text{ m} = 40\text{ cm}$$

20. A body cools in a surrounding which is at a constant temperature of θ_0. Assume that it obeys Newton's law of cooling. Its temperature θ is plotted against time t. Tangents are drawn to the curve at the points $P(\theta = \theta_2)$ and $Q(\theta = \theta_1)$. These tangents meet the time axis at angles of ϕ_2 and ϕ_1, as shown



(a) $\dfrac{\tan\phi_2}{\tan\phi_1} = \dfrac{\theta_1 - \theta_0}{\theta_2 - \theta_0}$ (b) $\dfrac{\tan\phi_2}{\tan\phi_1} = \dfrac{\theta_2 - \theta_0}{\theta_1 - \theta_0}$

(c) $\dfrac{\tan\phi_1}{\tan\phi_2} = \dfrac{\theta_1}{\theta_2}$ (d) $\dfrac{\tan\phi_1}{\tan\phi_2} = \dfrac{\theta_2}{\theta_1}$

Sol. (b) For θ-t plot, rate of cooling $= \dfrac{d\theta}{dt}$ = slope of the curve

At P, $\dfrac{d\theta}{dt} = \tan\phi_2 = k(\theta_2 - \theta_0)$, where k = constant.

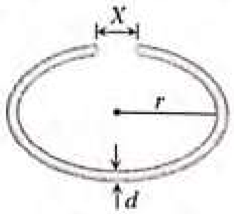
At Q, $\dfrac{d\theta}{dt} = \tan\phi_1 = k(\theta_1 - \theta_0)$

$$\Rightarrow \frac{\tan\phi_2}{\tan\phi_1} = \frac{\theta_2 - \theta_0}{\theta_1 - \theta_0}$$

EXERCISES

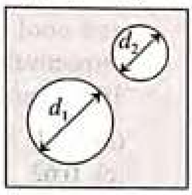
Thermal Expansion

1. A cylindrical metal rod of length L_0 is shaped into a ring with a small gap as shown. On heating the system



(a) x decreases, r and d increase
(b) x and r increase, d decreases
(c) x, r and d all increase
(d) Data insufficient to arrive at a conclusion

2. Two holes of unequal diameters d_1 and d_2 $(d_1 > d_2)$ are cut in a metal sheet. If the sheet is heated



(a) Both d_1 and d_2 will decrease
(b) Both d_1 and d_2 will increase
(c) d_1 will increase, d_2 will decrease
(d) d_1 will decrease, d_2 will increase

3. The coefficient of linear expansion of an inhomogeneous rod changes linearly from α_1 to α_2 from one end to the other end of the rod. The effective coefficient of linear expansion of rod is

(a) $\alpha_1 + \alpha_2$ (b) $\frac{\alpha_1+\alpha_2}{2}$
(c) $\sqrt{\alpha_1\alpha_2}$ (d) $\alpha_1 - \alpha_2$

4. An iron tyre is to be fitted onto a wooden wheel 1.0 m in diameter. The diameter of the tyre is 6 mm smaller than that of wheel. The tyre should be heated so that its temperature increases by a minimum of (coefficient of volume expansion of iron is 3.6×10^{-5}/°C)

(a) 167°C (b) 334°C
(c) 500°C (d) 1000°C

5. The absolute coefficient of expansion of a liquid is 7 times that the volume coefficient of expansion of the vessel. Then the ratio of absolute and apparent expansion of the liquid is

(a) $\frac{1}{7}$ (b) $\frac{7}{6}$
(c) $\frac{6}{7}$ (d) None of these

6. A solid whose volume does not change with temperature floats in a liquid. For two different temperatures t_1 and t_2 of the liquid, fractions f_1 and f_2 of the volume of the solid remain submerged in the liquid. The coefficient of volume expansion of the liquid is equal to

(a) $\frac{f_1-f_2}{f_2t_1-f_1t_2}$ (b) $\frac{f_1-f_2}{f_1t_1-f_2t_2}$
(c) $\frac{f_1+f_2}{f_2t_1+f_1t_2}$ (d) $\frac{f_1+f_2}{f_1t_1+f_2t_2}$

7. A clock with a metal pendulum beating seconds keeps correct time at 0°C. If it loses 12.5 s a day at 25°C, the coefficient of linear expansion of metal of pendulum is

(a) $\frac{1}{86400}$/°C (b) $\frac{1}{43200}$/°C
(c) $\frac{1}{14400}$/°C (d) $\frac{1}{28800}$/°C

8. A wire of length L_0 is supplied heat to raise its temperature by T. If γ is the coefficient of volume expansion of the wire and Y is Young's modulus of the wire then the energy density stored in the wire is

(a) $\frac{1}{2}\gamma^2T^2Y$ (b) $\frac{1}{3}\gamma^2T^2Y^3$
(c) $\frac{1}{18}\frac{\gamma^2T^2}{Y}$ (d) $\frac{1}{18}\gamma^2T^2Y$

9. Span of a bridge is 2.4 km. At 30°C a cable along the span sags by 0.5 km. Taking $\alpha = 12 \times 10^{-6}$/°C, change in length of cable for a change in temperature from 10°C to 42°C is

(a) 9.9 m
(b) 0.099 m
(c) 0.99 m
(d) 0.4 km

10. A brass wire 2 m long at 27°C is held taut with negligible tension between two rigid supports. If the wire is cooled to a temperature of –33°C, then the tension developed in the wire, its diameter being 2 mm, will be (coefficient of linear expansion of brass = 2.0×10^{-5}/°C and Young's modulus of brass = 0.91×10^{11} Pa)

(a) 3400 N (b) 34 kN
(c) 0.34 kN (d) 6800 N

11. The loss in weight of a solid when immersed in a liquid at 0°C is W_0 and at t°C is W. If cubical coefficients of expansion of the solid and the liquid are γ_S and γ_L, respectively, then W is equal to

(a) $W_0[1 + (\gamma_S - \gamma_L)t]$ (b) $W_0[1 - (\gamma_S - \gamma_L)t]$
(c) $W_0[(\gamma_S - \gamma_L)t]$ (d) $W_0t/(\gamma_S - \gamma_L)$

12. A pendulum clock having copper rod keeps correct time at 20°C. It gains 15 s per day if cooled to 0°C. The coefficient of linear expansion of copper is

(a) 1.7×10^{-4}/°C (b) 1.7×10^{-5}/°C
(c) 3.4×10^{-4}/°C (d) 3.4×10^{-5}/°C

13. A glass flask is filled up to a mark with 50 cc of mercury at 18°C. If the flask and contents are heated to 38°C, how much mercury will be above the mark (α for glass is 9×10^{-6}/°C and coefficient of real expansion of mercury is 180×10^{-6}/°C)?
(a) 0.85 cc (b) 0.46 cc
(c) 0.153 cc (d) 0.05 cc

14. A flask of volume 10^3 cc is completely filled with mercury at 0°C. The coefficient of cubical expansion of mercury is 180×10^{-6}/°C and heat of glass is 40×10^{-6}/°C. If the flask is now placed in boiling water at 100°C, how much mercury will overflow?
(a) 7 cc (b) 14 cc
(c) 21 cc (d) 28 cc

15. An aluminium measuring rod, which is correct at 5°C measures the length of a line as 80 cm at 45°C. If thermal coefficient of linear expansion of aluminium is 2.50×10^{-5}/°C, the correct length of the line is:
(a) 80.08 cm (b) 79.92 cm
(c) 81.12 cm (d) 79.62 cm

16. A 1 L glass flask contains some mercury. It is found that at different temperatures the volume of air inside the flask remains the same. What is the volume of mercury in this flask if coefficient of linear expansion of glass is 9×10^{-6}/°C while of volume expansion of mercury is 1.8×10^{-4}/°C?
(a) 50 cc (b) 100 cc
(c) 150 cc (d) 200 cc

Calorimetry

17. Work done in converting 1 g of ice at –10°C into steam at 100°C is
(a) 3045 J (b) 6056 J
(c) 721 J (d) 6 J

18. The specific heat of a substance varies with temperature t(°C) as
$c = 0.20 + 0.14t + 0.023t^2$ (cal/g/°C)
The heat required to raise the temperature of 2 g of substance from 5°C to 15°C will be
(a) 24 cal (b) 56 cal
(c) 82 cal (d) 100 cal

19. 50 g of copper is heated to increase its temperature by 10°C. If the same quantity of heat is given to 10 g of water, the rise in its temperature is (specific heat of copper = 420 J/kg/°C)
(a) 5°C (b) 6°C
(c) 7°C (d) 8°C

20. Two liquids A and B are at 32°C and 24°C. When mixed in equal masses the temperature of the mixture is found to be 28°C. Their specific heats are in the ratio of
(a) 3:2 (b) 2:3
(c) 1:1 (d) 4:3

21. A beaker contains 200 g of water. The heat capacity of the beaker is equal to that of 20 g of water. The initial temperature of water in the beaker is 20°C. If 440 g of hot water at 92°C is poured in it, the final temperature (neglecting radiation loss) will be nearest to
(a) 58°C (b) 68°C
(c) 73°C (d) 78°C

22. Heat is required to change 1 kg of ice at –20°C into steam. Q_1 is the heat needed to warm the ice from –20°C to 0°C, Q_2 is the heat needed to melt the ice, Q_3 is the heat needed to warm the water from 0°C to 100°C and Q_4 is the heat needed to vapourize the water. Then
(a) $Q_4 > Q_3 > Q_2 > Q_1$ (b) $Q_4 > Q_3 > Q_1 > Q_2$
(c) $Q_4 > Q_2 > Q_3 > Q_1$ (d) $Q_4 > Q_2 > Q_1 > Q_3$

23. 250 g of water and equal volume of alcohol of mass 200 g are replaced successively in the same calorimeter and cool from 606°C to 55°C in 130 s and 67 s, respectively. If the water equivalent of the calorimeter is 10 g, then the specific heat of alcohol in cal/g-°C is
(a) 1.30 (b) 0.67
(c) 0.62 (d) 0.985

24. A 2 g bullet moving with a velocity of 200 m/s is brought to a sudden stoppage by an obstacle. The total heat produced goes to the bullet. If the specific heat of the bullet is 0.03 cal/g-°C, the rise in its temperature will be
(a) 158.0°C (b) 15.80°C
(c) 1.58°C (d) 0.1580°C

25. 10 g of ice at –20°C is dropped into a calorimeter containing 10 g of water at 10°C; the specific heat of water is twice that of ice. When equilibrium is reached, the calorimeter will contain
(a) 20 g of water
(b) 20 g of ice
(c) 10 g ice and 10 g of water
(d) 5 g ice and 15 g of water

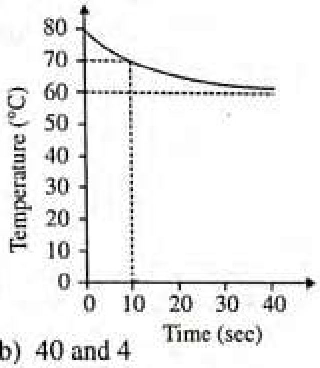
26. Which of the following, when mixed, would raise the temperature of 20 g of water at 30°C most?
(a) 20 g of water at 40°C
(b) 40 g of water at 35°C
(c) 10 g of water at 50°C
(d) 4 g of water at 80°C

27. A kettle with 2 L water at 27°C is heated by operating coil heater of power 1 kW. The heat is lost to the atmosphere at constant rate 160 J/s, when it is open. In how much time will water be heated to 77°C (sp. heat of water = 4.2 kJ/kg) with the lid open?
(a) 8 min 20 s (b) 6 min 2 s
(c) 14 min (d) 7 min

28. An earthen pitcher loses 1 g of water per minute due to evaporation. If the water equivalent of pitcher is 0.5 kg and the pitcher contains 9.5 kg of water, calculate the time required for the water in the pitcher to cool to 28°C from its original temperature of 30°C. Neglect radiation effects. Latent heat of vapourization of water in this range of temperature is 580 cal/g and specific heat of water is 1 k cal/g C°.
(a) 38.6 min (b) 30.5 min
(c) 34.5 min (d) 41.2 min

29. 5 g of water at 30°C and 5 g of ice at –20°C are mixed together in a calorimeter. Find the final temperature of the mixture. Assume water equivalent of calorimeter to be negligible, sp. heats of ice and water are 0.5 and 1 cal/g C°, and latent heat of ice is 80 cal/g.
(a) 0°C (b) 10°C
(c) –30°C (d) >10°C

30. A vessel contains M grams of water at a certain temperature and water at certain other temperature is passed into it at a constant rate of m g/s. The variation of temperature of the mixture with time is shown in figure. The values of M and m are, respectively (the heat exchanged after a long time is 800 cal)

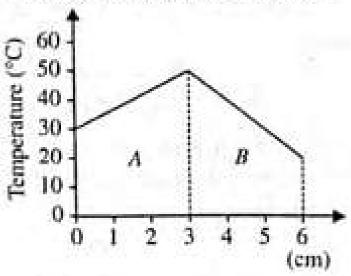


(a) 40 and 2 (b) 40 and 4
(c) 20 and 4 (d) 20 and 2

Transmission of Heat

31. The coefficients of thermal conductivity of copper, mercury and glass are K_c, K_m and K_g, respectively, such that $K_c > K_m > K_g$. If the same quantity of heat is to flow per second per unit area of each and corresponding temperature gradients are, X_c, X_m and X_g, respectively, then
(a) $X_c = X_m = X_g$ (b) $X_c > X_m > X_g$
(c) $X_c < X_m < X_g$ (d) $X_m < X_c < X_g$

32. The temperatures across two different slabs A and B are shown in the steady state (as shown in figure). The ratio of thermal conductivities of A and B is



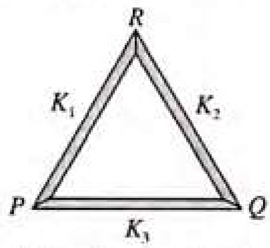
(a) 2:3 (b) 3:2 (c) 1:1 (d) 5:3

33. A point source of heat of power P is placed at the centre of a spherical shell of mean radius R. The material of the shell has thermal conductivity K. If the temperature difference between the outer and the inner surface of the shell is not to exceed T, then the thickness of the shell should not be less than
(a) $\dfrac{2\pi R^2 KT}{P}$ (b) $\dfrac{4\pi R^2 KT}{P}$
(c) $\dfrac{\pi R^2 KT}{P}$ (d) $\dfrac{\pi R^2 KT}{4P}$

34. There are three thermometers–one in contact with the skin of the man, other in between the vest and the shirt and third in between the shirt and coat. The readings of the thermometers are 30°C, 25°C and 22°C, respectively. If the vest and the shirt are of the same thickness, the ratio of their thermal conductivities is
(a) 9:25 (b) 25:9 (c) 5:3 (d) 3:5

35. Two rods of same length and material transfer a given amount of heat in 12 s, when they are joined end to end. But when they are joined lengthwise, they will transfer same heat in same conditions in
(a) 24 s (b) 3 s (c) 1.5 s (d) 48 s

36. Three rods of same dimensions are arranged as shown in figure. They have thermal conductivities K_1, K_2 and K_3. The points P and Q are maintained at different temperatures for the heat to flow at the same rate along PRQ and PQ. Which of the following options is correct?

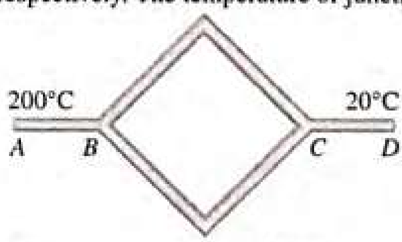


(a) $K_3 = \dfrac{1}{2}(K_1 + K_2)$
(b) $K_3 = K_1 + K_2$
(c) $K_3 = \dfrac{K_1 K_2}{K_1 + K_2}$
(d) $K_3 = 2(K_1 + K_2)$

37. The coefficient of thermal conductivity of copper is nine times that of steel. In the composite cylindrical bar shown in figure, what will be the temperature at the junction of copper and steel?

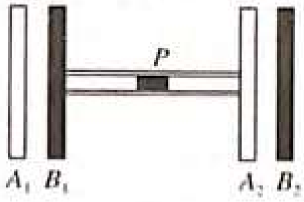
(a) 75°C
(b) 67°C
(c) 33°C
(d) 25°C

38. Six identical conducting rods are joined as shown in figure. Points A and D are maintained at temperatures 200°C and 20°C, respectively. The temperature of junction B will be



(a) 120°C (b) 100°C
(c) 140°C (d) 80°C

39. Two plates identical in size, one of black and rough surface (B_1) and the other smooth and polished (A_2) are interconnected by a thin horizontal pipe with a mercury pellet at the centre. Two more plates A_1 (identical to A_2) and B_2 (identical to B_1) are heated to the same temperature and placed closed to the plates B_1, and A_2 as shown in figure. The mercury pellet



(a) moves to the right
(b) moves to the left
(c) remains stationary
(d) starts oscillating left and right

40. The rates of cooling of two different liquids put in exactly similar calorimeters and kept in identical surroundings are the same if
(a) The masses of the liquids are equal
(b) Equal masses of the liquids at the same temperature are taken
(c) Different volumes of the liquids at the same temperature are taken
(d) Equal volumes of the liquids at the same temperature are taken

41. Two hollow spheres of different materials, one with double the radius and one-fourth wall thickness of the other, are filled with ice. If the times taken for complete melting of ice in the larger to the smaller one are in the ratio of 25 : 16, then their corresponding thermal conductivities are in the ratio
(a) 4:5 (b) 5:4
(c) 8:25 (d) 25:8

42. The wavelength of maximum energy released during an atomic explosion was 2.93×10^{-10} m. Given that Wien's constant is 2.93×10^{-3} m-K, the maximum temperature attained must be of the order of
(a) 10^{-7} K (b) 10^{7} K
(c) 10^{-13} K (d) 5.86×10^{7} K

43. The rectangular surface of area 8 cm × 4 cm of a black body at a temperature of 127°C emits energy at the rate of E per second. If the length and breadth of the surface are each reduced to half of the initial value and the temperature is raised to 327°C, the rate of emission of energy will become
(a) $\frac{3}{8}E$ (b) $\frac{81}{16}E$
(c) $\frac{9}{16}E$ (d) $\frac{81}{64}E$

44. A solid copper cube of edges 1 cm is suspended in an evacuated enclosure. Its temperature is found to fall from 100°C to 99°C in 100 s. Another solid copper cube of edges 2 cm, with similar surface nature, is suspended in a similar manner. The time required for this cube to cool from 100°C to 99°C will be approximately
(a) 25 s (b) 50 s
(c) 200 s (d) 400 s

45. A sphere, a cube and a thin circular plate are made of same substance and all have same mass. These are heated to 200°C and then placed in a room. Then the
(a) Temperature of sphere drops to room temperature at last
(b) Temperature of cube drops to room temperature at last
(c) Temperature of thin circular plate drop to room temperature at last
(d) Temperatures of all the three drop to room temperature at the same time

46. A sphere and a cube of same material and same volume are heated up to same temperature and allowed to cool in the same surroundings. The ratio of the amounts of radiations emitted in equal time intervals will be
(a) 1:1 (b) $\frac{4\pi}{3}:1$
(c) $\left(\frac{\pi}{6}\right)^{1/3}:1$ (d) $\frac{1}{2}\left(\frac{4\pi}{3}\right)^{2/3}:1$

47. A bucket full of hot water cools from 75°C to 70°C in time T_1, from 70°C to 65°C in time T_2 and from 65°C to 60°C in time T_3, then
(a) $T_1 = T_2 = T_3$ (b) $T_1 > T_2 > T_3$
(c) $T_1 < T_2 < T_3$ (d) $T_1 > T_2 < T_3$

48. A cup of tea cools from 80°C to 60°C in 1 min. The ambient temperature is 30°C. In cooling from 60°C to 50°C it will take
(a) 30 s (b) 60 s (c) 90 s (d) 48 s

49. A body takes T minutes to cool from 62°C to 61°C when the surrounding temperature is 30°C. The time taken by the body to cool from 46°C to 45.5°C is
(a) Greater than T minutes
(b) Equal to T minutes
(c) Less than T minutes
(d) None of these

50. Hot water cools from 60°C to 50°C in the first 10 min and to 42°C in the next 10 min. The temperature of the surrounding is
(a) 5°C (b) 10°C
(c) 15°C (d) 20°C

51. A body cools in 7 min from 60°C to 40°C. What will be its temperature after the next 7 min? The temperature of surroundings is 10°C.
(a) 28°C (b) 25°C
(c) 30°C (d) 22°C

52. A body cools from 50°C to 49°C in 5 s. How long will it take to cool from 40°C to 39.5°C? Assume the temperature

of surroundings to be 30°C and Newton's law of cooling to be valid:

(a) 2.5 s (b) 10 s (c) 20 s (d) 5 s

53. A liquid takes 5 min to cool from 80°C to 50°C. How much time will it take to cool from 60°C to 30°C? The temperature of the surrounding is 20°C.
(a) 5 min (b) 9 min
(c) 4 min (d) 12 min

Problems Based on Mixed Concepts

54. An ice box used for keeping eatables cool has a total wall area of 1 m^2 and a wall thickness of 5.0 cm. The thermal conductivity of the ice box is $K = 0.01$ J/m°C. It is filled with large amount of ice at 0°C along with eatables on a day when the temperature is 30°C. The latent heat of fusion of ice is 334×10^3 J/kg. The amount of ice melted in one day is (1 day = 86,400 s)
(a) 776 g (b) 7760 g
(c) 11520 g (d) 1552 g

55. A wire is made by attaching two segments together end to end. One segment is made of aluminium and the other is steel. The effective coefficient of linear expansion of the two segment wire is 19×10^{-6}/(°C). The fraction length of aluminium is [linear coefficients of thermal expansion of aluminium and steel are 23×10^{-6}/(°C) and 12×10^{-6}/(°C), respectively]
(a) $\frac{5}{11}$ (b) $\frac{6}{11}$
(c) $\frac{7}{11}$ (d) $\frac{8}{11}$

56. A block of wood is floating in water at 0°C. The temperature of water is slowly raised from 0°C to 10°C. With the rise in temperature the volume of block V above water level will
(a) increase
(b) decrease
(c) first increase and then decrease
(d) first decrease and then increase

57. An incandescent lamp consuming $P = 54$ W is immersed into a transparent calorimeter containing $V = 10^3$ cm^3 of water. In 420 s the water is heated by 4°C. The percentage of the energy consumed by the lamp that passes out of the calorimeter in the form of radiant energy is
(a) 81.5% (b) 26%
(c) 40.5% (d) 51.5%

58. A thread of liquid is in a uniform capillary tube of length L, as measured by a ruler. The temperature of the tube and thread of liquid is raised by ΔT. If γ be the coefficient of volume expansion of the liquid and α be the coefficient of linear expansion of the material of the tube, then the increase ΔL in the length of the thread, again measured by the ruler will be
(a) $\Delta L = L(\gamma - \alpha)\,\Delta T$ (b) $\Delta L = L(\gamma - 2\alpha)\,\Delta T$
(c) $\Delta L = L(\gamma - 3\alpha)\,\Delta T$ (d) $\Delta L = L\gamma\Delta T$

59. A mass m of lead shot is placed at the bottom of a vertical cardboard cylinder that is 1.5 m long and closed at both ends. The cylinder is suddenly inverted so that the shot falls 1.5 m. If this process is repeated quickly 100 times, assuming no heat is dissipated or lost, the temperature of the shot will increase by (specific heat of lead = 0.03 cal/g°C)
(a) 0 (b) 5°C
(c) 7.3°C (d) 11.3°C

60. An iron rocket fragment initially at −100°C enters the earth's atmosphere almost horizontally and quickly fuses completely in atmospheric friction. Specific heat of iron is 0.11 kcal/kg °C its melting point is 1535°C and the latent heat of fusion is 3 kcals/kg. The minimum velocity with which the fragment must have entered the atmosphere is
(a) 0.45 km/s (b) 1.32 km/s
(c) 2.32 km/s (d) zero

61. A liquid of density 0.85 g/cm^3 flows through a calorimeter at the rate of 8.0 cm^3/s. Heat is added by means of a 250 W electric heating coil and a temperature difference of 15°C is established in steady-state conditions between the inflow and the outflow points of the liquid. The specific heat for the liquid will be
(a) 0.6 kcal/kgK (b) 0.3 kcal/kgK
(c) 0.5 kcal/kgK (d) 0.4 kcal/kgK

62. Ice at 0°C is added to 200 g of water initially at 70°C in a vacuum flask. When 50 g of ice has been added and has all melted, the temperature of flask and contents is 40°C. When a further 80 g of ice is added and has all melted, the temperature of whole becomes 10°C. Neglecting heat lost to surroundings the latent heat of fusion of ice is
(a) 80 cal/g (b) 90 cal/g
(c) 70 cal/g (d) 540 cal/g

63. One end of a copper rod of uniform cross section and of length 1.5 m is kept in contact with ice and the other end with water at 100°C. At what point along its length should a temperature of 200°C be maintained so that in steady state, the mass of ice melting be equal to that of the steam produced in same interval of time? Assume that the whole system is insulated from surroundings. Latent heat of fusion of ice and vapourization of water are 80 cal/g and 540 cal/g, respectively.

(a) 8.59 cm from ice end
(b) 10.34 cm from water end
(c) 10.34 cm from ice end
(d) 8.76 cm from water end

64. A steel ball of mass 0.1 kg falls freely from a height of 10 m and bounces to a height of 5.4 m from the ground. If the dissipated energy in this process is absorbed by the ball, the rise in its temperature is (specific heat of steel = 460 K/kg °C, $g = 10\ m/s^2$)
(a) 0.01°C (b) 0.1°C
(c) 1°C (d) 1.1°C

65. The earth receives on its surface radiation from the sun at the rate of 1400 W/m². The distance of the centre of the sun from the surface of the earth is 1.5×10^{11} m and the radius of the sun is 7.0×10^8 m. Treating sun as a black body, it follows from the above data that its surface temperature is
(a) 5801 K (b) 10^6 K
(c) 50.1 K (d) 5801°C

66. A vessel is partly filled with a liquid. Coefficients of cubical expansion of material of the vessel and liquid are γ_V and γ_L, respectively. If the system is heated, then volume unoccupied by the liquid will necessarily
(a) remain unchanged if $\gamma_V = \gamma_L$
(b) increase if $\gamma_V = \gamma_L$
(c) decrease if $\gamma_V = \gamma_L$
(d) none of the above

67. An electrically heated coil is immersed in a calorimeter containing 360 g of water at 10°C. The coil consumes energy at the rate of 90 W. The water equivalent of calorimeter and coil is 40 g. The temperature of water after 10 min is
(a) 4.214°C (b) 42.14 °C
(c) 30°C (d) None of these

68. A room at 20°C is heated by a heater of resistance 20 ohm connected to 200 V mains. The temperature is uniform throughout the room and the heat is transmitted through a glass window of area 1 m² and thickness 0.2 cm. Calculate the temperature outside. Thermal conductivity of glass is 0.2 cal/m C° s and mechanical equivalent of heat is 4.2 J/cal.
(a) 13.69°C (b) 15.24°C
(c) 17.85°C (d) 19.96°C

ARCHIVES

1. Two spheres of the same material have radii 1 m and 4 m and temperatures 4000 K and 2000 K, respectively. The ratio of the energy radiated per second by the first sphere to that by the second is
(a) 1 : 1 (b) 16 : 1
(c) 4 : 1 (d) 1 : 9 **(AIEEE 2002)**

2. According to Newton's law of cooling, the rate of cooling of a body is proportional to $(\Delta\theta)^n$, where $\Delta\theta$ is the difference of the temperature of the body and the surroundings, and n is equal to
(a) one (b) two
(c) three (d) four **(AIEEE 2002)**

3. If mass energy equivalence is taken into account, when water is cooled to form ice, the mass of water should
(a) increase (b) remain unchanged
(c) decrease (d) first increase then decrease **(AIEEE 2002)**

4. Amount of heat required to raise the temperature of a body through 1k is called its
(a) Water equivalent (b) Thermal capacity
(c) Entropy (d) Specific heat **(AIEEE 2002)**

5. Infrared radiation is detected by
(a) Spectrometer (b) Pyrometer
(c) Nanometer (d) Photometer **(AIEEE 2002)**

6. Which of the following is the example of ideal black body?
(a) Kajal (b) Black board
(c) A pin hole in a box (d) None of these **(AIEEE 2002)**

7. The earth radiates in the infrared region of the spectrum. The spectrum is correctly given by
(a) Wien's law
(b) Rayleigh–Jeans law
(c) Planck's law of radiation
(d) Stefan's law of radiation **(AIEEE 2003)**

8. If the temperature of the sun were to increase from T to $2T$ and its radius from R to $2R$, then the ratio of the radiant energy received on the earth to what it was previously will be
(a) 4 (b) 16
(c) 32 (d) 64 **(AIEEE 2003)**

9. The temperatures of the two outer surfaces of a composite slab, consisting of two materials having coefficients of thermal conductivity K and $2K$ and thicknesses x and $4x$, respectively, are T_2 and T_1 ($T_2 > T_1$). The rate of heat transfer through the slab, in a steady state, is

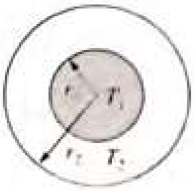
$$\left[\frac{A(T_2 - T_1)K}{x}\right] f,$$

where f is equal to

(a) 1 (b) $\frac{1}{2}$

(c) $\frac{2}{3}$ (d) $\frac{1}{3}$ **(AIEEE 2004)**

10. The figure shows a system of two concentric spheres of radii r_1 and r_2 and kept at temperatures T_1 and T_2, respectively. The radial rate of flow of heat in a substance between the two concentric spheres is proportional to



(a) $\frac{r_1 r_2}{(r_1 - r_2)}$ (b) $(r_2 - r_1)$

(c) $(r_2 - r_1)(r_1 r_2)$ (d) $\ln\left(\frac{r_2}{r_1}\right)$ **(AIEEE 2005)**

11. Assuming the sun to be a spherical body of radius R at a temperature of T kelvin, evaluate the total radiant power incident on the earth at a distance r from the sun.

(a) $r_0^2 R^2 \sigma \frac{T^4}{4\pi r^2}$ (b) $R^2 \frac{\sigma T^4}{r^2}$

(c) $4\pi r_0^2 R^2 \frac{\sigma T^4}{r^2}$ (d) $\pi r_0^2 R^2 \frac{\sigma T^4}{r^2}$

(AIEEE 2006)

12. This question contains Statement 1 and Statement 2. Of the four choices given after the statements, choose the one that best describes the two statements.

Statement 1: The temperature dependence of resistance is usually given as $R = R_0(1 + \alpha\Delta t)$. The resistance of a wire changes from 100 Ω to 150 Ω when its temperature is increased from 27°C to 227°C. This implies that $\alpha = 2.5 \times 10^{-3}$/°C.

Statement 2: $R = R_i(1 + \alpha\Delta T)$ is valid only when the change in the temperature ΔT is small and $\Delta R = (R - R_0) << R_0$.

(a) Statement 1 is true but statement 2 is false.

(b) Statement 1 is true, statement 2 is true; statement 2 is the correct explanation for statement 1.

(c) Statement 1 is true, statement 2 is true; statement 2 is not the a correct explanation for statement 1.

(d) Statement 1 is false but statement 2 is true.

(AIEEE 2009)

13. A long metallic bar is carrying heat from one of its ends to the other end under steady state. The variation of temperature θ along the length x of the bar from its hot end is best described by which of the following figures.

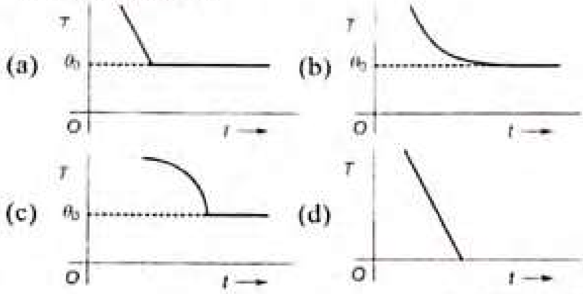
17. If a piece of metal is heated to temperature θ and then allowed to cool in a room which is at temperature θ_0, the

graph between the temperature T of the metal and time t will be closest to



(JEE Main 2013)

18. Three rods of copper, brass and steel are welded together to form a Y-shaped structure. Area of cross-section of each rod = 4 cm^2. The end of copper rod is maintained at 100°C where as ends of brass and steel are kept at 0°C. Lengths of the copper, brass and steel rods are 46, 13 and 12 cm respectively. The rods are thermally insulated from surroundings except at ends. Thermal conductivities of copper, brass and steel are 0.92, 0.26 and 0.12 CGS units respectively. The rate of heat flow through copper rod is

(a) 4.8 cal/s (b) 6.0 cal/s
(c) 1.2 cal/s (d) 2.4 cal/s

(JEE Main 2014)

19. The pressure that has to be applied to the ends of a steel wire of length 10 cm to keep its length constant when its temperature is raised by 100°C is:

(For steel Young's modulus is 2×10^{11} N m^{-2} and coefficient of thermal expansion is 1.1×10^{-5} K^{-1})

(a) 2.2×10^7 Pa (b) 2.2×10^6 Pa
(c) 2.2×10^8 Pa (d) 2.2×10^9 Pa

(JEE Main 2014)

20. A pendulum clock loses 12 s a day if the temperature is 40°C and gains 4 s a day if the temperature is 20°C. The temperature at which the clock will show correct time, and the co-efficient of linear expansion (α) of the metal of the pendulum shaft are respectively:

(a) 25 °C ; $\alpha = 1.85 \times 10^{-5}$ /°C
(b) 60 °C ; $\alpha = 1.85 \times 10^{-4}$ /°C
(c) 30 °C ; $\alpha = 1.85 \times 10^{-3}$ /°C
(d) 55 °C ; $\alpha = 1.85 \times 10^{-2}$ /°C

(JEE Main 2016)

21. An external pressure P is applied on a cube at 0°C so that it is equally compressed from all sides. K is the bulk modulus of the material of the cube and a is its coefficient of linear expansion. Suppose we want to bring the cube to its original size by heating. The temperature should be raised by

(a) $\dfrac{3\alpha}{PK}$ (b) $3PK\alpha$

(c) $\dfrac{P}{3\alpha K}$ (d) $\dfrac{P}{\alpha K}$ **(JEE Main 2017)**

22. A copper ball of mass 100 g is at a temperature T. It is dropped in a copper calorimeter of mass 100 g, filled with 170 g of water at room temperature. Subsequently, the temperature of the system is found to be 75°C. T is given by (Given: room temperature = 30°C, specific heat of copper = 0.1 cal/g°C)

(a) 1250°C (b) 825°C
(c) 800°C (d) 885°C **(JEE Main 2017)**

Chapter 14

Kinetic Theory of Gases and Thermodynamics

KINETIC THEORY OF GASES

In gases, the intermolecular forces are very weak and the molecules may fly apart in all directions. So, the gas is characterized by the following properties:

(1) It has no shape and size and can be obtained in a vessel of any shape or size.
(2) It expands indefinitely and uniformly to fill the available space.
(3) It exerts pressure on its surroundings.

Assumption of Kinetic Theory of Gases

Kinetic theory of gases relates the macroscopic properties of gases (such as pressure, temperature, etc.) to the microscopic properties of the gas molecules (such as speed, momentum, kinetic energy of molecule, etc.).

Actually, the kinetic theory of gases attempts to develop a model of the molecular behaviour which should result in the observed behaviour of an ideal gas. It is based on the following assumptions:

(1) Every gas consists of extremely small particles known as molecules. The molecules of a given gas are all identical, but are different from those of another gas.
(2) The molecules of a gas are identical, spherical, rigid and perfectly elastic point masses.
(3) Their molecular size is negligible in comparison to intermolecular distance (10^{-9} m).
(4) The volume of molecules is negligible in comparison to the volume of a gas. (The volume of molecules is only about 0.014% of the volume of the gas.)
(5) The speed of gas molecules lies between zero and infinity (very high speed).
(6) The number of molecules moving with most probable speed is maximum.
(7) The gas molecules keep on colliding among themselves as well as with the walls of the containing vessel. These collisions are perfectly elastic (i.e., the total energy before collision = total energy after the collision).
(8) The molecules move in a straight line with constant speeds between successive collisions.
(9) The distance covered by the molecules between two successive collisions is known as free path and mean of all free paths is known as mean free path.
(10) The time spent in a collision between two molecules is negligible in comparison to the time between two successive collisions.
(11) The number of collisions per unit volume in a gas remains constant.
(12) No attractive or repulsive force acts between gas molecules.
(13) Gravitational attraction among the molecules is ineffective due to extremely small masses and very high speed of molecules.
(14) The molecules constantly collide with the walls of the container due to which their momenta change. The change in momentum is transferred to the walls of the container. Consequently, pressure is exerted by gas molecules on the walls of the container.
(15) The density of a gas is constant at all points of the container.

Important Points

i. Relation between pressure, volume, mass and temperature

$$P = \frac{1}{3}\frac{mN}{V}v_{rms}^2 \quad \text{or} \quad P \propto \frac{(mN)T}{V} \qquad (\text{as } v_{rms}^2 \propto T)$$

- If volume and temperature of a gas are constant, then $P \propto mN$, i.e., pressure $\propto$ (mass of gas). That is, if mass of a gas is increased, number of molecules and hence number of collision per second will also increase, i.e., pressure will increase.
- If mass and temperature of a gas are constant, then $P \propto (1/V)$, i.e., if volume decreases, the number of collisions per second will increase due to lesser effective distance between the walls resulting in greater pressure.
- If mass and volume of gas are constant, then $P \propto (v_{rms})^2 \propto T$. That is, if temperature increases, the mean square speed of gas molecules will increase and as gas molecules are moving faster, they will collide with the walls more often with greater momentum resulting in greater pressure. Therefore,

$$P = \frac{1}{3}\frac{mN}{V}v_{rms}^2 = \frac{1}{3}\frac{M}{V}v_{rms}^2$$

(As $M = mN$ = total mass of the gas)

$$\therefore \quad P = \frac{1}{3}\rho v_{rms}^2 \qquad (\text{as } \rho = M/V)$$

ii. Relation between pressure and kinetic energy

Kinetic energy = $1/2\, M\, v_{rms}^2$

Therefore, kinetic energy per unit volume

$$E = (1/2)(M/V)v_{rms}^2 = (1/2)\rho v_{rms}^2 \quad \text{(i)}$$

We know

$$P = \frac{1}{3}\rho v_{rms}^2 \quad \text{(ii)}$$

From Eqs. (i) and (ii), we get $P = 2/3E$.

That is, the pressure exerted by an ideal gas is numerically equal to two-thirds of the mean kinetic energy of translation per unit volume of the gas.

ILLUSTRATION 14.1 (a) Calculate (i) root-mean-square speed and (ii) the mean energy of 1 mol of hydrogen at STP (given that density of hydrogen is 0.09 kg /m^3).

(b) Given that the mass of a molecule of hydrogen is 3.34×10^{-27} kg, calculate Avogadro's number.

(c) Calculate Boltzmann's constant.

Solution.

(a) (i) We know that the pressure of a gas is given as

$$P = \frac{1}{3}\rho v_{rms}^2$$

$$v_{rms} = \sqrt{\left(\frac{3P}{\rho}\right)} = \sqrt{\left(\frac{3 \times 0.76 \times 13.6 \times 10^3 \times 9.8}{0.09}\right)}$$

$$= 1837 \text{ m/s} = 1.837 \text{ km/s}$$

(ii) Kinetic energy $= \frac{1}{2}mv_{rms}^2$

Here $M = 2 \text{ g} = 2 \times 10^{-3}$ kg

or KE $= \frac{1}{2} \times 2 \times 10^{-3} \times (1837)^2 = 3374.56$ J

(b) Mass of one molecule of $H_2 = 3.34 \times 10^{-27}$ kg

Molecular mass of hydrogen $= 2 \times 10^{-3}$ kg

Avogadro's number N_A, which is the number of molecules in one gram molecule of hydrogen, is given by

$$N_A = \frac{2 \times 10^{-3}}{3.34 \times 10^{-27}} = 5.988 \times 10^{23} \text{ molecules}$$

(c) We know that

$k = R/N_A = 8.3/(5.988 \times 10^{23}) = 1.37 \times 10^{-23}$ J/mol K

Ideal Gas Equation

A gas that strictly obeys the gas laws is called perfect or an ideal gas. The size of the molecule of an ideal gas is zero, i.e., each molecule is a point mass with no dimension. There is no force of attraction or repulsion amongst the molecules of the gas. All real gases are not perfect gases. However, at extremely low pressure and high temperature, the gases such as hydrogen, nitrogen and helium, are nearly perfect gases.

The equation that relates the pressure (P), volume (V) and temperature (T) of the given state of an ideal gas is known as gas equation.

Ideal gas equations	
For 1 mole or N_A molecule or M grams or 22.4 L of gas	$PV = RT$
For μ moles of gas	$PV = \mu RT$
For 1 molecule of gas	$PV = (R/N_A)T = kT$
For N molecules of gas	$PV = NkT$
For 1 g of gas	$PV = (R/M)T = rT$
For n grams of gas	$PV = nrT$

Various Speeds of Gas Molecules

The motion of molecules in a gas is characterized by any of the following three speeds, such as root-mean-square speed, most probable speed and average speed.

1. **Root-mean-square speed:** It is defined as the square root of mean of squares of the speed of different molecules, i.e.,

$$v_{rms} = \sqrt{\frac{v_1^2 + v_2^2 + v_3^2 + v_4^2 + \cdots}{N}}$$

(i) From the expression for pressure of ideal gas,

$$P = \frac{1}{3}\frac{mN}{V}v_{rms}^2$$

$$v_{rms} = \sqrt{\frac{3PV}{mN}} = \sqrt{\frac{3PV}{\text{Mass of gas}}} = \sqrt{\frac{3P}{\rho}}$$

(as ρ = mass of gas / V)

(ii) $$v_{rms} = \sqrt{\frac{3PV}{\text{Mass of gas}}} = \sqrt{\frac{3\mu RT}{\mu M}} = \sqrt{\frac{3RT}{M}}$$

(as M is the molecular weight of gas; $PV = \mu RT$ and mass of gas $= \mu M$)

(iii) $$v_{rms} = \sqrt{\frac{3RT}{M}} = \sqrt{\frac{3N_A kT}{N_A m}} = \sqrt{\frac{3kT}{m}}$$

(as $M = N_A m$ and $R = N_A k$)

Therefore, root-mean-square velocity

$$v_{rms} = \sqrt{\frac{3P}{\rho}} = \sqrt{\frac{3RT}{M}} = \sqrt{\frac{3kT}{m}}$$

Important Points

- With rise in temperature, rms speed of gas molecules increases as $v_{rms} \propto \sqrt{T}$.
- With the increase in molecular weight, rms speed of gas molecule decreases as $v_{rms} \propto 1/\sqrt{M}$. For example, rms speed of hydrogen molecules is four times that of oxygen molecules at the same temperature.
- rms speed of gas molecules is of the order of km/s. For example, at NTP for hydrogen gas

$(v_{rms}) = \sqrt{3RT/M} = \sqrt{(3 \times 8.31 \times 273)/(2 \times 10^{-3})} = 1840$ m/s

- rms speed of gas molecules is $\sqrt{3/\gamma}$ times that of speed of sound in gas.

  As $v_{rms} = \sqrt{\frac{3RT}{M}}$ and $v_s = \sqrt{\frac{\gamma RT}{M}}$

  $\therefore \quad v_{rms} = \frac{3}{\gamma} v_s$
- rms speed of gas molecules does not depend on the pressure of gas (if temperature remains constant) because $P \propto \rho$ (Boyle's law). If pressure is increased n times, then density will also increase by n times hence v_{rms} remains constant.
- Moon has no atmosphere because v_{rms} of gas molecules is more than escape velocity (v_e) on moon. A planet or satellite will have atmosphere only and only if $v_{rms} < v_e$
- At $T = 0$, $v_{rms} = 0$, i.e., the rms speed of molecules of a gas is zero at 0 K. This temperature is called absolute zero.

2. **Most probable speed:** The particles of a gas have a range of speeds. This is defined as the speed which is possessed by the maximum fraction of total number of molecules of the gas. For example, if speeds of 10 molecules of a gas are 1, 2, 2, 3, 3, 3, 4, 5, 6, 6 km/s, then the most probable speed is 3 km/s, as the maximum fraction of total molecules possess this speed.

   Most probable speed $v_{mp} = \sqrt{\frac{2P}{\rho}} = \sqrt{\frac{2RT}{M}} = \sqrt{\frac{2kT}{m}}$

3. **Average speed:** It is the arithmetic mean of the speed of molecules in a gas at given temperature, i.e.,

   $$v_{av} = \frac{v_1 + v_2 + v_3 + v_4 + \cdots}{N}$$

   According to kinetic theory of gases

   Average speed $v_{av} = \sqrt{\frac{8P}{\pi\rho}} = \sqrt{\frac{8}{\pi}\frac{RT}{M}} = \sqrt{\frac{8}{\pi}\frac{kT}{m}}$

NOTE:

- $v_{rms} > v_{av} > v_{mp}$
- $v_{rms} : v_{av} : v_{mp} = \sqrt{3} : \sqrt{\frac{8}{\pi}} : \sqrt{2} = \sqrt{3} : \sqrt{2.5} : \sqrt{2}$

Kinetic Energy of Ideal Gas

Molecules of ideal gases possess only translational motion. So they possess only translational kinetic energy.

Quantity of gas	Kinetic energy
Kinetic energy of a gas molecule ($E_{molecule}$)	$= \frac{1}{2}mv_{rms}^2 = \frac{1}{2}m\left(\frac{3kT}{m}\right) = \frac{3}{2}kT$ $\left(\text{as } v_{rms} = \sqrt{\frac{3kT}{m}}\right)$
Kinetic energy of 1 mole (M gram) gas (E_{mole})	$= \frac{1}{2}Mv_{rms}^2 = \frac{1}{2}M\frac{3RT}{M} = \frac{3}{2}RT$ $\left(\text{as } v_{rms} = \sqrt{\frac{3RT}{M}}\right)$
Kinetic energy of 1g of gas (E_{gram})	$= \frac{3}{2}\frac{R}{M}T = \frac{3}{2}\frac{kN_A}{mN_A}T$ $= \frac{3}{2}\frac{k}{m}T = \frac{3}{2}rT$

Here m, mass of each molecule; M, molecular weight of gas; N_A, Avogadro number $= 6.023 \times 10^{23}$.

Important Points

- Kinetic energy per molecule of gas does not depend upon the mass of the molecule but only depends upon the temperature of the gas.

  As $E = \frac{3}{2}kT$ or $E \propto T$, i.e., molecules of different gases such as He, H_2 and O_2 at same temperature will have same translational kinetic energy, though their rms speeds are different. $\left[v_{rms} = \sqrt{\frac{3kT}{m}}\right]$
- Kinetic energy per mole of gas depends only upon the temperature of gas.
- Kinetic energy per gram of gas depends upon the temperature as well as molecular weight (or mass of one molecule) of the gas.

  $E_{gram} = \frac{3}{2}\frac{k}{m}T \qquad \therefore E_{gram} \propto \frac{T}{m}$

  From the above expressions, it is clear that higher the temperature of the gas, more will be the average kinetic energy possessed by the gas molecules. At $T = 0$, $E = 0$, i.e., at absolute zero the molecular motion stops.

ILLUSTRATION 14.2 A glass bulb of volume 400 cm^3 is connected to another bulb of volume 200 cm^3 by means of a tube of negligible volume. The bulbs contain dry air and are both at a common temperature and pressure of 20°C and 1.000 atm, respectively. The larger bulb is immersed in steam at 100°C and the smaller in melting ice at 0°C. Find the final common pressure.

Solution. Let n_1 and n_2 denote the number of moles of gas in the large and small bulbs, in the final configuration, respectively. Denoting the final temperatures by T_1 and T_2 and the final pressure by P_f, the ideal gas law implies that

$$p_f V_1 = n_1 RT_1 \quad \text{(i)}$$

and $$p_f V_2 = n_2 RT_2 \quad \text{(ii)}$$

where p_0, $V_0 = V_1 + V_2$ and T_0 are the initial pressure, volume, and temperature, respectively.

Using Eqs. (i) and (ii) in the equation $n_1 + n_2 = n$, we get

$$\frac{p_f V_1}{RT_1} + \frac{p_f V_2}{RT_2} = \frac{p_0 V_0}{RT_0}$$

Solving for P_f, we obtain $p_f = \dfrac{p_0 V_0}{T_0\left(\dfrac{V_1}{T_1} + \dfrac{V_2}{T_2}\right)}$

Inserting the numerical values; $p_0 = 1.00$ atm,

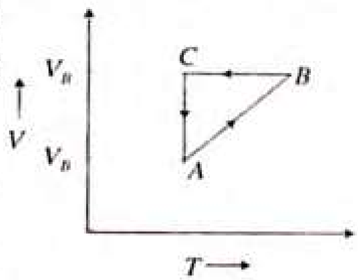
$T_0 = 293.15$ K ($T_0 = 20°$C),

$T_1 = 373.15$ K ($t_1 = 100°$C),

and $T_2 = 237.15$ K ($t_2 = 0°$C), we find

$$p_f = \frac{(1.00)(600)}{(293.15)\left[\left(\frac{400}{373.15}\right) + \left(\frac{200}{273.15}\right)\right]} = 1.13\text{atm}$$

ILLUSTRATION 14.3 A cyclic process $ABCA$ shown in V–T diagram (figure) is performed with a constant mass of an ideal gas. Show the same process on a P–V diagram.



Solution.

According to given diagram, we notice the following:

(a) For line AB, $V = aT$ and both V and T increase so the gas equation $PV = \mu RT$ in the light of above yields $P(aT) = \mu RT$, i.e., $P = (\mu R/a)$ = constant, with V increasing.

So in P–V diagram, line AB will be a straight line parallel to the V-axis (with V increasing)

(b) For line BC, V = constant and T decreasing; so, the gas equation $PV = \mu RT$ in the light above yields.

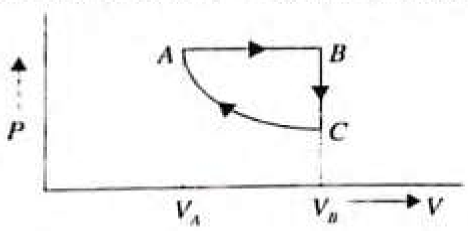
$P = \dfrac{\mu RT}{\text{Constant}}$, where $P \propto T$ with T decreasing

i.e., along line BC, P decreases with V = constant. So in P–V diagram, line BC will be a straight line parallel to the P-axis (with P decreasing).

(c) $P = \dfrac{\mu RT}{V}$, where PV = constant with V decreasing

So in P–V curve line, CA will be a hyperbola (with P increasing).

The complete cycle on P–V diagram is shown in figure.



DEGREE OF FREEDOM

Degree of freedom is the minimum number of variables required to completely specify the state of system.

For thermodynamic system (moving particles), these are the total number of independent terms of energy. The independent possible motions are translational, rotational and vibrational, so there are three types of degrees of freedom.

i. **Translational degrees of freedom:** The maximum number of translational degrees of freedom can be three. These are $1/2mv_x^2$, $1/2mv_y^2$, $1/2mv_z^2$.

ii. **Rotational degrees of freedom:** The maximum number of rotational degrees of freedom can be three. These are $1/2I_x\omega_x^2$, $1/2I_y\omega_y^2$, $1/2I_z\omega_z^2$.

iii. **Vibrational degrees of freedom:** Their numbers depend on atoms in the molecule and their arrangement. These degrees of freedom are considered at a very high temperature only.

NOTE: At room temperature only translational and rotational degrees of freedom are taken into account.

i. **Monatomic gas:** It has been assumed that the molecules of a gas are negligible in size, so moment of inertia and hence rotational kinetic energy of monatomic gas molecules about the axis passes through itself will be zero. The degrees of freedom of monatomic gas molecules are due to three independent translation along the x-, y- and z-axis.

ii. **Diatomic gas:** In diatomic gases, the molecules are assumed to be in the shape of dumbbells; two atoms of negligible size are at some separation. In addition to translation motion, the molecule can rotate about an axis, so the degrees of freedom of diatomic gas molecules are due to translation and due to rotation. If the line joining the two atoms (particles) is taken as the z-axis, then moment of inertia and hence rotational kinetic energy about the z-axis becomes zero. The molecule has three degrees of freedom of translation and two degrees of rotation.

NOTE: If vibrational degrees of freedom are taken into account, then the total number of degrees of freedom of diatomic molecule becomes seven.

Triatomic or polyatomic gas: A non-linear molecule has non-zero moment of inertia about any axis, so there are three rotational degrees of freedom. A total number of degrees of freedom are six.

NOTE:

- At high temperature, in case of diatomic or polyatomic molecules, the atoms within the molecule may also vibrate with respect to each other. In such cases, the molecule will have an additional degrees of freedom due to vibrational motion.
- An object that vibrates in one dimension has two additional degree's of freedom. One for the potential energy and one for the kinetic energy of vibration.

- A diatomic molecule that is free to vibrate (in addition to translation and rotation) will have 7 (2 + 3 + 2) degrees of freedom.
- Though an atom in a solid has no degree of freedom for translational and rotational motion, due to vibration along 3 axes, it has 3 × 2 = 6 degrees of freedom.
- When a diatomic or polyatomic gas dissociates into atoms, it behaves as monatomic gas whose degrees of freedom are changed accordingly.

LAW OF EQUIPARTITION OF ENERGY

For any system in thermal equilibrium, the total energy is equally distributed among its various degrees of freedom. And the energy associated with each molecule of the system per degree's of freedom of the system is $1/2kT$, where k (Boltzmann's constant) $= 1.38 \times 10^{-23}$ J/K, T = absolute temperature of the system.

If the system possesses number of degrees of freedom f, then we study equipartition of energy as given below.

Total energy associated with each molecule	$(f/2)kT$
Total energy associated with N molecules	$N(f/2)kT$
Total energy associated with each mole	$(f/2)RT$
Total energy associated with μ mole	$(\mu f/2)RT$
Total energy associated with each gram	$(f/2)rT$
Total energy associated with M_0 gram	$M_0(f/2)rT$

ILLUSTRATION 14.4 Calculate (a) the average kinetic energy of translation of an oxygen molecule at 27°C, (b) the total kinetic energy of an oxygen molecule at 27°C, (c) the total kinetic energy in joule of one mole of oxygen at 27°C. Given Avogadro's number $= 6.02 \times 10^{23}$ and Boltzmann's constant $= 1.38 \times 10^{-23}$ J/(mol-K).

Solution.

(a) An oxygen molecule has three translational degrees of freedom, thus the average translational kinetic energy of an oxygen molecule at 27°C is given as

$$E_T = \frac{3}{2}kT = \frac{3}{2} \times 1.38 \times 10^{-23} \times 300$$

$$= 6.21 \times 10^{-21} \text{ J/molecule}$$

(b) An oxygen molecule has total five degrees of freedom, hence its total kinetic energy is given as

$$E_T = \frac{5}{2}kT = \frac{5}{2} \times 1.38 \times 10^{-23} \times 300$$

$$= 10.35 \times 10^{-21} \text{ J/molecule}$$

(c) Total kinetic energy of one mole of oxygen is its internal energy, which can be given as

$$U = \frac{f}{2}\mu RT = \frac{5}{2} \times 1 \times 8.314 \times 300 = 6235.5 \text{ J/mole}$$

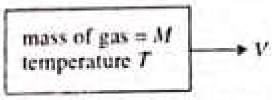
ILLUSTRATION 14.5 A light container having a diatomic gas enclosed with in is moving with velocity v. Mass of the gas is M and number of moles is n.

(a) What is the kinetic energy of gas w.r.t. centre of mass of the system?

(b) What is K.E. of gas w.r.t. ground?

Solution.

The kinetic energy of gas w.r.t. centre of mass of the system is the kinetic energy of molecules due to their random motion. This will be the internal energy of the gas.



(a) $\text{K.E.} = \frac{5}{2}nRT$

(b) Kinetic energy of gas w.r.t. ground = Kinetic energy of centre of mass w.r.t. ground + Kinetic energy of gas w.r.t. centre of mass.

$$\text{K.E.} = \frac{1}{2}MV^2 + \frac{5}{2}nRT$$

SPECIFIC HEAT OR SPECIFIC HEAT CAPACITY

It characterizes the nature of the substance in response to the heat supplied to the substance. Specific heat can be defined by two following ways: gram specific heat and molar specific heat.

Gram Specific Heat

Gram specific heat of a substance may be defined as the amount of heat required to raise the temperature of unit mass of the substance by unit degree.

Gram specific heat $c = \dfrac{\Delta Q}{m\Delta T}$

Units: $\dfrac{\text{cal}}{\text{g} \times {}^\circ\text{C}}; \dfrac{\text{cal}}{\text{g} \times \text{K}}; \dfrac{\text{J}}{\text{kg} \times \text{K}}$; dimension: $(L^2T^{-2}\theta^{-1})$

Molar Specific Heat

Molar specific heat of a substance may be defined as the amount of heat required to raise the temperature of 1 g mole of the substance by a unit degree, it is represented by C.

$$C = \frac{\Delta Q}{\mu \Delta T}$$

Units: $\dfrac{\text{cal}}{\text{mole} \times {}^\circ\text{C}}, \dfrac{\text{cal}}{\text{mole} \times \text{K}}$ or $\dfrac{\text{J}}{\text{mole} \times \text{K}}$

☞ Important Points

- $C = Mc = (M/m)(\Delta Q/\Delta T) = (1/\mu)(\Delta Q/\Delta T)$ (as $\mu = m/M$)
  It means that molar specific heat of the substance is M times the gram specific heat, where M is the molecular weight of that substance.
- Specific heat for hydrogen is maximum, i.e., $C = 3.5(\text{cal/g}^\circ\text{C})$.
- In liquids, water has maximum specific heat $C = 1(\text{cal/g}^\circ\text{C})$.
- Specific heat of a substance also depends on the state of substance, i.e., solid, liquid or gas. For example,
  $$C_{\text{ice}} = 0.5\frac{\text{cal}}{\text{g}^\circ\text{C}},\quad C_{\text{water}} = 1\frac{\text{cal}}{\text{g}^\circ\text{C}},\quad C_{\text{steam}} = 0.47\frac{\text{cal}}{\text{g}^\circ\text{C}}$$
- Specific heat also depends on the conditions of the experiment, i.e., the way in which heat is supplied to the body. In general, experiments are made either at constant volume or at constant pressure.
  In case of solids and liquids, due to small thermal expansion, the difference in measured values of specific heats is very small and is usually neglected. However, in case of gases, specific heat at constant volume is quite different from that at constant pressure.

Specific Heat of Gases

In case of gases, heat energy supplied to a gas is spent not only in increasing the temperature of the gas but also in expanding the gas against atmospheric pressure.

Hence, specific heat of a gas, which is the amount of heat energy required to raise the temperature of 1 g of gas through a unit degree, shall not have a single or unique value.

Consider a gas enclosed in a cylinder which is fitted with an airtight and frictionless piston.

i. If the gas is compressed suddenly and no heat is supplied from outside, i.e., $\Delta Q = 0$, the temperature of the gas increases on the account of compression

$$\therefore \quad C = \frac{\Delta Q}{m(\Delta T)} = 0, \quad \text{i.e., } C = 0$$

Such a process is called 'adiabatic'.

ii. If the gas is heated and allowed to expand at such a rate that the rise in temperature due to heat supplied is exactly equal to the fall in temperature due to expansion of the gas, i.e., $\Delta T = 0$

$$\therefore \quad C = \frac{\Delta Q}{m(\Delta T)} = \frac{\Delta Q}{0} = \infty, \quad \text{i.e. } C = \infty$$

Such a process is called 'isothermal'.

iii. If the rate of expansion of the gas was slow, the fall in temperature of the gas due to expansion would be smaller than the rise in temperature of the gas due to heat supplied. Therefore, there will be some net rise in temperature of the gas, i.e., ΔT will be positive.

$$\therefore \quad C = \frac{\Delta Q}{m(\Delta T)} = \text{positive}, \quad \text{i.e., } C = \text{positive}$$

iv. If the gas is heated and allowed to expand very fast, the fall of temperature of the gas due to expansion would be greater than the rise in temperature due to heat supplied. Therefore, there will be some net fall in temperature of the gas, i.e., ΔT will be negative.

$$\therefore \quad C = \frac{\Delta Q}{m(-\Delta T)} = \text{negative}, \quad \text{i.e., } C = \text{negative}$$

Hence, the specific heat of gas can have any positive value ranging from zero to infinity. Further, it can even be negative. The exact value depends upon the mode of heating the gas. Out of many values of specific heat of a gas, two are of special significance:

1. **Specific heat of a gas at constant volume (c_v):** The specific heat of a gas at constant volume is defined as the quantity of heat required to raise the temperature of unit mass of gas through 1 K when its volume is kept constant, i.e.,

$$c_v = \frac{(\Delta Q)_v}{m\Delta T}$$

If instead of unit mass, 1 mole of gas is considered, the specific heat is called molar specific heat at constant volume and is represented by C_v.

$$C_v = Mc_v = \frac{M(\Delta Q)_v}{m\Delta T} = \frac{1}{\mu}\frac{(\Delta Q)_v}{\Delta T} \qquad (\text{as } \mu = m/M)$$

2. **Specific heat of a gas at constant pressure (c_p):** The specific heat of a gas at constant pressure is defined as the quantity of heat required to raise the temperature of unit mass of gas through 1 K when its pressure is kept constant, i.e.,

$$c_p = \frac{(\Delta Q)_p}{m\Delta T}$$

If instead of unit mass, 1 mole of gas is considered, the specific heat is called molar specific heat at constant pressure and is represented by C_p.

$$C_p = Mc_p = \frac{M(\Delta Q)_p}{m\Delta T} = \frac{1}{\mu}\frac{(\Delta Q)_p}{\Delta T} \qquad (\text{as } \mu = m/M)$$

Mayer's Formula

Out of two principle specific heats of a gas, C_p is more than C_v because in case of C_v, volume of gas is kept constant and heat is required only for raising the temperature of 1 g mole of the gas through 1°C or 1 K.

No heat, whatsoever, is spent in the expansion of the gas. It means that the heat supplied to the gas increases its internal energy only, i.e., (i)

$$(\Delta Q)_v = \Delta U = \mu C_v \Delta T$$

while in case of C_p, the heat is used in two ways:

i. In increasing the temperature of the gas by ΔT,
ii. In doing work (ΔW), due to expansion at constant pressure.

Therefore, (ii)

$$(\Delta Q)_p = \Delta U + \Delta W = \mu C_p \Delta T$$

From Eqs. (i) and (ii), we get

$$\mu C_p \Delta T - \mu C_v \Delta T = \Delta W$$

$\Rightarrow \quad \mu\Delta T(C_p - C_v) = P\Delta V$ (for constant P, $\Delta W = P\Delta V$)

$$\Rightarrow \quad C_p - C_v = \frac{P\Delta V}{\mu\Delta T}$$

(from $PV = \mu RT$. At constant pressure $P\Delta V = \mu R\Delta T$)

$$\Rightarrow \quad C_p - C_v = R$$

This relation is called the Mayer's formula and shows that $C_p > C_v$, i.e., molar specific heat at constant pressure is greater than that at constant volume.

Specific Heat and Kinetic Energy for Different Gases

		Monatomic	Diatomic	Triatomic non-linear	Triatomic linear
Atomicity	A	1	2	3	3
Restriction	B	0	1	3	2
Degree of freedom	$f = 3A - B$	3	5	6	7
Molar specific heat at constant volume	$C_v = (f/2)R = R/(\gamma - 1)$	$3/2R$	$5/2R$	$3R$	$7/2R$
Molar specific heat at constant pressure	$C_p = [(f/2) + 1]\, R = (\gamma/\gamma - 1)R$	$5/2R$	$7/2R$	$4R$	$9/2R$
Ratio of C_p to C_v	$\gamma = C_p/C_v = 1 + (2/f)$	$5/3 = 1.66$	$7/5 = 1.4$	$4/3 = 1.33$	$9/7 = 1.28$
Kinetic energy of 1 mole	$E_{mole} = (f/2)RT$	$(3/2)RT$	$(5/2)RT$	$3RT$	$(7/2)RT$
Kinetic energy of 1 molecule	$E_{molecule} = (f/2)kT$	$(3/2)kT$	$(5/2)kT$	$3kT$	$(7/2)kT$
Kinetic energy of 1 g	$E_{gram} = (f/2)rT$	$(3/2)rT$	$(5/2)rT$	$3rT$	$(7/2)rT$

ILLUSTRATION 14.6 An ideal gas has a specific heat at constant pressure $C_P = (5/2)\, R$. The gas is kept in a closed vessel of volume $8.3 \times 10^{-3}\ \text{m}^3$ at a temperature of 300 K and a pressure of $1.6 \times 10^6\ \text{N/m}^2$. An amount of 2.49×10^4 J of heat energy is supplied to the gas. Calculate the final temperature and pressure of the gas ($R = 8.3$ J/mol K).

Solution. As here volume of gas remains constant, we have

$$(\Delta Q)_V = \mu C_V \Delta T$$

Here, $C_V = C_P - R = (5/2)R - R = (3/2)R$

$$\mu = \frac{PV}{RT} = \frac{1.6\times10^6 \times 8.3\times10^{-3}}{8.3\times300} = \frac{16}{3}$$

$$2.49\times10^4 = \frac{16}{3}\times\frac{3}{2}\times8.3\Delta T$$

i.e., $\Delta T = 375$ or $T_2 - T_1 = 375$

i.e., $T_2 = (375 + 300)1 = 675$ K

Now as for a given mass of an ideal gas at constant volume,

$$P \propto T$$

$$(P_2/P_1) = (T_2/T_1)$$

$$P_2 = \frac{675}{300}\times1.6\times10^6 = 3.6\times10^6\ \text{N/m}^2$$

GASEOUS MIXTURE

If two non-reactive gases are enclosed in a vessel of volume V. In the mixture μ_1 moles of one gas are mixed with μ_2 moles of another gas. If N_A is Avogadro's number then number of molecules of first gas $N_1 = \mu_1 N_A$ and number of molecules of second gas $N_2 = \mu_2 N_A$.

i. Total number of moles $\mu = (\mu_1 + \mu_2)$.

ii. If M_1 is the molecular weight of first gas and M_2 that of second gas. Then molecular weight of mixture will be

$$M = \frac{\mu_1 M_1 + \mu_2 M_2}{\mu_1 + \mu_2}$$

iii. Specific heat of the mixture at constant volume will be

$$C_{V_{mix}} = \frac{\mu_1 C_{V_1} + \mu_2 C_{V_2}}{\mu_1 + \mu_2} = \frac{\mu_1\left(\frac{R}{\gamma_1 - 1}\right) + \mu_2\left(\frac{R}{\gamma_2 - 1}\right)}{\mu_1 + \mu_2}$$

$$= \frac{R}{\mu_1 + \mu_2}\left(\frac{\mu_1}{\gamma_1 - 1} + \frac{\mu_2}{\gamma_2 - 1}\right)$$

$$\therefore \quad C_{V_{mix}} = \frac{R}{\frac{m_1}{M_1} + \frac{m_2}{M_2}}\left(\frac{m_1/M_1}{\gamma_1 - 1} + \frac{m_2/M_2}{\gamma_2 - 1}\right)$$

iv. Specific heat of the mixture at constant pressure will be

$$C_{P_{mix}} = \frac{\mu_1 C_{P_1} + \mu_2 C_{P_2}}{\mu_1 + \mu_2}$$

$$\Rightarrow \quad C_{P_{mix}} = \frac{\mu_1\left(\frac{\gamma_1}{\gamma_1 - 1}\right)R + \mu_2\left(\frac{\gamma_2}{\gamma_2 - 1}\right)R}{\mu_1 + \mu_2}$$

$$= \frac{R}{\mu_1 + \mu_2}\left[\mu_1\left(\frac{\gamma_1}{\gamma_1 - 1}\right) + \mu_2\left(\frac{\gamma_2}{\gamma_2 - 1}\right)\right]$$

$$\therefore \quad C_{P_{mix}} = \frac{R}{\frac{m_1}{M_1} + \frac{m_2}{M_2}}\left[\frac{m_1}{M_1}\left(\frac{\gamma_1}{\gamma_1 - 1}\right) + \frac{m_2}{M_2}\left(\frac{\gamma_2}{\gamma_2 - 1}\right)\right]$$

Illustration 14.7 How much heat energy should be added to the gaseous mixture consisting of 1 g of hydrogen and 1 g of helium to raise its temperature from 0°C to 100°C

(a) at constant volume,

(b) at constant pressure ($R = 2$ cal/mol K)?

Solution. As hydrogen is diatomic and has molecular weight 2,

$$(C_V)_H = \frac{5}{2}R \quad \text{and} \quad \mu_H = \frac{1}{2}$$

While He is monatomic and has molecular weight 4,

$$(C_V)_{mix} = \frac{3}{2}R \quad \text{and} \quad \mu_{He} = \frac{1}{4}$$

So, by conservation of energy, we get

$$(C_V)_{mix} = \frac{\mu(C_V)_1 + \mu_2(C_V)_2}{\mu_1 + \mu_2} = \frac{\frac{1}{2}\times\frac{5}{2}R + \frac{1}{4}\times\frac{3}{2}R}{\frac{1}{2}+\frac{1}{4}}$$

$$= \frac{13}{8}\times\frac{4}{3}R = \frac{13}{6}R$$

(a) So

$$Q_V = \mu C_V \Delta T = \left(\frac{1}{2}+\frac{1}{4}\right)\times\frac{13}{6}\times 2\times(100-0) = 325 \text{ cal}$$

(b) Now as $(C_P)_{mix} = (C_V)_{mix} + R = \frac{13}{6}R + R = \frac{19}{6}R$

$$Q_P = \mu C_P \Delta T = \left(\frac{1}{2}+\frac{1}{4}\right)\times\frac{19}{6}\times 2\times(100-0) = 475 \text{ cal}$$

Concept Application Exercise 14.1

1. A thermally insulated vessel with gaseous nitrogen at a temperature of 27°C moves with velocity 100 m/s^{-1}. How much (in percentage) and in what way will the gas pressure change if the vessel is brought to rest suddenly?
2. Find the molar mass and the number of degrees of freedom of molecules in a gas if its heat capacities are $C_v = 650$ J kg^{-1} K^{-1} and $C_p = 910$ J kg^{-1} K^{-1}.
3. At 127°C and 1.00×10^{-2} atm pressure, the density of a gas is 1.24×10^{-2} kg m^{-3}.
   (a) Find v_{rms} for the gas molecules.
   (b) Find the molecular weight of the gas and identify it.
4. The mass of a gas molecule can be computed from the specific heat at constant volume. Take $C_v = 0.075$ kcal kg^{-1} k^{-1} for argon and calculate
   (a) the mass of an argon atom
   (b) the atomic weight of argon.
5. In a certain gas, 2/5th of the energy of the molecules is associated with the rotation of the molecules, and the rest is associated with the motion of their centres of mass. What is the average translational energy of one such molecule when the temperature is 27°C? How much energy is required to raise the temperature by 1°C?
6. If the water molecules in 1 g of water were distributed uniformly over the surface of the earth, how many molecules would there be in 1 m^2 of the earth's surface (radius of the earth = 6400 km)?

THERMODYNAMICS

Thermodynamics is a branch of science which deals with exchange of heat energy between bodies and conversion of the heat energy into mechanical energy and vice versa.

Thermodynamic Variables and Equation of State

A thermodynamic system can be described by specifying its pressure, volume, temperature, internal energy and the number of moles. These parameters are called thermodynamic variables. The relation between the thermodynamic variables (P, V, T) of the system is called equation of state.

For μ moles of an ideal gas, equation of state is $PV = \mu RT$ and for 1 mole of an it ideal gas is $PV = RT$.

Thermodynamic Equilibrium

When the thermodynamic variables attain a steady value, i.e., they are independent of time, the system is said to be in the state of thermodynamic equilibrium. For a system to be in thermodynamic equilibrium, the following conditions must be fulfilled.

Mechanical equilibrium: There is no unbalanced force between the system and its surroundings.

Thermal equilibrium: There is a uniform temperature in all parts of the system and is same as that of surrounding.

Chemical equilibrium: There is a uniform chemical composition throughout the system and the surrounding.

Thermodynamic Process

The transaction of heat between the surroundings and a thermodynamic system can be achieved in several ways, effecting the work done by or on it, and/or allowing an alternation in its internal energy. Each of the ways executed is said to be a process (thermodynamic). Obviously, there is no limitation to the variety of thermodynamic processes.

The process of change of state of a system involves change of thermodynamic variables such as pressure P, volume V and temperature T of the system. This is known as thermodynamic process. Some important processes are (i) isothermal process, (ii) adiabatic process, (iii) isobaric process, (iv) isochoric (isovolumic process), (v) cyclic and non-cyclic process and (vi) reversible and irreversible process.

ZEROTH LAW OF THERMODYNAMICS

If systems A and B are separately in thermal equilibrium with a third system C, then A and B are also in thermal equilibrium with each other.

i. The zeroth law leads to the concept of temperature. All bodies in thermal equilibrium must have a common property which has the same value for all of them. This property is called the temperature.

ii. The zeroth law came to light long after the first and second laws of thermodynamics had been discovered and numbered. Because the concept of temperature is fundamental to those two laws, the law that establishes temperature as a valid concept should have the lowest number. Hence, it is called zeroth law.

FIRST LAW OF THERMODYNAMICS

Consider a thermodynamic system at a certain thermodynamic state with a certain external pressure bearing on its surface (due to surrounding). Let an infinitely small quantity of heat dQ be imparted to it externally. In the general case, the temperature of the system increases and it also expands.

An increase in temperature signifies an increase in the randomness and intensity of molecular motion, i.e., an increase in the kinetic energy of the molecules, which is the modern concept of increase in temperature, according to the kinetic theory's interpretation. Let the increase in internal kinetic energy be dK.

The increased volume of the system also denotes some work done against the intermolecular forces of attraction, which is the work of dispersion, and is stored in the system itself as an increased internal potential energy. Let it be denoted by dU'.

The increase in volume also involves an appreciable amount of work done against the external forces, the work of expansion often spoken of as external work. Let it be denoted by dW.

Ignoring, any other type of changes (electrical, chemical, hysterical, etc.) by the law of conservation of energy, and the principle of the equivalence of heat and work, the heat energy balance equation can be written as

$$dQ = dK + dU' + dW$$

Now, $dK + dU'$ is evidently the sum total of the increase in the internal kinetic and potential energy of the system, which can be more briefly stated as the increase in the internal energy of the system and can be denoted by dU.

The above equation can be rewritten

$$dQ = dU + dW \qquad \text{(i)}$$

Equation (i) establishes the first law of thermodynamics, which states that the heat imparted to a body is, in general, expanded in two ways. A part of it is used to increase its internal energy and the remaining is utilized to do work against external pressure.

While substituting the values of dU, dQ and dW in Eq. (i) the following sign convention should be adopted:

1. If heat is imparted or supplied to a system, then dQ is positive; if heat is extracted from a system, then dQ is negative.
2. If there is an increase in volume, i.e., dV is positive, then the system does work against the external pressure bearing upon the system's surface and accordingly dW is positive and work is said to be done by the system; on the other hand, if there is a decrease in volume, i.e., dV is negative, then dW is negative and work is said to have been done on the system.
3. $dU = U_f - U_i$, where U_i and U_f are the initial and final internal energies of the system, respectively. If the internal energy increases (i.e., $U_f > U_i$), then dU is positive, while if the internal energy decreases during the process (i.e., $U_f < U_i$), then dU is negative.
4. For an ideal gas, internal energy depends on temperature only.

Quantities Involved in First Law of Thermodynamics

Heat (Q)

It is the energy that is transferred between a system and its environment because of the temperature difference between them. Heat always flows from a body at higher temperature to a body at lower temperature till their temperatures become equal.

Important Points

- Heat is a form of energy, so it is a scalar quantity with dimension (ML^2T^{-2}).
- Unit: joule (SI), calorie (practical unit), and 1 calorie = 4.2 J.
- Heat is a path dependent quantity, i.e., heat required to change the temperature of a given gas at a constant pressure is different from that required to change the temperature of same gas through same amount at constant volume.
- For solids and liquids: $Q = mL$ (for change in state) and $Q = mc\Delta T$ (for change in temperature)
  For gases when heat is absorbed and temperature changes:
  $Q_V = \mu C_V \Delta T$ (for constant volume)
  $Q_P = \mu C_P \Delta T$ (for constant pressure)

The total work done by the gas, while its volume change from V_1 to V_2, can be obtained by adding up (integrating) the small works dW performed by the gas in stages during each element change in volume dV. Thus, the total work done will be

$$W = \int dW = \int_{V_1}^{V_2} P dV$$

If the pressure P remains constant during the process of change in volume, then

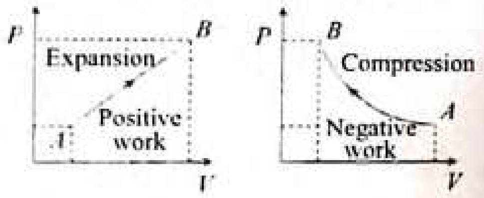
$$W = P\int_{V_1}^{V_2} dV$$

(Pressure being constant can be taken out of the integrating sign)

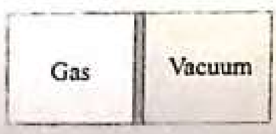
$$W = P[V]_{V_1}^{V_2} = P(V_2 - V_1) = P\Delta V$$

Important Points

- From $\Delta W = P\Delta V = P(V_f - V_i)$
  ΔW = positive if $V_f > V_i$, i.e., system expands against some external force.
  ΔW = negative if $V_f < V_i$, i.e., system contracts because of some external force exerted by the surrounding.
- In P–V diagram or indicator diagram, the area under P–V curve represents work done.
  W = area under P–V diagram
  It is positive if volume increases (for expansion).
  It is negative if volume decreases (for compression).
- In a cyclic process, work done is equal to the area under the cycle.
  It is positive if the cycle is clockwise.
  It is negative if the cycle is anticlockwise.

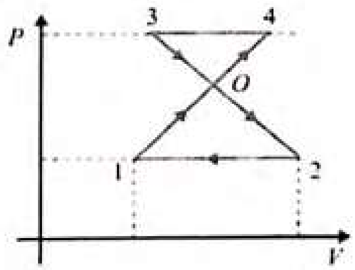


- If the gas expands in such a way that the other side of the piston is vacuum, then work done by the gas will be zero.



As $W = P\Delta V = 0$ (here $P = 0$)

ILLUSTRATION 14.8 Determine the work done by an ideal gas doing $1 \to 4 \to 3 \to 2 \to 1$.
Given $P_1 = 10^5$ Pa, $P_0 = 3 \times 10^5$ Pa, $P_3 = 4 \times 10^5$ Pa and $V_2 - V_1 = 10$ L.



Solution. From figure,

$$\frac{V_4 - V_3}{V_2 - V_1} = \frac{P_3 - P_0}{P_0 - P_1} \Rightarrow \frac{V_4 - V_3}{10} = \frac{4\times10^5 - 3\times10^5}{3\times10^5 - 10^5}$$

$$V_4 - V_3 = 5\text{ L}$$

Now, work done

$$W = \left(\frac{1}{2}\times10\times2\times10^5 - \frac{1}{2}\times5\times1\times10^5\right)\times10^{-3} = 750\text{ J}$$

Internal Energy (U)

Internal energy of a system is the energy possessed by the system due to molecular motion and molecular configuration.

The energy due to molecular motion is called internal kinetic energy U_K and energy due to molecular configuration is called internal potential energy U_P. Therefore, total internal energy

$$U = U_K + U_P$$

i. For an ideal gas, as there is no molecular attraction $U_p = 0$, i.e., internal energy of an ideal gas is totally kinetic and is given by $U = U_K = (3/2)\mu RT$ and change in internal energy $U = (3/2)\mu R\Delta T$

ii. In case of gases, whatever may be the process

$$\Delta U = \mu\frac{f}{2}R\Delta T = \mu C_v\Delta T$$

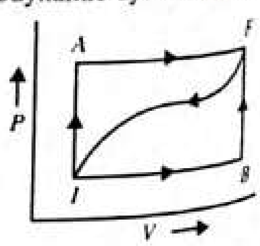
$$= \mu\frac{R}{(\gamma - 1)}\Delta T = \frac{\mu R(T_f - T_i)}{\gamma - 1}$$

$$= \frac{\mu RT_f - \mu RT_i}{\gamma - 1} = \frac{(P_fV_f - P_iV_i)}{\gamma - 1}$$

iii. Change in internal energy does not depend on the path of the process. So it is called a point function, i.e., it depends only on the initial and final states of the system, i.e., $U = U_f = U_i$

iv. Change in internal energy in a cyclic process is always zero as for cyclic process $U_f = U_i$. Therefore, $\Delta U = U_f = U_i = 0$

ILLUSTRATION 14.9 When a thermodynamic system is taken from an initial state I to a final state F along the path IAF, as shown in figure, the heat energy absorbed by the system is $Q = 55$ J and the work done by the system is $W = 25$ J. If the same system is taken along the path IBF, the value of $Q = 35$ J.



(a) Find the work done along the path IBF.
(b) If $W = -15$ J for the curved path FI, how much heat energy is lost by the system along this path?
(c) If $U_I = 10$ J, what is U_F?
(d) If $U_B = 20$ J, what is Q for the process BF and IB?

Solution. The first law of thermodynamics states that

$$Q = \Delta U + W \quad \text{or} \quad Q = (U_f - U_i) + W$$

Here U_i and U_f are the internal energies in the initial and the final state, respectively. Given that for path IAF, $Q = 55$ J and $W = 25$ J. Therefore,

$$\Delta U = U_f - U_i = Q - W = 55 - 25 = 30 \text{ J}$$

The internal energy is independent of the path; it depends only on the initial and final states of the system. Thus, the internal energy between I and F states is 30 J irrespective of the path followed by the system.

(a) For path IBF, $Q = 35$ J and $\Delta U = 30$ J.
Therefore, $W = Q - \Delta U = 35 - 30 = 5$ J

(b) $W = -15$ J, but $\Delta U = -30$ J.
Therefore, $Q = W + \Delta U = -15 - 30 = -45$ J.

(c) Given $U_i = 10$ J.
Therefore, $U_f = \Delta U + U_i = 30 + 10 = 40$ J.

(d) The process BF is isochoric, i.e., the volume is constant. Hence, $W = 0$. Therefore, $Q = (\Delta U)_{BF} = U_F - U_B = 40 - 20 = 20$ J. The process IB is isobaric (constant pressure). Therefore, $Q = (Q)_{IBF} - (Q)_{BF} = 35 - 20 = 15$ J.

☞ Important Points

- First law of thermodynamics makes no distinction between work and heat as according to it the internal energy (and hence temperature) of a system may be increased by adding either heat to it or doing work on it or both.
- ΔQ and ΔW are the path functions, but ΔU is the point function.
- In the above equation all three quantities ΔQ, ΔU and ΔW must be expressed either in Joule or in calorie.
- Sign conventions are as follows:

ΔQ	Positive	When heat is supplied to a system
	Negative	When heat is drawn from the system
ΔW	Positive	When work is done by the gas (expansion)
	Negative	When work is done on the gas (compression)
ΔU	Positive	When temperature increases, internal energy increases
	Negative	When temperature decreases, internal energy decreases

- Limitation: First law of thermodynamics does not indicate the direction of heat transfer. It does not tell anything about the conditions under which heat can be transformed into work and also it does not indicate as to why the total heat energy cannot be converted into mechanical work continuously.

ILLUSTRATION 14.10 Gaseous hydrogen contained initially under standard conditions in a sealed vessel of volume $V = 5$ L was cooled by $\Delta T = 55$ K. Find how much the internal energy of the gas will change and what amount of heat will be lost by the gas.

Solution. By the first law of thermodynamics,

$$Q = \Delta U + W$$

Here $\Delta W = 0$ as the volume remains constant.

$$\therefore \quad Q = \Delta U$$

Now $$\Delta U = \frac{m}{M} C_v (-\Delta T)$$

$$= -\frac{m}{M}\frac{R}{\gamma - 1}\Delta T \qquad \left(\text{as } C_v = \frac{R}{\gamma - 1}\right)$$

We have $$p_0 V = \frac{m}{M} R T_0$$

$$\Rightarrow \quad \Delta U = -\frac{1.013 \times 10^5 \times (5 \times 10^{-3}) \times 55}{273(1.4 - 1)} = -255 \text{ J}$$

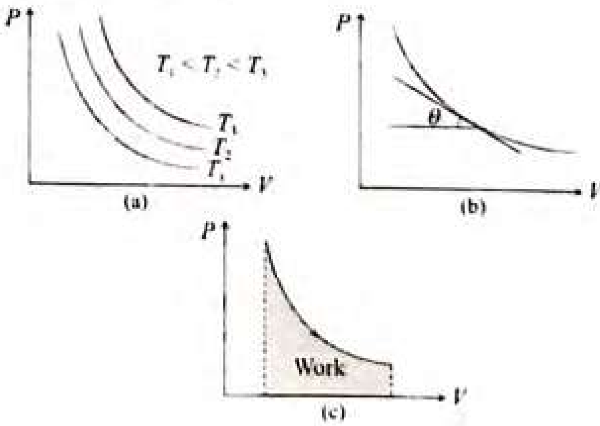
Isothermal Process

When a thermodynamic system undergoes a physical change in such a way that its temperature remains constant, then the change is known as isothermal change.

In this process, P and V change but T = constant, i.e., change in temperature $\Delta T = 0$

1. **Essential condition for isothermal process:**
   i. The walls of the container must be perfectly conducting to allow free exchange of heat between the gas and its surrounding.

   ii. The process of compression or expansion should be so slow so as to provide time for the exchange of heat.
   Since these two conditions are not fully realized in practice, no process is perfectly isothermal.
2. **Equation of state:** From ideal gas equation $PV = \mu RT$, we observe that if temperature remains constant, then PV = constant, i.e., in all isothermal process Boyle's law is obeyed.
   Hence, equation of state is PV = constant.
3. **Indicator diagram:**



i. Curves obtained on PV graph are called isotherms and they are hyperbolic in nature.

ii. Slope of isothermal curve: By differentiating PV = constant, we get

$$PdV + VdP = 0 \Rightarrow P\,dV = -VdP \Rightarrow \frac{dP}{dV} = -\frac{P}{V}$$

$$\therefore \quad \tan\theta = \frac{dP}{dV} = -\frac{P}{V}$$

iii. Area between the isotherm and volume axis represents the work done in isothermal process.
If volume increases W = positive area under curve and if volume decreases W = negative area under curve

4. Specific heat: Specific heat of gas during isothermal change is infinite.

As $\quad C = \dfrac{Q}{m\Delta T} = \dfrac{Q}{m \times 0} \to \infty \qquad$ (as $\Delta T = 0$)

5. Isothermal elasticity: For isothermal process, PV = constant
Differentiating both sides we get

$PdV + VdP = 0$

$\Rightarrow \quad PdV = -VdP$

$$\Rightarrow \quad P = \frac{dP}{-dV/V} = \frac{\text{Stress}}{\text{Strain}} = E_\theta$$

$\therefore \quad E_\theta = P$, i.e., isothermal elasticity is equal to pressure.
At NTP, isothermal elasticity of gas = atmospheric pressure = 1.01×10^5 N/m^2

6. Work done in isothermal process:

$$W = \int_{V_i}^{V_f} PdV = \int_{V_i}^{V_f} \frac{\mu RT}{V} dV \qquad (\text{as } PV = \mu RT)$$

$$W = \mu RT \log_e\left(\frac{V_f}{V_i}\right) = 2.303\mu RT \log_{10}\left(\frac{V_f}{V_i}\right)$$

or $$W = \mu RT \log_e\left(\frac{P_i}{P_f}\right) = 2.303\mu RT \log_{10}\left(\frac{P_i}{P_f}\right)$$

7. First law of thermodynamics in isothermal process:

$Q = \Delta U + W \quad$ but $\quad \Delta U \propto \Delta T$

$\therefore \quad \Delta U = 0 \qquad$ (as $\Delta T = 0$)

$\therefore \quad \Delta U = W$, i.e., heat supplied in an isothermal change is used to do work against the external surrounding, or if the work is done on the system, then equal amount of heat energy will be liberated by the system.

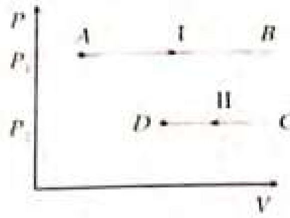
Isobaric Process

When a thermodynamic system undergoes a physical change in such a way that its pressure remains constant, the change is known as isobaric process.

In this process, V and T change but P remains constant. Hence, Charles' law is obeyed in this process.

1. Equation of state: From ideal gas equation, we get $PV = \mu RT$
If pressure remains constant, then $V \propto T$
or $\quad V_1/T_1 = V_2/T_2$ = Constant

2. Indicator diagram: In figure, graph I represents isobaric expansion, and graph II represents isobaric compression. Slope of indicator diagram $dP/dV = 0$.



3. Specific heat: Specific heat of gas during isobaric process

$$C_p = \left(\frac{f}{2} + 1\right)R$$

4. Bulk modulus of elasticity:

$$K = \frac{\Delta P}{-\Delta V/V} = 0 \qquad (\text{as } \Delta P = 0)$$

5. Work done in isobaric process:

$$W = \int_{V_i}^{V_f} PdV = P\int_{V_i}^{V_f} dV = P[V_f - V_i] \qquad (\text{as } P = \text{constant})$$

$$W = P(V_f - V_i) = \mu R[T_f - T_i] = \mu R\Delta T$$

6. First law of thermodynamics in isobaric process:

$$\Delta U = \mu C_v \Delta T = \mu \frac{R}{(\gamma - 1)}\Delta T \quad \text{and} \quad W = \mu R\Delta T$$

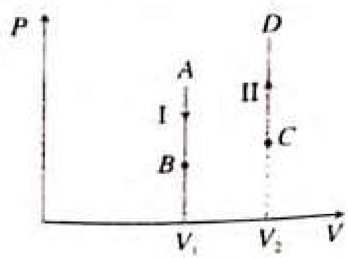
and $\Delta Q = \mu C_p \Delta T$

Isochoric or Isometric Process

When a thermodynamic process undergoes a physical change in such a way that its volume remains constant, the change is known as isochoric process.

In this process, P and T changes, but V = constant. Hence Gay-Lussac's law is obeyed in this process.

1. Equation of state: From ideal gas equation, we get $PV = \mu RT$. If volume remains constant, then $P \propto T$ or $P_1/T_1 = P_2/T_2$ = constant.

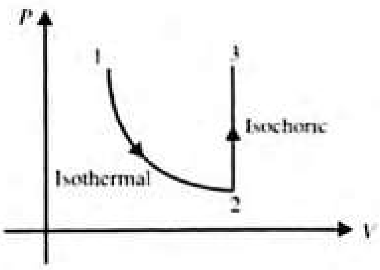


2. **Indicator diagram:** In figure, graphs I and II represent isometric decrease in pressure at volume V_1 and isometric increase in pressure at volume V_2, respectively, and slope of indicator diagram $dP/dV = \infty$.
3. **Specific heat:** Specific heat of gas during isochoric process $C_v = (f/2)R$.
4. **Bulk modulus of elasticity:** $K = \Delta P/(-\Delta V/V)$
$= \Delta P/0 = \infty$.
5. **Work done in isobaric process:** $W = P\Delta V = P[V_f - V_i]$ (as $V = 0$).
$\therefore \quad W = 0$
6. **From the first law of thermodynamics in isochoric process:**
$Q = \Delta U + W = \Delta U$ (as $W = 0$)

$$Q = \mu C_v \Delta T = \mu \frac{R}{\gamma - 1}\Delta T = \frac{P_f V_f - P_i V_i}{\gamma - 1}$$

ILLUSTRATION 14.11 Six grams of hydrogen gas at a temperature of 273 K was isothermally expanded to five times its initial volume and then isochorically heated so that the pressure in the final state becomes equal to that in the initial state. Find the total amount of heat absorbed by the gas during the entire process.

Solution. The processes represent on the P–V diagram by the curve 1 to 2 (isothermal) and the line 2 to 3 (isochoric). Here $P_1 = P_3$



For the process 1 to 2 (isothermal)

$$T_2 = T_1,\ V_2 = 5V_1$$

$$Q = \Delta U + W = 0 + W$$

$$\Rightarrow \quad Q = 2.303\, nRT_1 \log\left(\frac{V_2}{V_1}\right)$$

$$Q = 2.303 \times \left(\frac{6}{2}\right) \times 8.3 \times 273 \times \log 5 = 10942.4\text{J}$$

State 1 and state 3 are at the same pressure.

$$\Rightarrow \quad \frac{V_1}{T_1} = \frac{V_3}{T_3} \quad \Rightarrow \quad T_3 = \frac{V_3}{V_1}T_1 = 5 \times 273 = 1365\text{ K}$$

Process 2 to 3: $Q = \Delta U + W$

$$Q = nC_v\Delta T + 0$$

$$= \frac{6}{2} \times \frac{5}{2} R \times (T_3 - T_2)$$

$$= 7.5 \times 8.3 \times (1365 - 273)\text{J} = 67977\text{J}$$

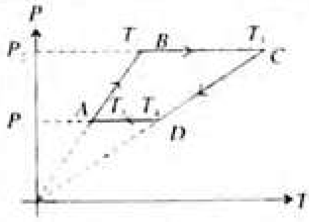
Thus total heat absorbed $= \Delta H_{1\to 2} + \Delta H_{2\to 3} = 78919.4$ J

$\therefore$ Net heat added is $\left[-\frac{1}{2}\frac{RT_0}{\gamma - 1}\right] + \left[\frac{1}{2}\frac{RT_0}{\gamma - 1} + \frac{1}{2}RT_0\right] = \frac{1}{2}RT_0$

This is the heat added when the number of moles is one. When there are 2 moles, heat added is

$$2 \times \frac{1}{2}RT_0 = RT_0 = 8.3 \times 300 = 2490\text{ J}$$

ILLUSTRATION 14.12 P–T curve of a cyclic process is shown. Find out the work done by the gas in the given process if number of moles of the gas are n.



Solution. Since path AB and CD are isochoric therefore work done during AB and CD is zero. Path BC and DA are isobaric.

Hence

$$W_{BC} = nR\Delta T = nR(T_3 - T_2)$$

$$W_{DA} = nR(T_1 - T_4)$$

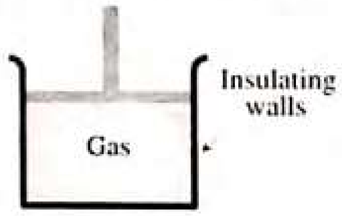
$$\text{Total work done} = W_{BC} + W_{DA} = nR(T_1 + T_3 - T_4 - T_2)$$

Adiabatic Process

When a thermodynamic system undergoes a change in such a way that no exchange of heat takes place between it and the surroundings, the process is known as adiabatic process.

In this process P, V and T change, but $Q = 0$.

1. **Essential conditions for adiabatic process:**



i. There should not be any exchange of heat between the system and its surroundings. All walls of the container and the piston must be perfectly insulating.

ii. The system should be compressed or allowed to expand suddenly so that there is no time for the exchange of heat between the system and its surroundings.

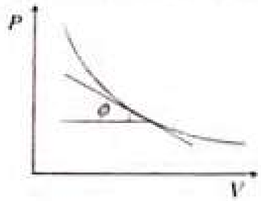
Since, these two conditions are not fully realized in practice, no process is perfectly adiabatic.

3. **First law of thermodynamics in adiabatic process:**
$Q = \Delta U + W$
but for adiabatic process $\Delta Q = 0 \qquad \therefore \quad \Delta U + W = 0$
If ΔW = positive, then ΔU = negative so temperature decreases, i.e., adiabatic expansion produces cooling.
If W = negative, then ΔU = positive so temperature increases, i.e., adiabatic compression produces heating.
4. **Equation of state:** As in case of adiabatic change, the first law of thermodynamics reduces to
$\Delta U + W = 0$, i.e., $dU + W = 0$ (i)
$\Rightarrow \quad PV^{\gamma} = \text{constant}$ (iv)
Equation (iv) is called equation of state for adiabatic change and can also be rewritten as

$TV^{\gamma-1} = \text{constant}$ (as $P = (mRT/V)$) (v)

and $\dfrac{T^{\gamma}}{(P^{\gamma-1})} = \text{constant}$ $\left(\text{as } V = \dfrac{\mu RT}{P}\right)$ (vi)

5. **Indicator diagram:**
   i. Curve obtained on PV graph are called adiabatic curve.
   ii. Slope of adiabatic curve:
   From $PV^{\gamma} = \text{constant}$.
   By differentiating, we get



$$dPV^{\gamma} + P\gamma V^{\gamma-1}dV = 0$$

$$\frac{dP}{dV} = -\gamma\frac{PV^{\gamma-1}}{V^{\gamma}} = -\gamma\left(\frac{P}{V}\right)$$

Therefore, slope of adiabatic curve $\tan\phi = -\gamma(P/V)$.
But we also know that slope of isothermal curve $\tan\phi = -P/V$.

So. $$\frac{\text{Slope of adiabatic curve}}{\text{Slope of isothermal curve}} = \frac{-\gamma(P/V)}{-(P/V)} = \gamma = \frac{C_p}{C_v} > 1$$

6. **Specific heat:** Specific heat of a gas during adiabatic change is zero.

$$C = \frac{Q}{(m\Delta T)} = \frac{0}{(m\Delta T)} = 0 \qquad (\text{as } Q = 0)$$

7. **Adiabatic elasticity:** For adiabatic process,
   $PV^{\gamma} = \text{constant}$.
   Differentiating both sides, we get

$$dPV^{\gamma} + P\gamma V^{\gamma-1}dV = 0$$

$$\gamma P = \frac{dP}{-dV/V} = \frac{\text{Stress}}{\text{Strain}} = E_{\phi}$$

$$E_{\phi} = \gamma P$$

i.e., adiabatic elasticity is γ times that of pressure but we know isothermal elasticity $E_{\theta} = P$

So $$\frac{E_{\phi}}{E_{\theta}} = \frac{\text{Adiabatic elasticity}}{\text{Isothermal elasticity}} = \frac{\gamma P}{P} = \gamma$$

i.e., the ratio of two elasticities of gases is equal to the ratio of two specific heats.

9. **Work done in adiabatic process:**

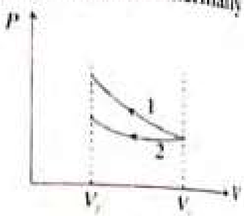
$$W = \int_{V_i}^{V_f} PdV = \int_{V_i}^{V_f} \frac{K}{V^{\gamma}}dV \qquad \left(\text{as } P = \frac{K}{V^{\gamma}}\right)$$

$$W = \frac{[P_fV_f - P_iV_i]}{(1-\gamma)}$$

and also $$W = \frac{[P_iV_i - P_fV_f]}{(\gamma-1)} = \frac{\mu R(T_i - T_f)}{(\gamma-1)}$$

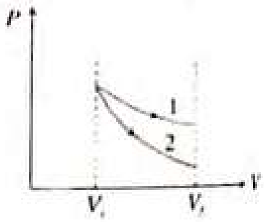
10. **Free expansion:** Free expansion is adiabatic process in which no work is performed on or by the system. Consider two vessels placed in a system which is enclosed with thermal insulation (asbestos-covered). One vessel contains a gas and the other is evacuated. The two vessels are connected by a stopcock. When suddenly the stopcock is opened, the gas rushes into the evacuated vessel and expands freely. The process is adiabatic as the vessels are placed in thermal insulating system ($dQ = 0$). Moreover, the walls of the vessel are rigid and hence no external work is performed ($dW = 0$).
    Now according to the first law of thermodynamics $dU = 0$, if U_i and U_f be the initial and final internal energies of the gas, then
    $U_f - U_i = 0$ (as $U_f = U_i$)
    Thus, the final and initial energies are equal in free expansion.

11. **Comparison between isothermal and adiabatic process:**
    i. **Compression:** If a gas is compressed isothermally and adiabatically from volume V_i to V_f, then from the slope of the graph it is clear that graph 1 (figure) represents adiabatic process, whereas graph 2 represents isothermal process.



Work done	$W_{\text{adiabatic}} > W_{\text{isothermal}}$
Final pressure	$P_{\text{adiabatic}} > P_{\text{isothermal}}$
Final temperature	$T_{\text{adiabatic}} > T_{\text{isothermal}}$

ii. **Expansion:** If a gas expands isothermally and adiabatically from volume V_i to V_f, then from the slope of the graph it is clear that graph 1 (figure) represents isothermal process, whereas graph 2 represents adiabatic process.



Work done	$W_{\text{isothermal}} > W_{\text{adiabatic}}$
Final pressure	$P_{\text{isothermal}} > P_{\text{adiabatic}}$
Final temperature	$T_{\text{isothermal}} > T_{\text{adiabatic}}$

Polytropic Process

A process $PV^{\rho} = \text{constant}$ is called polytropic process, in which $\rho \neq 1$ or γ.

i. **Work done in polytropic process:** As we have calculated in adiabatic process, here also the work done is

$$W = \frac{\nu R}{(r-1)}[T_i - T_f] = \frac{-nR}{(r-1)}[T_f - T_i] = -\frac{nR\Delta T}{(r-1)}$$

For one mole of a gas, $n = 1$

$$W = -\frac{-R\Delta T}{(r-1)}$$

ii. **Specific heat:** If C is the molar specific heat, then heat required to increase the temperature of one mole of a gas by ΔT is

$$Q = C\Delta T$$

From the first law of thermodynamics

$$Q = \Delta U + W$$

or $\quad C\Delta T = C_v\Delta T - \dfrac{R\Delta T}{(r-1)}$

$\therefore \quad C = C_v - \dfrac{R}{(r-1)} = \dfrac{R}{(\gamma-1)} - \dfrac{R}{(r-1)}$

ILLUSTRATION 14.13 An ideal gas ($C_P/C_V = \gamma$) is taken through a process in which the pressure and the volume vary as $P = aV^b$. Find the value of b for which the specific heat capacity in the process is zero.

Solution. Given that $P = aV^b$

or $\quad PV^{-b} = a$

Comparing with PV^γ = constant, we have

$\gamma = -b$

We know that $C = C_v - \dfrac{R}{r-1}$

Here, $C = 0 = C_v - \dfrac{R}{\gamma-1}$

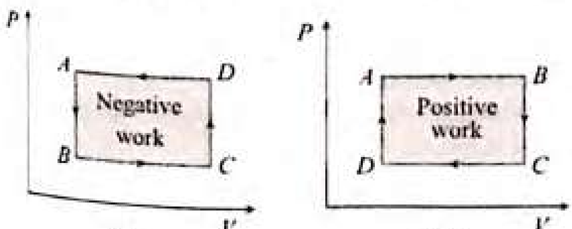
$\therefore \quad 0 = \dfrac{R}{\gamma-1} = \dfrac{R}{-b-1}$

or $\quad b = -\gamma$

Cyclic and Non-Cyclic Processes

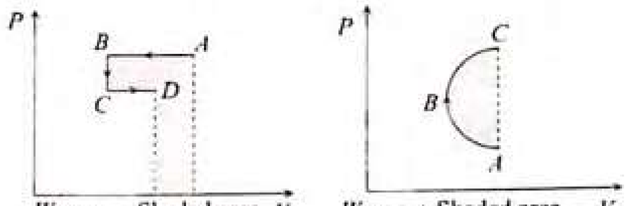
A cyclic process consists of a series of changes that return the system back to its initial state. In a non-cyclic process, the series of changes involved do not return the system back to its initial state.

1. In case of cyclic process as $U_f = U_i$. Therefore
   $\Delta U = U_f - U_i = 0$
   i.e., change in internal energy for cyclic process is zero and also $\Delta U \propto \Delta T$
   $\therefore \quad \Delta T = 0$, i.e., temperature of system remains constant.
2. From the first law of thermodynamics
   $Q = \Delta U + W$
   $Q = W$, i.e., heat supplied is equal to the work done by the system (as $\Delta U = 0$).
3. For cyclic process, P–V graph is a closed curve and area enclosed by the closed path represents the work done.



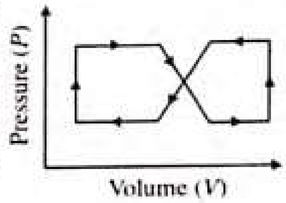
(a) (b)

If the cycle is clockwise work done is positive and if the cycle is anticlockwise work done is negative.



W_{ABCD} = − Shaded area (a) $\quad$ W_{ABC} = + Shaded area (b)

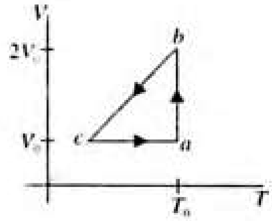
4. Work done in non-cyclic process depends upon the path chosen or the series of changes involved and can be calculated by the area covered between the curve and volume axis on P–V diagram.



Here, it is worth mentioning that the loop can be of any possible shape. Further, it can ever intersect.

The working substance in heat engines, meant to draw a continuous supply of work at the cost of heat, is subjected to cyclic process repeatedly.

ILLUSTRATION 14.14 A sample of an ideal gas has pressure p_0, volume V_0 and temperature T_0. It is isothermally expanded to twice its original volume. It is then compressed at constant pressure to have the original volume V_0. Finally, the gas is heated at constant volume to get the original temperature. (a) Show the process in a V-T diagram; (b) Calculate the heat absorbed in the process.



Solution.

(a) The V–T diagram for the process is shown in figure. The initial state is represented by the POINT a. In the first step, it is isothermally expanded to a volume $2V_0$. This shown by ab. Then the pressure is kept constant and the gas is compressed to the volume V_0. From the ideal gas equation, V/T is constant at constant pressure. Hence, the process is shown by a line bc which passes through the origin. At POINT c, the volume is V_0. In the final step, the gas is heated at constant volume to a temperature T_0. This is shown by ca. The final state is the same as the initial state.

(b) The process is cyclic so that the change in internal energy is zero. The heat supplied is, therefore, equal to the work done by the gas. The work done during ab is

$$W_1 = nRT_0 \ln\frac{2V_0}{V_0} = nRT_0 \ln 2 = p_0V_0 \ln 2$$

Also from the ideal gas equation,

$$p_a V_a = p_b V_b \quad \text{or,} \quad p_b = \frac{p_a V_a}{V_b} = \frac{p_0 V_0}{2V_0} = \frac{p_0}{2}$$

In the step bc, the pressure remains constant. Hence the work done is, $W_2 = \frac{p_0}{2}(V_0 - 2V_0) = -\frac{p_0 V_0}{2}$

In the step ca, the volume remains constant and so the work done is zero. The net work done by the gas in the cyclic process is

$W = W_1 + W_2$

$= p_0V_0 [\ln 2 - 0.5] = 0.193\, p_0V_0.$

Hence, the heat supplied to the gas is $0.193\, p_0V_0$.

Efficiency of a Cyclic Process

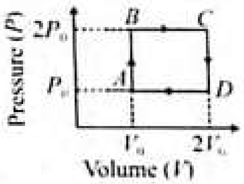
When a system is subjected to a cyclic process, heat is applied during some part of the process, while heat is abstracted during other part.

Evidently, the net heat applied will be the work done by the system ($\therefore Q = W$). However, the gross heat applied will be more than that of the net heat.

Efficiency (η) of a cycle is defined as the ratio of the work performed (net heat given) to the gross heat supplied to the system per cycle. Thus,

$$\eta = \frac{\text{Work done per cycle}}{\text{Gross heat supplied per cycle}}$$

ILLUSTRATION 14.15 Figure shows the indicator diagram corresponding to n moles of an ideal gas taken along the cyclic process $ABCDA$. Find the efficiency of the cycle.



Solution. Evidently, work done by the gas during the cyclic process is

$$W = (2P_0 - P_0)(2V_0 - V_0) \text{ unit} = P_0V_0 \text{ unit}$$

For the process A to B which is isochoric, the heat supplied will be given by

$$Q_1 = \Delta U + W = nC_v\Delta T + 0$$

$$= n\left(\frac{3R}{2}\right)\left[\frac{V_0(2P_0 - P_0)}{nR}\right] \qquad (\because nR\Delta T = V\Delta P)$$

$$= \frac{3}{2}P_0V_0 \text{ unit}$$

And for the process B to C which is isobaric, the heat absorbed will be given by

$$Q_2 = nC_p\Delta T$$

$$= n\left(\frac{5R}{2}\right)\left[\frac{2P_0(2V_0 - V_0)}{nR}\right] \qquad (\because nR\Delta T = P(\Delta V))$$

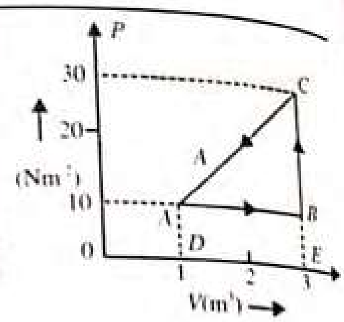
$$= 5P_0V_0 \text{ unit}$$

For the processes C to D and D to A, the heat given will be obviously negative, which implies that heat is abstracted from the system. Therefore, efficiency (η) of the cycle

$$= \frac{\text{Work done per cycle}}{\text{Total heat given per cycle}} \times 100$$

$$= \frac{P_0V_0}{\left(\frac{3P_0V_0}{2}\right) + 5P_0V_0} = \frac{2}{13} \times 100 = \frac{200}{13}\% = 15.38\%$$

ILLUSTRATION 14.16 An ideal gas is taken round a cyclic thermodynamic process $ABCA$ as shown in figure. If the internal energy of the gas at point A is assumed zero while at B it is 50 J. The heat absorbed by the gas in the process BC is 90 J.



(a) What is the internal energy of the gas at point C?

(b) How much heat energy is absorbed by the gas in the process AB?

(c) Find the heat energy rejected or absorbed by the gas in the process CA.

(d) What is the net work done by the gas in the complete cycle $ABCA$?

Solution. Given that $U_A = 0$, $U_B = 50$ J and $Q_{BC} = 90$ J.

Also $P_A = P_B = 10$ Nm^{-2}, $P_C = 300$ Nm^{-2}, $V_A = 1$ m^3

and $V_B = V_C = 3$ m^3

(a) In process BC, as volume of gas remains constant, work done by gas in this process is zero. Thus

$W_{BC} = 0$

Heat absorbed by the gas is $Q_{BC} = 90$ J. From the first law of thermodynamics,

$(\Delta U)_{BC} = U_C - U_B = Q_{BC} - W_{BC} = 90\text{ J} - 0 = 90\text{ J}$

$U_C = (\Delta U)_{BC} + U_B = 90\text{ J} + 50\text{ J} = 140\text{ J}$

(b) In process AB, we have

$(\Delta U)_{AB} = U_B - U_A = 50 - 0 = 50$ J

Work done is given as

W_{AB} = area under AB in P–V diagram

= area of rectangle $ABED$

$= AB \times AD = (3\text{ m}^3 - 1\text{ m}^3) \times 10\text{ Nm}^{-2}$

$= 20$ J

Thus, heat absorbed by the system is

$Q_{AB} = (\Delta U)_{AB} + W_{AB} = 50 + 20 = 70$ J

(c) For process CA

$(\Delta U)_{CA} = U_A - U_C = 0 - 140 = -140$ J

Work done is given as

W_{CA} = area $ACED$

= area of triangle ACB + area of rectangle $ABED$

$= 1/2 \times AB \times BC + AB \times AD$

$= 1/2 \times (3 - 1)\text{ m}^3 \times (30 - 10)\text{Nm}^{-2} + 20$

$= 20 + 20 = 40$ J

In this process, the volume decreases, the work is done on the gas. Hence, the work done is negative.

Thus, $W_{CA} = -40$ J.

Thus heat rejected by the gas is

$$Q_{CA} = (\Delta U)_{CA} + W_{CA} = -140 - 40 = -180 \text{ J}$$

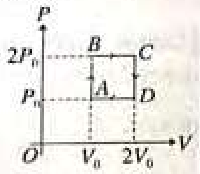
(d) Net work done in the complete cyclic process $ABCA$ is

$$W = \text{area of triangle } ABC = \frac{1}{2} \times 2 \times 20 = 20 \text{ J}$$

As the cycle is anticlockwise, net work is done on the gas.

CONCEPT APPLICATION EXERCISE 14.2

1. A cylindrical vessel of 28 cm diameter contains 20 g of nitrogen compressed by a piston supporting a weight of 75 kg. The temperature of the gas is 17°C. What work will the gas do if it is heated to a temperature of 250°C? What amount of heat should be supplied? To what distance will the weight be raised? The process should be assumed to be isobaric; the heating of the vessel as well as the external pressure is negligible.
2. One mole of oxygen is heated at constant pressure starting at 0°C. How much heat energy must be added to the gas to double its volume?
3. An ideal gas expands from an initial temperature T_1 to a final temperature T_2. Prove that the work done by the gas is $C_v(T_1 - T_2)$.
4. An ideal gas whose adiabatic exponent equals γ expands so that the amount of heat transferred to it is equal to the decrease of its internal energy. Find
   (a) the molar heat capacity of the gas, and
   (b) the T–V equation for the process.
5. One mole of argon expands polytropically, the polytropic constant being 1.5, that is, the process proceeds according to the law $pV^{1.5}$ = constant. In the process, its temperature changes by $\Delta T = -26$ K. Find
   (a) the amount of heat obtained by the gas,
   (b) the work performed by the gas.
6. Find out the work done in the given graph. Also draw the corresponding T–V curve and P–T curve.



SECOND LAW OF THERMODYNAMICS

First law of thermodynamics merely explains the equivalence of work and heat. It does not explain why heat flows from bodies at higher temperatures to those at lower temperatures. It cannot tell us why the converse is possible. It cannot explain why the efficiency of a heat engine is always less than unity.

It is also unable to explain why cool water on stirring gets hotter whereas there is no such effect on stirring warm water in a beaker. Second law of thermodynamics provides answers to these questions. Statement of this law is as follows:

Clausius statement: It is impossible for a self-acting machine to transfer heat from a colder body to a hotter one without the aid of an external agency.

From Clausius statement, it is clear that heat cannot flow from a body at low temperature to one at higher temperature unless work is done by an external agency. This statement is in fair agreement with our experiences in different branches of physics. For example, electrical current cannot flow from a conductor at lower electrostatic potential to that at higher potential unless an external work is done. Similarly, a body at a lower gravitational potential level cannot move up to higher level without work done by an external agency.

Kelvin's statement: It is impossible for a body or system to perform continuous work by cooling it to a temperature lower than the temperature of the coldest one of its surroundings. A Carnot engine cannot work if the source and sink are at the same temperature because work done by the engine will result into cooling the source and heating the surroundings more and more.

Kelvin-Planck's statement: It is impossible to design an engine that extracts heat and fully utilises into work without producing any other effect.

From this statement it is clear that any amount of heat can never be converted completely into work. It is essential for an engine to return some amount of heat to the sink. An engine essentially requires a source as well as sink. The efficiency of an engine is always less than unity because heat cannot be fully converted into work.

CARNOT ENGINE

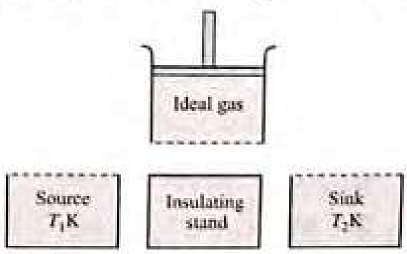
Carnot designed a theoretical engine which is free from all the defects of a practical engine. This engine cannot be realised in actual practice, however, this can be taken as a standard against which the performance of an actual engine can be judged. It consists of the following parts

(i) A cylinder with perfectly non-conducting walls and a perfectly conducting base containing a perfect gas as working substance and fitted with a non-conducting frictionless piston

(ii) A source of infinite thermal capacity maintained at constant higher temperature T_1.

(iii) A sink of infinite thermal capacity maintained at constant lower temperature T_2.

(iv) A perfectly non-conducting stand for the cylinder.



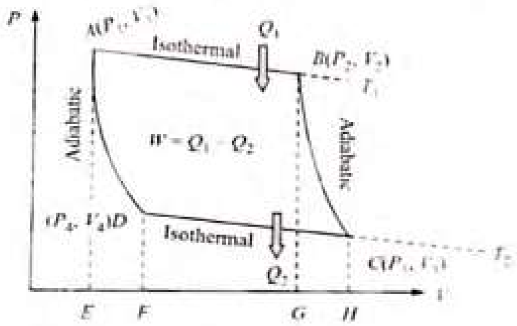
Carnot cycle: As the engine works, the working substance of the engine undergoes a cycle known as Carnot cycle. The Carnot cycle consists of the following four strokes

(i) First stroke (Isothermal expansion) (curve AB):
The cylinder containing ideal gas as working substance allowed to expand slowly at this constant temperature T_1.
Work done = Heat absorbed by the system

$$W_1 = Q_1 = \int_{V_1}^{V_2} P\,dV = RT_1 \log_e\left(\frac{V_2}{V_1}\right) = \text{Area } ABGE$$

(ii) Second stroke (Adiabatic expansion) (curve BC):
The cylinder is then placed on the non conducting stand and the gas is allowed to expand adiabatically till the temperature falls from T_1 to T_2.

$$W_2 = \int_{V_2}^{V_3} P\,dV = \frac{R}{(\gamma-1)}[T_1 - T_2] = \text{ Area } BCHG$$



(iii) Third stroke (Isothermal compression) (curve CD):
The cylinder is placed on the sink and the gas is compressed at constant temperature T_2.
Work done = Heat released by the system

$$W_3 = Q_2 = -\int_{V_3}^{V_4} P\,dV = -RT_2 \log_e \frac{V_4}{V_3} = RT_2 \log_e \frac{V_3}{V_4}$$

$$= \text{Area } CDFH$$

(iv) Fourth stroke (adiabatic compression) (curve DA):
Finally the cylinder is again placed on non-conducting stand and the compression is continued so that gas returns to its initial stage.

$$W_4 = -\int_{V_4}^{V_1} P\,dV = -\frac{R}{\gamma-1}(T_2 - T_1) = \frac{R}{\gamma-1}(T_1 - T_2)$$

$$= \text{Area } ADFE$$

Efficiency of Carnot cycle: The efficiency of engine is defined as the ratio of work done to the heat supplied i.e.

$$\eta = \frac{\text{Work done}}{\text{Heat input}} = \frac{W}{Q_1}$$

Net work done during the complete cycle

$$W = W_1 + W_2 + (-W_3) + (-W_4)$$

$$= W_1 - W_3 = \text{Area } ABCD \qquad [\text{As } W_2 = W_4]$$

$$\eta = \frac{W}{Q_1} = \frac{W_1 - W_3}{W_1} = \frac{Q_1 - Q_2}{Q_1} = 1 - \frac{W_3}{W_1} = 1 - \frac{Q_2}{Q_1}$$

or $$\eta = 1 - \frac{RT_2 \log_e (V_3 / V_4)}{RT_1 \log_e (V_2 / V_1)}$$

Since points B and C lie on same adiabatic curve

$$\therefore \quad T_1 V_2^{\gamma-1} = T_2 V_3^{\gamma-1} \text{ or } \frac{T_1}{T_2} = \left(\frac{V_3}{V_2}\right)^{\gamma-1} \quad \text{...(i)}$$

Also point D and A lie on the same adiabatic curve

$$\therefore \quad T_1 V_1^{\gamma-1} = T_2 V_4^{\gamma-1} \text{ or } \frac{T_1}{T_2} = \left(\frac{V_4}{V_1}\right)^{\gamma-1} \quad \text{...(ii)}$$

From (i) and (ii) $\frac{V_3}{V_2} = \frac{V_4}{V_1}$ or $\frac{V_3}{V_4} = \frac{V_2}{V_1}$

$$\Rightarrow \quad \log_e\left(\frac{V_3}{V_4}\right) = \log_e\left(\frac{V_2}{V_1}\right)$$

So efficiency of Carnot engine $\eta = 1 - \frac{T_2}{T_1}$

(i) Efficiency of a heat engine depends only on temperatures of source and sink and is independent of all other factors.
(ii) All reversible heat engines working between same temperatures are equally efficient and no heat engine can be more efficient than Carnot engine (as it is ideal).
(iii) As on Kelvin scale, temperature can never be negative (as 0 K is defined as the lowest possible temperature) and T_1 and T_2 are finite, efficiency of a heat engine is always lesser than unity, i.e., whole of heat can never be converted into work which is in accordance with second law.

NOTE:

The efficiency of an actual engine is much lesser than that of an ideal engine. Actually the practical efficiency of a steam engine is about (8–15)% while that of a petrol engine is 40%. The efficiency of a diesel engine is maximum and is about (50–55)%.

Carnot theorem: The efficiency of Carnot's heat engine depends only on the temperature of source (T_1) and temperature of sink (T_2), *i.e.*, $\eta = 1 - \frac{T_2}{T_1}$.

Carnot stated that no heat engine working between two given temperatures of source and sink can be more efficient than a perfectly reversible engine (Carnot engine) working between the same two temperatures. Carnot's reversible engine working between two given temperatures is considered to be the most efficient engine.

ENTROPY

Mathematical definition of entropy and its relation to the second law of thermodynamics.

Any thermodynamics system has a state function S, called the entropy. By this is meant that S- like p, V and U is always the same for the system when it is in a given equilibrium state. Entropy may be defined as follows. Let a system at absolute T undergo an infinitesimal reversible process in which it absorbs heat ΔQ. Then, the change in entropy of the system is given by

$$\Delta S = \frac{\Delta Q}{T} \text{ or } dS = \frac{\Delta Q}{T} \quad \text{for infinitesimals}$$

Note that dQ is not the differential of a true function. Entropy will have the units J/K.

The Clausius equation, $dS = dQ/T$, holds only for reversible processes. However, since S is a state function, the entropy change accompanying an irreversible process can be calculated by integrating dQ/T along the path of an arbitrary reversible process connecting the initial and final states.

The importance of the entropy function is exhibited in the following form of the second law of thermodynamics. In any process, the total entropy of the system and its surroundings increases or (in a reversible process) does not change. The second law applies to the system alone if the system is isolated; that is, if it in no way interacts with its surroundings.

ILLUSTRATION 14.17 An ideal gas is confined to a cylinder by a piston. The piston is slowly pushed in so that the gas temperature remains at 20° C. During the compression, 730 J of work is done on the gas. Find the entropy change of the gas.

Solution. The first law tells us that $\Delta Q = \Delta U + \Delta W$. Because the process was isothermal, the internal energy of the ideal gas did not change. Therefore, $\Delta U = 0$ and $\Delta Q = \Delta W = -730$ J. (Because the gas was compressed, the gas did negative work, hence the minus sign). Now we can write

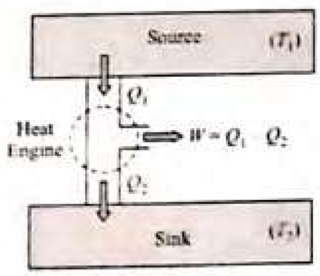
$$\Delta S = \frac{\Delta Q}{T} = \frac{-730 T}{293 K} = -2.49 \text{ J/K}$$

Note that the entropy change is negative. Disorder of the gas decreased as it was pushed into a smaller volume.

HEAT ENGINE

Heat engine is a device which converts heat into work continuously through a cyclic process.

The essential parts of a heat engine are



Source: It is a reservoir of heat at high temperature and infinite thermal capacity. Any amount of heat can be extracted from it.

Working substance: Steam, petrol *etc.*

Sink: It is a reservoir of heat at low temperature and infinite thermal capacity. Any amount of heat can be given to the sink.

The working substance absorbs heat Q_1 from the source, does an amount of work W, returns the remaining amount of heat to the sink and comes back to its original state and there occurs no change in its internal energy.

By repeating the same cycle over and over again, work is continuously obtained.

The performance of heat engine is expressed by means of "efficiency" η which is defined as the ratio of useful work obtained from the engine to the heat supplied to it.

$$\eta = \frac{\text{Work done}}{\text{Heat input}} = \frac{W}{Q_1}$$

But by first law of thermodynamics for cyclic process $\Delta U = 0$.

$\therefore \quad \Delta Q = \Delta W$, so $W = Q_1 - Q_2$

$$\therefore \quad \eta = \frac{Q_1 - Q_2}{Q_1} = 1 - \frac{Q_2}{Q_1}$$

A perfect heat engine is one which converts all heat into work i.e. $W = Q_1$ so that $Q_2 = 0$ and hence $\eta = 1$.

But practically efficiency of an engine is always less than 1.

Refrigerator or Heat Pump

A refrigerator or heat pump is basically a heat engine run in reverse direction.

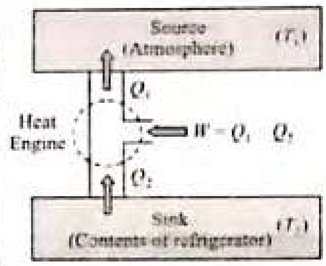
It essentially consists of three parts

Source: At higher temperature T_1.

Working substance: It is called refrigerant liquid ammonia and freon works as a working substance.

Sink: At lower temperature T_2.

The working substance takes heat Q_2 from a sink (contents of refrigerator) at lower temperature, has a net amount of work done W on it by an external agent (usually compressor of refrigerator) and gives out a larger amount of heat Q_1 to a hot body at temperature T_1 (usually atmosphere). Thus, it transfers heat from a cold to a hot body at the expense of mechanical energy supplied to it by an external agent. The cold body is thus cooled more and more.



The performance of a refrigerator is expressed by means of "coefficient of performance" β which is defined as the ratio of the heat extracted from the cold body to the work needed to transfer it to the hot body.

$$\text{i.e.} \quad \beta = \frac{\text{Heat extracted}}{\text{work done}} = \frac{Q_2}{W} = \frac{Q_2}{Q_1 - Q_2}$$

$$\therefore \quad \beta = \frac{Q_2}{Q_1 - Q_2}$$

A perfect refrigerator is one which transfers heat from cold to hot body without doing work

i.e. $\quad W = 0$ so that $Q_1 = Q_2$ and hence $\beta = \infty$

Carnot Refrigerator

For Carnot refrigerator, $\dfrac{Q_1}{Q_2} = \dfrac{T_1}{T_2}$

$$\therefore \quad \frac{Q_1 - Q_2}{Q_2} = \frac{T_1 - T_2}{T_2} \text{ or } \frac{Q_2}{Q_1 - Q_2} = \frac{T_2}{T_1 - T_2}$$

So, coefficient of performance, $\beta = \dfrac{T_2}{T_1 - T_2}$

where T_1 = temperature of surrounding and T_2 = temperature of cold body.

It is clear that $\beta = 0$ when $T_2 = 0$, i.e. the coefficient of performance will be zero if the cold body is at the temperature equal to absolute zero.

Relation Between Coefficient of Performance and Efficiency of Refrigerator

We know

$$\beta = \frac{Q_2}{Q_1 - Q_2} \text{ or } \beta = \frac{Q_2/Q_1}{1 - Q_2/Q_1} \quad \text{(i)}$$

But the efficiency

$$\eta = 1 - \frac{Q_2}{Q_1} \text{ or } \frac{Q_2}{Q_1} = 1 - \eta \quad \text{(ii)}$$

From (i) and (ii), we get $\beta = \dfrac{1-\eta}{\eta}$

ILLUSTRATION 14.18 A Carnot-type engine is designed to operate between 480 and 300 K. Assuming that the engine actually produces 1.2 kJ of mechanical energy per kilocalorie of heat absorbed, compare the actual efficiency with the theoretical maximum efficiency.

Solution. Maximum efficiency $= \dfrac{T_h - T_c}{T_h} = \dfrac{480-300}{480} = 37.5\%$

Actual efficiency $= \dfrac{\text{Energy output}}{\text{Energy input}} = \dfrac{1.2}{1 \times 4.184} = 28.7\%$

ILLUSTRATION 14.19 What is the maximum amount of work that a Carnot engine can perform per kilocalorie of heat input if it absorbs heat at 427°C and exhausts heat at 177°C?

Solution. Efficiency $= \dfrac{Q_h - Q_c}{Q_h} = \dfrac{T_h - T_c}{T_h}$

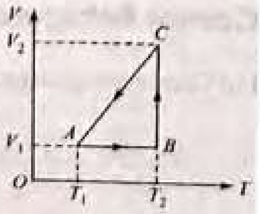
Q_h = (1 kcal) (4.184 kJ/kcal) = 4.184 kJ

Efficiency $= \dfrac{Q_h - Q_c}{4.184 \text{ kJ}} = \dfrac{700 \text{ K} - 450 \text{ K}}{700 \text{ K}}$

Then $W = Q_h = 1.49$ kJ

CONCEPT APPLICATION EXERCISE 14.3

1. Find the coefficient of performance of a Carnot refrigerator working between 30°C and 0°C.
2. A Carnot engine working between 300 K and 600 K has work output of 800 J per cycle. What is amount of heat energy supplied to the engine from source per cycle.



3. Carnot cycle (reversible) of a gas represented by a Pressure–Volume curve is shown in the diagram. Consider the following statements

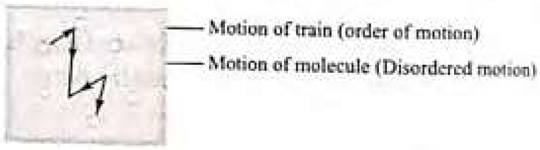
   I. Area $ABCD$ = Work done on the gas
   II. Area $ABCD$ = Net heat absorbed
   III. Change in the internal energy in cycle = 0

   Which of these are correct?
4. A Carnot engine takes 103 kcal of heat from a reservoir at 627°C and exhausts it to a sink at 27°C. Find the efficiency of the engine.

SOLVED EXAMPLES

1. A gas is enclosed in a closed pot. On keeping this pot in a train moving with high speed, the temperature of the gas
   (a) will increase
   (b) will decrease
   (c) will remain the same
   (d) will change according to the nature of the gas

Sol. (c) Temperature of the gas is concerned only with it's disordered motion. It is no way concerned with it's ordered motion.



2. Two spherical vessel of equal volume, are connected by a narrow tube. The apparatus contains an ideal gas at one atmosphere and 300 K. Now if one vessel is immersed in a bath of constant temperature 600 K and the other in a bath of constant temperature 300 K. Then the common pressure will be

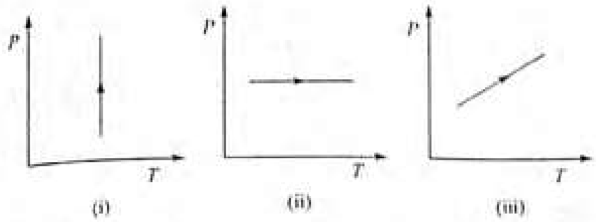
   (a) 1 atm (b) $\dfrac{4}{5}$ atm
   (c) $\dfrac{4}{3}$ atm (d) $\dfrac{3}{4}$ atm

Sol. (c) $\mu = \mu_1 + \mu_2$

$$\frac{P(2V)}{RT_1} = \frac{P'V}{RT_1} + \frac{P'V}{RT_2} \Rightarrow \frac{2P}{RT_1} = \frac{P'}{R}\left[\frac{T_2 + T_1}{T_1 T_2}\right]$$

$$P' = \frac{2PT_2}{(T_1 + T_2)} = \frac{2 \times 1 \times 600}{(300 + 600)} = \frac{4}{3} \text{ atm}$$

3. Pressure versus temperature graphs of an ideal gas are as shown in figure. Choose the wrong statement



(a) Density of gas is increasing in graph (i)
(b) Density of gas is decreasing in graph (ii)
(c) Density of gas is constant in graph (iii)
(d) None of these

Sol. (c) $\rho = \frac{PM}{RT}$

Density ρ remains constant when P/T or volume remains constant.

In graph (i), pressure is increasing at constant temperature hence volume is decreasing so density is increasing. In graphs (ii) and (iii) volume is increasing. Hence, density is decreasing. Note that volume would has been constant in case the straight line in graph (iii) had passed through origin.

4. A cylinder of fixed capacity 44.8 litre contains a monatomic gas at standard temperature and pressure. The amount of heat required to cylinder by 10°C will be.
(R= universal gas constant)
(a) R (b) $10R$
(c) $20R$ (d) $30R$

Sol. (d) As we know, 1 mol of any ideal gas at STP occupies a volume of 22.4 litres.

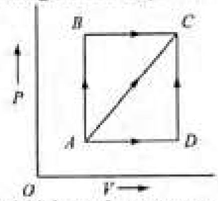
Hence, number of moles of gas, $\mu = \frac{44.8}{22.4} = 2$

Since the volume of cylinder is fixed,

Hence $Q_v = \mu\omega\Delta T$

$$= 2\times\frac{3}{2}R\times 10 = 30R \quad \left(\because (C_V)_{mono} = \frac{3}{2}R\right)$$

5. A thermodynamic process is shown in the following figure. The pressures and volumes corresponding to some points in the figure are:
$P_A = 3\times 10^4$ Pa,
$V_A = 2\times 10^{-3}$ m^3,
$P_B = 8\times 10^4$ Pa,
$V_D = 5\times 10^{-3}$ m^3.



In the process AB, 600 J of heat is added to the system and in process BC, 200 J of heat is added to the system. The change in internal energy of the system in the process AB would be
(a) 560 J (b) 800 J
(c) 60 J (d) 640 J

Sol. (a). No work is done along the path AB, because the process is isochoric.

$\therefore$ Work done $= P_B(V_D - V_A)$
$= 8\times 10^4(5\times 10^{-3} - 2\times 10^{-3}) = 240$ J

$Q_{AC} = Q_{AB} + Q_{BC} = 600 + 200 = 800$ J

$\therefore$ $(\Delta U)_{AC} = Q - W = 800 - 240 = 560$ J

6. One mole of an ideal monatomic gas requires 210 J heat to raise the temperature by 10 K, when heated at constant temperature. If the same gas is heated at constant volume to raise the temperature by 10 K then heat required is
(a) 238 J (b) 126 J
(c) 210 J (d) 350 J

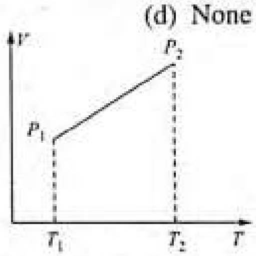
Sol. (b) $Q_P = \mu C_P\Delta T$ and $Q_v = \mu C_v\Delta T$

$$\Rightarrow \quad \frac{Q_V}{Q_P} = \frac{C_V}{C_P} = \frac{\frac{3}{2}R}{\frac{5}{2}R} = \frac{3}{5}$$

$$\left[\because (C_V)_{mono} = \frac{3}{2}R, (C_P)_{mono} = \frac{5}{2}R\right]$$

$$\Rightarrow \quad Q_V = \frac{3}{5}\times(\Delta Q)_P = \frac{3}{5}\times 210 = 126\,\text{J}$$

7. From the following V-T diagram, we can conclude
(a) $P_1 = P_2$ (b) $P_1 > P_2$
(c) $P_1 < P_2$ (d) None of these



Sol. (b) In case of given graph, V and T are related as $V = aT - b$, where a and b are constants.

From ideal gas equation, $PV = \mu RT$,

we find $P = \frac{\mu RT}{aT - b} = \frac{\mu R}{a - b/T}$

Since $T_2 > T_1$, therefore $P_2 < P_1$.

8. Certain amount of an ideal gas are contained in a closed vessel. The vessel is moving with a constant velocity v. The molecular mass of gas is M. The rise in temperature of the gas when the vessel is suddenly stopped is ($\gamma = C_p/C_v$)

(a) $\frac{Mv^2}{2R(\gamma+1)}$ (b) $\frac{Mv^2(\gamma-1)}{2R}$

(c) $\frac{Mv^2}{2R(\gamma+1)}$ (d) $\frac{Mv^2}{2R(\gamma+1)}$

Sol. (b) If m is the total mass of the gas then its kinetic energy $= \frac{1}{2}mv^2$

When the vessel is suddenly stopped, then total kinetic energy will increase the temperature of the gas. Hence,

$$\frac{1}{2}mv^2 = \mu C_v \Delta T = \frac{m}{M}C_v \Delta T \left[\text{as } C_v = \frac{R}{\gamma - 1}\right]$$

$$\Rightarrow \quad \frac{m}{M}\frac{R}{\gamma-1}\Delta T = \frac{1}{2}mv^2 \Rightarrow \Delta T = \frac{Mv^2(\gamma-1)}{2R}.$$

9. Two identical containers A and B with frictionless pistons contain the same ideal gas at the same temperature and the same volume V. The mass of the gas in A is m_A and that in B is mg. The gas in each cylinder is now allowed to expand isothermally to the same final volume $2V$. The changes in the pressure in A and B are found to be ΔP and $1.5\Delta P$, respectively. Then
(a) $4m_A = 9m_B$ (b) $2m_A = 3m_B$
(c) $3m_A = 2m_B$ (d) $9m_A = 3m_B$

Sol. (c) Process is isothermal. Therefore, T = constant

$\left(P \propto \frac{1}{V}\right)$ volume is increasing, therefore pressure will decrease

In chamber A:

$$\Delta P = P_i - P_f = \frac{\mu_A RT}{V} - \frac{\mu_A RT}{2V} = \frac{\mu_A RT}{2V} \quad .....(i)$$

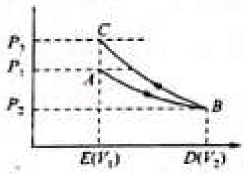
In chamber B :

$$\Delta P = P_i - P_f = \frac{\mu_B RT}{V} - \frac{\mu_B RT}{2V} = \frac{\mu_B RT}{2V} \quad .....(ii)$$

From equations (i) and (ii), $\frac{\mu_A}{\mu_B} = \frac{1}{1.5} = \frac{2}{3}$

$$\Rightarrow \quad \frac{m_A/M}{m_B/M} = \frac{2}{3} \Rightarrow 3m_A = 2m_B.$$

10. An ideal gas expands isothermally from a volume V_1 to V_2 and then compressed to original volume V_1 adiabatically. Initial pressure is P_1 and final pressure is P_3. The total work done is W. Then
(a) $P_3 > P_1$, $W > 0$
(b) $P_3 < P_1$, $W < 0$
(c) $P_3 > P_1$, $W < 0$
(d) $P_3 = P_1$, $W = 0$



Sol. (c) From graph, it is clear that $P_3 > P_1$.
Since area under adiabatic process ($BCED$) is greater than that of isothermal process ($ABDE$), therefore, net work done

$$W = W_1 + (-W_A)$$

$$\because \quad W_A > W_1 \Rightarrow W < 0$$

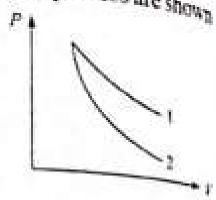
11. Two cylinders A and B fitted with pistons contain equal amounts of an ideal diatomic gas at 300 K. The piston of A is free to move while that of B is held fixed. The same amount of heat is given to the gas in each cylinder. If the rise in temperature of the gas in A is 30 K, then the rise in temperature of the gas in B is
(a) 30 K (b) 18 K
(c) 50 K (d) 42 K

Sol. (d) In both cylinders A and B, the gases are diatomic ($\gamma = 1.4$). Piston A is free to move i.e. it is isobaric process. Piston B is fixed i.e. it is isochoric process. If same amount of heat ΔQ is given to both, then

$$Q_{\text{isobaric}} = Q_{\text{isochoric}} \Rightarrow \mu C_P(\Delta T)_A = \mu C_v(\Delta T)_B$$

$$\Rightarrow \quad (\Delta T)_B = \frac{C_P}{C_v}(\Delta T)_A = \gamma(\Delta T)_A = 1.4 \times 30 = 42\text{ K}$$

12. P-V plots for two gases during adiabatic process are shown in the figure. Plots 1 and 2 should correspond respectively to
(a) He and O_2 (b) O_2 and He
(c) He and Ar (d) O_2 and N_2

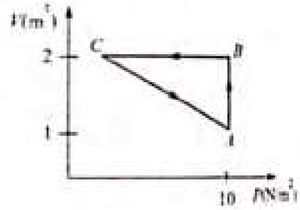


Sol. (b) In adiabatic process, slope of PV-graph.

$$\frac{dp}{dV} = -\gamma\frac{P}{V} \Rightarrow |\text{Slope}| \propto \gamma$$

From the given graph $(\text{Slope})_2 > (\text{Slope})_1 \Rightarrow \gamma_2 > \gamma_1$
Therefore, 1 should correspond to O_2 ($\gamma = 1.4$) and 2 should correspond to He ($\gamma = 1.66$)

13. An ideal gas is taken through the cycle $A \to B \to C \to A$, as shown in the figure. If the net heat supplied to the gas in the cycle is 5 J, the work done by the gas in the process $C \to A$ is
(a) -5 J
(b) -10 J
(c) -15 J
(d) -20 J



Sol. (a) For cyclic process. Total work done $= W_{AB} + W_{BC} = W_{CA}$

$$W_{AB} = P\Delta V = 10(2-1) = 10\text{ J and } \Delta W_{BC} = 0$$

(as V = constant)

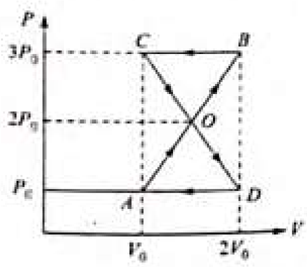
From FLOT, $Q = \Delta U + W$

$\Delta U = 0$ (Process $ABCA$ is cyclic)

$$\Rightarrow \quad Q = W_{AB} + W_{BC} + W_{CA}$$

$$\Rightarrow \quad 5 = 10 + 0 + \Delta W_{CA} \Rightarrow \Delta W_{CA} = -5\text{ J}$$

14. A thermodynamic system undergoes cyclic process $ABCDA$ as shown in figure. The work done by the system is

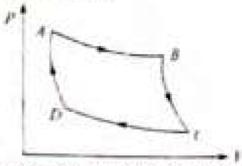


(a) P_0V_0 (b) $2P_0V_0$
(c) $\frac{P_0V_0}{2}$ (d) Zero

Sol. (d) $W_{BCOB} = -$ Area of triangle $BCO = -\frac{P_0V_0}{2}$

$$W_{AODA} = +\text{ Area of triangle } AOD = +\frac{P_0V_0}{2}$$

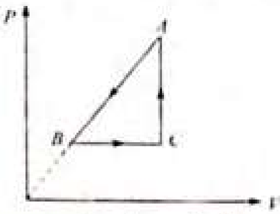
15. The P-V graph of an ideal gas cycle is shown here as below. The adiabatic process is described by



(a) AB and BC
(b) AB and CD
(c) BC and DA
(d) BC and CD

Sol. (c) AD and BC represent adiabatic process (more slope). AB and DC represent isothermal process (less slope).

16. The P-V diagram of a cyclic process $ABCA$ is as shown in the figure. Choose the correct statement.

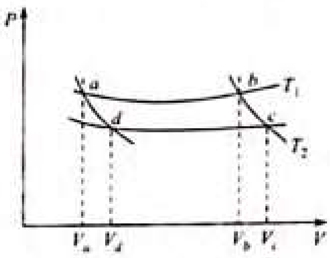


(a) $Q_{A\to B}$ = negative
(b) $U_{B\to C}$ = positive
(c) W_{CAB} = negative
(d) All of these

Sol. (d) During process A to B, pressure and volume both are decreasing. Therefore, temperature and, hence, internal energy of the gas will decrease ($T \propto PV$) or $\Delta U_{A\to B}$ negative. Further $\Delta W_{A\to B}$ is also negative as the volume of the gas is decreasing. Thus, $\Delta Q_{A\to B}$ is negative.

In process B to C, pressure of the gas is constant while volume is increasing. Hence, temperature should increase or $\Delta U_{B\to C}$ = positive. During C to A, volume is constant while pressure is increasing. Therefore, temperature and hence, internal energy of the gas should increase or $\Delta U_{C\to A}$= positive. During process CAB, volume of the gas is decreasing. Hence, work done by the gas is negative.

17. In the following P-V diagram, two adiabatics cut two isothermals at temperatures T_1 and T_2 (figure). The value of V_a/V_d will be



(a) $\frac{V_b}{V_c}$

(b) $\frac{V_c}{V_b}$

(c) $\frac{V_d}{V_a}$

(d) V_bV_c

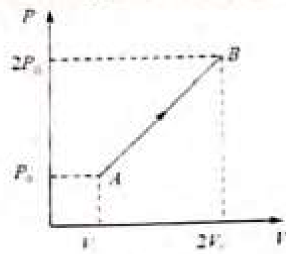
Sol. (a) For adiabatic process, $T_1V_b^{\gamma-1}$ = Constant

For bc curve, $T_1V_b^{\gamma-1} = T_2V_c^{\gamma-1}$ or $\frac{T_2}{T_1} = \left(\frac{V_b}{V_c}\right)^{\gamma-1}$ .....(i)

For ad curve, $T_1V_a^{\gamma-1} = T_2V_d^{\gamma-1}$ or $\frac{T_2}{T_1} = \left(\frac{V_a}{V_d}\right)^{\gamma-1}$ .....(ii)

From equation (i) and (ii), $\frac{V_b}{V_c} = \frac{V_a}{V_d}$

18. The P-V diagram of 2 gm of helium gas for a certain process $A\to B$ is shown in the figure. what is the heat given to the gas during the process $A\to B$



(a) $4P_0V_0$
(b) $6P_0V_0$
(c) $4.5P_0V_0$
(d) $2P_0V_0$

Sol. (b) Change in internal energy from $A \to B$ is

$$\Delta U = \frac{f}{2}\mu R\Delta T = \frac{f}{2}(P_fV_f - P_iP_i)$$

$$= \frac{3}{2}(2P_0 \times 2V_0 - P_0 \times V_0) = \frac{9}{2}P_0V_0$$

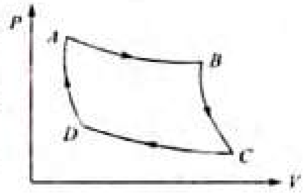
Work done in process $A \to B$ is equal to the area covered by the graph with volume axis, i.e.,

$$W_{A\to B} = \frac{1}{2}(P_0 + 2P_0)\times(2V_0 - V_0) = \frac{3}{2}P_0V_0$$

Hence, $Q = \Delta U + W = \frac{9}{2}P_0V_0 + \frac{3}{2}P_0V_0 = 6P_0V_0$

19. Carnot cycle (reversible) of a gas represented by a Pressure–Volume curve is shown in the diagram. Consider the following statements:

I. Area $ABCD$ = Work done on the gas
II. Area $ABCD$ = Net heat absorbed
III. Change in the internal energy in cycle = 0



Which of these are correct?

(a) I only (b) II only
(c) II and III (d) I, II and III

Sol. (c) Work done by the gas (as cyclic process is clockwise)
$\therefore$ ΔW = Area $ABCD$
So from the first law of thermodynamics ΔQ (net heat absorbed) = ΔW = Area $ABCD$

20. A Carnot engine absorbs an amount Q of heat from a reservoir at an abosolute temperature T and rejects heat to a sink at a temperature of $T/3$. The amount of heat rejected is

(a) $Q/4$ (b) $Q/3$ (c) $Q/2$ (d) $2Q/3$

Sol. (b) $\because \eta = 1 - \frac{T_2}{T_1} = \frac{W}{Q_1} = \frac{Q_1 - Q_2}{Q_1}$

where Q_1= heat absorbed, Q_2 = heat rejected

$$\Rightarrow 1 - \frac{T/3}{T} = \frac{W}{Q_1} \Rightarrow \frac{2}{3} = \frac{W}{Q_1} = \frac{Q_1 - Q_2}{Q_1}$$

$$\Rightarrow \frac{2}{3} = 1 - \frac{Q_2}{Q_1} \Rightarrow \frac{Q_2}{Q_1} = \frac{1}{3} \Rightarrow Q_2 = \frac{Q_1}{3} = \frac{Q}{3}$$

EXERCISES

Kinetic Theory of Gases

1. If pressure of a gas contained in a closed vessel is increased by 0.4% when heated by 1°C, the initial temperature must be
(a) 250 K (b) 250°C
(c) 2500 K (d) 25°C

2. The capacity of a vessel is 3 L. It contains 6 g oxygen, 8 g nitrogen and 5 g CO_2 mixture at 27°C. If $R = 8.31$ J/mol K, then the pressure in the vessel in N/m^2 will be (approx.)
(a) 5×10^5 (b) 5×10^4
(c) 10^6 (d) 10^5

3. Energy of all molecules of a monatomic gas having a volume V and pressure P is 3/2 PV. The total translational kinetic energy of all molecules of a diatomic gas at the same volume and pressure is
(a) 1/2 PV (b) 3/2 PV
(c) 5/2 PV (d) 3 PV

4. A monatomic gas expands at constant pressure on heating. The percentage of heat supplied that increases the internal energy of the gas and that is involved in the expansion is
(a) 75%, 25% (b) 25%, 75%
(c) 60%, 40% (d) 40%, 60%

5. Certain amount of an ideal gas is contained in a closed vessel. The vessel is moving with a constant velocity v. The molecular mass of gas is M. The rise in temperature of the gas when the vessel is suddenly stopped is ($\gamma = C_P/C_V$)
(a) $\dfrac{Mv^2(\gamma-1)}{2R(\gamma+1)}$ (b) $\dfrac{Mv^2(\gamma-1)}{2R}$
(c) $\dfrac{Mv^2}{2R(\gamma+1)}$ (d) $\dfrac{Mv^2}{2R(\gamma-1)}$

6. One mole of a diatomic gas undergoes a process $P = P_0/[1 + (V/V_0)^3]$ where P_0 and V_0 are constants. The translational kinetic energy of the gas when $V = V_0$ is given by
(a) $5P_0V_0/4$ (b) $3P_0V_0/4$
(c) $3P_0V_0/2$ (d) $5P_0V_0/2$

7. Two identical containers A and B have frictionless pistons. They contain the same volume of an ideal gas at the same temperature. The mass of the gas in A is m_A and that in B is m_B. The gas in each cylinder is now allowed to expand isothermally to double the initial volume. The change in the pressure in A and B, respectively, is Δp and 1.5 Δp. Then
(a) $4m_A = 9m_B$ (b) $2m_A = 3m_B$
(c) $3m_A = 2m_B$ (d) $9m_A = 4m_B$

8. The pressure P, volume V and temperature T of a gas in the jar A and the other gas in the jar B at pressure $2P$, volume $V/4$ and temperature $2T$, then the ratio of the number of molecules in the jar A and B will be
(a) 1 : 1 (b) 1 : 2
(c) 2 : 1 (d) 4 : 1

9. The root mean square speed of the molecules of a diatomic gas is v. When the temperature is doubled, the molecules dissociate into two atoms. The new root mean square speed of the atom is
(a) $\sqrt{2}v$ (b) v
(c) $2v$ (d) $4v$

10. The molecules of a given mass of a gas have a rms velocity of 200 m/sec at 27°C and 1.0×10^5 N/m^2 pressure. When the temperature is 127°C and pressure is 0.5×10^5 N/m^2 the rms velocity in m/sec will be
(a) $\dfrac{100\sqrt{2}}{3}$ (b) $100\sqrt{2}$
(c) $\dfrac{400}{\sqrt{3}}$ (d) None of these

11. Two molecules of a gas have speeds of 9×10^6 ms^{-1} and 1×10^6 ms^{-1} respectively. What is the root mean square speed of these molecules?
(a) $\sqrt{21} \times 10^6$ m/s (b) $\sqrt{41} \times 10^6$ m/s
(c) 8.5×10^6 m/s (d) $\sqrt{17} \times 10^6$ m/s

12. The molecules of a given mass of a gas have root mean square speeds of 100 ms^{-1} at 27°C and 1.00 atmospheric pressure. What will be the root mean square speeds of the molecules of the gas at 127°C and 2.0 atmospheric pressure?
(a) $\dfrac{150}{\sqrt{3}}$ m/s (b) $\dfrac{125}{\sqrt{3}}$ m/s
(c) $\dfrac{200}{\sqrt{3}}$ m/s (d) $100\sqrt{3}$ m/s

13. The r.m.s. speed of particle of mass 5×10^{-17} kg in their random motion in air at NTP will be (Boltzmann's constant) $K = 1.38 \times 10^{-23}$ J/K:
(a) 15×10 m/s (b) 15×10^{-3} m/s
(c) 10×10^{-2} (d) 1.5×10^{2} m/s

14. Calculate the ratio of the mean free paths of the molecules of two gases having molecular diameters 1 Å and 2 Å. The gases may be considered under identical conditions of temperature, pressure and volume.
(a) 2 : 1 (b) 3 : 1
(b) 4 : 3 (d) 4 : 1

15. Calculate the number of degrees of freedom of molecules of hydrogen in 1 cc of hydrogen gas at NTP.
(a) 2.344×10^{16} (b) 1.344×10^{20}
(c) 2.124×10^{21} (d) 4.212×10^{20}

Ideal Gas Equation and Specific Heat Capacity of Gases

16. Pressure versus temperature graph of an ideal gas of equal number of moles of different volumes is plotted as shown in figure. Choose the correct alternative.

(a) $V_1 = V_2, V_3 = V_4$ and $V_2 > V_3$
(b) $V_1 = V_2, V_3 = V_4$ and $V_2 < V_3$
(c) $V_1 = V_2 = V_3 = V_4$
(d) $V_4 > V_3 > V_2 > V_1$

17. Two gases occupy two containers A and B; the gas in A, of volume $0.10\ m^3$, exerts a pressure of 1.40 MPa and that in B, of volume $0.15\ m^3$, exerts a pressure 0.7 MPa. The two containers are joined by a tube of negligible volume and the gases are allowed to intermingle. Then if the temperature remains constant, the final pressure in the container will be (in MPa)
(a) 0.70 (b) 0.98
(c) 1.40 (d) 2.10

18. A closed vessel contains 8 g of oxygen and 7 g of nitrogen. The total pressure is 10 atm at a given temperature. If now oxygen is absorbed by introducing a suitable absorbent, the pressure of the remaining gas in atm will be
(a) 2 (b) 10 (c) 4 (d) 5

19. Forty calories of heat is needed to raise the temperature of 1 mol of an ideal monatomic gas from 20°C to 30°C at a constant pressure. The amount of heat required to raise its temperature over the same interval at a constant volume ($R = 2$ cal $mol^{-1}K^{-1}$) is
(a) 20 cal (b) 40 cal
(c) 60 cal (d) 80 cal

20. For a gas, the difference between the two specific heats is 4150 J/kg K. What is the specific heat at constant volume of gas if the ratio of specific heats is 1.4?
(a) 8475 J/kg-K (b) 5186 J/kg-K
(c) 1660 J/kg-K (d) 10375 J/kg-K

21. The specific heat at constant volume for the monatomic argon is 0.075 kcal/kg-K, whereas its gram molecular specific heat is $C_v = 2.98$ cal/mol/K. The mass of the argon atom is (Avogadro's number $= 6.02 \times 10^{23}$ molecules/mol)
(a) 6.60×10^{-23} g (b) 3.30×10^{-23} g
(c) 2.20×10^{-23} g (d) 13.20×10^{-23} g

22. The temperature of 5 mol of a gas which was held at constant volume was changed from 100°C to 120°C. The change in internal energy was found to be 80 J. The total heat capacity of the gas at constant volume will be equal to
(a) 8 JK^{-1} (b) 0.8 JK^{-1}
(c) 4 JK^{-1} (d) 0.4 JK^{-1}

23. The density of a polyatomic gas in standard conditions is 0.795 kgm^{-3}. The specific heat of the gas at constant volume is
(a) 930 $J\text{-}kg^{-1}K^{-1}$ (b) 1400 $J\text{-}kg^{-1}K^{-1}$
(c) 1120 $J\text{-}kg^{-1}K^{-1}$ (d) 1600 $J\text{-}kg^{-1}K^{-1}$

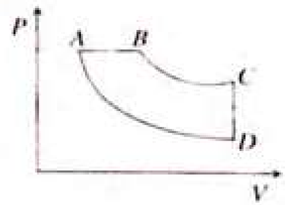
24. The value of $C_p - C_v = 1.00\ R$ for a gas in state A and $C_p - C_v = 1.06\ R$ in another state. If P_A and P_B denote the pressure and T_A and T_B denote the temperatures in the two states, then
(a) $P_A = P_B, T_A > T_B$ (b) $P_A > P_B, T_A = T_B$
(c) $P_A < P_B, T_A > T_B$ (d) $P_A = P_B, T_A < T_B$

25. If 2 moles of diatomic gas and 1 mole of monatomic gas are mixed, then the ratio of specific heats for the mixture is
(a) $\frac{7}{3}$ (b) $\frac{5}{4}$
(c) $\frac{19}{13}$ (d) $\frac{15}{19}$

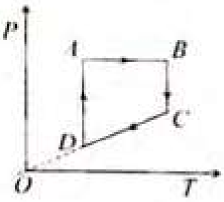
26. Twenty-two grams of CO_2 at 27°C is mixed with 16 g of O_2 at 37°C. The temperature of the mixture is about
(a) 31.5°C (b) 27°C
(c) 37°C (d) 30.5°C

27. A gas mixture consists of 2 mol of oxygen and 4 mol of argon at temperature T. Neglecting all vibrational modes, the total internal energy of the system is
(a) $4RT$ (b) $15RT$
(c) $9RT$ (d) $11RT$

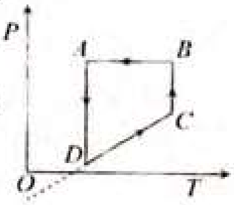
28. A cyclic process $ABCD$ is shown in the following P–V diagram. Which of the following curves represents the same process?



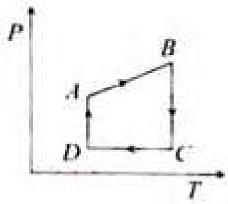
(a)



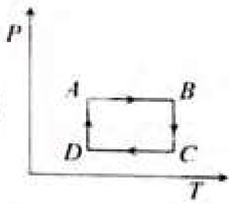
(b)



(c)

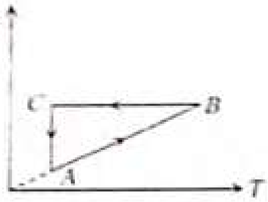


(d)

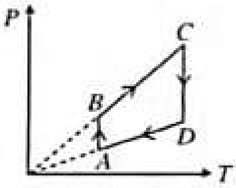


29. An ideal gas expands in such a manner that its pressure and volume can be related by equation PV^2 = constant. During this process, the gas is
(a) heated (b) cooled
(c) neither heated nor cooled
(d) first heated and then cooled

30. A cyclic process $ABCA$ is shown in the V–T diagram. Process on the P–V diagram is

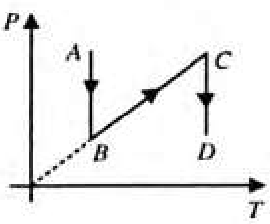


(a)  (b) 
(c)  (d) 
31. Pressure versus temperature graph of an ideal gas is as shown in figure.



Corresponding density (ρ) versus volume (V) graph will be

(a)  (b) 
(c)  (d) 
32. P–T diagram is shown in figure. Choose the corresponding V–T diagram.



(a)  (b) 
(c)  (d) 
First Law of Thermodynamics, Internal Energy and Work Done

33. A gas is heated at a constant pressure. The fraction of heat supplied used for external work is

(a) $\dfrac{1}{\gamma}$ (b) $\left(1-\dfrac{1}{\gamma}\right)$

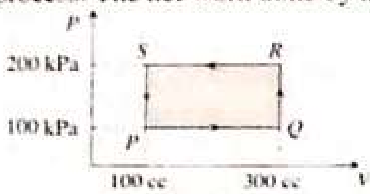
(c) $\gamma-1$ (d) $\left(1-\dfrac{1}{\gamma^2}\right)$

34. The average degrees of freedom per molecule for a gas are 6. The gas performs 25 J of work when it expands at constant pressure. The heat absorbed by gas is

(a) 75 J (b) 100 J

(c) 150 J (d) 125 J

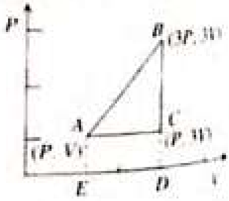
35. A thermodynamic system is taken through the cycle $PQRSP$ process. The net work done by the system is



(a) 20 J (b) −20 J

(c) 400 J (d) −374 J

36. An ideal gas is taken around $ABCA$ as shown in the above P–V diagram. The work done during a cycle is



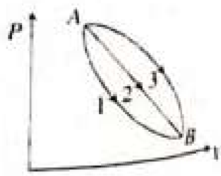
(a) $2PV$

(b) PV

(c) $1/2PV$

(d) Zero

37. An ideal gas of mass m in a state A goes to another state B via three different processes as shown in figure. If Q_1, Q_2 and Q_3 denote the heat absorbed by the gas along the three paths, then



(a) $Q_1 < Q_2 < Q_3$

(b) $Q_1 < Q_2 = Q_3$

(c) $Q_1 = Q_2 > Q_3$

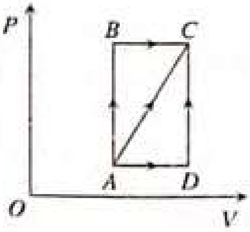
(d) $Q_1 > Q_2 > Q_3$

38. The relation between the internal energy U and adiabatic constant γ is

(a) $U=\dfrac{PV}{\gamma-1}$ (b) $U=\dfrac{PV^{\gamma}}{\gamma-1}$

(c) $U = \frac{PV}{\gamma}$ (d) $U = \frac{\gamma}{PV}$

39. A thermodynamic process is shown in figure. The pressures and volumes corresponding to some points in the figure are:



$P_A = 3 \times 10^4$ Pa,
$P_B = 8 \times 10^4$ Pa and
$V_A = 2 \times 10^{-3}$ m^3,
$V_D = 5 \times 10^{-3}$ m.

In process *AB*, 600 J of heat is added to the system and in process *BC*, 200 J of heat is added to the system. The change in internal energy of the system in process *AC* would be

(a) 560 J (b) 800 J
(c) 600 J (d) 640 J

40. If R = universal gas constant, the amount of heat needed to raise the temperature of 2 mol of an ideal monatomic gas from 273 K to 373 K when no work is done is

(a) $100R$ (b) $150R$ (c) $300R$ (d) $500R$

41 During an adiabatic process, the pressure of a gas is found to be proportional to the cube of its absolute temperature. The ratio C_p/C_v for the gas is

(a) $\frac{3}{2}$ (b) $\frac{4}{3}$ (c) 2 (d) $\frac{5}{3}$

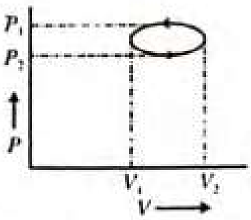
42. An ideal gas at 27 °C is compressed adiabatically to 8/27 of its original volume. If $\gamma = 5/3$, then the rise in temperature is

(a) 450 K (b) 375 K
(c) 225 K (d) 405 K

43. A thermally insulated container is divided into two parts by a screen. In one part the pressure and temperature are P and T for an ideal gas filled. In the second part, it is vacuum. If now a small hole is created in the screen, then the temperature of the gas will

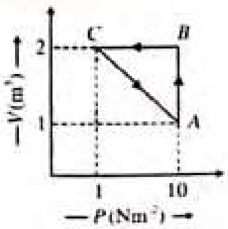
(a) decrease (b) increase
(c) remain same (d) none of these

44. In the given elliptical P–V diagram,



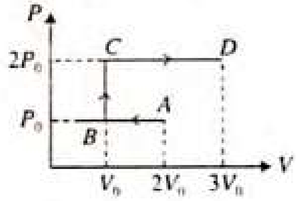
(a) the work done is positive
(b) the change in internal energy is non-zero
(c) the work done $= -(\pi/4)(P_2 - P_1)(V_2 - V_1)$
(d) the work done $= \pi(V_1 - V_1)^2 - \pi(P_1 - P_1)^2$

45. An ideal gas is taken through $A \to B \to C \to A$, as shown in figure. If the net heat supplied to the gas in the cycle is 55 J, the work done by the gas in the process $C \to A$ is



(a) –5 J (b) –10 J
(c) –15 J (d) –20 J

46. P–V diagram of an ideal gas is as shown in figure. Work done by the gas in the process *ABCD* is



(a) $4P_0V_0$ (b) $2P_0V_0$
(c) $3P_0V_0$ (d) P_0V_0

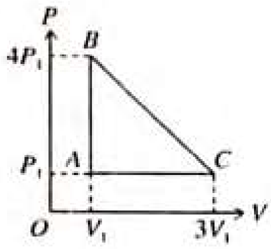
47. One mole of an ideal gas at temperature T_1 expands according to the law (P/V) = constant. Find the work done when the final temperature becomes T_2.

(a) $R(T_2 - T_1)$ (b) $(R/2)(T_2 - T_1)$
(c) $(R/4)(T_2 - T_1)$ (d) $PV(T_2 - T_1)$

48. Two moles of an ideal gas at 300 K were cooled at constant volume so that the pressure is reduced to half the initial value. Then as a result of heating at constant pressure, the gas expands till it attains the original temperature. Find the total heat absorbed by the gas, if R is the gas constant.

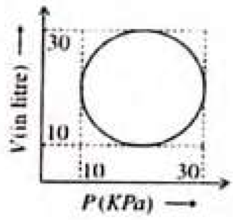
(a) $150R$ J (b) $300R$ J
(c) $75R$ J (d) $100R$ J

49. An ideal gas is taken around the cycle *ABCA* shown in P–V diagram. The net work done by the gas during the cycle is equal to



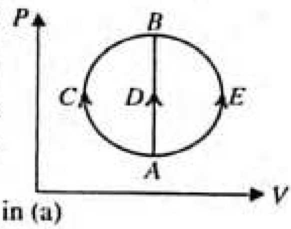
(a) $12P_1V_1$
(b) $6P_1V_1$
(c) $3P_1V_1$
(d) P_1V_1

50. Heat energy absorbed by a system in going through a cyclic process shown in figure is



(a) $10^7\pi$ J (b) $10^4\pi$ J
(c) $10^2\pi$ J (d) $10^{-3}\pi$ J

51. One mole of an ideal gas is taken from state A to state B by three different processes (a) *ACB*, (b) *ADB* and (c) *AEB* as shown in the P–V diagram. The heat absorbed by the gas is



(a) greater in process (b) than in (a)
(b) the least in process (b)
(c) the same in (a) and (c)
(d) less in (c) than in (b)

52. Find the amount of work done to increase the temperature of 1 mol of an ideal gas by 30°C if it is expanding under the condition $V \propto T^{2/3}$.

(a) 166.2 J (b) 136.2 J
(c) 126.2 J (d) none of these

Second Law of Thermodynamics

53. A Carnot engine has the same efficiency between 800 K and 500 K and x K to 600 K. The value of x is
(a) 1000 K (b) 960 K
(c) 846 K (d) 754 K

54. A Carnot's engine is made to work between 200°C and 0°C first and then between 0°C and –200°C. The ratio of efficiencies of the engine in the two cases is
(a) 1.73 : 1 (b) 1 : 1.73
(c) 1 : 1 (d) 1 : 2

55. Efficiency of a Carnot engine is 50% when temperature of outlet is 500 K. In order to increase efficiency up to 60% keeping temperature of intake the same what is temperature of outlet
(a) 200 K (b) 400 K
(c) 600 K (d) 800 K

56. An ideal heat engine working between temperature T_1 and T_2 has an efficiency η, the new efficiency if both the source and sink temperature are doubled, will be
(a) $\frac{\eta}{2}$ (b) η
(c) 2η (d) 3η

57. An ideal refrigerator has a freezer at a temperature of –13°C. The coefficient of performance of the engine is 5. The temperature of the air (to which heat is rejected) will be
(a) 325°C (b) 325K
(c) 39°C (d) 320°C

58. In a mechanical refrigerator, the low temperature coils are at a temperature of –23°C and the compressed gas in the condenser has a temperature of 27°C. The theoretical coefficient of performance is
(a) 5 (b) 8 (c) 6 (d) 6.5

59. An engine is supposed to operate between two reservoirs at temperature 727°C and 227°C. The maximum possible efficiency of such an engine is
(a) 1/2 (b) 1/4
(c) 3/4 (d) 1

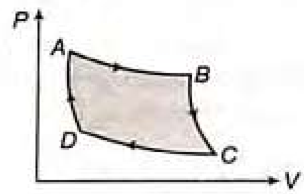
60. An ideal gas heat engine operates in Carnot cycle between 227°C and 127°C. It absorbs 6×10^4 cals of heat at higher temperature. Amount of heat converted to work is
(a) 2.4×10^4 cal (b) 6×10^4 cal
(c) 1.2×10^4 cal (d) 4.8×10^4 cal

61. Two Carnot engines A and B are operated in succession. The first one, A receives heat from a source at $T_1 = 800$ K and rejects to sink at T_2K. The second engine B receives heat rejected by the first engine and rejects to another sink at $T_3 = 300$ K. If the work outputs of two engines are equal, then the value of T_2 is
(a) 100 K (b) 300 K
(c) 550 K (d) 700 K

62. A reversible engine converts one-sixth of the heat input into work. When the temperature of the sink is reduced by 62°C, the efficiency of the engine is doubled. The temperatures of the source and sink are
(a) 80°C, 37°C (b) 95°C, 28°C
(c) 90°C, 37°C (d) 99°C, 37°C

63. A Carnot engine whose low temperature reservoir is at 7°C has an efficiency of 50%. It is desired to increase the efficiency to 70%. By how many degrees should the temperature of the high temperature reservoir be increased
(a) 840 K (b) 280 K
(c) 560 K (d) 380 K

64. Carnot cycle (reversible) of a gas represented by a Pressure–Volume curve is shown in the diagram.
Consider the following statements:
I. Area $ABCD$ = Work done on the gas
II. Area $ABCD$ = Net heat absorbed
III. Change in the internal energy in cycle = 0
Which of these are correct



(a) I only (b) II only
(c) II and III (d) I, II and III

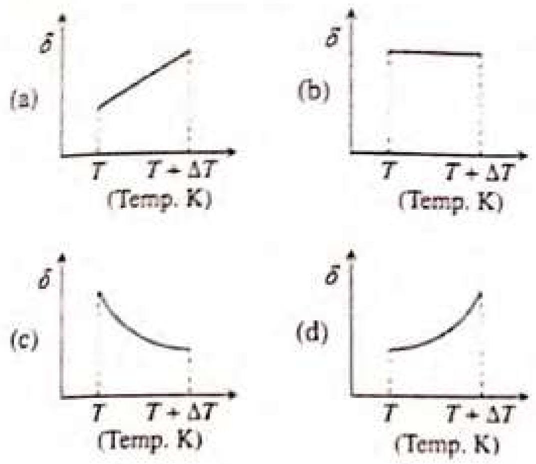
65. A motor cycle engine delivers a power of 10 kW, by consuming petrol at the rate of 2.4 kg/hour. If the calorific value of petrol is 35.5 MJ/kg, the rate of heat rejection by the exhaust is
(a) 5.5 kW (b) 13.7 kW
(c) 11.2 kW (d) 9.7 kW

66. A heat engine receives 50 kcal of heat from the source per cycle, and operates with an efficiency of 20%. The heat rejected by engine to the sink per cycle is
(a) 40 kcal (b) 25 kcal
(c) 30 kcal (d) 50 kcal

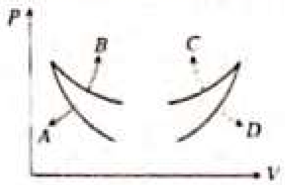
67. A Carnot's engine operates with an efficiency of 40% with its sink at 27°C. By what amount should the temperature of the source be increased with an aim to increase the efficiency by 10%?
(a) 50 K (b) 150 K
(c) 80 K (d) 100 K

Problems Based on Mixed Concepts

68. An ideal gas is initially at a temperature T and volume V. Its volume is increased by ΔV due to an increase in temperature ΔT, pressure remaining constant. The quantity $\delta = \Delta V / V\Delta T$ varies with temperature as

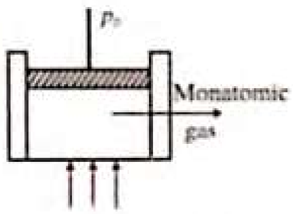


69. Four curves A, B, C and D are drawn in figure for a given amount of gas. The curves which represent adiabatic and isothermal changes are



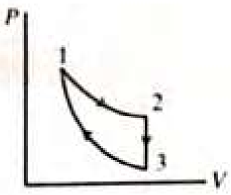
(a) C and D, respectively
(b) D and C, respectively
(c) A and B, respectively
(d) B and A, respectively

70. If 50 cal of heat is supplied to the system containing 2 mol of an ideal monatomic gas, the rise in temperature is (R = 2 cal/mol-K)



(a) 50 K (b) 5 K
(c) 10 K (d) 20 K

71. Three processes compose a thermodynamic cycle shown in the accompanying P–V, diagram of an ideal gas.



Process 1→2 takes place at constant temperature, during this process 60 J of heat enters the system.

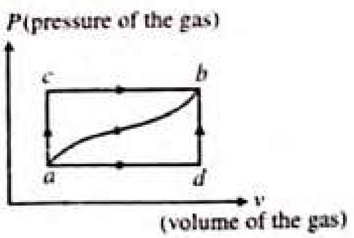
Process 2→3 takes place at constant volume. During this process 40 J of heat leaves the system.

Process 3→1 is adiabatic.

What is the change in internal energy of the system during process 3→1?

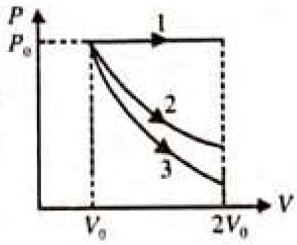
(a) −40 J (b) −20 J
(c) +20 J (d) +40 J

72. When an ideal gas is taken from state a to b, along a path acb, 84 kJ of heat flows into the gas and the gas does 32 kJ of work. The following conclusions are drawn. Mark the one which is not correct.



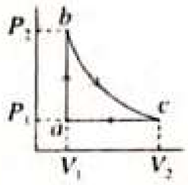
(a) If the work done along the path adb is 10.5 kJ, the heat that will flow into the gas is 62.5 kJ.
(b) When the gas is returned from b to a along the curved path, the work done on the gas is 21 kJ, and the system absorbs 73 kJ of heat.
(c) If $U_a = 0$, $U_d = 42$ kJ, and the work done along the path adb is 10.5 kJ then the heat absorbed in the process ad is 52.5 kJ.
(d) If $U_a = 0$, $U_d = 42$ kJ, heat absorbed in the process db is 10 kJ.

73. A gas is expanded from volume V_0 to $2V_0$ under three different processes. Process 1 is isobaric process, process 2 is isothermal process and process 3 is adiabatic. Let ΔU_1, ΔU_2 and ΔU_3 be the change in internal energy of the gas in these three processes. Then



(a) $\Delta U_1 > \Delta U_2 > \Delta U_3$
(b) $\Delta U_1 < \Delta U_2 < \Delta U_3$
(c) $\Delta U_2 > \Delta U_1 > \Delta U_3$
(d) $\Delta U_2 < \Delta U_3 < \Delta U_1$

74. Carbon monoxide is carried around a closed cyclic process abc, in which bc is an isothermal process, as shown in figure. The gas absorbs 7000 J of heat as its temperature is increased from 300 K to 1000 K in going from a to b. The quantity of heat ejected by the gas during the process ca is



(a) 4200 J (b) 500 J
(c) 9000 J (d) 9800 J

75. An ideal gas is taken through a cyclic thermodynamic process through four steps. The amounts of heat involved in these steps are Q_1 = 5960 J, Q_2 = −5585 J, Q_3 = −2980 J, Q_4 = 3645 J, respectively. The corresponding works involved are W_1 = 2200 J, W_2 = −825 J, W_3 = −1100 J and W_4, respectively. The value of W_4 is

(a) 1315 J (b) 275 J
(c) 765 J (d) 675 J

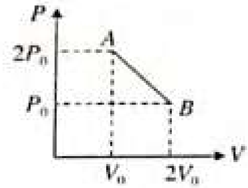
76. Argon gas is adiabatically compressed to half its volume. If P, V and T represent the pressure, volume and temperature of the gaseous system, respectively, at any stage, then the correct equation representing the process is

(a) $TV^{2/5}$ = constant (b) $VP^{5/3}$ = constant
(c) $TP^{-2/5}$ = constant (d) $PT^{2/3}$ = constant

77. Three samples of the same gas A, B and C ($\gamma = 3/2$) initially have equal volume. Now the volume of each sample is doubled. The process is adiabatic for A, isobaric for B and isothermal for C. If the final pressures are equal for all the three samples, the ratio of their initial pressures is

(a) $2\sqrt{2}:2:1$ (b) $2\sqrt{2}:1:2$
(c) $\sqrt{2}:1:2$ (d) $2:1:\sqrt{2}$

78. n moles of an ideal gas undergoes a process $A \to B$ as shown in figure. Maximum temperature of the gas during the process is:



(a) $\frac{3P_0V_0}{2nR}$ (b) $\frac{9P_0V_0}{4nR}$

(c) $\frac{9P_0V_0}{2nR}$ (d) $\frac{9P_0V_0}{nR}$

79. The relation between internal energy U, pressure P and volume V of a gas in an adiabatic process is

$U = a + bPV$

where a and b are constants. What is the effective value of adiabatic constant γ?

(a) $\frac{a}{b}$ (b) $\frac{b+1}{b}$

(c) $\frac{a+1}{a}$ (d) $\frac{b}{a}$

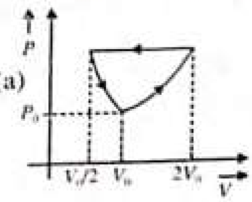
80. A diatomic ideal gas is heated at constant volume until the pressure is doubled and again heated at constant pressure until the volume is doubled. The average molar heat capacity for the whole process is

(a) $\frac{13R}{6}$ (b) $\frac{19R}{6}$

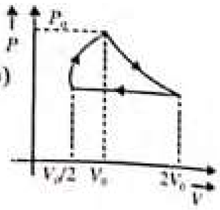
(c) $\frac{23R}{6}$ (d) $\frac{17R}{6}$

81. One mole of an ideal gas at pressure P_0 and temperature T_0 is expanded isothermally to twice its volume and then compressed at constant pressure to $(V_0/2)$ and the gas is brought back to original state by a process in which $P \propto V$ (pressure is directly proportional to volume). The correct temperature of the process is

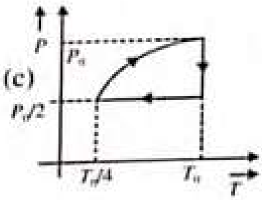
(a)



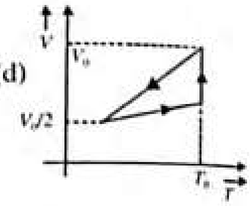
(b)



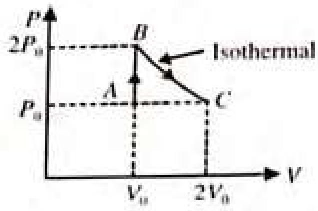
(c)



(d)



82. A diatomic ideal gas undergoes a thermodynamic change according to the P–V diagram shown in figure. The total heat given to the gas is nearly



(a) $2.5P_0V_0$ (b) $1.4P_0V_0$

(c) $3.9P_0V_0$ (d) $1.1P_0V_0$

ARCHIVES

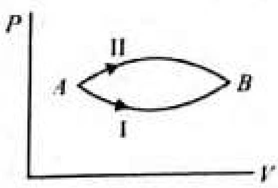
1. Two thermally insulated vessels, 1 and 2, are filled with air at temperature (T_1, T_2), volumes (V_1, V_2), and pressures (P_1, P_2), respectively. If the valve joining the two vessels is opened, the temperature inside the vessel at equilibrium will be

(a) $T_1 + T_2$ (b) $(T_1 + T_2)/2$

(c) $\frac{T_1T_2(P_1V_1 + P_2V_2)}{P_1V_1T_2 + P_2V_2T_1}$ (d) $\frac{T_1T_2(P_1V_1 + P_2V_2)}{P_1V_1T_1 + P_2V_2T_2}$

(AIEEE 2004)

2. A system goes from A to B via two processes I and II as shown in the figure. If ΔU_1 and ΔU_2 are the changes in internal energies in the processes I and II, respectively, then



(a) $\Delta U_2 > \Delta U_1$

(b) $\Delta U_2 < \Delta U_1$

(c) relation between ΔU_1 and ΔU_2 cannot be determined

(d) $\Delta U_1 = \Delta U_2$ **(AIEEE 2005)**

3. A gaseous mixture consists of 16 g of helium and 16 g of oxygen. The ratio C_p/C_v of the mixture is

(a) 1.54 (b) 1.62

(c) 1.4 (d) 1.59 **(AIEEE 2005)**

4. The work done in compressing 1 kg-mol of a gas adiabatically is 146 kJ. in this process, the temperature of the gas increases by 7°C. The gas is (R = 8.3 J/mol-K)

(a) diatomic

(b) triatomic

(c) a mixture of monatomic and diatomic

(d) monatomic **(AIEEE 2006)**

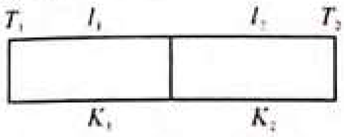
5. Two rigid boxes containing different ideal gases are placed on a table. Box A contains 1 mol of nitrogen at temperature T_0, while box B contains 1 mol of helium at temperature $(7/3)T_0$. The boxes are then put in thermal contact with each other and heat flows between them until

the gases reach a common final temperature. (Ignore the heat capacity of boxes.) Then the final temperature of gases, T_f, in terms of T_0 is

(a) $T_f = \frac{7}{3}T_0$ (b) $T_f = \frac{3}{7}T_0$

(c) $T_f = \frac{3}{2}T_0$ (d) $T_f = \frac{5}{2}T_0$ **(AIEEE 2006)**

6. One end of a thermally insulated rod is kept at a temperature T_1 and the other at T_2. The rod is composed of two sections of lengths l_1 and l_2 and thermal conductivities K_1 and K_2, respectively. The temperature at the interface of the two sections is



(a) $(K_2l_2T_1 + K_1l_1T_2)/(K_1l_1 + K_2l_2)$
(b) $(K_2l_1T_1 + K_1l_2T_2)/(K_2l_1 + K_1l_2)$
(c) $(K_1l_2T_1 + K_2l_1T_2)/(K_1l_2 + K_2l_1)$
(d) $(K_1l_1T_1 + K_2l_2T_2)/(K_1l_1 + K_2l_2)$ **(AIEEE 2007)**

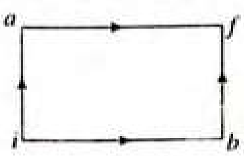
7. If C_P and C_v denote the specific heats of nitrogen per unit mass at constant pressure and constant volume, respectively, then

(a) $C_P - C_v = R/28$ (b) $C_P - C_v = R/14$
(c) $C_P - C_v = R$ (d) $C_P - C_v = 28R$ **(AIEEE 2007)**

8. A Carnot engine, having an efficiency of $h = 1/10$ as heat engine, is used as a refrigerator. If the work done on the system is 10 J, the amount of energy absorbed from the reservoir at a lower temperature is

(a) 99 J (b) 90 J
(c) 1 J (d) 100 J **(AIEEE 2007)**

9. When a system is taken from state i to state f along the path iaf, it is found that $Q = 50$ cal and $W = 20$ cal. Along the path ibf, $Q = 36$ cal. W along the path ibf is



(a) 6 cal (b) 16 cal
(c) 66 cal (d) 14 cal **(AIEEE 2007)**

10. An insulated container of gas has two chambers separated by an insulating partition. One of the chambers has volume V_1 and contains ideal gas at pressure P_1 and temperature T_1. The other chamber has volume V_2 and contains ideal gas at pressure P_2 and temperature T_2. If the partition is removed without doing any work on the gas, the final equilibrium temperature of the gas in the container will be

(a) $\frac{T_1T_2(P_1V_1 + P_2V_2)}{P_1V_1T_2 + P_2V_2T_1}$ (b) $\frac{p_1V_1T_1 + p_2V_2T_2}{p_1V_1 + p_2V_2}$

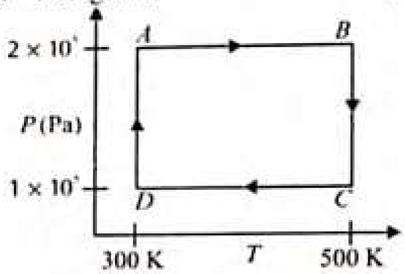
(c) $\frac{p_1V_1T_2 + p_2V_2T_1}{p_1V_1 + p_2V_2}$ (d) $\frac{T_1T_2(p_1V_1 + p_2V_2)}{p_1V_1T_1 + p_2V_2T_2}$ **(AIEEE 2008)**

11. One kilogram of a diatomic gas is at a pressure of 8×10^4 N/m^2. The density of the gas is 4 kg/m^3. What is the energy of the gas due to its thermal motion?

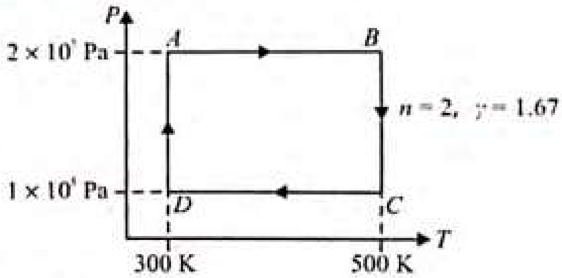
(a) 3×10^4 J (b) 5×10^4 J
(c) 6×10^4 J (d) 7×10^4 J **(AIEEE 2009)**

For Questions 12–14

Two moles of helium gas is taken over the cycle $ABCDA$, as shown in the P–T diagram. **(AIEEE 2009)**



12. Assuming the gas to be ideal, the work done on the gas in taking it from A to B is



(a) $200R$ (b) $300R$
(c) $400R$ (d) $500R$

13. The work done on the gas in taking it from D to A is

(a) $-414R$ (b) $+414R$
(c) $-690R$ (d) $+690R$

14. The net work done on the gas in the cycle $ABCDA$ is

(a) zero (b) $276R$
(c) $1076R$ (d) $1904R$

15. A diatomic ideal gas is used in a Carnot engine as the working substance. If during the adiabatic expansion part of the cycle, the volume of the gas increases from V to $32V$, the efficiency of the engine is

(a) 0.5 (b) 0.75
(c) 0.99 (d) 0.25 **(AIEEE 2010)**

16. Three perfect gases at absolute temperatures T_1, T_2 and T_3 are mixed. The masses of molecules are m_1, m_2

and m_3 and the number of molecules are n_1, n_2 and n_3 respectively. Assuming no loss of energy, the final temperature of the mixture is

(a) $\frac{(T_1+T_2+T_3)}{3}$

(b) $\frac{n_1T_1+n_2T_2+n_3T_3}{n_1+n_2+n_3}$

(c) $\frac{n_1T_1^2+n_2T_2^2+n_3T_3^2}{n_1T_1+n_2T_2+n_3T_3}$

(d) $\frac{n_1^2T_1^2+n_2^2T_2^2+n_3^2T_3^2}{n_1T_1+n_2T_2+n_3T_3}$ **(AIEEE 2011)**

17. A thermally insulated vessel contains an ideal gas of molecular mass M and ratio of specific heats g. It is moving with speed v and is suddenly brought to rest. Assuming no heat is lost to the surroundings, its temperature increases by

(a) $\frac{(\gamma-1)}{2(\gamma+1)R}Mv^2$ K (b) $\frac{(\gamma-1)}{2\gamma}Mv^2$ K

(c) $\frac{\gamma Mv^2}{2R}$ K (d) $\frac{(\gamma-1)}{2R}Mv^2$ K

(AIEEE 2011)

18. A Carnot engine operating between temperatures T_1 and T_2 has efficiency 1/6. When T_2 is lowered by 62 K, its efficiency increases to 1/3. Then T_1 and T_2 are, respectively,

(a) 372 K and 310 K (b) 372 K and 330 K

(c) 330 K and 268 K (d) 310 K and 248 K

(AIEEE 2011)

19. A Carnot engine, whose efficiency is 40%, takes in heat from a source maintained at a temperature of 500 K. It is desired to have an engine of efficiency 60%. Then, the intake temperature for the same exhaust (sink) temperature must be

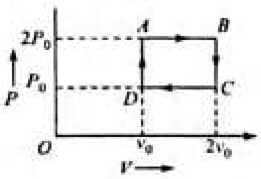
(a) efficiency of carnot engine cannot be made larger than 50%

(b) 1200 K

(c) 750 K

(d) 600 K **(AIEEE 2012)**

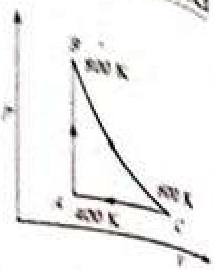
20. The above P–V diagram represents the thermodynamic cycle of an engine, operating with an ideal monoatomic gas. The amount of heat extracted from the source in a single cycle is



(a) $\left(\frac{13}{2}\right)P_0V_0$ (b) $\left(\frac{11}{2}\right)P_0V_0$

(c) $4P_0V_0$ (d) P_0V_0 **(JEE Main 2013)**

21. One mole of diatomic ideal gas undergoes a cyclic process ABC as shown in the figure. The process BC is adiabatic. The temperatures at A, B and C are 400 K, 800 K and 600 K respectively. Choose the correct statement:



(a) The change in internal energy in the process AB is $-350R$.

(b) The change in internal energy in the process BC is $-500R$.

(c) The change in internal energy in whole cyclic process is $250R$.

(d) The change in internal energy in the process CA is $700R$. **(JEE Main 2014)**

22. Consider a spherical shell of radius R at temperature T. The black body radiation inside it can be considered as an ideal gas of photons with internal energy per unit volume $u=\frac{U}{V}\propto T^4$ and pressure $P=\frac{1}{3}\left(\frac{U}{V}\right)$. If the shell now undergoes an adiabatic expansion the relation between T and R is

(a) $T\propto e^{-R}$ (b) $T\propto e^{-3R}$

(c) $T\propto\frac{1}{R}$ (d) $T\propto\frac{1}{R^3}$ **(JEE Main 2015)**

23. A solid body of constant heat capacity 1 J/°C is being heated by keeping it in contact with reservoirs in two ways:

(i) Sequentially keeping in contact with 2 reservoirs such that each reservoir supplies same amount of heat.

(ii) Sequentially keeping in contact with 8 reservoirs such that each reservoir supplies same amount of heat.

In both the cases, body is brought from initial temperature 100°C to final temperature 200°C. Entropy changes of the body in the two cases, respectively, is

(a) ln 2, 4 ln 2 (b) ln 2, ln 2

(c) ln 2, 2 ln 2 (d) 2 ln 2, 8 ln 2

(JEE Main 2015)

24. Consider an ideal gas confined in an isolated closed chamber. As the gas undergoes an adiabatic expansion, the average time of collision between molecules increases as V^q, where V is the volume of the gas. The value of q is $\left(\gamma=\frac{C_P}{C_V}\right)$

(a) $\frac{3\gamma+5}{6}$ (b) $\frac{3\gamma-5}{6}$

(c) $\frac{\gamma+1}{2}$ (d) $\frac{\gamma-1}{2}$ **(JEE Main 2015)**

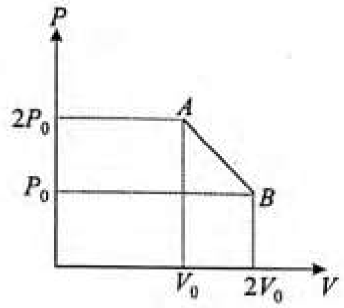
25. An ideal gas undergoes a quasi-static, reversible process in which its molar heat capacity C remains constant. If during this process the relation of pressure P and volume V is given by PV^n = constant, then n is given by (Here C_P and C_V are molar specific heat at constant pressure and constant volume, respectively):

(a) $n = \frac{C_P}{C_V}$ (b) $n = \frac{C - C_P}{C - C_V}$

(c) $n = \frac{C_P - C}{C - C_V}$ (d) $n = \frac{C - C_V}{C - C_P}$

(JEE Main 2016)

26. 'n' moles of an ideal gas undergoes a process $A \to B$ as shown in the figure. The maximum temperature of the gas during the process will be:



(a) $\frac{9P_0V_0}{4nR}$ (b) $\frac{3P_0V_0}{2nR}$

(c) $\frac{9P_0V_0}{2nR}$ (d) $\frac{9P_0V_0}{nR}$

(JEE Main 2016)

27. The temperature of an open room of volume 30 m^3 increases from 17°C to 27°C due to sunshine. The atmospheric pressure in the room remains 1×10^5 Pa. If n_i and n_f are the number of molecules in the room before and after heating, then $n_f - n_i$ will be

(a) 2.5×10^{25} (b) -2.5×10^{25}

(c) -1.61×10^{23} (d) 1.38×10^{23}

(JEE Main 2017)

28. C_p and C_v are specific heats at constant pressure and constant volume respectively. It is observed that

$C_p - C_v = a$ for hydrogen gas

$C_p - C_v = b$ for nitrogen gas

The correct relation between a and b is

(a) $a = 14b$ (b) $a = 28b$

(c) $a = \frac{1}{14}b$ (d) $a = b$ **(JEE Main 2017)**

29. Two moles of an ideal monoatomic gas occupies a volume V at 27°C. The gas expands adiabatically to a volume $2V$. Calculate (i) the final temperature of the gas and (ii) change in its internal energy.

(a) (i) 195 K (ii) 2.7 kJ

(b) (i) 189 K (ii) 2.7 kJ

(c) (i) 195 K (ii) –2.7 kJ

(d) (i) 189 K (ii) –2.7 kJ

(JEE Main 2018)

30. The mass of a hydrogen molecule is 3.32×10^{-27} kg. If 10^{23} hydrogen molecules strike, per second, a fixed wall of area 2 cm^2 at an angle of 45° to the normal, and rebound elastically with a speed of 10^3 m/s, then the pressure on the wall is nearly

(a) 4.70×10^2 N/m^2 (b) 2.35×10^3 N/m^2

(c) 4.70×10^3 N/m^2 (d) 2.35×10^2 N/m^2

(JEE Main 2018)

Chapter 15

Oscillation and Simple Harmonic Motion

PERIODIC MOTION

Periodic motion is motion of an object that regularly returns to a given position after a fixed time interval. With a little thought, we can identify several types of periodic motions in everyday life. Your car returns to the driveway each afternoon. You return to the dinner table each night to eat. A bumped chandelier swings back and forth, returning to the same position at a regular rate. The earth returns to the same position in its orbit around the sun each year, resulting in the variation among the four seasons.

If T is the period of motion after which it repeats itself, then the frequency f of the periodic motion is the number of cycles performed in 1 s and it is given as $f = 1/T$.

Units of f are s^{-1} or per second. A special name is given to the unit of frequency, hertz (Hz) after the discoverer of radio waves.

1 Hz = 1 cycle per second

Oscillations

An oscillation is a spherical type of periodic motion in which a particle moves to and fro about a fixed point called mean position of particle. Oscillations are commonly seen in general life in our surroundings. As discussed, in all types of oscillations, about which the particle can oscillate. This is the position where the particle is in equilibrium, that is, net force on the particle at this position is zero. If particle is displaced from the mean position.

Periodic Function

If a particle moves along x-axis, its position depends upon time t. We express this fact mathematically by writing

$x = f(t)$ or $x(t)$

There are certain motions that are repeated at equal intervals of time. By this we mean that particle is found at the same position moving in the same direction with the same velocity and acceleration, after each period of time. Let T be the interval of time in which motion is repeated. Then

$x(t) = x(t + T)$

where T is the minimum change in time. The function that repeats itself is known as a periodic function. During the period, its values may remain finite. Such functions are bound functions. Periodic motion of a particle is also bound because it must not go to infinity and return back in one finite period.

ILLUSTRATION 15.1 Find the period of the function.

$y = \sin \omega t + \sin 2\omega t + \sin 3\omega t$

Solution. The given function can be written as

$$y = y_1 + y_2 + y_3$$

Here $y_1 = \sin \omega t$, $T_1 = 2\pi/\omega$

$$y_2 = \sin 2\omega t,\ T_2 = \frac{2\pi}{2\omega} = \frac{\pi}{\omega}$$

and $y_3 = \sin 3\omega t$, $T_3 = 2\pi/3\omega$

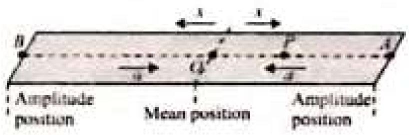
$$T_1 = 2T_2 \quad \text{and } T_1 = 3T_3$$

So, the time period of the given function is T_1 or $2\pi/\omega$.

Because in time $T = 2\pi/\omega$, first function completes one oscillation, the second function two oscillations and the third, three.

SIMPLE HARMONIC MOTION

It is a special case of oscillatory motion in which the acceleration of the vibrating particle (or body), at any position directly as its displacement from a fixed point (which may or may not lie along the line of motion) and is always directed towards that fixed point. Thus, simple harmonic motion (abbreviated as SHM) is a case of variable acceleration; however, the variation takes place in a regular and periodic fashion.



Suppose a particle P performs oscillatory motion between two fixed points A and B. Let O be the mid-point of A and B. If the particle P oscillates about point O in such a way that its acceleration 'a' at any position when its displacement from O

is x can be mathematically expressed as $a \propto x$ and is directed towards O, then its motion will be SHM. Here, the point 'O' is known as mean or stable or equilibrium or neutral position, and in case of 'simple' harmonic motion, the maximum displacement of the particle on either side of the mean position is the same, i.e., $OA = OB$.

Now, taking the motion of the particle to be along the x-axis, SHM can be mathematically expressed as

$$a \propto x \quad \text{or} \quad \vec{a} = (-\omega^2)\vec{x} \qquad \text{(i)}$$

Here, the negative sign stands for the fact that the direction of acceleration is opposite to that of displacement, and ω^2 is a positive constant.

Again, if m is the mass of the oscillating particle (or body), then multiplying both side of Eq. (i) by m, we have

$$m\vec{a} = (-m\omega^2)\vec{x} \quad \text{or} \quad F = (-k)\vec{x} \qquad \text{(ii)}$$

where $m\vec{a} = \vec{F}$ is the force acting on the particle and $k = m\omega^2$ is a positive constant.

Equations (i) and (ii) can equally be used to show that a given motion is SHM.

NOTE:

- The oscillation amplitude of the particle must be very small as compared to its surrounding dimensions (dimensions of bodies with which it can interact).
- During oscillation the acceleration of the particle toward mean position, due to net restoring forces, must be directly proportional to its displacement for mean position.

Equation of Simple Harmonic Motion

The differential equation of simple harmonic motion is given by $d^2x/dt = \omega^2 x$.

The necessary and sufficient condition for a motion to be simple harmonic is that the net restoring force (or torque) must be linear, i.e., $F = ma = -kx$ (where k is a constant). Thus,

$$a = \frac{d^2x}{dt^2} = -\frac{k}{m}x \qquad \text{(iii)}$$

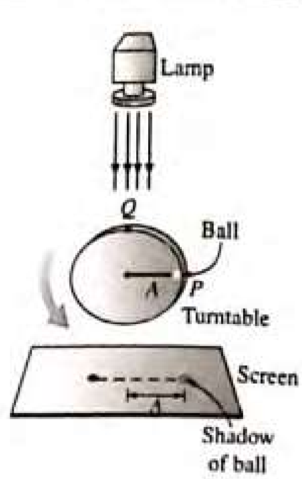
where x is the instantaneous displacement. Multiplying both sides by dx/dt and integrating with respect to t, we get

$$x = A\sin(\omega t + \phi) \qquad \text{(iv)}$$

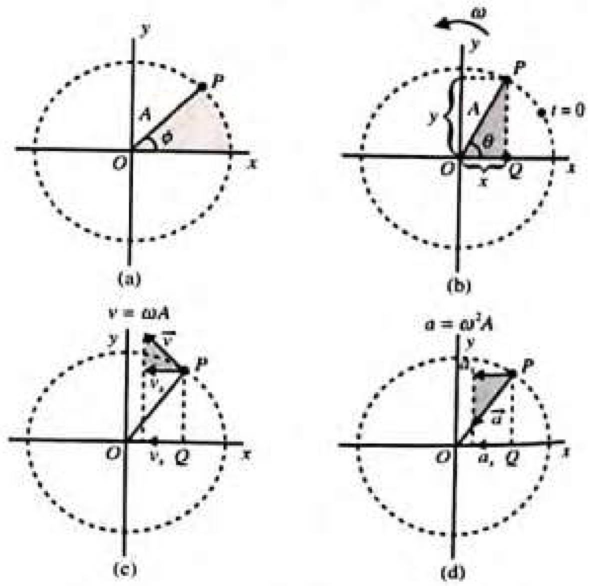
Here ω is called angular frequency and ϕ is called initial phase or epoch constant, whose value depends upon initial conditions.

Comparing Simple Harmonic Motion with Uniform Circular Motion

In this section, we explore this interesting relationship between these two types of motion. Figure is a view of an experimental arrangement that shows this relationship. A ball is attached to the rim of a turntable of radius A, which is illuminated from the side by a lamp. The ball casts a shadow on a screen. As the turntable rotates with constant angular speed, the shadow of the ball moves back and forth in simple harmonic motion.



Consider a particle located at point P on the circumference of a circle of radius A as in Figure (a) with the line OP making an angle ϕ with the x-axis at $t = 0$; we call this circle a reference circle for comparing simple harmonic motion with uniform circular motion, and we choose the position of P at $t = 0$ as our reference position. If the particle moves along the circle with constant angular speed ω until OP makes an angle ϕ with the x-axis as in Figure (b), at some time $t > 0$ the angle between OP and the x-axis is $\theta = \omega t + \phi$. As the particle moves along the circle, the projection of P on the x-axis, labelled as point Q, moves back and forth along the x-axis between the limits $x = \pm a$. Notice that points P and Q always have the same x-coordinate. From the right triangle OPQ, we see that this x-coordinate is



$$x(t) = A\cos(\omega t + \phi) \qquad \text{(i)}$$

This expression is the same as Eq. (i) and shows that the point Q moves with simple harmonic motion along the x-axis. Therefore, simple harmonic motion along a straight line can be represented by the projection of uniform circular motion along a diameter of a reference circle.

If we take projection of point P on y-axis, the y-coordinate is given by

$$y(t) = A\sin(\omega t + \phi) \qquad \text{(ii)}$$

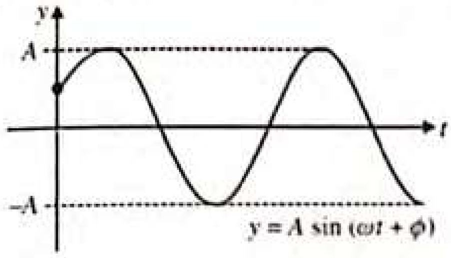
This geometric interpretation shows that the time interval for one complete revolution of point P on the reference circle is equal to the period of motion T for simple harmonic motion between $x = \pm a$. That is, the angular speed ω of P is the same as the angular frequency ω of simple harmonic motion along the x-axis (which is why we use the same symbol).

We may choose any position of the particle as initial position by pressing the stop watch on. It means, from any position of the particle you may start calculating time; for this, we can use $y = A \sin(\omega t + \phi)$ or $y = A\cos(\omega t + \phi)$.

If you start calculating time from extreme position use $y = A\cos\omega t$.

If you start calculating time from mean (stable equilibrium) position then use $y = A\sin\omega t$.

If you choose to start calculation of time when the particle stays in any intermediate position, the variation of displacement 'y' with time can be given as 'sin' or 'cosine' function.



The displaceemnt is always measured from mean position whereas time t can be calculated from any position of the oscillating particle.

If we differentiate Eq. (i) or (ii) twice, we get differential equation of SHM.

Differentiating Eq. (i), we get

$$\frac{dy}{dt} = A\omega\cos(\omega t + \phi) \qquad \text{(iii)}$$

Again differentiating Eq. (iii),

$$\frac{d^2y}{dt^2} = -A\omega^2\sin(\omega t + \phi) = -\omega^2 y\text{, i.e., } \frac{d^2y}{dt^2} + \omega^2 y = 0$$

This is the basic equation of SHM.

ILLUSTRATION 15.2 Identify which of the following functions represent simple harmonic motion.

i. $y = Ae^{i\omega t}$
ii. $y = ae^{-\omega t}$
iii. $y = a\sin^2\omega t$
iv. $y = a\sin\omega t + b\cos\omega t$
v. $y = \sin\omega t + \cos 2\omega t$

Solution.

i. According to given equation in problem, differentiating with respect to time, we get $\frac{dy}{dt} = iA\omega e^{i\omega t}$.

Differentiating again with respect to time, we get

$$\frac{d^2y}{dt^2} = -\omega^2 Ae^{i\omega t} = -\omega^2 y \qquad [\text{as } y = Ae^{i\omega t}]$$

Thus, we have $\frac{d^2y}{dt^2} + \omega^2 y = 0$

This is the basic differential equation of SHM.

ii. Given $y = ae^{-\omega t}$

$$\frac{dy}{dt} = -\omega ae^{-\omega t}$$

and $$\frac{d^2y}{dt^2} = \omega^2 ae^{-\omega t} = \omega^2 y$$

or $$\frac{d^2y}{dt^2} \propto y$$

Hence, the function is not S.H.M.

iii. $y = a\sin^2\omega t$

The function $y = a\sin^2\omega t$ is harmonic.

To become simple harmonic $\frac{d^2y}{dt^2} \propto -y$

Here, $\frac{dy}{dt} = 2a\omega\sin\omega t\cos\omega t$

$$\frac{d^2y}{dt^2} = 2a\omega^2[\cos^2\omega t - \sin^2\omega t]$$

$$= 2a\omega^2[1 - 2\sin^2\omega t] = 2a\omega^2\left[1 - \frac{2y}{a}\right]$$

The function is not simple harmonic.

iv. $y = a\sin\omega t + b\cos\omega t$

The function $y = a\sin\omega t + b\cos\omega t$ is simple harmonic.

Because $\frac{dy}{dt} = \omega a\cos\omega t - \omega b\sin\omega t$

$$\frac{d^2y}{dt^2} = -\omega^2 a\sin\omega t - \omega^2 b\cos\omega t$$

$$\Rightarrow \quad \frac{d^2y}{dt^2} = -\omega^2 y$$

This is the basic differential equation of SHM.

v. $y = \sin\omega t + \cos 2\omega t$

The function $y = \sin\omega t + \cos 2\omega t$ is not simple harmonic.

Because $\frac{dy}{dt} = \omega\cos\omega t - 2\omega\sin 2\omega t$

$$\frac{d^2y}{dt^2} = -\omega^2\sin\omega t - 4\omega^2\cos 2\omega t$$

$$= -\omega^2[\sin\omega t + \cos 2\omega t]$$

$$\frac{d^2y}{dt^2} \neq -\omega^2 y$$

The function is not simple harmonic.

Velocity and Acceleration in SHM

We can write the equation of motion of a particle performing SHM is

$$y = A\sin(\omega t + \phi) \qquad \text{(i)}$$

Differentiatintg y with respect to 't' given velocity of the particle

$$v = \frac{dy}{dt} = A\omega\cos(\omega t + \phi)$$

From Eq. (i), we can write $\sin(\omega t + \phi) = \frac{y}{A}$ and we know that

$$\cos(\omega t + \phi) = \sqrt{1 - \sin^2(\omega t + \phi)}$$

$$= \sqrt{1 - \frac{y^2}{A^2}} = \frac{1}{A}\sqrt{A^2 - y^2}$$

Substituting the value of $\cos(\omega t + \phi)$ in Eq. (i), we get

$$v = A\omega\left[\frac{1}{A}\sqrt{A^2 - y^2}\right] = \omega\sqrt{A^2 - y^2} \qquad \text{(ii)}$$

Differentiating Eq. (ii) again w.r.t. time,

$$a = \frac{dv}{dt} = -A\omega^2 \sin\omega t = -\omega^2 y$$

NOTE:

For a particle performing SHM

- Velocity of a particle is maximum at mean position and is zero at amplitude positions.
- Acceleration of a particle is zero at mean position and maximum at amplitude positions.
- We have differential equation of SHM as

$$a = -\omega^2 y \Rightarrow \frac{d^2 y}{dt^2} = -\omega^2 y$$

$$v\frac{dv}{dy} = -\omega^2 y \quad \Rightarrow v\,dv = -\omega^2 y\,dy$$

- Integrating both sides $\int v\,dv = -\omega^2 \int y\,dy$

$$\frac{v^2}{2} = -\omega^2\frac{y^2}{2} + \text{constant}$$

$$v^2 + \omega^2 y^2 = \text{constant} \qquad \text{(i)}$$

- the above equation is also an important equation to express SHM.

ILLUSTRATION 15.3 A particle executes SHM with an amplitude 8 cm and a frequency 10 s^{-1}. Assuming the particle to be at a displacement 4 cm initially, in the positive direction, determine its displacement equation and the maximum velocity and acceleration.

Solution. Given $a = 8$ cm and $\omega = 2\pi n = 20\pi$ rad/s

Let the phase constant be ϕ.

The displacement equation can be written as

$x = 8\sin(20\pi t + \phi)$

Given, at $t = 0$; $x = 4$ cm, therefore

$$4 = 8\sin(20\pi(0) + \phi) \quad \Rightarrow \sin(\phi) = \frac{1}{2} \quad \Rightarrow \phi = \frac{\pi}{6}$$

$$\text{Displacement equation } x = 8\sin\left(20\pi t + \frac{\pi}{6}\right)$$

Differentiating the above equation w.r.t. time 't'

$$\frac{dx}{dt} = v = 160\pi\cos\left(20\pi t + \frac{\pi}{6}\right)$$

$\therefore \quad v_{max} = \pm 160\pi$ cm/s $\qquad$ [when $\cos(20\pi t + \pi/6) = \pm 1$]

Differentiating once again w.r.t. time t.

$$\frac{d^2x}{dt^2} = f = -3200\pi^2\sin\left(20\pi t + \frac{\pi}{6}\right)$$

$$f_{max} = \pm 3200\pi^2$$

Phase and Phase Difference in SHM

Phase: We have seen earlier that the displacement, velocity and acceleration of a particle executing SHM vary periodically with the angle $(\omega t + \phi)$ associated with the sine or cosine term. Knowing this angle, we can be sure of its position as well as state of motion as to how and where it is oscillating. This angle $(\omega t + \phi)$ is known as the 'phase' of the oscillating particle. Since the phase is a time dependent factor, it will be more worthwhile to speak in terms of instantaneous phase (i.e., phase at any instant).

Taking the displacement equation as $x = A\sin(\omega t + \phi)$, we have

at $\omega t + \phi = 0$; $\quad x = 0$ (mean position)

at $\omega t + \phi = \pi/2$; $\quad x = A$ (amplitude position)

at $\omega t + \phi = \pi$; $\quad x = 0$ mean position

at $\omega t + \phi = 3\pi/2$; $\quad x = -A \quad$ and so on

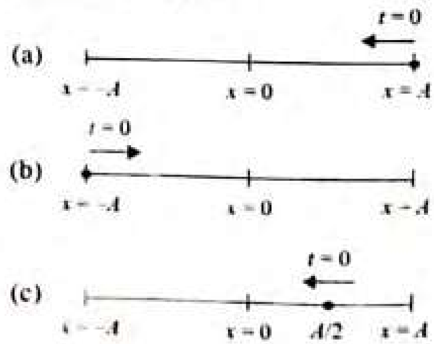
Notice that as time varies indefinitely, phase keeps on changing, 0 to 2π; the reason being $(\omega t + \phi) = (\omega t + \phi) + 2n\pi$, where $n \in I$.

Phase constant (Epoch): The phase of a particle executing SHM, initially (i.e., at the instant when time was reckoned), is known as the initial phase or phase constant or epoch.

Since instantaneous phase $= \omega t + \phi$, so initial phase can be obtained by putting $t = 0$

$\therefore \quad$ Phase constant $= \phi$

ILLUSTRATION 15.4 Write the equation of SHM for the situations shown below:



Solution.

(a) We know general equation of SHM is

$x = A\sin(\omega t + \phi)$

At $t = 0$, $x = +A$

$A = A\sin(\phi) \Rightarrow \sin\phi = 1$; Hence, $\phi = \pi/2$

$$x = A\sin\left(\omega t + \frac{\pi}{2}\right) = A\cos\omega t$$

(b) $x = A\sin(\omega t + \phi)$

At $t = 0$, $x = -A$

$-A = A\sin\phi \Rightarrow \sin\phi = -1$; Hence, $\phi = \frac{3\pi}{2}$

$$x = A\sin\left(\omega t + \frac{3\pi}{2}\right)$$

$$x = -A\cos\omega t$$

(c) $x = A\sin(\omega t + \phi)$

At $t = 0$, $x = \frac{A}{2}$

$\frac{A}{2} = A\sin(\phi) \Rightarrow \sin\phi = \frac{1}{2}$. Hence, $\phi = \frac{\pi}{6}, \frac{5\pi}{6}$

The particle is moving towards the mean position and in negative direction, i.e., its velocity is negative. The value of ϕ should be selected such that $\cos\phi$ should be negative.

Velocity, $v = A\omega\cos(\omega t + \phi)$

At $t = 0$, $v = -$ve

$v = A\omega\cos\phi$

Hence $\phi = \frac{5\pi}{6}$

$$x = A\sin\left(\omega t + \frac{5\pi}{6}\right)$$

Phase Difference in Two SHMs

Same Phase SHMs

Two particles execute SHM in such a way that their oscillations are exactly parallel to each other or their phase difference during oscillation is zero, i.e., they are said to be in same phase. We have seen that this happens when both SHMs are started at same time with same angular frequency. This can happen also when the time lag between starting of the two SHMs is T or an integral multiple of time period of SHM. Because if one starts at $t = 0$ and other starts at $t = T$, in this duration the first particle will complete its the first oscillation and is going to start its second oscillations and the second particle will start in synchronization with the first. Hence, the two oscillation will still be parallel or in same phase. The phase difference in the two SHMs will be 2π. Not only this even if the time lag in starting of the two SHMs is $2T, 3T, \ldots, nT$ or the phase difference in the two SHMs is $4\pi, 6\pi, 8\pi, \ldots, 2n\pi$, then also these SHMs can be treated in same phase.

Thus phase difference in two SHMs of same phase is

$$\phi = 2\pi, 4\pi, 6\pi \ldots 2n\pi$$

Opposite Phase SHMs

Two SHMs are said to be in opposite phase when their oscillations are antiparallel. This happens when two SHMs of same angular frequency start with a time lag of $T/2$ and phase difference among the two SHMs is π. By analyzing the situation it can also be stated that the same thing also happens when the time lag in starting of the two SHMs is $3T/2, 5T/2, \ldots, (2n+1)T/2$ or the phase difference between the two is $3\pi, 5\pi, \ldots, (2n+1)\pi$.

Thus phase difference in two SHMs of opposite phase is

$$\phi = \pi, 3\pi\ 5\pi \ldots, (2n+1)\pi$$

Relation between Phase Difference and Time Difference

Let the phase of a particle at time t_1 be ϕ_1, then

$$\phi_1 = \omega t_1 + \phi \quad \text{(i)}$$

Let the phase of the particle at time t_2 changes to ϕ_2, then

$$\phi_2 = \omega t_2 + \phi \quad \text{(ii)}$$

Subtracting Eq. (i) from Eq. (ii), phase difference becomes

$$\phi_2 - \phi_1 = \omega(t_2 - t_1)$$

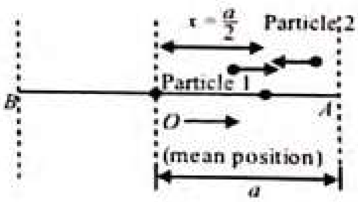
or $$\Delta\phi = \omega\,\Delta t = \frac{2\pi}{T}\Delta t$$

Putting $\Delta t = T$ and $\omega = 2\pi/T$, we have $\Delta\phi = 2\pi$

Thus, a phase difference of 2π is equivalent to a time difference of T. Similarly, a phase difference of π is equivalent to a time difference of $T/2$, and so on.

ILLUSTRATION 15.5 Two particles execute SHM with same frequency and amplitude along the same straight line. They cross each other, at a point midway between the mean and the extreme position. Find the phase difference between them.

Solution. **Method 1**



Let a be the amplitude and ϕ_1 and ϕ_2 their respective phases at any instant, when they cross each other.

Then their displacement equations can be written as

$$x = a\sin(\text{phase})$$

For the two particles we have

$$\frac{a}{2} = a\sin\phi_1 \quad \text{and} \quad \frac{a}{2} = a\sin\phi_2$$

$\Rightarrow$ Taking the least value, $\phi_1 = \frac{\pi}{6}$

and taking the next possible value $\phi_2 = \frac{5\pi}{6}$. Moreover, from $\vec{v} = a\omega\cos(\text{phase})$.

If $\vec{v}_1$ and $\vec{v}_2$ are the respective velocities of the two particles.

The particles cross each other their velocities should be in opposite directions. If we take velocity of the particle 1 positive then velocity of particle should be negative. The velocity of the particle 2 will be negative when it has phase $\phi_2 = 5\pi/6$.

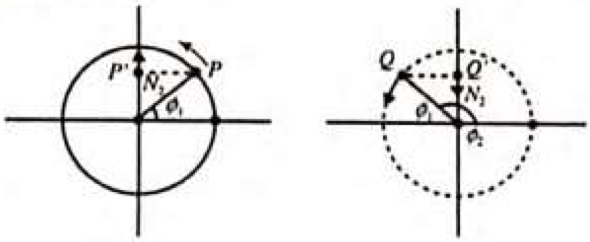
Therefore, the required phase difference $= \phi_2 - \phi_1 = \dfrac{2\pi}{3}$ rad

NOTE: The phase difference can in general be

$$\frac{2\pi}{3} + 2n\pi;\ n \in I^{+}$$

Method 2

Figures (a) and (b) show that two particles P' and Q' in SHM along with their corresponding particles in circular motion. Let P' moves in upward direction when crossing Q' at $A/2$ as shown in Figure (a).



(a) (b)

At this instant, phase of P' is

$$\phi_1 = \sin^{-1}\left(\frac{1}{2}\right) = \frac{\pi}{6} \quad \text{(i)}$$

Similarly as shown in Figure (b), particle Q' moves in downward direction (opposite P') at $A/2$, this implies its circular motion particle is in second quadrant thus its phase angle is

$$\phi_2 = \pi - \phi_1 = \pi - \sin^{-1}\left(\frac{1}{2}\right) = \pi - \frac{\pi}{6} = \frac{5\pi}{6} \quad \text{(ii)}$$

As both are oscillating at same angular frequency, their phase difference remains constant which can be given from Eqs. (i) and (ii), as $\Delta\phi = \phi_2 - \phi_1 = \dfrac{5\pi}{6} - \dfrac{\pi}{6} = \dfrac{2\pi}{3}$

NOTE: In a particular position we have one displacement, one acceleration but two velocities, one is away from mean position other is towards mean position. It means, we have two different phases at a position. Hence the phase is not only decided by the position but it is also decided by the velocity of the particle.

Energy of a Body in SHM

The total energy of a harmonic oscillator consists of two parts, potential energy (PE) and kinetic energy (KE). The former being due to its displacement from the mean position and later due to its velocity. Since the position and velocity of the harmonic oscillator are continuously changing, PE and KE also change but their sum, i.e., the total energy (TE) must have the same value at all times.

Simple harmonic motion is defined by the equation

Let $U(x)$be the potential energy of the system when the displacement is x. The change in potential energy corresponding to a force is negative of the work done by this force,

$$U(x) - U(0) = -W = \frac{1}{2}kx^2$$

Let us choose the potential energy to be zero when the particle is at the centre of oscillation $x = 0$. Then

$$U(0) = 0 \text{ and } U(x) = \frac{1}{2}kx^2$$

This expression for potential energy is same as that for a spring and has been used so far in this chapter.

As $\omega = \sqrt{\dfrac{k}{m}},\quad k = m\omega^2$

We can write

$$U(x) = \frac{1}{2}m\omega^2 x^2 \quad \text{(i)}$$

The displacement and the velocity of a particle executing a simple harmonic motion are given by $x = A\sin(\omega t)$

and $v = A\omega\cos(\omega t)$

The potential energy at time t is, therefore,

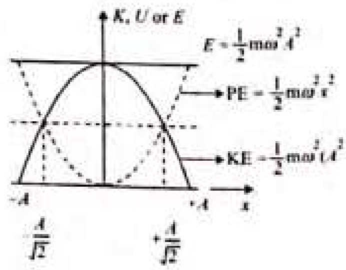
$$U = \frac{1}{2}m\omega^2 x^2 = \frac{1}{2}m\omega^2 A^2 \sin^2(\omega t)$$

$$= \frac{m\omega^2 A^2}{4}(1 - \cos 2\omega t)$$

and the kinetic energy at time t is

$$K = \frac{1}{2}mv^2 = \frac{1}{2}mA^2\omega^2\cos^2(\omega t)$$

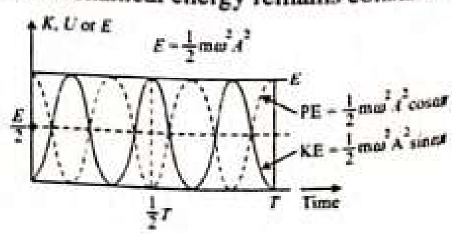
$$= \frac{m\omega^2 A^2}{4}(1 + \sin 2\omega t)$$



The total mechanical energy at time t is

$$E = U + K = \frac{1}{2}m\omega^2 A^2\left[\sin^2(\omega t) + \cos^2(\omega t)\right] = \frac{1}{2}m\omega^2 A^2 \quad \text{(ii)}$$

We see that the total mechanical energy at time t is independent of t. Thus, the mechanical energy remains constant as expected.



NOTE: We can write total mechanical energy of a particle/body performing SHM as

KE + PE = constant

$$\frac{1}{2}mv^2 + \frac{1}{2}kx^2 = \text{constant} \Rightarrow v^2 + \frac{k}{m}x^2 = \text{constant} \quad \text{(i)}$$

Here k is the equivalent force constant of oscillation ($k = m\omega^2$)

We have differential equation of SHM as

$$\frac{d^2x}{dt^2} = -\omega^2 x \text{ or } v^2 = \omega^2 x^2 = \text{constant} \quad \text{(ii)}$$

If we compare Eqs. (i) and (ii), both equations are same.

ILLUSTRATION 15.6 A particle of mass 0.2 kg executes simple harmonic motion along a path of length 0.2 m at the rate of 600 oscillations per minute. Assume at $t = 0$ the particle starts SHM in positive direction. Find the kinetic and potential energies in joules when the displacement is $x = A/2$, where A stands for the amplitude.

Solution. Given that f = 600 oscillations/min, $m = 0.2$ kg

$$A = \text{Amplitude} = 1/2 \times \text{Length of path} = 0.1 \text{ m} = \frac{1}{10}\text{m}$$

As $\quad f = \dfrac{1}{T} = \dfrac{600}{60} = 10 \text{ Hz} \Rightarrow \omega = 2\pi f = 20\pi$ rad/s

The magnitude of velocity of a particle performing SHM is given as $v = \omega\sqrt{A^2 - x^2}$

At $x = A/2 = \dfrac{1}{20}$ m, the velocity at this position

$$v_{x=A/2} = 20\pi\sqrt{\left(\frac{1}{10}\right)^2 - \left(\frac{1}{20}\right)^2} = \sqrt{3}\pi \text{ m/s}$$

Hence, kinetic energy at this position

$$k_{x=A/2} = \frac{1}{2}mv^2_{x=A/2} = \frac{1}{2}(0.2)(\sqrt{3}\pi)^2 = \frac{3\pi^2}{10}\text{ J}$$

We can write potential energy at any position x as

$$U = \frac{1}{2}kx^2 = \frac{1}{2}(m\omega^2)x^2$$

Hence,

$$U_{x=A/2} = \frac{1}{2}(0.2)(20\pi)^2\left(\frac{1}{20}\right)^2 = \frac{\pi^2}{10}\text{ J}$$

ILLUSTRATION 15.7 A particle of mass m is located in a unidimensional potential field where potential energy of the particle depends on the coordinates x as: $U(x) = U_0(1 - \cos Ax)$; U_0 and A are constants.

Find the period of small oscillations that the particle performs about the equilibrium position.

Solution. The equation of potential energy of the particle as a function of position is given as

$$U_x = U_0(1 - \cos Ax) \quad \text{(i)}$$

Hence, force acting on the particle is given as

$$F_x = -\frac{dU_x}{dx} = U_0 A \sin Ax \quad \text{(ii)}$$

So, for the equilibrium of the body the force given by the above equation must be zero and d^2U/dx^2 should be negative. So, $F = 0$ situations are given by $0 = -U_0 A \sin Ax$

$$x = 0, \quad x = \frac{\pi}{A} \quad \text{(iii)}$$

Since $\quad \dfrac{d^2U}{dx^2} = -U_0A^2\cos Ax$

So, at $x = 0$, $\dfrac{d^2U}{dx^2} = -U_0A^2\cos 0° = -U_0A^2$

i.e., negative

So, $x = 0$ satisfies the condition for stable equilibrium situation. Now, if the particle is given a very small displacement from $x = 0$ position, then the small force arising due to this small displacement is given as: $\Delta F = -U_0 A \sin(A\Delta x)$

$$\Delta F = -U_0A^2\Delta x \quad (\because \sin(A\Delta x) \approx A\Delta x)$$

If the acceleration of the particle is a, then $ma = -U_0A^2\Delta x$

$$a = -\left(\frac{U_0A^2}{m}\right)\Delta x \quad \text{(iv)}$$

$$\Rightarrow \quad a \propto -\Delta x$$

So, from the above relation it is clear that the acceleration is proportional and opposite to the displacement. So the particle performs SHM. But for any SHM,

$$a = -\omega^2\Delta x \quad \text{(v)}$$

So, from Eqs. (iv) and (v), we get

$$\omega^2 = \frac{U_0A^2}{m} \quad \text{or} \quad T = 2\pi\sqrt{\frac{m}{U_0A^2}}$$

Superposition of Two SHMs

In same direction and of same frequency

Let two particles are preforming SHM with same angular frequency and in same direction.

$$x_1 = A_1 \sin \omega t$$
$$x_2 = A_2 \sin(\omega t + \phi)$$

Then resultant displacement

$$x = x_1 + x_2$$
$$= A_1 \sin \omega t + A_2 \sin(\omega t + \phi) = A \sin(\omega t + \phi')$$

where $A = \sqrt{A_1^2 + A_2^2 + 2A_1A_2\cos\phi}$

and $\quad \phi' = \tan^{-1}\left[\dfrac{A_2\sin\phi}{A_1 + A_2\cos\phi}\right]$

If $\phi = 0$, both SHMs are in phase and $A = A_1 + A_2$

If $\phi = \pi$, both SHMs are out of phase and $A = |A_1 - A_2|$

The resultant amplitude due to superposition of two or more than two SHMs of this case can also be found by phasor diagram.

In same direction but are of different frequencies

Let in this case angular frequencies be ω_1 and ω_2.

$$x_1 = A_1 \sin \omega_1 t \Rightarrow x_2 = A_2 \sin \omega_2 t$$

then resultant displacement

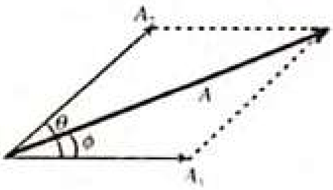
$$x = x_1 + x_2 = A_1 \sin \omega_1 t + A_2 \sin \omega_2 t$$

This resultant motion is not SHM.

Superposition of SHMs Along the Same Direction (Using Phasor Diagram)

If two or more SHMs are along the same line, their resultant can be obtained by vector addition by making a phasor diagram.

1. Amplitude of SHM is taken as length (magnitude) of vector.
2. Phase difference between the vectors is taken as the angle between these vectors. The magnitude of resultant of vector gives resultant amplitude of SHM and angle of resultant vector gives phase constant of resultant SHM.



For example, $x_1 = A_1 \sin \omega t$

$x_2 = A_2 \sin (\omega t + \theta)$

If equation of resultant SHM is taken as $x = A \sin (\omega t + \phi)$

$$A = \sqrt{A_1^2 + A_2^2 + 2A_1A_2 \cos\theta}$$

$$\tan\phi = \frac{A_2 \sin\theta}{A_1 + A_2 \cos\theta}$$

Illustration 15.8 If the displacement of a moving point at any time is given by an equation of the form $y(t) = a\cos\omega t + b\sin\omega t$, show that the motion is simple harmonic. If $a = 3$m, $b = 4$m and $w = 2$; determine the period, amplitude, maximum velocity and maximum acceleration.

Solution. The particle is moving along the y-axis.

$$y(t) = a \cos \omega t + b \sin \omega t$$

$$y = \sqrt{a^2 + b^2}\sin(\omega t + \phi_0)$$

where $\tan\phi_0 = a/b \Rightarrow y = \sqrt{a^2+b^2}\sin(\omega t + \tan^{-1} a/b)$

Comparing with $y = a\sin(\omega t + \phi)$,

$$T = \frac{2\pi}{\omega} = \frac{2\pi}{2} = \pi \text{ s}$$

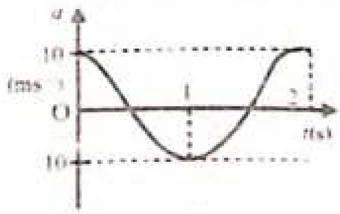
$$A = \sqrt{a^2+b^2} = \sqrt{3^2+4^2} = 5 \text{ m}$$

$$v_{max} = \omega A = 2 \times 5 = 10 \text{ m/s}$$

$$\Rightarrow \quad a_{max} = \omega^2 A = 4 \times 5 = 20 \text{ m/s}^2$$

Concept Application Exercise 15.1

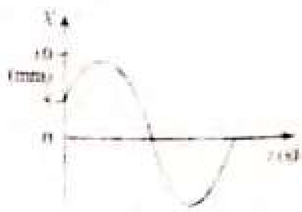
1. The acceleration versus time graph of a particle executing SHM is shown in the following figure



(A)

   i. Plot the displacement versus time graph
   ii. The frequency of oscillation is ______
   iii. The displacement amplitude is ______
   iv. At $t = 0$, the velocity of the particle is ______
   v. The kinetic energy of the particle is maximum at $t =$ ______ and $t =$ ______
   vi. The potential energy is maximum at $t =$ ______ $t =$ ______ and $t =$ ______

2. The equation of motion of a particle started at $t = 0$ is given by $x = 5 \sin (20t + \pi/3)$ where x is in centimetres and t is in second. When does the particle
   (a) first come to rest ______
   (b) first have zero acceleration ______
   (c) first have maximum speed ______
3. A particle in SHM has a period of 4 s. It takes time t_1 to start from mean position and reach half the amplitude. In another case it takes a time t_2 to start from extreme position and reach half the amplitude. Find the ratio t_1/t_2.
4. A particle is subjected to two simple harmonic motions in the same direction having equal amplitudes and equal frequency. If the resultant amplitude is equal to the amplitude of the individual motions, find the phase difference between the individual motions.
5. Figure shows the displacement–time graph of a particle executing SHM. If the time period of oscillation is 2 s, find the equation of motion.



6. A body executing SHM has its velocity 10 cm/sec and 7 cm/sec when its displacement from the mean position are 3 cm and 4 cm, respectively. Calculate the length of the path.

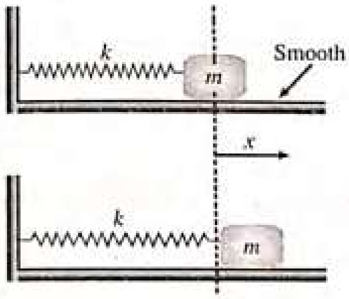
SPRING–MASS SYSTEM

Case 1: Spring–mass system oscillating on a smooth horizontal surface

Let us find out the time period of a spring–mass system oscillating on a smooth horizontal surface as shown in the figure. The SHM will be about relaxed position of spring.

At the equilibrium position the spring is relaxed. When the block is displaced through a distance x towards right, it experiences a net restoring force $F = -kx$ towards left.

The negative sign shows that the restoring force is always opposite to the displacement. That is, when x is positive, F is negative, the force is directed to the left. When x is negative, F is positive, the force always tends to restore the block to its equilibrium position $x = 0$.



$$F = -kx$$

Applying Newton's second law,

$$F = m\frac{d^2x}{dt^2} = -kx \quad \text{or} \quad \frac{d^2x}{dt^2} + \left(\frac{k}{m}\right)x = 0$$

Comparing the above equation with $a = d^2x/dt^2 = -\omega^2 x$, we get

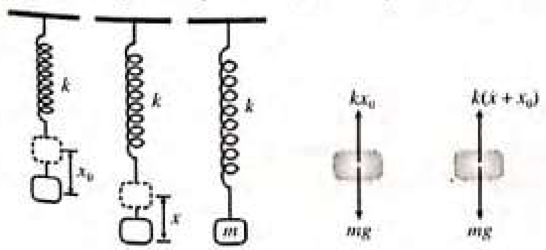
$$\omega^2 = \frac{k}{m} \text{ or } T = 2\pi\sqrt{\frac{m}{k}}$$

NOTE: Time period is independent of the amplitude. For a given spring constant, the period increases with the mass of the block that means more massive block oscillates more slowly. For a given block, the period decreases as k increases. A stiffer spring produces quicker oscillations.

Case 2: Spring–mass system oscillating in a vertical plane

A block of mass m attached to a spring of stiffness k oscillates in a vertical plane. Let us find the period of oscillation of a vertical spring–mass system.

Let x_0 be the deformation in the spring in equilibrium. Then $kx_0 = mg$. When the block is further displaced by x, the net restoring force is given by $F = -[k(x + x_0) - mg]$



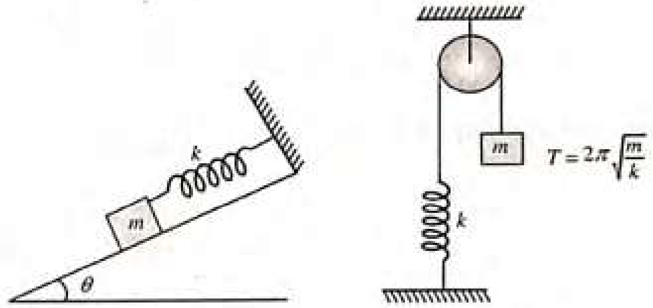
Using second law of motion,

$$m\frac{d^2x}{dt^2} = -kx \Rightarrow \frac{d^2x}{dt^2} + \left(\frac{k}{m}\right)x = 0$$

$$\text{Thus, } \omega^2 = \frac{k}{m} \Rightarrow T = 2\pi\sqrt{\frac{m}{k}}$$

NOTE: Gravity does not influence the time period of the spring–mass system; it merely changes the equilibrium position.

As we have seen that the time period of block–spring system depends only on the mass of the block and force constant of the spring, so the time period in the following cases is

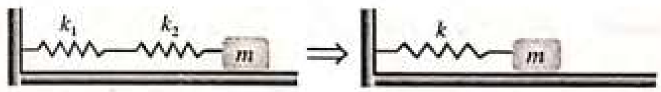


(a) (b)

Series and Parallel Combination of Springs

(a) **Series combination of springs:** When two springs are joined in series, the equivalent stiffness of the combination may be obtained as

$$\frac{1}{k} = \frac{1}{k_1} + \frac{1}{k_2}$$



(b) **Parallel combination of springs:** When two springs are joined in parallel, the equivalent stiffness of the combination is given by

$$k = k_1 + k_2$$

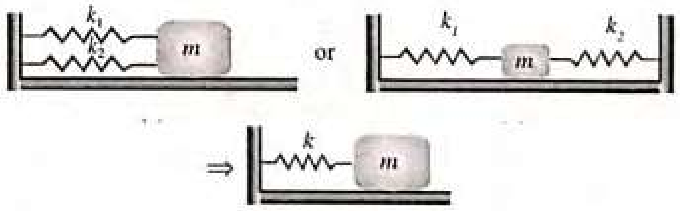


ILLUSTRATION 15.9 A spring of stiffness constant k and natural length l is cut into two parts of length $3l/4$ and $l/4$, respectively, and an arrangement is made as shown in figure. If the mass is slightly displaced, find the time period of oscillation.

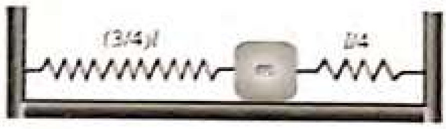
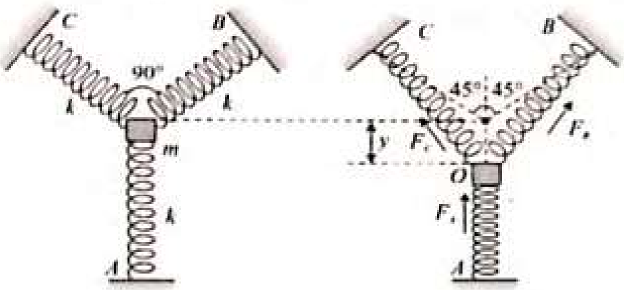


Solution. The stiffness of a spring is inversely proportional to its length. Therefore the stiffness of each part is

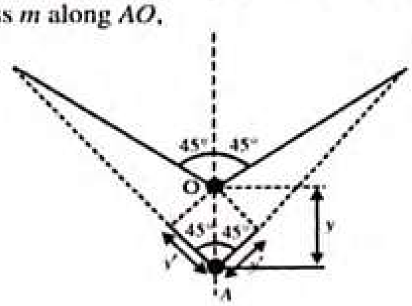
$$k_1 = \frac{4}{3}k \quad \text{and} \quad k_2 = 4k$$

Time period, $T = 2\pi\sqrt{\dfrac{m}{k_1 + k_2}} = 2\pi\sqrt{\dfrac{3m}{16k}} = \dfrac{\pi}{2}\sqrt{\dfrac{3m}{k}}$

Illustration 15.10 A particle of mass m placed on smooth horizontal surface is attached to three identical springs A, B and C each of force constant k as shown in figure. If the particle of mass m is pushed slightly against spring A and released, find the time period of oscillations.



Solution. When the particle of mass m at O is pushed by y in the direction of A, spring A will be compressed by y while B and C will be stretched by $y' = y\cos 45°$; so the total restoring force on mass m along AO.



$$RF = F_A + F_B\cos 45° + F_C\cos 45°$$

$$= ky + 2(ky')\cos 45°$$

$$= ky + 2k(y\cos 45°)\cos 45°$$

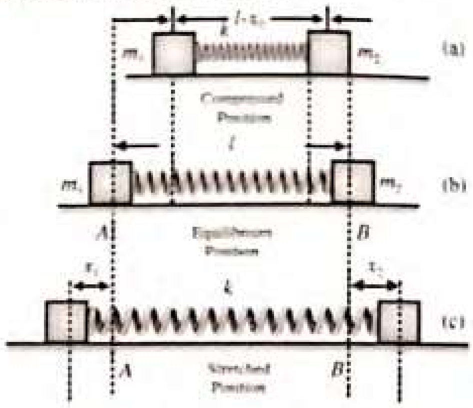
$$F = (2k)y \Rightarrow ma = -(2k)y$$

Hence $a = -\left(\dfrac{2k}{m}\right)y$ as compared with $a = -\omega^2 y$

We get $\omega^2 = \dfrac{2k}{m}$ which gives $T = 2\pi\sqrt{\dfrac{m}{2k}}$

OSCILLATION OF A TWO-PARTICLE SYSTEM TWO-BODY PROBLEM

Two blocks of masses m_1 and m_2 are connected with a spring of natural length l and spring constant k. The system is lying on a frictionless horizontal surface. Initially spring is compressed by a distance x_0 as shown in figure.



The two blocks will perform SHM about their equilibrium position. We will discuss in this section about the oscillation of the system. If we release the blocks.

(a) **Time period of the blocks:** Here both the blocks will be in equilibrium at the same time when spring is in its natural length. Let A and B be equilibrium positions of blocks m_1 and m_2 as shown in figure.

Let at any time during oscillations, blocks are at a distance of x_1 and x_2 from their equilibrium positions (A and B) [Figure (c)]

As no external force is acting on the spring–block system, the displacement of centre of mass of the system, $\Delta r_{CM} = 0$

$\therefore \quad (m_1 + m_2)\Delta x_{CM} = m_1 x_1 - m_2 x_2 \Rightarrow m_1 x_1 = m_2 x_2$

For first particle, force equation can be written as

$$k(x_1 + x_2) = m_1\frac{d^2x_1}{dt^2} \quad \text{or,} \quad k\left(x_1\frac{m_1}{m_2} + x_1\right) = m_1 a_1$$

or, $a_1 = \dfrac{k(m_1 + m_2)}{m_1 m_2}x_1 \qquad \because \omega^2 = \dfrac{k(m_1 + m_2)}{m_1 m_2}$

Using vector we can write $\vec{a}_1 = -\dfrac{k(m_1 + m_2)}{m_1 m_2}\vec{x}_1$

'–' sign is included as $\vec{a}_1$ and $\vec{x}_1$ are opposite to each other.

Hence, $T = 2\pi\sqrt{\dfrac{m_1 m_2}{k(m_1 + m_2)}} = 2\pi\sqrt{\dfrac{\mu}{K}}$

where $\mu = m_1 m_2/(m_1 + m_2)$ which is known as reduced mass.

Similarly time period of 2nd particle can be found. Both will have the same time period.

(b) **Amplitude of the particles:** Let the amplitude of blocks be A_1 and A_2.

$m_1 A_1 = m_2 A_2$

By energy conservation, $\frac{1}{2}k(A_1+A_2)^2 = \frac{1}{2}kx_0^2$

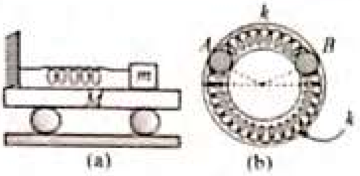
or $A_1 + A_2 = x_0$

or $A_1 + \frac{m_1}{m_2}aA_1 = x_0$

or $A_1 = \frac{m_2 x_0}{m_1 + m_2}$

Similarly, $A_2 = \frac{m_1 x_0}{m_1 + m_2}$

ILLUSTRATION 15.11 Figures (a) and (b) represent spring-block system. If m is displaced slightly, find the time period of oscillation of the system.



(a) (b)

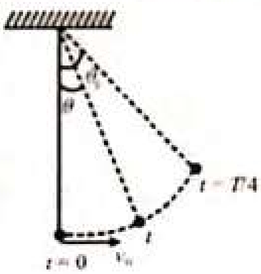
Solution. Both the cases are as follows:

Case (a) Reduced mass of the system	Case (b) Reduced mass of the system
$\mu = \left(\frac{mM}{m+m}\right)$ $\therefore T = 2\pi\sqrt{\frac{\mu}{k}}$	$\mu = \frac{mm}{m+m} = \frac{m}{2}$ and $k_e = k + k = 2k$ $\therefore T = 2\pi\sqrt{\frac{\mu}{k_e}}$

ANALYSIS OF ANGULAR SHM

In case of a simple pendulum a heavy point mass is suspended by a weightless, inextensible and perfectly flexible string from a rigid support.

When the particle is at its extreme position, its angular displacement θ_0 can be regarded as the angular amplitude of oscillations. As the displacement of bob from its mean position is given as



$$x = A\sin(\omega t + \alpha) \quad \text{[general equation of SHM]} \qquad \text{(i)}$$

If θ and θ_0 are angular displacement and angular amplitude of bob, respectively, we have $\theta = \frac{x}{l}$ and $\theta_0 = \frac{A}{l}$

Thus, general equation of SHM of bob in angular form can be given by substituting the values of x and in Eq. (i) as

$$\theta = \theta_0 \sin(\omega t + \phi_0) \qquad \text{(ii)}$$

Using the above equation we can find the angular velocity of the body which in angular SHM is

$$\dot{\theta} = \frac{d\theta}{dt} = \theta_0\omega\cos(\omega t + \phi_0) \qquad \text{(iii)}$$

$$= \omega\sqrt{\theta_0^2 - \theta^2} \qquad \text{(iv)}$$

NOTE: Here we represent angular velocity $\frac{d\theta}{dt}$ by $\dot{\theta}$, not v, as the notation ω is already being used for angular frequency of body in SHM.

Similarly angular acceleration of body is given as

$$\alpha = \frac{d^2\theta}{dt^2} = -\theta_0\omega^2\sin(\omega t + \phi_0) \qquad \text{(v)}$$

Thus restoring torque on body is given as

$$\tau_R = -I\alpha = -I\omega^2\theta \qquad \text{(vi)}$$

Thus we can state that in angular SHM, angular acceleration of the body and the restoring torque on the body are directly proportional to the angular displacement of body from its mean position and are directed toward mean position. Similarly basic differential equation for angular SHM can be written as

$$\frac{d^2\theta}{dt^2} + \omega^2\theta = 0 \qquad \text{(vii)}$$

In terms of angular velocity and angular displacement we can write above equation as $(\dot{\theta})^2 + \omega^2(\theta)^2 = \text{constant}$

$\dot{\theta}$ = angular velocity

θ = angular displacement

OSCILLATION OF SIMPLE PENDULUM

As Angular SHM

Length of the simple pendulum is the distance between the point of suspension and the centre of mass of the suspended mass.

Consider the bob when string deflects through a small angle θ.

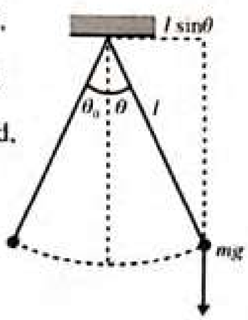
Forces acting on the bob are tension T in the string and weight mg of the bob.

Torque on the bob about point O is

$$\tau = \tau_{mg} + \tau_T = mgl\sin\theta + 0$$

$$\tau = mgl\theta \quad (\text{as } \theta \text{ is very small}) \qquad \text{(i)}$$

Since MI of the bob about point O is $I = ml^2$,



$$\tau = ml^2\frac{d^2\theta}{dt^2} \qquad \text{(ii)}$$

As torque τ and θ are oppositely directed, From Eqs. (i) and (ii), we get

$$ml^2\frac{d^2\theta}{dt^2} = -mgl\theta$$

$$\frac{d^2\theta}{dt^2} = -(g/l)\theta$$

Comparing with the equation $d^2x/dt^2 = -\omega^2 x$, we get

$$\omega = \sqrt{\frac{g}{l}}$$

Since $T = 2\pi/\omega \quad \Rightarrow \quad T = 2\pi\sqrt{\dfrac{l}{g}}$

Equivalent force constant (k_{eq}) for simple pendulum: Finally substituting $T = mg$ from Eq. (ii) in Eq. (i), we have

$$\vec{F}_{net} = -\left(\frac{T}{l}\right)x = \frac{-mg}{l}\vec{x}$$

Frequency and time period: Comparing the above equation with $F_{net} = -kx$, the effective spring constant is $k_{eff} = mg/l$.

As we know $k_{eq} = m\omega^2$

This gives $\quad \omega = \sqrt{\dfrac{k_{eff}}{m}} = \sqrt{\dfrac{g}{l}}$

Then the time period of the simple pendulum is $T = 2\pi/\omega$, where $\omega = \sqrt{g/l}$

This gives $T = 2\pi\sqrt{\dfrac{l}{g}}$

NOTE:

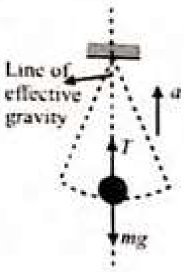
- In simple pendulum, we can find the value of equivalent force constant of oscillation $k_{eq} = T/l$, where T is the tension in the string at equilibrium position of the bob and l is the length of the string.
- Even in case of simple pendulum in accelerated frame, we can use the same approach for calculating the equivalent force of oscillation. In this case, T is the tension in the string at equilibrium position with respect to accelerated frame.

Time Period of Simple Pendulum in Accelerating Reference Frame

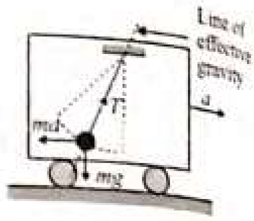
Time period of simple pendulum when point of suspension is accelerating

1. **Acceleration up or retardation down**
   From free body diagram of bob
   $T - mg = ma$, i.e., $T = m(g + a)$
   $$k_{eq} = \frac{T}{l} = \frac{m(g+a)}{l}$$
   Hence $\omega = \sqrt{\dfrac{k_{eq}}{m}} \quad \Rightarrow T = 2\pi\sqrt{\dfrac{l}{g_{eff}}} = 2\pi\sqrt{\dfrac{l}{(g+a)}}$

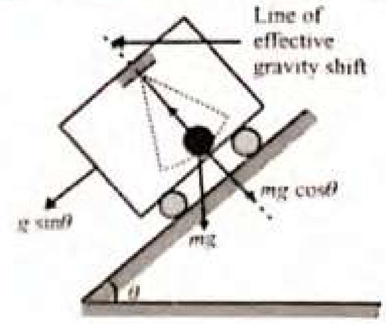
2. **Acceleration down or retardation up**
   $$k_{eq} = \frac{T}{l} = \frac{m(g-a)}{l}$$
   $$\omega = \sqrt{\frac{k_{eq}}{m}}$$
   $$\Rightarrow \quad T = 2\pi\sqrt{\frac{l}{g_{eff}}} = 2\pi\sqrt{\frac{l}{(g-a)}}$$



3. **Pendulum is accelerating horizontally**
   $$k_q = \frac{T}{l} = \frac{m\sqrt{a^2+g^2}}{l}$$
   $$\omega = \sqrt{\frac{k_q}{m}}$$
   $$\Rightarrow \quad T = 2\pi\sqrt{\frac{l}{g_{eff}}} = 2\pi\sqrt{\frac{l}{g^2+a^2}}$$



4. **Pendulum accelerating down an incline**

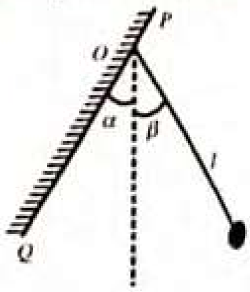


$$T = m\sqrt{g^2 + (g\sin\theta)^2 + 2g(g\sin\theta)\cos(90^\circ+\theta)}$$

$$= mg\cos\theta; \quad \Rightarrow T = 2\pi\sqrt{\frac{l}{g_{eff}}} = 2\pi\sqrt{\frac{l}{g\cos\theta}}$$

$$k_{eq} = \frac{T}{l} = \frac{mg\cos\theta}{l}$$

ILLUSTRATION 15.12 A ball is suspended by a thread of length l at the point O on an incline wall as shown. The inclination of the wall with the vertical is (α) the thread is displaced through a small angle α away from the vertical and (b) the ball is released. Find the period of oscillation of pendulum. Consider both cases.



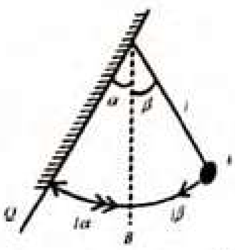
(a) $\alpha > \beta$ (b) $\alpha < \beta$

Assume that any impact between the wall and the ball is elastic.

Solution.

(a) If $\alpha > \beta$, the ball does not collide with the wall and it performs full oscillations like simple pendulum. Thus,

Period $= 2\pi\sqrt{\dfrac{l}{g}}$



(b) If $\alpha < \beta$, the ball collides with the wall and rebounds with same speed; the motion of ball from A to Q is one part of a simple pendulum time period of ball $= 2\,(t_{AQ})$.

Consider A as the starting point ($t = 0$), equation of motion is $x(t) = A\cos\omega t$.

$x(t) = l\beta\cos\omega t$, because amplitude $= A = l\beta$.

Time from A to Q is the time t when x becomes $-l\alpha$.

$$\Rightarrow -l\alpha = l\beta\cos\omega t \quad \Rightarrow t = t_{AQ} = 1/\omega\cos^{-1}\left(\frac{-\alpha}{\beta}\right)$$

The return path from Q to A will involve the same time interval.

Hence time period of ball $= 2t_{AQ}$

$$= \frac{2}{\omega}\cos^{-1}\left(-\frac{\alpha}{\beta}\right) = 2\sqrt{\frac{l}{g}}\cos^{-1}\left(\frac{-\alpha}{\beta}\right)$$

$$= 2\pi\sqrt{\frac{l}{g}} - 2\sqrt{\frac{l}{g}}\cos^{-1}\left(\frac{\alpha}{\beta}\right)$$

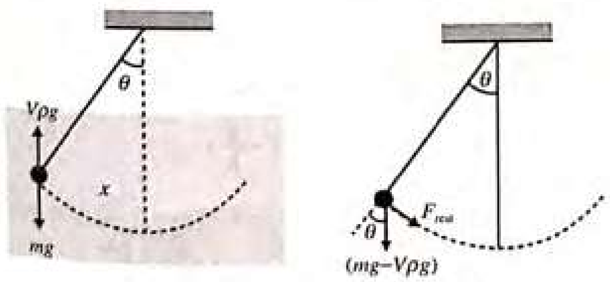
Simple Pendulum in a Liquid

If we immerse a simple pendulum in a liquid, the bob of the pendulum will experience buoyant force in upward direction in addition to the other forces such as gravity and tension. To find the k_{eff}, we need to find the net force on the bob near (or at) the equilibrium position. Dividing F_{net} by the small displacement x of the bob from the equilibrium position, we can find $k_{eff}\left(= \frac{F_{net}}{x} = \frac{T}{l}\right)$. After finding k_{eff}, substitute k_{eff} in the formula $\omega = \sqrt{k_{eff}/m}$ to find frequency (or time period). We will explain the above idea through the following illustration.

ILLUSTRATION 15.13 Derive an expression for the angular frequency of small oscillation of the bob of a simple pendulum when it is immersed in a liquid of density θ. Assume the density of the bob as ρ and length of the string as l.

***Solution.* Method 1**

The bob of the pendulum experiences buoyant force due to liquid $= V\rho g$, in addition to gravitational force. Thus net force on the bob $= (mg - V\rho g)$.



(a) (b)

For small displacement x of the bob, restoring force

$$F_{rest} = (mg - V\rho g)\sin\theta = -(mg - V\rho g)\frac{x}{l}$$

and acceleration $= -\left(g - \frac{V\rho g}{m}\right)\frac{x}{l}$

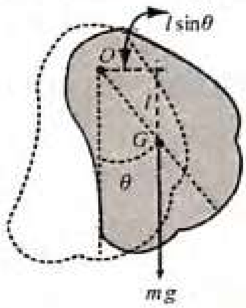
On comparing with standard equation of SHM, $a = -\omega^2 x$, we get

$$\omega = \sqrt{\frac{\left(g - \frac{V\rho g}{m}\right)}{l}} = \sqrt{\frac{g}{l}\left(1 - \frac{\rho}{\sigma}\right)}$$

and $$T = 2\pi\sqrt{\frac{l}{g\left(1 - \frac{\rho}{\sigma}\right)}}$$

PHYSICAL PENDULUM (COMPOUND PENDULUM)

Any rigid body suspended from a fixed support constitutes a physical pendulum. Consider the situation when a body is displaced through a small angle θ. Torque on the body about O is given by



$$\tau = mgl\sin\theta \qquad \text{(i)}$$

where l is the distance between point of suspension and centre of mass of the body.

If I is the MI of the body about O, then $\tau = I\alpha$ (ii)

From Eqs. (i) and (ii), we get

$$I\frac{d^2\theta}{dt^2} = -mgl\sin\theta$$

as θ and $d^2\theta/dt^2$ are oppositely directed.

$$\Rightarrow \frac{d^2\theta}{dt^2} = \frac{-mgl}{I}\theta, \text{ since } \theta \text{ is very small.}$$

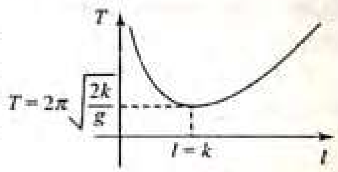
Comparing with the equation $d^2\theta/dt^2 = -\omega^2\theta$, we get

$$\omega = \sqrt{\frac{mgl}{I}} \qquad \Rightarrow T = 2\pi\sqrt{\frac{I}{mgl}}$$

NOTE:

Time period, $T = 2\pi\sqrt{\frac{I}{mgl}}$; $I = I_{CM} + ml^2$

where I_{CM} is moment of inertia relative to the axis which passes from the center of mass and parallel to the axis of oscillation.



Graph of T vs l

$$T = 2\pi\sqrt{\frac{I_{CM} + ml^2}{mgl}},$$

where $I_{CM} = mk^2$

k is gyration radius (about axis passing from centre of mass)

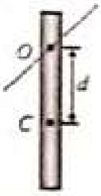
$$T = 2\pi\sqrt{\frac{mk^2 + ml^2}{mgl}} = 2\pi\sqrt{\frac{k^2 + l^2}{lg}} = 2\pi\sqrt{\frac{L_{eq}}{g}}$$

$L_{eq} = \frac{k^2}{l} + l$ = equivalent length of simple pendulum;

T is minimum when $l = k$.

$$T_{min} = 2\pi\sqrt{\frac{2k}{g}}$$

Illustration 15.14 What is the period of a pendulum formed by pivoting a metre stick so that it is free to rotate about a horizontal axis passing through the 75 cm mark?



Solution. Let m be the mass and l be the length of the stick.

$l = 100$ cm

The distance of the point of suspension from centre of gravity is $d = 25$ cm

Moment of inertia about a horizontal axis through O is

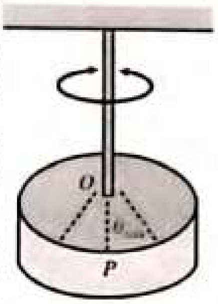
$$I = I_c + md^2 \quad \Rightarrow I = \frac{ml^2}{12} + md^2$$

$$\Rightarrow \quad T = 2\pi\sqrt{\frac{I}{mgd}} = 2\pi\sqrt{\frac{\frac{ml^2}{12} + md^2}{mgd}}$$

$$T = 2\pi\sqrt{\frac{l^2 + 12d^2}{12\,gd}} = 2\pi\sqrt{\frac{l^2 + 12(0.25)^2}{12 \times 9.8 \times 0.25}} = 1.53 \text{ s}$$

TORSIONAL PENDULUM

Figure shows a rigid object suspended by a wire attached at the top to a fixed support. When the object is twisted through some angle θ, the twisted wire exerts on the object a restoring torque that is proportional to the angular position. That is, $\tau = -k\theta$, where k (Greek letter kappa) is called the torsion constant of the support wire. The value of k can be obtained by applying a known torque to twist the wire through a measureable angle θ. Applying Newton's second law for rotational motion, we find that

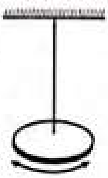


$$\tau = -k\theta = I\frac{d^2\theta}{dt^2} \Rightarrow \frac{d^2\theta}{dt^2} = -\frac{k}{I}\theta$$

Again, this result is the equation of motion for a simple harmonic oscillator with $\omega = \sqrt{k/I}$ and a period $T = 2\pi\sqrt{I/k}$.

This system is called a torsional pendulum. There is no small angle restriction in this situation as long as the elastic limit of the wire is not exceeded.

Illustration 15.15 A uniform disc of radius 5.0 cm and mass 200 g is fixed at its centre to a metal wire, the other end of which is fixed to a ceiling. The hanging disc is rotated about the wire through an angle and is released. If the disc makes torsional oscillations with time period 0.20 s, find the torsional constant of the wire.



Solution. The situation is shown in figure. The moment of inertia of the disc about the wire is

$$I = \frac{mr^2}{2} = \frac{(0.200 \text{ kg})(5.0 \times 10^{-2} \text{ m})^2}{2}$$

$$= 2.5 \times 10^{-4} \text{ kg-m}^2$$

The time period is given by

$$T = 2\pi\sqrt{\frac{I}{k}} \quad \text{or} \quad k = \frac{4\pi^2 I}{T^2}$$

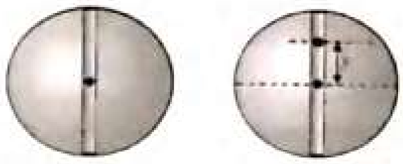
$$= \frac{4\pi^2(2.5 \times 10^{-4} \text{ kg-m}^2)}{(0.20 \text{ s})^2} = 0.25 \text{ kg-m}^2/\text{s}^2$$

MOTION OF A BALL IN A TUNNEL THROUGH THE EARTH

Case I: If the tunnel is along a diameter and the ball is released from the surface. If the ball at any time is at a distance y from the centre of the earth, the restoring force will act on the ball due to gravitation between ball and earth.

Acceleration of the particle at the distance y from the centre of earth.

$$a = -GMy/R^3 = -(GM)y/R^3$$



(a) (b)

Furthermore as $g = GM/R^2$

$$a = \frac{-(gR^2)y}{R^3} = -\frac{g}{R}y$$

Comparing with $a = -\omega^2 y$

$$\omega^2 = \frac{g}{R} \quad \text{or} \quad \omega = \sqrt{\frac{g}{R}} \quad \Rightarrow T = 2\pi\sqrt{\left(\frac{R}{g}\right)} = 84.6 \text{ min}$$

Case II: If the tunnel is along a chord and ball is released from the surface. If the ball at any time is at a distance x from the centre of tunnel, acceleration of the particle at the distance y from the centre of earth

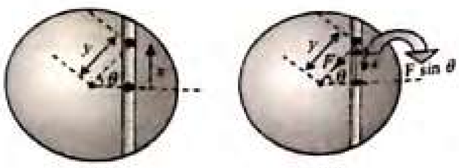
$$a = -GMy/R^3 = -(GM)y/R^3$$

Furthermore, as $g = GM/R^2$

$$a = -(gR^2)y/R^3$$

This acceleration will be towards the centre of earth. The component of acceleration towards the centre of earth

$$a' = a\sin\theta = \left(-\frac{g}{R}y\right)\left(\frac{x}{y}\right) = -\frac{g}{R}x$$



(a) (b)

Comparing with $a = -\omega^2 y$

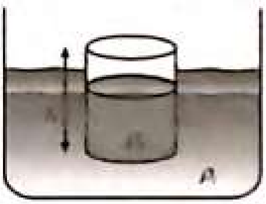
$$\omega^2 = \frac{g}{R} \Rightarrow \omega = \sqrt{\frac{g}{R}} \Rightarrow T = 2\pi\sqrt{\frac{R}{g}} = 84.6 \text{ min}$$

Note:
Time period of oscillation is same in both the cases wheather the tunnel is along a distance or along the chord.

OSCILLATION OF A FLOATING BODY IN A LIQUID

A floating body is in a stable equilibrium. When it is displaced up and released, it accelerates down and when it is pushed down and released, it accelerates up. It means, a floating body experiences a net (resting) force towards its stable equilibrium position. Hence, a floating body oscillates when displaced up or down from its mean position.

ILLUSTRATION 15.16 Consider a solid cylinder of density θ_s, cross-sectional area A and height h floating in a liquid of density θ_l, as shown in figure ($\theta_l > \theta_s$). It is depressed slightly and allowed to oscillate vertically. Find the frequency of small oscillations.



Solution. At equilibrium the net force on the cylinder is zero in the vertical direction.

$F_{net} = B - W = 0$; B = the buoyancy and W = the weight of the cylinder.

When the cylinder is depressed slightly by x, the buoyancy increases from B to $B + \delta B$, where $\delta B = |x|\rho_l Ag$

The weight W remains the same.

Therefore the net force, $F_{net} = B + \delta B - W = \delta B = |x|\rho_l Ag$

The equation of motion is, therefore,

$$\rho_s Ah\frac{d^2x}{dt^2} = -x\rho_l Ag$$

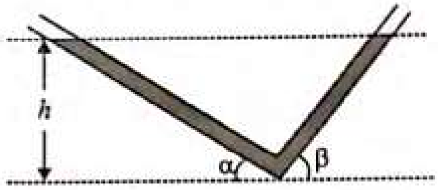
The minus sign takes into account the fact that x and restoring force are in opposite directions. Therefore

$$\frac{d^2x}{dt^2} = -x\frac{\rho_l g}{\rho_s h}$$

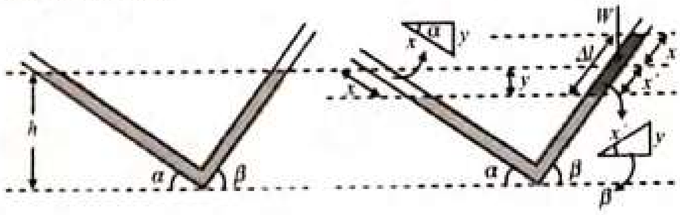
and the angular frequency, ω, is $\omega = \sqrt{\dfrac{g\rho_l}{h\rho_s}}$

OSCILLATION OF A LIQUID COLUMN IN U-TUBE

ILLUSTRATION 15.17 A V-shaped glass tube of uniform cross section is kept in a vertical plane as shown. A liquid is poured in the tube. In equilibrum the level of liquid in both limbs of tube are equal. Find the angular frequency of small oscillations of liquid.



Solution. Let us displace the liquid of left limb by a distance x, the liquid of right limb will rise relative to equilibrum line by same distance x.



Excess length of the liquid on the right limb

$$\Delta l = x + x' \quad \text{(i)}$$

From the figure,

$$y = x\sin\alpha = x'\sin\beta \quad \text{(ii)}$$

From Eq. (ii)

$$x' = \frac{x\sin\alpha}{\sin\beta} \quad \text{(iii)}$$

from Eqs. (i) and (iii), $\Delta l = \left(\dfrac{\sin\alpha + \sin\beta}{\sin\beta}\right)x$

This excess length Δl in right limb will provide restoring force to the liquid in tube.

Weight of the excess liquid column

$$W = \rho A \cdot \Delta l g = \left(\frac{\sin\alpha + \sin\beta}{\sin\beta}\right)\rho Axg$$

ρ is the density of liquid and A is the area of cross section of tube. The component of W along the tube will be equal to restoring force

$$F = W\sin\beta = \rho(\sin\alpha + \sin\beta)Axg$$

This force helps the entire liquid to restore its original position by moving it with an acceleration $a = F/m$; m = mass of total liquids

$$a = \frac{\rho(\sin\alpha + \sin\beta)Axg}{m}$$

Here m = mass of liquid in the tube = $A\rho l$

Length of total liquid column,

$$l = \frac{h}{\sin\alpha} + \frac{h}{\sin\beta} = h\left[\frac{\sin\alpha + \sin\beta}{\sin\alpha \cdot \sin\beta}\right]$$

Hence $a = \dfrac{\rho(\sin\alpha + \sin\beta)Axg}{A\rho\left[h\dfrac{(\sin\alpha + \sin\beta)}{\sin\alpha \cdot \sin\beta}\right]}$

$$\vec{a} = -\left(\frac{g\sin\alpha\cdot\sin\beta}{h}\right)\cdot\vec{x} \quad \begin{bmatrix}\text{with proper}\\ \text{vector sign}\end{bmatrix}$$

Compare with $\vec{a} = -\omega^2\vec{x}$

which gives

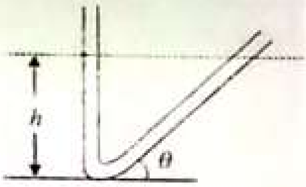
$$\omega = \sqrt{\frac{g\sin\alpha\cdot\sin\beta}{h}} \Rightarrow T = 2\pi\sqrt{\frac{h}{g\sin\alpha\cdot\sin\beta}}$$

NOTE: If we modify the tube as shown in the figure, the different time periods will be

In Figure (a), $\sin\alpha = 1$,

$\sin\beta = \sin\theta$

Hence $T = 2\pi\sqrt{\frac{h}{g\sin\theta}}$



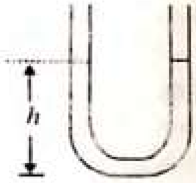
(a)

In Figure (b), $\alpha = \beta = 90°$

Hence $T = 2\pi\sqrt{\frac{h}{g}}$

For an arbitary tube if α and β are the angles made by the targets (with horizontal) drawn at the tube at the free surface of the liquid in both limbs. The time period is given by

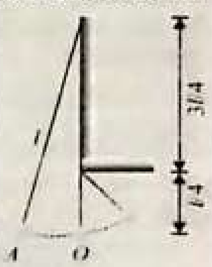
$$T = 2\pi\frac{\sqrt{h}}{g\sin\alpha\cdot\sin\beta}$$



(b)

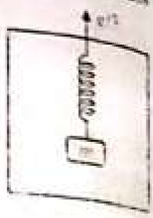
Concept Application Exercise 15.2

1. A pendulum has a period T for small oscillations. An obstacle is placed directly below the pivot, so that only the lowest one-fourth of the string can follow the pendulum bob when it swings to the right of its resting position as shown. The pendulum is released from rest at a certain point. Assuming that the angle between the moving string and the vertical stays small throughout the motion, find the time it takes to return to that point.

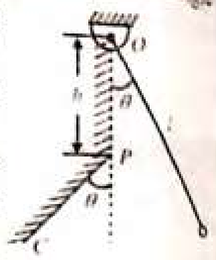


2. A horizontal string-mass system of mass M executes oscillatory motion of amplitude a_0 and time period T_0. When mass M is passing through its equilibrium position another mass m is placed on it such that both move together. Find the new amplitude and time period.

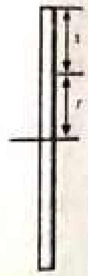
3. A spring of spring constant 200 N/m has a block of mass 1 kg hanging at its one end and from the other end the spring is attached to a ceiling of an elevator. The elevator rises upwards with an acceleration of $g/3$. When acceleration is suddenly ceased, then what should be the angular frequency and elongation during the time when the elevator is accelerating?



4. A simple pendulum of length l swings from a small angle θ. Its swinging is constrained by the smooth inclined planes OP and PC. Assuming elastic collision of the bob with the plane PC, find
   (a) angular amplitude for the motion of the bob in the left hand side of its mean position.
   (b) time period for a complete cycle of motion of the bob.



5. A uniform rod of length l is pivoted at a distance x from the top of the rod. Neglecting friction, find the
   (a) value of x for minimum period of oscillation.
   (b) minimum period of oscillation of the rod.



6. The period of oscillation of a spring pendulum is T. If the spring is cut into four equal parts, then find the time period corresponding to each part.

FREE, FORCED AND RESONANT VIBRATIONS

Free vibrations: A system is said to execute free oscillations if on being displaced or disturbed from its position of equilibrium it is left to oscillate itself without outside interference or under any external force.

The time period of such oscillations is determined by the dimensions and elastic and inertial (mass) properties of the system. This time period is called natural or free time period and the corresponding frequency is called natural frequency. It may be denoted by v_0.

The natural frequency is given by v_0.

$$v_0 = \frac{1}{2\pi}\left[\frac{\text{Elasticity factor}}{\text{Inertia factor}}\right]^{1/2}$$

The frequency of the free vibrations is a constant depending on the nature of the oscillatior.

Forced vibrations: When a system is compelled to oscillate with a frequency other than its natural frequency, it is said to execute forced oscillations.

For example, sound boxes of musical instruments execute forced vibrations, due to the periodic force of the vibrating strings

When a periodic force acts on an oscillator, then to start with it tends to oscillate with a case the oscillator executes vibration with the frequency of external periodic force.

Forced oscillations are of two types: non-resonant and resonant.

Non-resonant oscillations: When the natural frequency of the oscillator is different than the external periodic force acting on it, the forced oscillations are called non-resonant.

The amplitude of non-resonant oscillations is not very large. The transfer of energy to the oscillator is also small.

Resonant vibrations: The phenomenon of producing oscillatory motion in a system by the influence of an external periodic force having the same frequency as the natural frequency of the system is called resonance.

In such a case the oscillator is said to be in resonance (with external periodic force) if the amplitude of oscillation tends to be large and the transfer of energy to the oscillator is also large. The oscillator vibrates in phase with external periodic force.

THEORY OF FORCED OSCILLATIONS

Suppose a simple harmonic oscillator is subjected to external periodic force $F_0 \sin \omega_0 t$. Let the spring constant of the oscillator be $-kx$. The net force on the oscillator is:

$$F = F_0 \sin \omega_0 t - kx$$

If M be the mass of the oscillator, then

$$F = M\frac{d^2x}{dt} = F_0 \sin\omega_0 t - kx$$

where $\frac{d^2x}{dt^2}$ is the acceleration of oscillation. This gives:

$$\frac{d^2x}{dt^2} = \frac{F_0}{M}\sin\omega_0 t - \frac{k}{M}x \qquad ...(i)$$

Here $\left[\frac{k}{M}\right]^{\frac{1}{2}} = \omega$, the natural angular frequency of the oscillator.

On solving Eq. (i), we find: $x = \frac{F_0}{M(\omega^2 - \omega_0^2)}\sin\omega_0 t$

The amplitude of the forced oscillations is given by:

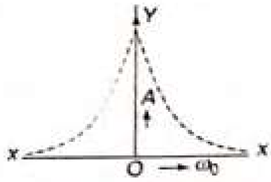
$$A = \frac{F_0}{M(\omega^2 - \omega_0^2)} \qquad (\because \sin \omega_0 t = 1, \text{ the max value})$$

From this expression it is clear that

- The amplitude of forced oscillations depends on the amplitude of applied force (F_0), inertia factor M and frequency of the external periodic force ω_0.
- It varies inversely as the difference of the squares of the natural angular frequency of the external periodic force and the angular frequency of the applied force.
- In principle, at resonance, $\omega = \omega_0$. Therefore, $A = \infty$. However, in actual practice, the amplitude may not be infinite. But it certainly varies with time.
- Amplitude of forced oscillation does not vary with time. The frequency of forced oscillations is the same as that of the external periodic force.

- The resonance frequency is given by:

$$\nu_0 = \frac{\omega}{2\pi} = \frac{\omega_0}{2\pi} = \frac{1}{2\pi}\sqrt{\frac{k}{M}}$$

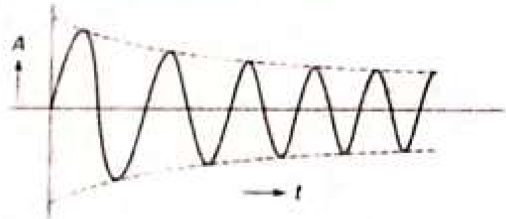


The variation of amplitude of forced oscillations with the frequency of the external periodic force is shown in the figure. For the value of frequency of ω_0 the amplitude 'A' is larger than that at any other frequency for a given system.

Resonance is a special case of forced oscillations. The applied periodic force is such that it helps to increase the amplitude of the system at each step of its oscillation. The result is that the system or the body oscillates with large amplitude.

DAMPED OSCILLATIONS

The external frictional force on an oscillatory system continuously dissipates the energy of the system. The energy of the system may be converted into heat, light, sound, etc. The amplitude of such an oscillator continuously decreases and ultimately the oscillator comes to rest.



The oscillations of a system under the influence of external frictional force are called damped oscillations. When we set a pendulum in oscillation in air, a frictional force due to the air acts on the bob. So, the oscillations are damped and the amplitude may decrease to zero as shown in the figure above. Suppose, an oscillator having mass M and force constant k is acted upon by a resistive force F_0. It is found that the resistive force is proportional to the velocity (v) of the oscillator. That is, $F_d = bv$, where b is a constant and is called the damping factor. If x be the instantaneous displacement of the oscillator, then

$$M\frac{d^2x}{dt^2} = kx - bv$$

But $v = dx/dt$. Therefore $\frac{d^2x}{dt^2} = \frac{k}{M} - \frac{b}{M}\frac{dx}{dt}$

Solving this equation, we find $x = Ae^{-\frac{b}{2M}t}\cos(\omega' t + \phi)$

where $\omega' = \left[\frac{k}{M} - \left(\frac{b}{2M}\right)^2\right]^{1/2}$

The amplitude of damped oscillations is given by: $A_d = Ae^{\frac{-b}{2M}T}$ where A is the amplitude of undamped oscillations. The frequency of the damped oscillations is less than that of the

natural oscillations. If ω be the natural angular frequency, then $\omega = [k/M]^{\frac{1}{2}}$. And, the frequency of the damped oscillations is (from the above equation)

$$\omega' = \left[\omega^2 - \left(\frac{b}{2M}\right)^2\right]^{1/2}$$

SOLVED EXAMPLES

1. Two particles executes S.H.M. of same amplitude and frequency along the same straight line. They pass one another when going in opposite directions, and each time their displacement is half of their amplitude. The phase difference between them is
(a) 30° (b) 60°
(c) 90° (d) 120°

Sol. (d) $y = a\sin(\omega t + \phi_0)$. According to the question

$$y = \frac{a}{2} \Rightarrow \frac{a}{2} = a\sin(\omega t + \phi_0)$$

$$\Rightarrow (\omega t + \phi_0) = \phi = \frac{\pi}{6} \text{ or } \frac{5\pi}{6}$$

Physical meaning of $\phi = \frac{\pi}{6}$: Particle is at point P and it is going towards B

Physical meaning of $\phi = \frac{5\pi}{6}$: Particle is at point P and it is going towards O

So phase difference, $\Delta\phi = \frac{5\pi}{6} - \frac{\pi}{6} = \frac{2\pi}{3} = 120°$

2. The displacement of a particle varies with time as $x = 12\sin\omega t - 16\sin^3\omega t$ (in cm). If its motion is S.H.M., then its maximum acceleration is
(a) $12\omega^2$ (b) $36\omega^2$
(c) $144\omega^2$ (d) $\sqrt{192}\,\omega^2$

Sol. (b) $x = 12\sin\omega t - 16\sin^3\omega t = 4[3\sin\omega t - 4\sin^3\omega t]$
$= 4[\sin 3\omega t]$ (By using $\sin3\theta = 3\sin\theta - 4\sin^3\theta$)
$\therefore A_{max} = (3\omega)^2 \times 4 = 36\omega^2$

3. A linear harmonic oscillator of force constant 2×10^6 N/m times and amplitude 0.01 m has a total mechanical energy of 160 joules. Its
(a) Maximum potential energy is 100 J
(b) Maximum K.E. is 160 J
(c) Maximum P.E. is 160 J
(d) Minimum P.E. is zero

Sol. (c) Harmonic oscillator has some initial elastic potential energy and amplitude of harmonic variation of energy is $\frac{1}{2}ka^2 = \frac{1}{2} \times 2 \times 10^6 (0.01)^2 = 100$ J

This is the maximum kinetic energy of the oscillator. Thus, $K_{max} = 100$ J

This energy is added to initial elastic potential energy may give maximum mechanical energy to have value 160 J.

4. A particle of mass m is executing oscillations about the origin on the x-axis. Its potential energy is $U(x) = k|x|^3$, where k is a positive constant. If the amplitude of oscillation is a, then its time period T is
(a) Proportional to $\frac{1}{\sqrt{a}}$ (b) Independent of a
(c) Proportional to $\sqrt{a}$ (d) Proportional to $a^{3/2}$

Sol. (a) $U = k|x|^3 \Rightarrow F = -\frac{dU}{dx} = -3k|x|^2$ ...(i)

Also, for SHM, $x = a\sin\omega t$ and $\frac{d^2x}{dt^2} + \omega^2 x = 0$

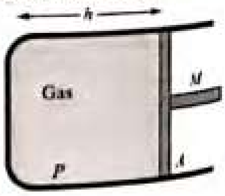
$$\Rightarrow \text{Acceleration } a = \frac{d^2x}{dt^2} = -\omega^2 x$$

$$\Rightarrow F = ma = m\frac{d^2x}{dt^2} = -m\omega^2 x \quad \text{...(ii)}$$

From eqs. (i) and (ii), we get $\omega = \sqrt{\frac{3kx}{m}}$

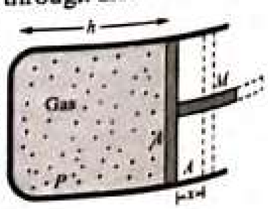
$$\Rightarrow T = \frac{2\pi}{\omega} = 2\pi\sqrt{\frac{m}{3kx}} = 2\pi\sqrt{\frac{m}{3k(a\sin\omega t)}} \Rightarrow T \propto \frac{1}{\sqrt{a}}.$$

5. A cylindrical piston of mass M slides smoothly inside a long cylinder closed at one end, enclosing a certain mass of gas. The cylinder is kept with its axis horizontal. If the piston is disturbed from its equilibrium position, it oscillates simple harmonically. The period of oscillation will be



(a) $T = 2\pi\sqrt{\left(\frac{Mh}{PA}\right)}$ (b) $T = 2\pi\sqrt{\left(\frac{MA}{Ph}\right)}$
(c) $T = 2\pi\sqrt{\left(\frac{M}{PAh}\right)}$ (d) $T = 2\pi\sqrt{MPhA}$

Sol. (a) Let the piston be displaced through distance x towards left, then volume decreases, pressure increases. If ΔP is increase in pressure and ΔV is decrease in volume, then considering the process to take place gradually (i.e. isothermal)



$$P_1V_1 = P_2V_2$$

$\Rightarrow PV = (P + \Delta P)(V - \Delta V)$

$\Rightarrow PV = PV + \Delta PV - P\Delta V - \Delta P\Delta V$

$\Rightarrow \Delta P.V - P.\Delta V = 0$ (neglecting $\Delta P.\Delta V$)

$\Delta P(Ah) = P(Ax) \Rightarrow \Delta P = \dfrac{P.x}{h}$

This excess pressure is responsible for providing the restoring force (F) to the piston of mass M.

Hence $F = \Delta P.A = \dfrac{PAx}{h}$

Comparing it with $|F| = kx \Rightarrow k = M\omega^2 = \dfrac{PA}{h}$

$$\Rightarrow \omega = \sqrt{\frac{PA}{Mh}} \Rightarrow T = 2\pi\sqrt{\frac{Mh}{PA}}$$

6. A particle is performing simple harmonic motion along x-axis with amplitude 4 cm and time period 1.2 sec. The minimum time taken by the particle to move from x = 2 cm to x = + 4 cm and back again is given by
   (a) 0.6 sec (b) 0.4 sec
   (c) 0.3 sec (d) 0.2 sec

Sol. (b) Time taken by particle to move from $x = 0$ (mean position) to $x = 4$ (extreme position) $= \dfrac{T}{4} = \dfrac{1.2}{4} = 0.3$ s

Let t be the time taken by the particle to move from $x = 0$ to $x = 2$ cm

$$y = a\sin\omega t \Rightarrow 2 = 4\sin\frac{2\pi}{T}t \Rightarrow \frac{1}{2} = \sin\frac{2\pi}{1.2}t$$

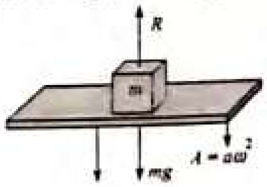
$$\Rightarrow \frac{\pi}{6} = \frac{2\pi}{1.2}t \Rightarrow t = 0.1\text{ s.}$$

Hence time to move from $x = 2$ to $x = 4$ will be equal to 0.3 - 0.1 = 0.2 s

Hence total time to move from $x = 2$ to $x = 4$ and back again = $2 \times 0.2 = 0.4$ sec

7. A horizontal platform with an object placed on it is executing S.H.M. in the vertical direction. The amplitude of oscillation is 3.92×10^{-3} m . What must be the least period of these oscillations, so that the object is not detached from the platform?
   (a) 0.1256 sec (b) 0.1356 sec
   (c) 0.1456 sec (d) 0.1556 sec

Sol. (a) By drawing free body diagram of object during the downward motion at extreme position, for equilibrium of mass



$Mg - R = mA$ (A = Acceleration)

For critical condition $R = 0$

so $mg = mA \Rightarrow mg = ma\omega^2$

$$\Rightarrow \omega = \sqrt{g/a} = \sqrt{\frac{9.8}{3.92\times10^{-3}}} = 50$$

$$\Rightarrow T = \frac{2\pi}{\omega} = \frac{2\pi}{50} = 0.1256\text{sec}$$

8. A particle executes simple harmonic motion (amplitude = A) between $x = -A$ and $x = +A$. The time taken for it to go from 0 to $A/2$ is T_1 and to go from $A/2$ to A is T_2. Then
   (a) $T_1 < T_2$ (b) $T_1 > T_2$
   (c) $T_1 = T_2$ (d) $T_1 = 2T_2$

Sol. (a) Using $x = A\sin\omega t$

For $x = A/2$, $\sin\omega T_1 = 1/2 \Rightarrow T_1 = \dfrac{\pi}{6\omega}$

For $x = A$, $\sin\omega(T_1 + T_2) = 1 \Rightarrow T_1 + T_2 = \dfrac{\pi}{2\omega}$

$$\Rightarrow T_2 = \frac{\pi}{2\omega} - T_1 = \frac{\pi}{2\omega} - \frac{\pi}{6\omega} = \frac{\pi}{3\omega}\text{ i.e. } T_1 < T_2$$

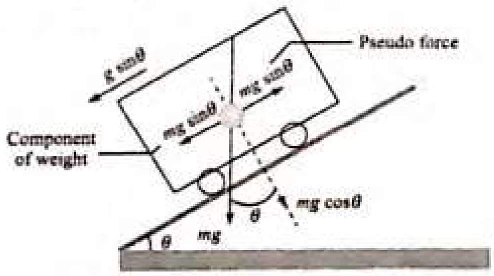
9. The metallic bob of a simple pendulum has the relative density ρ. The time period of this pendulum is T. If the metallic bob is immersed in water, then the new time period is given by
   (a) $T\dfrac{\rho - 1}{\rho}$ (b) $T\dfrac{\rho}{\rho - 1}$
   (c) $T\sqrt{\dfrac{\rho - 1}{\rho}}$ (d) $T\sqrt{\dfrac{\rho}{\rho - 1}}$

Sol. (d) When the bob is immersed in water, its effective weight $= \left(mg - \dfrac{m}{\rho}g\right) = mg\left(\dfrac{\rho - 1}{\rho}\right) \therefore g_{eff} = g\left(\dfrac{\rho - 1}{\rho}\right)$

$$\frac{T'}{T} = \sqrt{\frac{g}{g_{eff}}} \Rightarrow T_1 = 2\pi\sqrt{\frac{m}{K}}$$

10. The period of oscillation of a simple pendulum of length L suspended from the roof of a vehicle which moves without friction down an inclined plane of inclination α, is given by
   (a) $2\pi\sqrt{\dfrac{L}{g\cos\alpha}}$ (b) $2\pi\sqrt{\dfrac{L}{g\sin\alpha}}$
   (c) $2\pi\sqrt{\dfrac{L}{g}}$ (d) $2\pi\sqrt{\dfrac{L}{g\tan\alpha}}$

Sol. (a) See the following force diagram.



Vehicle is moving down the frictionless inclined surface so, it's acceleration is g sinθ sin. Since vehicle is accelerating, a pseudo force $m(g\sin\theta)$ will act on bob of pendulum which cancel the sinθ component of weight of the bob.

Hence net force on the bob is $F_{net} = mg\cos\theta$ or net acceleration of the bob is $g_{eff} = g\cos\theta$

$\therefore$ Time period $T = 2\pi\sqrt{\dfrac{l}{g_{eff}}} = 2\pi\sqrt{\dfrac{l}{g\cos\theta}}$

11. The displacement y of a particle executing periodic motion is given by $y = 4\cos^2(t/2)\sin(1000t)$. This expression may be considered to be a result of the superposition of .... independent harmonic motions
(a) Two (b) Three
(c) Four (d) Five

Sol. (b) $y = 4\cos^2\left(\dfrac{t}{2}\right)\sin 1000\,t$

$\Rightarrow y = 2(1 + \cos t)\sin 1000t$

$\Rightarrow y = 2\sin 1000t + 2\cos t \sin 1000t$

$\Rightarrow y = 2\sin 1000t + \sin 999t + \sin 1001\,t$

It is a sum of three S.H.M.

12. Three simple harmonic motions in the same direction having the same amplitude a and same period are superposed. If each differs in phase from the next by 45°, then
(a) The resultant amplitude is $\sqrt{2}a$
(b) The phase of the resultant motion relative to the first is 90°
(c) The energy associated with the resulting motion is $(3+2\sqrt{2})$ times the energy associated with any single motion
(d) The resulting motion is not simple harmonic

Sol. (c) Let simple harmonic motions be represented by

$y_1 = a\sin\left(\omega t - \dfrac{\pi}{4}\right)$; $y_2 = a\sin\omega t$ and

$y_3 = a\sin\left(\omega t + \dfrac{\pi}{4}\right)$. On superimposing, resultant SHM

will be $y = a\left[\sin\left(\omega t - \dfrac{\pi}{4}\right) + \sin\omega t + \sin\left(\omega t + \dfrac{\pi}{4}\right)\right]$

$= a\left[2\sin\omega t\cos\dfrac{\pi}{4} + \sin\omega t\right]$

$= a[\sqrt{2}\sin\omega t + \sin\omega t] = a(1+\sqrt{2})\sin\omega t$

Resultant amplitude $= (1+\sqrt{2})a$

Energy is S.H.M. $\propto$ (Amplitude)^2

$$\therefore \frac{E_{\text{Resultant}}}{E_{\text{Single}}} = \left(\frac{A}{a}\right)^2 = (\sqrt{2}+1)^2 = (3+2\sqrt{2})$$

$$\Rightarrow E_{\text{Resultant}} = (3+2\sqrt{2})E_{\text{Single}}$$

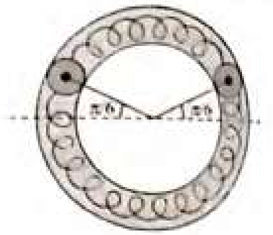
13. A simple pendulum has time period T_1. The point of suspension is now moved upward according to equation $y = kt^2$ where $k = 1$ m/sec^2. If new time period is T_2 then ratio $\dfrac{T_1^2}{T_2^2}$ will be
(a) 2/3 (b) 5/6
(c) 6/5 (d) 3/2

Sol. (c) $y = kt^2 \Rightarrow \dfrac{d^2y}{dt^2} = a_y = 2K = 2 \Rightarrow 1 = 2\text{m/s}^2$ ($\because k = 1$ m/s^2)

Now, $T_1 = 2\pi\sqrt{\dfrac{l}{g}}$ and $T_2 = 2\pi\sqrt{\dfrac{l}{(g+a_y)}}$

Dividing, $\dfrac{T_1}{T_2} = \sqrt{\dfrac{g+a_y}{g}} \Rightarrow \sqrt{\dfrac{6}{5}} \Rightarrow \dfrac{T_1^2}{T_2^2} = \dfrac{6}{5}$

14. Two identical balls A and B each of mass 0.1 kg are attached to two identical massless springs. The spring mass system is constrained to move inside a rigid smooth pipe bent in the form of a circle as shown in the figure. The pipe is fixed in a horizontal plane. The centres of the balls can move in a circle of radius 0.06 m. Each spring has a natural length of 0.06π m and force constant 0.1N/m. Initially both the balls are displaced by an angle $\theta = \pi/6$ radian with respect to the diameter PQ of the circle and released from rest. The frequency of oscillation of the ball B is



(a) π Hz
(b) $\dfrac{1}{\pi}$ Hz
(c) 2π Hz
(d) $\dfrac{1}{2\pi}$ Hz

Sol. (b) As here two masses are connected by two springs, this problem is equivalent to the oscillation of a reduced mass m_r of a spring of effective spring constant.

$$T = 2\pi\sqrt{\frac{m_r}{K_{eff}}}$$

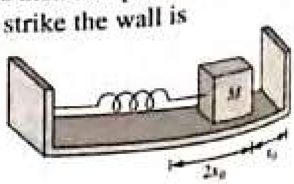
Here $m_r = \dfrac{m_1m_2}{m_1+m_2} = \dfrac{m}{2}$

$\Rightarrow k_{eff} = k_1 + k_2 = 2k$

$\therefore n = \dfrac{1}{2\pi}\sqrt{\dfrac{k_{eff}}{m_r}} = \dfrac{1}{2\pi}\sqrt{\dfrac{2k}{m}\times 2}$

$= \dfrac{1}{\pi}\sqrt{\dfrac{k}{m}} = \dfrac{1}{\pi}\sqrt{\dfrac{0.1}{0.1}} = \dfrac{1}{\pi}$ Hz

15. One end of a spring of force constant k is fixed to a vertical wall and the other to a block of mass m resting on a smooth horizontal surface. There is another wall at a distance x_0 from the block. The spring is then compressed by $2x_0$ and released. The time taken to strike the wall is



(a) $\dfrac{1}{6}\pi\sqrt{\dfrac{k}{m}}$

(b) $\sqrt{\dfrac{k}{m}}$

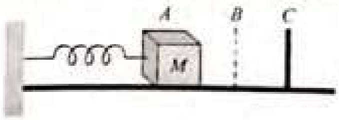
(c) $\frac{2\pi}{3}\sqrt{\frac{m}{k}}$

(d) $\frac{\pi}{4}\sqrt{\frac{k}{m}}$

Sol. (c) The total time from A to C

$$t_{AC} = t_{AB} + t = (T/4) + t_{BC}$$

where T = time period of oscillation of spring mass system



t_{BC} can be obtained from, $BC = A\ B\sin(2\pi/T)t_{BC}$

Putting $\frac{BC}{AB} = \frac{1}{2}$ we obtain $t_{BC} = \frac{T}{12}$

$$\Rightarrow \quad t_{AC} = \frac{T}{4} + \frac{T}{12} = \frac{2\pi}{3}\sqrt{\frac{m}{k}}.$$

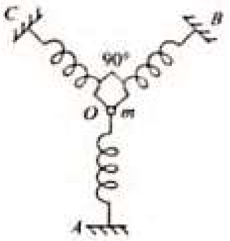
16. A particle of mass m is attached to three identical springs A, B and C each of force constant k a shown in figure. If the particle of mass m is pushed slightly against the spring A and released then the time period of oscillations is

(a) $2\pi\sqrt{\frac{2m}{k}}$

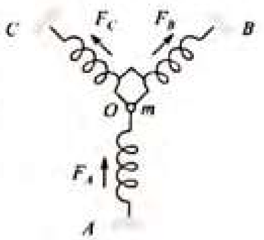
(b) $2\pi\sqrt{\frac{m}{2k}}$

(c) $2\pi\sqrt{\frac{m}{k}}$

(d) $2\pi\sqrt{\frac{m}{3k}}$



Sol. (b) When the particle of mass m at O is pushed by y in the direction of A The spring A will be compressed by y while spring B and C will be stretched by $y' = y\cos 45°$. So that the total restoring force on the mass m along OA.

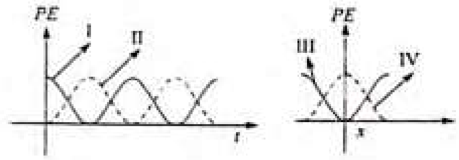


$$F_{net} = F_A + F_B\cos 45° + F_C\cos 45°$$
$$= ky + 2ky'\cos 45°$$
$$= ky + 2k(y\cos 45°)\cos 45°$$
$$= 2ky$$

Also $F_{net} = k'y \Rightarrow k'y = 2ky \Rightarrow k' = 2k$

$$T = 2\pi\sqrt{\frac{m}{k'}} = 2\pi\sqrt{\frac{m}{2k}}$$

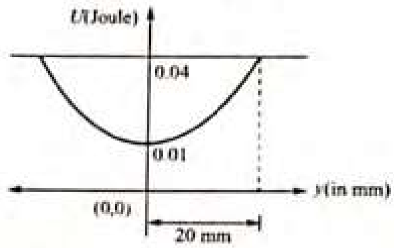
17. For a particle executing S.H.M. the displacement x is given by $x = A\cos\omega t$. Identify the graph which represents the variation of potential energy (P.E.) as a function of time t and displacement x



(a) I, III (b) II, IV
(c) II, III (d) I, IV

Sol. (a) Potential energy is minimum (in this case zero) at mean position ($x = 0$) and maximum at extreme position ($x = \pm A$) At time $t = 0$, $x = A$, hence potential should be maximum. Therefore graph I is correct. Further in graph III. Potential energy is minimum at $x = 0$, hence this is also correct.

18. The variation of potential energy of harmonic oscillator is as shown in figure. The spring constant is



(a) 1×10^2 N/m (b) 150 N/m
(c) 0.667×10^2 N/m (d) 3×10^2 N/m

Sol. (b) Total potential energy = 0.04 J

Resting potential energy =0.01 J

Maximum kinetic energy =(0.04–0.01) = 0.03 J

$$0.03\text{ J} = \frac{1}{2}m\,\omega^2 a^2 = \frac{1}{2}ka^2$$

$$0.03 = \frac{1}{2} \times k \times \left(\frac{20}{1000}\right)^2$$

$k = 0.06 \times 2500$ N/m = 150 N/m.

19. Two pendulums have time periods T and $5T/4$. They start S.H.M. at the same time from the mean position. What will be the phase difference between them after the bigger pendulum has complete one oscillation?

(a) 45° (b) 90°
(c) 60° (d) 30°

Sol. (b) As $\frac{5T}{4} = T + \frac{T}{4}$

By the time, the bigger pendulum makes one full oscillation, the smaller pendulum will make $\left(1 + \frac{1}{4}\right)$ oscillation. The bigger pendulum will be in the mean position and the smaller one will be in the positive extreme position. Thus, phase difference = 90°

20. A man weighing 60 kg stands on the horizontal platform of a spring balance. The platform starts executing simple

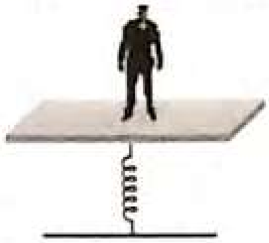
harmonic motion of amplitude 0.1 m and frequency $\frac{2}{\pi}$ Hz. Which of the following statement is correct?

(a) The spring balance reads the weight of man as 60 kg

(b) The spring balance reading fluctuates between 60 kg. and 70 kg

(c) The spring balance reading fluctuates between 50 kg and 60 kg

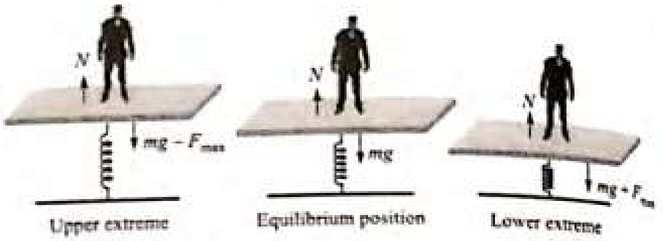
(d) The spring balance reading fluctuates between 50 kg and 70 kg



Sol. (d) The maximum force acting on the body executing simple harmonic motion is

$$m\omega^2 a = m \times (2\pi f)^2 a = 60 \times \left(2\pi \times \frac{2}{\pi}\right)^2 \times 0.1 \ N$$

$$= 60 \times 16 \times 0.1 = 96 \text{ N} = \frac{96}{9.8} = 10 kgf$$ and this force is towards mean position.



The reaction of the force on the platform away from the mean position. It reduces the weight of man on upper extreme i.e. net weight = (60 – 10) kgf.

This force adds to the weight at lower extreme position i.e. net weight becomes = (60 + 10) kgf.

Therefore, the reading the weight recorded by spring balance fluctuates between 50 kgf and 70 kgf.

EXERCISES

Problems Based on Basic Theory

1. A particle is moving in a circle with uniform speed. Its motion is
   (a) not periodic
   (b) periodic and simple harmonic
   (c) periodic but not simple harmonic
   (d) none of the above

2. As the expression is involving sine function, which of the following equations does not represent a simple harmonic motion?
   (a) $y = a \sin \omega t$
   (b) $y = a \cos \omega t$
   (c) $y = a \sin \omega t + b \cos \omega t$
   (d) $y = a \tan \omega t$

3. Two particles P and Q describe SHM of same amplitude a, same frequency f along the same straight line. The maximum distance between the two particles is $a\sqrt{2}$. The phase difference between the particle is
   (a) zero (b) $\frac{\pi}{2}$
   (c) $\frac{\pi}{6}$ (d) $\frac{\pi}{3}$

4. A particle executing SHM of amplitude 4 cm and $T = 4$ sec. The time taken by it to move from positive extreme position to half the amplitude is
   (a) 1 sec (b) 1/3 sec
   (c) 2/3 sec (d) $\sqrt{3/2}$ sec

5. The equation of motion of a particle executing simple harmonic motion is $a + 16\pi^2 x = 0$. In this equation, a is the linear acceleration in m/s^2 of the particle at a displacement x in meter. The time period in simple harmonic motion is
   (a) $\frac{1}{4}$ sec (b) $\frac{1}{2}$ sec
   (c) 1 sec (d) 2 sec

6. A particle executes SHM of amplitude A and time period T. The distance travelled by the particle in the duration its phase changes from $\frac{\pi}{12}$ to $\frac{5\pi}{12}$.
   (a) $\frac{1}{\sqrt{2}}A$ (b) $\sqrt{\frac{3}{2}}A$
   (c) $\frac{2}{\sqrt{3}}A$ (d) $\sqrt{\frac{2}{3}}A$

7. The phase difference between the displacement and acceleration of a particle executing simple harmonic motion is
   (a) zero (b) $\pi/2$
   (c) π (d) 2π

8. The phase difference between two particles executing SHM of the same amplitudes and frequency along same straight line while passing one another when going in opposite directions with equal displacement from their respective stating point is $2\pi/3$. If the phase of one particle

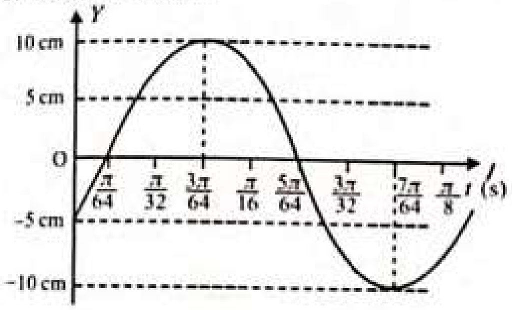
is $\pi/6$, find the displacement at this instant, if amplitude is A

(a) $A/3$ (b) $2A/3$
(c) $3A/4$ (d) $A/2$

9. Time period (T) and amplitude (A) are same for two particles which undergo SHM along the same line. At one particular instant, one particle is at phase $\frac{3\pi}{2}$ and other is at phase zero. While moving in the same direction. Find the time at which they will cross each other:

(a) $4T/2$ (b) $3T/8$
(c) $3T/4$ (d) $3T/7$

10. The diagram below shows a sinusoidal curve. The equation of the curve will be



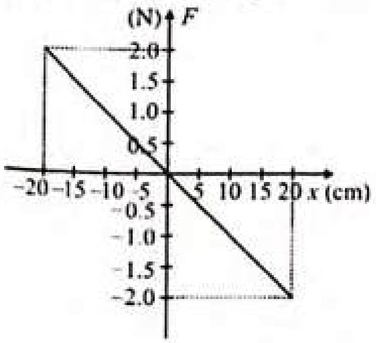
(a) $y = 10\sin\left(16t - \frac{\pi}{3}\right)$ cm

(b) $y = 10\sin\left(16t + \frac{\pi}{3}\right)$ cm

(c) $y = 10\sin\left(16t - \frac{\pi}{4}\right)$ cm

(d) $y = 10\cos\left(16t + \frac{\pi}{4}\right)$ cm

11. Figure shows the variation of force acting on a particle of mass 400 g executing simple harmonic motion. The frequency of oscillation of the particle is



(a) $4\ s^{-1}$ (b) $(5/2\pi)\ s^{-1}$
(c) $(1/8\pi)\ s^{-1}$ (d) $(1/2\pi)\ s^{-1}$

12. Two simple harmonic motions are represented by equations

$y_1 = 4\sin(10t + \phi)$

$y_2 = 5\cos 10t$

What is the phase difference between their velocities?

(a) ϕ (b) $-\phi$

(c) $\left(\phi + \frac{\pi}{2}\right)$ (d) $\left(\phi - \frac{\pi}{2}\right)$

13. Two particles move parallel to the x-axis about the origin with same amplitude 'a' and frequency ω. At a certain instant they are found at a distance $a/3$ from the origin on opposite sides but their velocities are in the same direction. What is the phase difference between the two?

(a) $\cos^{-1}\frac{7}{9}$ (b) $\cos^{-1}\frac{5}{9}$

(c) $\cos^{-1}\frac{4}{9}$ (d) $\cos^{-1}\frac{1}{9}$

14. A small mass executes linear SHM about O with amplitude a and period T. Its displacement from O at time $T/8$ after passing through O is

(a) $a/8$ (b) $a/2\sqrt{2}$
(c) $a/2$ (d) $a/\sqrt{2}$

15. Time period of a particle executing SHM is 8 s. At $t = 0$, it is at the mean position. The ratio of the distance covered by the particle in the 1st second to the 2nd second is

(a) $\frac{1}{\sqrt{2}+1}$ (b) $\sqrt{2}$

(c) $\frac{1}{\sqrt{2}}$ (d) $\sqrt{2}+1$

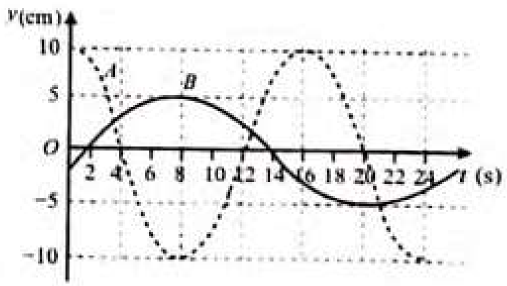
16. A particle moves with a simple harmonic motion in a straight line. In the first second starting from rest it travels a distance a and in the next second it travels a distance b in the same direction. The amplitude of the motion is

(a) $\frac{2a^2}{3b-a}$ (b) $\frac{3a^2}{3a-b}$

(c) $\frac{2a^2}{3a-b}$ (d) $\frac{3a^2}{3b-a}$

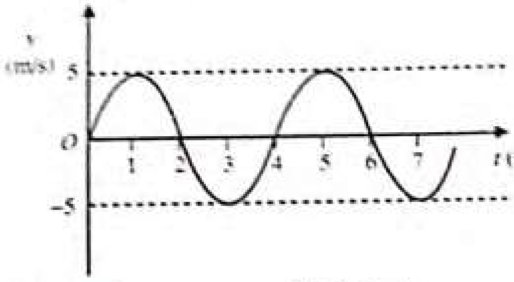
Velocity, Acceleration and Energy of SHM

17. The following figure shows the displacement versus time graph for two particles A and B executing simple harmonic motions. The ratio of their maximum velocities is



(a) 3:1 (b) 1:3 (c) 1:9 (d) 9:1

18. The variation of velocity of a particle executing SHM with time is shown in figure. The velocity of the particle when a phase change of $\pi/6$ takes place from the instant it is at one of the extreme positions will be



(a) 3.53 m/s (b) 2.5 m/s
(c) 4.330 m/s (d) None of these

19. In problem 18, the displacement of the particle from the mean position corresponding to the instant mentioned is

(a) $\frac{5}{\pi}$ m (b) $\frac{5\sqrt{3}}{\pi}$ m

(c) $\frac{10\sqrt{3}}{\pi}$ m (d) $\frac{5\sqrt{3}}{2\pi}$ m

20. In problem 18, the acceleration of the particle is

(a) $\frac{5\sqrt{3}\pi}{2}$ m/s^2 (b) $\frac{5\pi^2}{2}$ m/s^2

(c) $\frac{5\sqrt{3}\pi}{4}$ m/s^2 (d) $5\sqrt{3}\pi$ m/s^2

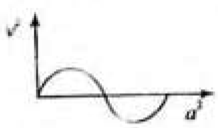
21. In problem 18, the maximum displacement and acceleration of the particle are respectively:

(a) $\frac{10}{\pi}$ m and 5π m/s^2 (b) $\frac{5}{\pi}$ m and $\frac{5\pi}{2}$ m/s^2

(c) $\frac{10}{\pi}$ m and $\frac{5\pi}{2}$ m/s^2 (d) $\frac{5}{\pi}$ m and $\frac{5\pi}{4}$ m/s^2

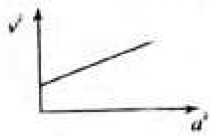
22. A graph of the square of the velocity against the square of the acceleration of a given simple harmonic motion is

(a)

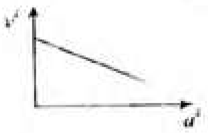


(b)

(c)



(d)



23. A particle perfroms SHM with a period T and amplitude a. The mean velocity of the particle over the time interval during which it travels a distance $a/2$ from the extreme position is

(a) a/T (b) $2a/T$
(c) $3a/T$ (d) $a/2T$

24. A particle executing harmonic motion is having velocities v_1 and v_2 at distances is x_1 and x_2 from the equilibrium position. The amplitude of the motion is

(a) $\sqrt{\frac{v_1^2x_2^2 - v_2^2x_1^2}{v_1^2 + v_2^2}}$ (b) $\sqrt{\frac{v_1^2x_1^2 - v_2^2x_2^2}{v_1^2 + v_2^2}}$

(c) $\sqrt{\frac{v_1^2x_2^2 - v_2^2x_1^2}{v_1^2 - v_2^2}}$ (d) $\sqrt{\frac{v_1^2x_2^2 + v_2^2x_1^2}{v_1^2 + v_2^2}}$

25. The potential energy of a particle executing SHM along the x-axis is given by $U = U_0 - U_0 \cos ax$. What is the period of oscillation?

(a) $2\pi\sqrt{\frac{ma}{U_0}}$ (b) $2\pi\sqrt{\frac{U_0}{ma}}$

(c) $\frac{2\pi}{a}\sqrt{\frac{m}{U_0}}$ (d) $2\pi\sqrt{\frac{m}{aU_0}}$

26. A particle executing SHM of amplitude 'a' has a displacement $a/2$ at $t = T/4$ and a negative velocity. The epoch of the particle is

(a) $\frac{\pi}{3}$ (b) $\frac{2\pi}{3}$

(c) π (d) $\frac{5\pi}{3}$

27. A particle is executing SHM according to the equation $x = A\cos\omega t$. Average speed of the particle during the interval $0 \le t \le \frac{\pi}{6\omega}$.

(a) $\frac{\sqrt{3}A\omega}{2}$ (b) $\frac{\sqrt{3}A\omega}{4}$

(c) $\frac{3A\omega}{\pi}$ (d) $\frac{3A\omega}{\pi}(2-\sqrt{3})$

28. A body is executing Simple Harmonic Motion. At a displacement x its potential energy is E_1 and at a displacement y its potential energy is E_2. The potential energy E at displacement $(x + y)$ is

(a) $\sqrt{E} = \sqrt{E_1} - \sqrt{E_2}$ (b) $\sqrt{E} = \sqrt{E_1} + \sqrt{E_2}$

(c) $E = E_1 + E_2$ (d) $E = E_1 - E_2$

29. An object of mass 0.2 kg executes simple harmonic along X-axis with frequency of $\frac{25}{\pi}$ Hz. At the position x = 0.04 m, the object has kinetic energy of 0.5 J and potential energy of 0.4 J. The amplitude of oscillation in meter is equal to

(a) 0.05 (b) 0.06
(c) 0.01 (d) None of these

30. A vertical mass-spring system executes simple harmonic oscillations with a period of 2 s. A quantity of this system which exhibits simple harmonic variation with a period of 1 s is

(a) velocity

(b) potential energy
(c) phase difference between acceleration and displacement
(d) difference between kinetic energy and potential energy

31. A body executes simple harmonic motion. The potential energy (PE), kinetic energy (KE) and total energy (TE) are measured as a function of displacement x. Which of the following statement is true?
(a) TE is zero when $x = 0$
(b) PE is maximum when $x = 0$
(c) KE is maximum when $x = 0$
(d) KE is maximum when x is maximum

Spring Particle System and Simple Pendulum

32. A body at the end of a spring executes SHM with a period t_1, while the corresponding period for another spring is t_2. If the period of oscillation with the two spring in series is T, then
(a) $T = t_1 + t_2$ (b) $T^2 = t_1^2 + t_2^2$
(c) $\frac{1}{T} = \frac{1}{t_1} + \frac{1}{t_2}$ (d) $\frac{1}{T^2} = \frac{1}{t_1^2} + \frac{1}{t_2^2}$

33. Two identical springs are attached to a small block P. The other ends of the springs are fixed at A and B. When P is in equilibrium the extension of top spring is 20 cm and extension of bottom spring is 10 cm. The period of small vertical oscillations of P about its equilibrium position is (use $g = 9.8$ m/s^2)

(a) $\frac{2\pi}{7}$ sec (b) $\frac{\pi}{7}$ sec
(c) $\frac{2\pi}{5}$ sec (d) none of these

34. Two equal masses are suspended separately by two springs of constants k_1 and k_2. If their oscillations satisfy the condition that their maximum velocities are equal, then the ratio of the amplitudes of the oscillations of the masses respectively is
(a) $\frac{k_1}{k_2}$ (b) $\frac{k_2}{k_1}$
(c) $\sqrt{\frac{k_1}{k_2}}$ (d) $\sqrt{\frac{k_2}{k_1}}$

35. A spring of spring constant k is cut into n equal parts, out of which r parts are placed in parallel and connected with mass M as shown in figure. The time period of oscillatory motion of mass M is
(a) $T = 2\pi\sqrt{\frac{M}{nrk}}$ (b) $T = 2\pi\sqrt{\frac{nrM}{k}}$
(c) $T = 2\pi\sqrt{\frac{rM}{nk}}$ (d) $T = 2\pi\sqrt{\frac{nM}{rk}}$

36. Three masses 700 g, 500 g and 400 g are suspended at the end of a spring a shown and are in equilibrium. When the 700 g mass is removed, the system oscillates with a period of 3 seconds, when the 500 g mass is also removed, it will oscillate with a period of

(a) 1 s (b) 2 s
(c) 3 s (d) $\sqrt{\frac{12}{5}}$ s

37. Two simple pendulums whose lengths are 100 cm and 121 cm are suspended side by side. Their bobs are pulled together and then released. After how many minimum oscillations of the longer pendulum, will the two be in phase again
(a) 11 (b) 10
(c) 21 (d) 20

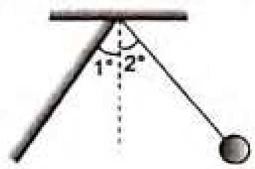
38. Two simple pendulum first of bob mass M_1 and length L_1 second of bob mass M_2 and length L_2. $M_1 = M_2$ and $L_1 = 2L_2$. If these vibrational energy of both is same. Then which is correct
(a) Amplitude of B greater than A
(b) Amplitude of B smaller than A
(c) Amplitudes will be same
(d) None of these

39. A simple pendulum hung from the ceiling of a train moving at constant speed has a period T. If the train starts accelerating or decelerating, then what will be the effect on time period of pendulum?
(a) Decreases only when train accelerates
(b) Decreases only when train decelerates
(c) Decreases in both cases
(d) Increases in both cases

40. Two simple pendulums of length 1 m and 16 m respectively are both given small displacement in the same direction at the same instant. They will be again in phase after the shorter pendulum has completed n oscillations. The value of n is
(a) 1/3 (b) 2/3
(c) 1 (d) 4/3

41. Two pendulums of different lengths are in phase at the mean position at a certain instant. The minimum time after which they will be again in phase is $5T/4$, where T is the time period of shorter pendulum. Find the ratios of lengths of the two pendulums.
(a) 1 : 16 (b) 1 : 4
(c) 1 : 2 (d) 1 : 25

42. A simple pendulum of length 1 m is allowed to oscillate with amplitude 2°. It collides elastically with a wall inclined at 1° to the vertical. Its time period will be: (use $g = \pi^2$)
(a) 2/3 sec
(b) 4/3 sec
(c) 2 sec
(d) none of these



43. A block of mass 1 kg hangs without vibrating at the end of a spring whose force constant is 200 N/m and which is attached to the ceiling of an elevator. The elevator is rising with an upward acceleration of $g/3$ when the acceleration suddenly ceases. The angular frequency of the block after the acceleration ceases is

(a) 13 rad/s (b) 14 rad/s
(c) 15 rad/s (d) None of these

44. A vertical spring carries a 5 kg body and is hanging in equilibrium, an additional force is applied so that the spring is further stretched. When released from this position, it performs 50 complete oscillations in 25 s, with an amplitude of 5 cm. The additional force applied is

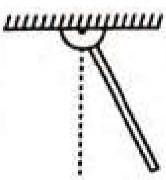
(a) 80 N (b) $80\,\pi^2$ N
(c) $4\,\pi^2$ N (d) 4 N

45. Frequency of a particle executing SHM is 10 Hz. The particle is suspended from a vertical spring. At the highest point of its oscillation the spring is unstretched. Maximum speed of the particle is ($g = 10$ m/s^2)

(a) 2π m/s (b) π m/s
(c) $1/\pi$ m/s (d) $1/2\pi$ m/s

Compound Pendulum and Superposition of SHM

46. A metre stick swinging in vertical plane about a fixed horizontal axis passing through its one end undergoes small oscillation of frequency f_0. If the bottom half of the stick were cut off, then its new frequency of small oscillation would become

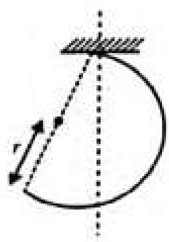


(a) f_0 (b) $\sqrt{2}f_0$ (c) $2f_0$ (d) $2\sqrt{2}f_0$

47. A physical pendulum is positioned so that its centre of gravity is above the suspension point. When the pendulum is released it passes the point of stable equilibrium with an angular velocity ω. The period of small oscillations of the pendulum is

(a) $\dfrac{4\pi}{\omega}$ (b) $\dfrac{2\pi}{\omega}$ (c) $\dfrac{\pi}{\omega}$ (d) $\dfrac{\pi}{2\omega}$

48. A uniform semicircular ring having mass m and radius r is hanging at one of its ends freely as shown in figure. The ring is slightly disturbed so that it oscillates in its own plane. The time period of oscillation of the ring is



(a) $2\pi\sqrt{\dfrac{r}{g\left(1+1/\pi^2\right)}}$

(b) $2\pi\sqrt{\dfrac{r}{g\left(1-4/\pi^2\right)^{1/2}}}$

(c) $2\pi\sqrt{\dfrac{r}{g\left(1-2/\pi^2\right)^{1/2}}}$

(d) $2\pi\sqrt{\dfrac{2r}{g\left(1+4/\pi\right)^{1/2}}}$

49. A system of two identical rods (L–shaped) of mass m and length l are resting on a peg P as shown in the figure. If the system is displaced in its plane by a small angle, find the period of oscillations.

(a) $2\pi\sqrt{\dfrac{\sqrt{2}\,l}{3g}}$ (b) $2\pi\sqrt{\dfrac{2l}{3g}}$

(c) $2\pi\sqrt{\dfrac{2\sqrt{2}\,l}{3g}}$ (d) $3\pi\sqrt{\dfrac{l}{3g}}$

50. A uniform square plate of side 'a' is hinged at one of its corners. It is suspended such that it can rotate about horizontal axis. The time period of small oscillation about its equilibrium position.

(a) $2\pi\sqrt{\dfrac{2a}{3g}}$ (b) $2\pi\sqrt{\dfrac{\sqrt{2}a}{3g}}$

(c) $2\pi\sqrt{\dfrac{2\sqrt{2}a}{3g}}$ (d) $2\pi\sqrt{\dfrac{2\sqrt{2}a}{g}}$

51. A particle is acted simultaneously by mutually perpendicular simple harmonic motion $x = a\cos\omega t$ and $y = a\sin\omega t$. The trajectory of motion of the particle will be

(a) an ellipse (b) a parabola
(c) a circle (d) a straight line

52. A particle is executing a motion in which its displacement as a function of time is given by
$x = 3\sin(5\pi t + \pi/3) + \cos(5\pi t + \pi/3)$ where x is in m and t is in s. Then the motion is

(a) simple harmonic with time period 0.2 s
(b) simple harmonic with time period 0.4 s
(c) simple harmonic with amplitude 3 m
(d) not a simple harmonic but a periodic motion

53. Two particles A and B execute simple harmonic motion according to the equations $y_1 = 3\sin\omega t$ and $y_2 = 4\sin\left(\omega t + \dfrac{\pi}{2}\right) + 3\sin\omega t$. The phase difference between them is

(a) $\dfrac{\pi}{2}$ (b) $\tan^{-1}\left(\dfrac{4}{3}\right)$

(c) $\tan^{-1}\left(\dfrac{3}{4}\right)$ (d) None of these

54. A charged particle is deflected by two mutually perpendicular oscillating electric fields such that the displacement of the particle due to each one of them is given by $x = A\sin(\omega t)$ and $y = A\sin\left(\omega t + \frac{\pi}{6}\right)$ respectively. The trajectory followed by the charged particle is
(a) a circle with equation $x^2 + y^2 = A^2$
(b) a straight line with equation $y = \sqrt{3}x$
(c) an ellipse with equation $x^2 + y^2 - xy = \frac{3}{4}A^2$
(d) an ellipse with equation $x^2 + y^2 - \sqrt{3}xy = \frac{1}{4}A^2$

55. Four types of oscillatory systems: a simple pendulum; a physical pendulum; a torsional pendulum and a spring–mass system, each of same time period is taken to the Moon. If time periods are measured on the moon, which system or systems will have it unchanged?
(a) only spring–mass system
(b) spring–mass system and torsional pendulum
(c) spring–mass system and physical pendulum
(d) none of these

56. A particle is subjected to two simple harmonic motions in the same direction having equal amplitude and equal frequency. If the resultant amplitude is equal to the amplitude of the individual motions, what is the phase difference between the two simple harmonic motions?
(a) $\frac{2\pi}{3}$ (b) $\frac{\pi}{3}$
(c) $\frac{\pi}{\sqrt{3}}$ (d) $\frac{2\pi}{\sqrt{3}}$

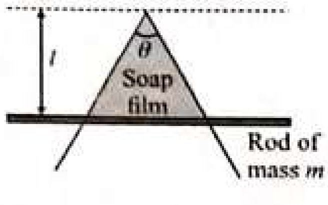
57. Three simple harmonic motions of equal amplitudes A and equal time periods along the same line combine. The phase of the second motion is 60° ahead of the first and phase of the third motion is 60° ahead of the second. The amplitude of resultant motion is
(a) $3A$ (b) $2\sqrt{2}\,A$
(c) $\sqrt{3}\,A$ (d) $2A$

Problems Based on Mixed Concepts

58. The string of a simple pendulum is replaced by a uniform rod of length L and mass M while the bob has a mass m. It is allowed to make small oscillations. Its time period is
(a) $2\pi\sqrt{\left(\frac{2M}{3m}\right)\frac{L}{g}}$ (b) $2\pi\sqrt{\frac{2(M+3m)L}{3(M+2m)g}}$
(c) $2\pi\sqrt{\left(\frac{M+m}{M+3m}\right)\frac{L}{g}}$ (d) $2\pi\sqrt{\left(\frac{2m+M}{3(M+2m)}\right)\frac{L}{g}}$

59. A cork floating on the pond water executes a simple harmonic motion, moving up and down over a range of 4 cm. The time period of the motion is 1 s. At $t = 0$, the cork is at its lowest position of oscillation, the position and velocity of the cork at $t = 10.5$ s, would be
(a) 2 cm above the mean position, 0 m/s
(b) 2 cm below the mean position, 0 m/s
(c) 1 cm above the mean position, $2\sqrt{3}\,\pi$ m/s up
(d) 1 cm below the mean position, $2\sqrt{3}\,\pi$ m/s up

60. A wire is bent at an angle θ. A rod of mass m can slide along the bended wire without friction as shown in figure. A soap film is maintained in the frame kept in a vertical position and the rod is in equilibrium as shown in the figure. If rod is displaced slightly in vertical direction, then the time period of small oscillation of the rod is

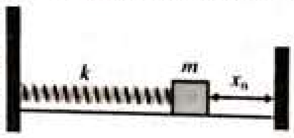


(a) $2\pi\sqrt{\frac{l}{g}}$ (b) $2\pi\sqrt{\frac{l\cos\theta}{g}}$
(c) $2\pi\sqrt{\frac{l}{g\cos\theta}}$ (d) $2\pi\sqrt{\frac{l}{g\tan\theta}}$

61. A solid right circular cylinder of weight 10 kg and cross-sectional area 100 cm² is suspended by a spring, where $k = 1$ kg/cm, and hangs partially submerged in water of density 1000 kg/m³ as shown in figure. What is its period when it makes simple harmonic vertical oscillations? (Take $g = 10$ m/s²)

(a) 0.6 s (b) 1 s
(c) 1.5 s (d) 2.2 s

62. One end of a spring of force constant k is fixed to a vertical wall and the other to a body of mass m resting on a smooth horizontal surface. There is another wall at a distance x_0 from the body. The spring is then compressed by $3x_0$ and released. The time taken to strike the wall from the instant of release is (given $\sin^{-1}(1/3) = (\pi/9)$)



(a) $\frac{\pi}{6}\sqrt{\frac{m}{k}}$ (b) $\frac{2\pi}{3}\sqrt{\frac{m}{k}}$
(c) $\frac{\pi}{4}\sqrt{\frac{m}{k}}$ (d) $\frac{11\pi}{9}\sqrt{\frac{m}{k}}$

63. A particle is moving along the x-axis under the influence of a force given by $F = -5x + 15$. At time $t = 0$, the particle is located at $x = 6$ and is having zero velocity. It takes 0.5 seconds to reach the origin for the first time. The equation of motion of the particle can be represented by

(a) $x = 3 + 3\cos \pi t$ (b) $x = 3\cos \pi t$
(c) $x = 3 + 3\sin \pi t$ (d) $x = 3 + 3\cos (2\pi t)$

64. A particle moves along a straight line to follow the equation $ax^2 + bv^2 = k$, where a, b and k are constants and x and v are x-coordinate and velocity of the particle respectively. Find the amplitude.

(a) $\sqrt{\frac{k}{b}}$ (b) $\sqrt{\frac{b}{k}}$
(c) $\sqrt{\frac{a}{k}}$ (d) $\sqrt{\frac{k}{a}}$

65. A particle starts its SHM on a line at initial phase of $\pi/6$. It reaches again the point of start after time t. It crosses yet another point P on the same line at successive intervals $2t$ and $3t$ respectively. Find the amplitude of the motion, if the particle crosses the point of start at speed 2 m/s:

(a) $\frac{8t}{\pi}$ (b) $\frac{4t}{\pi}$
(c) $\frac{2t}{\pi}$ (d) $\frac{t}{\pi}$

66. A particle of mass m is executing oscillations about the origin on the X-axis with amplitude A. Its potential energy is given as $U(x) = bx^4$, where β is a positive constant. The x-coordinate of the particle, where the potential energy is one-third of the kinetic energy, is

(a) $\pm\frac{A}{2}$ (b) $\pm\frac{A}{\sqrt{2}}$
(c) $\pm\frac{A}{3}$ (d) $\pm\frac{A}{\sqrt{3}}$

67. A constant force produces maximum velocity v on the block connected to the spring of force constant k as shown in the figure. When the force constant of spring becomes $4k$, the maximum velocity of the block is (block is at rest when spring is relaxed):

(a) $v/4$ (b) $2v$
(c) $v/2$ (d) v

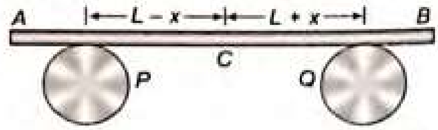
68. An air chamber of volume V, has a long of cross-sectional area A. A ball of mass m is fitted smoothly in the neck. The bulk modulus of air is B. If the ball is pressed down slightly and released, the time period of its oscillation is

(a) $2\pi\sqrt{\frac{mV}{2BA^2}}$ (b) $\pi\sqrt{\frac{2mV}{BA^2}}$
(c) $2\pi\sqrt{\frac{mV}{BA^2}}$ (d) $\frac{\pi}{2}\sqrt{\frac{m}{BA^2}}$

69. From the variation of potential energy in the direction of small oscillation of a simple pendulum, find the effective spring constant for the simple pendulum, where m is mass of the bob, l is length of the simple pendulum.

(a) $\frac{mg}{l}$ (b) $\frac{mg}{2l}$
(c) $\frac{2mg}{l}$ (d) $\frac{mg}{\sqrt{2}l}$

70. Initially cylindrical drums P and Q were placed at equal distance L from center of mass C of the rough rod AB in horizontal position. The drums were spinning in opposite directions with angular velocities. The rod is displaced by distance x towards left and released so that it performs SHM. If difference in reactions at Q and P is $\frac{mgx}{L}$, where m is the mass of the rod, find the time period of oscillations, if m is the coefficient of friction:



(a) $2\pi\sqrt{\frac{L}{g}}$ (b) $2\pi\sqrt{\frac{(L-x)}{g}}$
(c) $2\pi\sqrt{\frac{(L+x)}{\mu g}}$ (d) $2\pi\sqrt{\frac{L}{\mu g}}$

ARCHIVES

1. If a spring has time period T and is cut into n equal parts, then the time period of each part will be

(a) $T\sqrt{n}$ (b) $\frac{T}{\sqrt{n}}$
(c) nT (d) T **(AIEEE 2002)**

2. In a simple harmonic oscillator, at the mean position,

(a) kinetic energy is minimum and potential energy is maximum
(b) both kinetic and potential energies are maximum
(c) kinetic energy is maximum and potential energy is minimum
(d) both kinetic and potential energies are minimum **(AIEEE 2002)**

3. A child swinging on a swing in sitting position stands up, then the time period of the swing will

(a) increase

(b) decrease
(c) remain the same
(d) increase if the child is long and decrease if the child is short **(AIEEE 2002)**

4. A mass M is suspended from a spring of negligible mass. The spring is pulled a little and then released so that the mass executes simple harmonic motion (SHM) of time period T. If the mass is increased by m, the time period becomes $5T/3$. Then the ratio m/M is
(a) 3/5 (b) 25/9
(c) 16/9 (d) 5/3 **(AIEEE 2003)**

5. The length of a simple pendulum executing SHM is increased by 21%. The percentage increase in the time period of the pendulum of increased length is
(a) 11% (b) 21%
(c) 42% (d) 10% **(AIEEE 2003)**

6. The displacement of a particle varies according to the relation $X = 4(\cos \pi t + \sin \pi t)$. The amplitude of the particle is
(a) −4 (b) 4
(c) $4\sqrt{2}$ (d) 8 **(AIEEE 2003)**

7. A body executes SHM. The potential energy (PE), the kinetic energy (KE), and the total energy (TE) are measured as a function of displacement X. Which of the following statements is true?
(a) KE is maximum when $X = 0$.
(b) TE is zero when $X = 0$.
(c) KE is maximum when X is maximum.
(d) PE is maximum when $X = 0$. **(AIEEE 2003)**

8. Two particles A and B of equal masses are suspended from two massless springs of spring constants k_1 and k_2, respectively. If the maximum velocities during oscillations are equal, the ratio of the amplitudes of A and B is
(a) $\sqrt{k_1/k_2}$ (b) k_1/k_2
(c) $\sqrt{k_2/k_1}$ (d) k_2/k_1 **(AIEEE 2003)**

9. The bob of a simple pendulum executes SHM in water with a period t, while the period of oscillation of the bob is t_0 in air. Neglecting the frictional force of water and given that the density of the bob is (4/3) × 1000 kg/m^3. What relationship between t and t_0 is true?
(a) $t = t_0$ (b) $t = 4t_0$
(c) $t = 2t_0$ (d) $t = t_0/2$ **(AIEEE 2004)**

10. A particle at the end of a spring executes SHM with a period t_1. While the corresponding period for another spring is t_2. If the period of oscillation with the two springs in series is T, then
(a) $T = t_1 + t_2$ (b) $T^2 = t_1^{-2} + t_2^{-2}$
(c) $T^{-1} = t_1^{-1} + t_2^{-1}$ (d) $T^2 = t_1^2 + t_2^2$
(AIEEE 2004)

11. The total energy of a particle executing SHM is
(a) proportional to x
(b) proportional to $x^{1/2}$
(c) independent of x
(d) proportional to x^2, where x is the displacement from the mean position **(AIEEE 2004)**

12. A particle of mass m is attached to a spring (of spring constant k) and has a natural angular frequency ω_0. An external force $F(t)$ proportional to $\cos \omega t$ ($\omega \neq \omega_0$) is applied to the oscillator. The time displacement of the oscillator will be proportional to
(a) $\dfrac{m}{\omega_0^2 - \omega^2}$ (b) $\dfrac{1}{m(\omega_0^2 - \omega^2)}$
(c) $\dfrac{1}{m(\omega_0^2 + \omega^2)}$ (d) $\dfrac{m}{\omega_0^2 + \omega^2}$ **(AIEEE 2004)**

13. In forced oscillation of a particle, the amplitude is maximum for a frequency ω_1 of the force, while the energy is maximum for a frequency ω_2 of the force, then
(a) $\omega_1 = \omega_2$
(b) $\omega_1 > \omega_2$
(c) $\omega_1 < \omega_2$, when damping is small and $\omega_1 > \omega_2$ when damping is large
(d) $\omega_1 < \omega_2$ **(AIEEE 2004)**

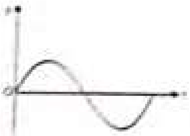
14. The function $\sin^2(\omega t)$ represents
(a) a periodic motion, but not SHM with a period $2\pi/\omega$
(b) a periodic motion, but not SHM with a period π/ω
(c) an SHM with a period $2\pi/\omega$
(d) an SHM with a period π/ω **(AIEEE 2005)**

15. Two SHMs are represented by the equations $y_1 = 0.15$ m $[100\pi t + (\pi/3)]$ and $y = 0.1 \cos \pi t$. The phase difference of the velocity of particle 1 with respect to the velocity of particle 2 is
(a) $-\dfrac{\pi}{6}$ (b) $\dfrac{\pi}{3}$
(c) $-\dfrac{\pi}{3}$ (d) $\dfrac{\pi}{6}$ **(AIEEE 2005)**

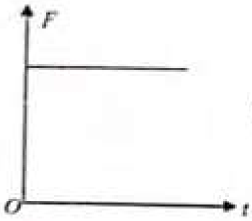
16. If an SHM is represented by $\dfrac{d^2X}{dt^2} + \alpha x = 0$, its time period is
(a) $\dfrac{2\pi}{\alpha}$ (b) $\dfrac{2\pi}{\sqrt{\alpha}}$
(c) $2\pi\alpha$ (d) $2\pi\sqrt{\alpha}$ **(AIEEE 2005)**

17. The bob of a simple pendulum is a spherical hollow ball filled with water. A plugged hole near the bottom of the oscillating bob gets suddenly unplugged. During observation, till water is coming out, the time period of oscillation would
(a) first increase and then decrease to the original value
(b) first decrease and then increase to the original value
(c) remain unchanged.
(d) increase towards a saturation value **(AIEEE 2005)**

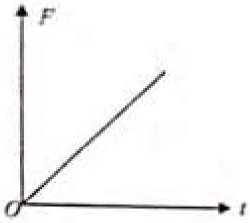
18. The displacement-time graph of a particle executing SHM is shown below. The corresponding force–time graph of the particle is



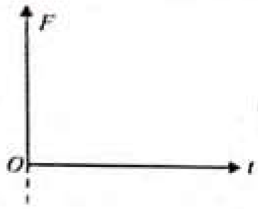
(a)



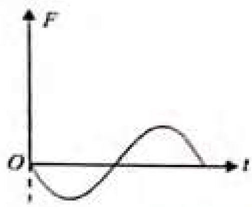
(b)



(c)



(d)



(AIEEE 2006)

19. The maximum velocity of a particle executing SHM with an amplitude 7 mm is 4.4 m/s. The period of oscillation is

(a) 0.01 s (b) 10 s
(c) 0.1 s (d) 100 s **(AIEEE 2006)**

20. Starting from origin, a body oscillates simple harmonically with a period of 2 s. After what time will its kinetic energy be 75% of the total energy?

(a) $\frac{1}{6}$ s (b) $\frac{1}{4}$ s
(c) $\frac{1}{3}$ s (d) $\frac{1}{12}$ s **(AIEEE 2006)**

21. A coin is placed on a horizontal platform which undergoes vertical SHM of angular frequency ω. The amplitude of oscillation is gradually increased. The coin will leave contact with platform for the first time

(a) at the mean position of platform
(b) for an amplitude g/ω^2
(c) for an amplitude g^2/ω^2
(d) at the highest position of the platform

(AIEEE 2006)

22. Two springs of force constants K_1 and K_2 are connected to a mass m as shown. The frequency of oscillation of the mass is f. If both K_1 and K_2 are made four times their original values, the frequency of oscillation becomes

(a) $f/4$ (b) $4f$
(c) $2f$ (d) $f/2$ **(AIEEE 2007)**

23. A particle of mass m executes SHM with amplitude a and frequency ν. The average kinetic energy during its motion from the position of equilibrium to the end is

(a) $\frac{1}{4}ma^2\nu^2$ (b) $4\pi^2 ma^2\nu^2$
(c) $2\pi^2 ma^2\nu^2$ (d) $\pi^2 ma^2\nu^2$ **(AIEEE 2007)**

24. The displacement of an object attached to a spring and executing SHM is given by $x = 2 \times 10^{-2} \cos \pi t$ m. The time at which the maximum speed first occurs is

(a) 0.75 s (b) 0.125 s
(c) 0.25 s (d) 0.5 s **(AIEEE 2007)**

25. A point mass oscillates along the x-axis according to the law $x = x_0 \cos\left(\omega t - \frac{\pi}{4}\right)$. If the acceleration of the particle is written as $a = A\cos(\omega t + \delta)$, then

(a) $A = x_0\omega^2, \delta = \frac{\pi}{4}$ (b) $A = x_0\omega^2, \delta = -\frac{\pi}{4}$
(c) $A = x_0\omega^2, \delta = \frac{3\pi}{4}$ (d) $A = x_0, \delta = -\frac{\pi}{4}$

(AIEEE 2007)

26. If x, v, and a denote the displacement, velocity, and acceleration of a particle executing SHM of time period T, then which of the following does not change with time?

(a) $a^2T^2 + 4\pi^2v^2$ (b) $\frac{aT}{x}$
(c) $aT + 2\pi v$ (d) $\frac{aT}{v}$ **(AIEEE 2009)**

27. A mass M, attached to a horizontal spring, executes SHM with a amplitude A_1. When the mass M passes through its mean position then a smaller mass m is placed over it and both of them move together with amplitude A_2. The ratio of (A_1/A_2) is

(a) $\frac{M}{M+m}$ (b) $\frac{M+m}{M}$
(c) $\left(\frac{M}{M+m}\right)^{1/2}$ (d) $\left(\frac{M+m}{M}\right)^{1/2}$

(AIEEE 2011)

28. Two particles are executing simple harmonic motion of the same amplitude A and frequency ω along the x-axis. Their mean position is separated by distance $X_0 (X_0 > A)$. If the maximum separation between them is $(X_0 + A)$, the phase difference between their motion is:

(a) $\pi/2$ (b) $\pi/3$
(c) $\pi/4$ (d) $\pi/6$ **(AIEEE 2011)**

29. An ideal gas enclosed in a vertical cylindrical container supports a freely moving piston of mass M. The piston and cylinder have equal cross sectional area A. When the

piston is in equilibrium, the volume of the gas is V_0 and its pressure is P_0. The piston is slightly displaced from the equilibrium position and released. Assuming that the system is completely isolated from its surrounding, the piston executes a simple harmonic motion with frequency

(a) $\frac{1}{2\pi}\frac{V_0MP_0}{A^2\gamma}$ (b) $\frac{1}{2\pi}\sqrt{\frac{A^2\gamma P_0}{MV_0}}$

(c) $\frac{1}{2\pi}\sqrt{\frac{MV_0}{A\gamma P_0}}$ (d) $\frac{1}{2\pi}\frac{A\gamma P_0}{V_0M}$

(JEE Main 2013)

30. The amplitude of a damped oscillator decreases to 0.9 times its original magnitude is 5s. In another 10s itwill decrease to α times its original magnitude, where α equals.

(a) 0.81 (b) 0.729

(c) 0.6 (d) 0.7 **(JEE Main 2013)**

31. A particle moves with simple harmonic motion in a straight line. In first τ s, after starting from rest it travels a distance a, and in next τ s it travels $2a$, in same direction, then:

(a) amplitude of motion is $4a$

(b) time period of oscillations is 6τ

(c) amplitude of motion is $3a$

(d) time period of oscillations is 8τ **(JEE Main 2014)**

32. For a simple pendulum, a graph is plotted between its kinetic energy (KE) and potential energy (PE) against its displacement d. Which one of the following represents these correctly?

(Graphs are schematic and not drawn to scale)

(a) 
(b) 
(c) 
(d) 
(JEE Main 2015)

33. A particle performs simple harmonic motion with amplitude A. Its speed is trebled at the instant that it is at a distance $\frac{2A}{3}$ from equilibrium position. The new amplitude of the motion is

(a) $\frac{A}{3}\sqrt{41}$ (b) $3A$

(c) $A\sqrt{3}$ (d) $\frac{7A}{3}$

(JEE Main 2016)

34. A particle is executing simple harmonic motion with a time period T. At time $t = 0$, it is at its position of equilibrium. The kinetic energy-time graph of the particle will look like

(a) 
(b) 

(c) 
(d) 
(JEE Main 2017)

35. A silver atom in a solid oscillates in simple harmonic motion in some direction with a frequency of 10^{12}/sec. What is the force constant of the bonds connecting one atom with the other? (Mole wt. of silver = 108 and Avogadro number = 6.02×10^{23} gm mole^{-1})

(a) 5.5 N/m (b) 6.4 N/m

(c) 7.1 N/m (d) 2.2 N/m

(JEE Main 2018)

Chapter 16

Wave and Acoustics

PROGRESSIVE WAVES

Wave motion is defined as a form of disturbance transferred from one point to another involving transfer of energy but no transfer of matter. Mechanical waves require a medium for propagation, whereas electromagnetic waves can travel in vacuum also (do not require any medium also called non-mechanical waves).

MECHANICAL WAVES

A mechanical wave can be produced and propagated only in those material media which possess *elasticity* and *inertia*. A wave originates due to the displacement of some portion of an elastic medium from its normal position, causing it to oscillate about an equilibrium position, so the medium should posses elasticity in order that it has a tendency to come back to its original position which is a necessary condition for disturbance to be transmitted from one layer to next and hence the wave to travel. The medium should also have inertia in order that it can store energy and transport it further.

TYPE OF WAVES

Transverse Waves

A travelling wave or pulse that causes the elements of the disturbed medium to move perpendicular to the direction of propagation is called a *transverse wave*.

For transverse wave propagating in a taut string, when the displacement of a particle is maximum above the line of mean position, the particle is said to be at crest of the wave, and when the displacement of a particle is maximum below the mean position it is said to be at the trough of the wave.

A particle either at the crest or at the trough has a tendency to move towards the mean position.

- A particle at the crest or the trough has zero velocity, and the distance of the particle from the mean position is termed as amplitude of the wave.
- Distance between two consecutive crests/troughs is equal to the wavelength of the wave.
- Distance between a consecutive pair of crest and trough is half the wavelength of the wave.

Longitudinal Waves

It is a kind of wave motion in which the individual particles of a medium execute periodic motion about their mean position along the direction of propagation of wave.

Sound waves are example of longitudinal waves. The disturbance in a sound wave is a series of high-pressure and low-pressure regions that travels through air.

A longitudinal wave moves by the phenomena of compression and rarefaction in the medium.

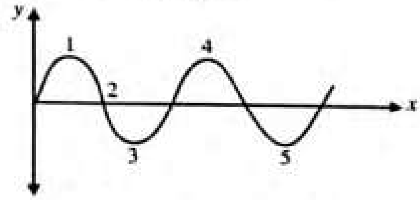
In compression, distance between any two consecutive particles of medium is less than their normal distance. Therefore, density is more than the normal density. In a rarefaction, distance between any two consecutive particles of medium is more than the normal distance, therefore, density is less than the normal density.

Distance between two consecutive compressions or rarefactions is equal to the wavelength of the wave. Longitudinal waves can propagate through any state of matter.

WAVE PARAMETERS

Phase

Phase defines the position (in terms of distance from mean position) and velocity of a particle oscillating under the influence of a wave. The particles of the medium which are in the same state of motion (at the same displacement from their respective mean positions moving in the same direction) are said to be in phase or differing in phase by $2n\pi$, where $n = 1, 2, 3, \ldots$ and the particles of which state of motion are exactly opposite (displacements from the mean position and velocities are exactly opposite) are said to be out of phase or differing in phase by $n\pi$ where $n = 1, 3, 5, \ldots$

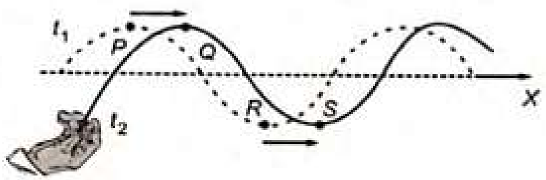


- Oscillations of the particles 1 and 4 are in phase.
- Oscillations of the particles 1 and 2 are not in phase.
- Oscillations of the particles 3 and 5 are in phase.
- Oscillations of the particles 4 and 5 are out of phase.

Wave Speed

Wave speed is the distance travelled by the wave in unit time. In wave motion, the disturbance created at a point of space travels and has a speed. The distance covered per unit time by the wave is known as wave speed.

If we plot the disturbance against position along wave motion at a fixed time, the graph so obtained is called waveform. For a string wave, it is a snapshot of string shape at some moment of time.



The figure shows waveforms at two nearby moments of time t_1 and t_2. The disturbance (say, peak of string) at P has moved to Q in time $t_2 - t_1$. The displacement of wave is $\overrightarrow{PQ}$ in time $\Delta t = t_2 - t_1$. Then

$$v = \text{wave speed} = \frac{PQ}{t_2 - t_1} = \left(\frac{RS}{t_2 - t_1}\right)$$

We see that waveform of t_1 has just translated by PQ, acquiring the new position at t_2.

Intensity of the Wave

Intensity of the wave is the energy transmitted per unit area per second in the form of the wave in the direction of the propagation of the wave by the source. This energy is carried forward by the medium particles which while oscillating transfer the energy to the next particles.

In our further discussion, we assume that as a wave proceeds forward, it does so without any dissipation of energy, i.e., neglecting the effects of air drag, internal resistances, etc. which cause loss of energy as wave progresses. In other words, the amplitude of a simple progressive wave remains same as it progresses forward.

Illustration 16.1 A sinusoidal wave is travelling along a rope. The oscillator that generates wave completes 40.0 vibrations in 30.0 s. Also, a given 'maximum' travels 425 cm along the rope in 10.0 s. What is the wavelength of the wave?

Solution. The given information comprises things that can be measured directly in laboratory. A high speed photograph would reveal the wavelength which can be computed from $v = f\lambda$.

The frequency is

$$f = \frac{40.0 \text{ waves}}{30.0 \text{ s}} = 1.33 \text{ s}^{-1}$$

And the wave speed is

$$v = \frac{425 \text{cm}}{10.0 \text{s}} = 42.5 \text{cm/s}$$

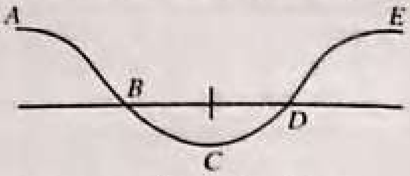
Since $v = \lambda f$, the wavelength is

$$\lambda = \frac{v}{f} = \frac{42.5 \text{ cm}}{1.33 \text{ s}^{-1}} = 0.319 \text{ m}$$

If we turn up the oscillator to a higher frequency, the wavelength would get shorter because speed is a constant factor. It is determined just by the properties of the string itself.

Concept Application Exercise 16.1

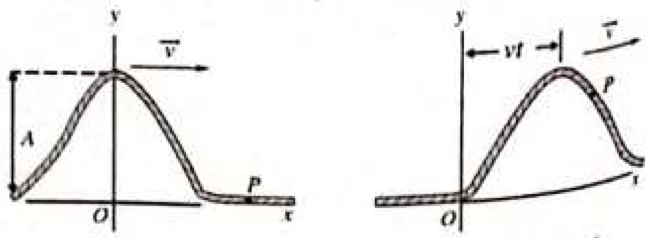
1. Which parts of the curve in the figure shown represent compression and rarefaction for a longitudinal wave?



2. A longitudinal wave is produced on a toy slinky. The wave travels at a speed of 30 cm/s and the frequency of the wave is 20 Hz. What is the minimum separation between two consecutive compressions of the slinky?
3. A narrow pulse (for example, a short pip by a whistle) is sent across a medium. If the pulse rate is 1 after every 20 s (that is the whistle is blown for a split of second after every 20 s), is the frequency of the note produced by the whistle equal to 1/20 or 0.05 Hz?
4. Waves are generated on a water surface. Calculate the phase difference between two points A and B, when
   (i) A and B lie on the same wave front at a distance of 2λ between them
   (ii) A and B lie on successive crests separated by 1 m
   (iii) A and B lie on successive troughs separated by 1.5 m

WAVE FUNCTION

A function of one variable is such as $x(t)$ is sufficient to describe the motion of a point mass moving along a line. To give a mathematical description of an extended moving object such as a moving pulse, functions which depend on two variables such as x and t are required. Functions which can mathematically represent a moving wave pulse are called wave function.



(a) Pulse at $t = 0$ (b) Pulse at time t

A one-dimensional pulse travelling to the right with a speed v. (a) At $t = 0$, the shape of the pulse is given by $y = f(x)$. (b) At some later time t, the shape remains unchanged and the vertical position of any element of the medium is given by $y = f(x - vt)$

In general, then we can represent the transverse position y for all positions and times, measured in a stationary frame with the origin at O, as

$$y(x, t) = f(x - vt) \qquad \text{(i)}$$

Similarly, if the pulse travels to the left, the transverse position of elements of the string is described by

$$y(x, t) = f(x + vt) \qquad \text{(ii)}$$

The function y, sometimes called the *wave function*, depends on the two variables x and t. For this reason, it is often written $y(x, t)$, which is read 'y as a function of x and t.'

ILLUSTRATION 16.2 At $t = 0$, transverse pulse in a wire is described by the function

$$y = \frac{6}{x^2 + 3}$$

where x and y are in metres. Write the function $y(x, t)$ that describes this pulse if it is travelling in the positive x-direction with a speed of 4.50 m/s.

Solution. At $t = 0$, the wave pulse looks like a bump centred at $x = 0$. As time goes on, the wave function will be function of t as well as x. The point about which the bump is centred will be $x_0 = 4.5t$.

We obtain a function of the same shape by writing

$$y(x, t) = 6/[(x - x_0)^2 + 3]$$

where the centre of the pulse is at $x_0 = 4.5\,t$. Thus we have

$$y(x, t) = \frac{6}{(x - 4.5t)^2 + 3}$$

Note that for y to stay constant as t increases, x must increase by $4.5\,t$, as it describes the wave moving at 4.5 m/s.

NOTE: In general, we can cause any waveform to move along the x-axis at a velocity n, by substituting $(x - n_s t)$ for x in the wave function $y(x)$ at $t = 0$. A wave function that depends on t through $(x + n_s t)$ describes a wave moving in the negative x-direction.

General Expression for a Sinusoidal Wave

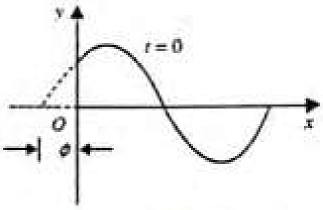
The general equation of simple harmonic progressive wave is given by

$$y = A \sin 2\pi\left(\frac{t}{T} \pm \frac{x}{\lambda}\right)$$

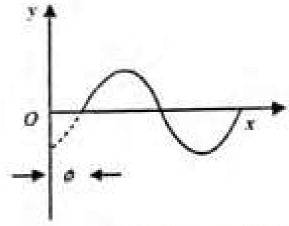
If an initial phase ϕ exists at origination point of wave, equation is changed to $y = A\sin\left[2\pi\left(\frac{t}{T} \pm \frac{x}{\lambda}\right) + \phi\right]$

Positive and Negative Initial Phase Constants

In general, the equation of a harmonic wave travelling along the positive x-axis is expressed as $y = A \sin (kx - \omega t \pm \phi)$, where ϕ is called the initial phase constant. It determines the initial displacement of the particle at $x = 0$ when $t = 0$.



Positive initial phase constant
$y = A \sin(kx - \omega t + \phi)$
The sine curve starts from the left of the origin.



Negative initial phase constant
$y = A \sin(kx - \omega t - \phi)$
The sine curve starts from the right of the origin.

Change in Phase with Time for a Constant x (at a Fixed Point in the Medium)

$$[\phi]_{t_1} = 2\pi\left(\frac{t_1}{T} - \frac{x}{\lambda}\right) + \phi;\ [\phi]_{t_2} = 2\pi\left(\frac{t_2}{T} - \frac{x}{\lambda}\right) + \phi$$

(For the wave travelling in positive x-direction)

$$\Delta\phi = \phi_{t_2} - \phi_{t_1} = \frac{2\pi}{T} \times (t_2 - t_1) = \frac{2\pi}{T} \times \Delta t \quad \Rightarrow \Delta\phi = \frac{2\pi \times \Delta t}{T}$$

$$\text{Phase difference} = \frac{2\pi}{T} \times \text{Time difference}$$

For $\Delta t = T$, i.e., after one time period,

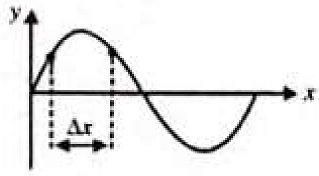
$$\Delta\phi = \frac{2\pi}{T} \times T = 2\pi$$

A phase change of 2π ($2n\pi$ in general) gives the points oscillating in phase.

Variation of Phase with Distance

At a given instant of time $t = t$, phase at $x = x_1$,

$$[\phi]_{x_1} = 2\pi\left(\frac{t}{T} - \frac{x_1}{\lambda}\right) + \phi$$



For the wave travelling in positive x-direction and phase at $x = x_2$,

$$[\phi]_{x_2} = 2\pi\left(\frac{t}{T} - \frac{x_2}{\lambda}\right) + \phi$$

$$\Rightarrow \quad \Delta\phi = [\phi]_{x_1} - [\phi]_{x_2} = \frac{2\pi}{\lambda}(x_2 - x_1) = \frac{2\pi}{\lambda}\Delta x$$

$$\Delta\phi = \frac{2\pi}{\lambda}\Delta x$$

i.e., Phase difference $= \frac{2\pi}{\lambda} \times$ Path difference

For $\Delta x = n\lambda$, $\Delta\phi = n2\pi$, where $n = 1, 2, 3, \ldots$

Points separated by distance $n\lambda$ where n is an integer are in same phase (at any instant of time).

For $\Delta x = m\frac{\lambda}{2}$, where $m = 1, 3, 5, 7, \ldots$

$$\Delta\phi = m \times \pi$$

Points separated by distance $m(\lambda/2)$, where m is an odd integer are out of phase (at any instant of time).

ILLUSTRATION 16.3 A wave travelling along X-axis is given by

$y = 2(\text{mm})\sin(3t - 6x + \pi/4)$

where x is in centimetres and t in second. Write the phases and, hence, the find the phase difference between them at $t = 0$ for two points on X-axis, $x = x_1 = \pi/3$ cm and $x = x_2 = \pi/2$ cm.

Solution. At $t = 0$

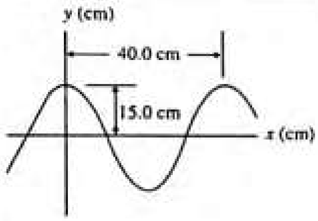
$$y = \sin(-6x + \pi/4)$$

Phase at x_1: $\phi = \left(-6 \times \frac{\pi}{3} + \frac{\pi}{4}\right) = \frac{7}{4}\pi$ and that at

x_2 is $\left(-6 \times \frac{\pi}{2} + \frac{\pi}{4}\right) = \frac{11}{4}\pi$

The phase difference is $\left|\frac{7}{4}\pi - \frac{11}{4}\pi\right| = \pi$; the disturbances at the two points are out of phase.

ILLUSTRATION 16.4 A sinusoidal wave travelling in the positive x-direction has an amplitude of 15 cm, wavelength 40 cm and frequency 8 Hz. The vertical displacement of the medium at $t = 0$ and $x = 0$ is also 15 cm, as shown in figure.



(a) Find the angular wave number, period, angular frequency and speed of the wave.

(b) Determine the phase constant ϕ, and write a general expression for the wave function.

Solution.

(a) Wave number $k = \frac{2\pi}{\lambda} = \frac{2\pi \text{ rad}}{40 \text{ cm}} = \frac{\pi}{20}$ rad/cm

Time period $T = \frac{1}{f} = \frac{1}{8}$ s

Angular frequency $\omega = 2\pi f = 16\pi$ rad/s

Speed of wave $v = f\lambda = 320$ cm/s

(b) It is given that $A = 15$ cm

and also $y = 15$ cm at $x = 0$, and $t = 0$

then using $y = A\sin(\omega t - kx + \phi)$

$15 = 15\sin\phi \Rightarrow \sin\phi = 1$

or $\phi = \frac{\pi}{2}$ rad

Therefore, the wave function is

$$y = A\sin\left(\omega t - kx + \frac{\pi}{2}\right)$$

$$= (15 \text{ cm})\sin\left[(16\pi \text{ rad s}^{-1})t - \left(\frac{\pi \text{ rad}}{20 \text{ cm}}\right)x + \frac{\pi}{2}\right]$$

SINUSOIDAL WAVES ON STRINGS

The wave function of a wave at $t = 0$ can be written as

$$y = A\sin(kx - \omega t) \quad \text{(i)}$$

We can use this expression to describe the motion of any element of the string. An element at point P (or any other element of the string) moves only vertically, and so its x coordinate remains constant. Therefore, the transverse speed v_y (not to be confused with the wave speed v) and the transverse acceleration a_y of elements of the string are

$$v_y = \left.\frac{dy}{dt}\right]_{x=\text{constant}} = \frac{\partial y}{\partial t} = -\omega A\cos(kx - \omega t) \quad \text{(ii)}$$

$$a_y = \left.\frac{dv_y}{dt}\right]_{x=\text{constant}} = \frac{\partial v_y}{\partial t} = -\omega^2 A\sin(kx - \omega t) \quad \text{(iii)}$$

These expressions incorporate partial derivatives because y depends on both x and t. In the operation $\partial y/\partial t$, for example, we take a derivative with respect to t while holding x constant. The maximum values of the transverse speed and transverse acceleration are simply the absolute values of the coefficients of the cosine and sine functions:

$$v_{y,\max} = \omega A \quad \text{(iv)}$$

$$a_{y,\max} = \omega^2 A \quad \text{(v)}$$

The transverse speed and transverse acceleration of elements of the string do not reach their maximum values simultaneously. The transverse speed reaches to its maximum value (ωA) when $y = 0$, whereas the magnitude of the transverse acceleration reaches its maximum value ($\omega^2 A$) when $y = \pm A$. Finally, Eqs. (iv) and (v) are identical in mathematical form to the corresponding equations for simple harmonic motion.

Differentiating Eq. (i) with respect to displacement of wave (x), we will get the slope of displacement curve of wave as

$$\frac{\partial y}{\partial x} = Ak\cos(kx - \omega t) \quad \text{(vi)}$$

From Eqs. (ii) and (vi), we have

$$\frac{\partial y}{\partial x} = -\frac{k}{\omega}\frac{\partial y}{\partial t} = -\frac{1}{v}\frac{\partial y}{\partial t}$$

$$\frac{\partial y}{\partial t} = -v\frac{\partial y}{\partial x} \quad \Rightarrow v_p = -v\frac{dy}{dx}$$

NOTE: Particle velocity = – (wave velocity) slope of wave curve

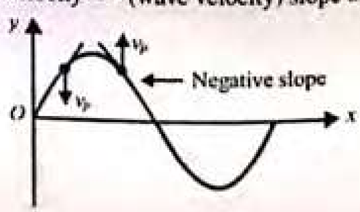


ILLUSTRATION 16.5 If the displacement relation for a particle in a wave is given by $y = 5\sin\left(\frac{t}{0.04} - \frac{x}{4}\right)$, determine the maximum speed of the particle in SI units.

Solution. Particle speed $v_p = \left|\frac{\partial y}{\partial t}\right|$

$$v_p = \left|5 \times \frac{1}{0.04}\cos\left(\frac{t}{0.04} - \frac{x}{4}\right)\right| \text{ms}^{-1}$$

The maximum particle speed is, thus,

$$\left|\frac{\partial y}{\partial t}\right|_{max} = \frac{5}{0.04}\text{ms}^{-1} = 125 \text{ ms}^{-1}$$

ILLUSTRATION 16.6 A plane progressive wave is given by $x = (40 \text{ cm})\cos(50\pi t - 0.02\pi y)$ where y is in centimetres and t in seconds. What will be the particle velocity at $y = 25$ cm in time $t = 1/200$s?

Solution. Given that $x = 40\cos(50\pi t - 0.02\pi y)$

Therefore, particle velocity can be given as

$$v_p = \frac{dx}{dt} = (40 \times 50\pi)[-\sin(50\pi t - 0.02\pi y)]$$

Putting $x = 25$ cm and $t = \frac{1}{200}$ s.

$$v_p = -(2000\pi \text{ cm/s})\sin\left[50\pi\left(\frac{1}{200}\right) - 0.02\pi(25)\right]$$

$$= 10\pi\sqrt{2} \text{ m/s}$$

SPEED OF WAVES ON STRING

If the tension in the string is T and its mass per unit length is μ (Greek letter mu), the wave speed, will be

$$v = \sqrt{\frac{T}{\mu}}$$

ILLUSTRATION 16.7 A transverse wave of wavelength 50 cm is travelling towards +ve x-axis along a string whose linear density is 0.05 g/cm. The tension in the string is 450 N. At $t = 0$, the particle at $x = 0$ is passing through its mean position with an upward velocity. Form an equation describing the wave. The amplitude of the wave is 2.5 cm.

Solution. Let the wave be described by:

$$y(x,t) = A\sin(kx - \omega t + \phi_0) \quad \text{and} \quad A = 2.5 \text{ cm}$$

where $k = \frac{2\pi}{\lambda} = \frac{2\pi}{0.5} = 4\pi$

$$y(0,0) = 0 \Rightarrow A\sin\phi_0 = 0$$

which gives $\phi_0 = 0, \pi$ (i)

we also have

$$\left(\frac{dy}{dt}\right)_{t=0} > 0 \Rightarrow -A\omega\cos\phi_0 > 0 \quad \text{(ii)}$$

From Eqs. (i) and (ii), we get $\phi_0 = \pi$

Velocity of transverse wave in the string is given by

$$\sqrt{\frac{T}{\mu}} = \sqrt{\frac{450}{0.05\times10^{-1}}} = 300 \text{ m/s}$$

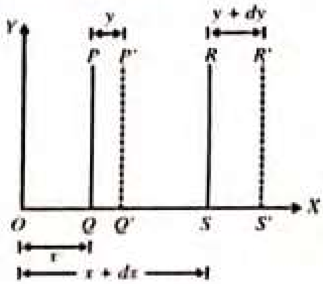
$$\Rightarrow \quad \omega = 2\pi f = \frac{2\pi c}{\lambda} = \frac{2\pi(300)}{0.5} = 1200\pi \text{ rad/s}$$

Using all the quantities, the equation is

$$y = 2.5\sin(4\pi x - 1200\pi t + \pi) \text{ cm}$$

INTERPRETATION OF dy/dx IN LONGITUDINAL WAVES AND TRANSVERSE WAVES

Consider a longitudinal wave travelling along the positive x-axis. Let us choose two layers of medium PQ and RS with planes normal to the direction of wave propagation, at distance x and $x + dx$ from the origin O. After the wave passes through these sections, the layers get displaced from their mean positions, say by y and $y + dy$ respectively. (as shown in figure) if a be the cross-sectional area of the layer, then, the initial volume of the cylinder $PQRS = a(dx)$



and final volume = volume of cylinder $P'Q'R'S'$

$$= a[x + dx + y + dy) - (x + y)]$$

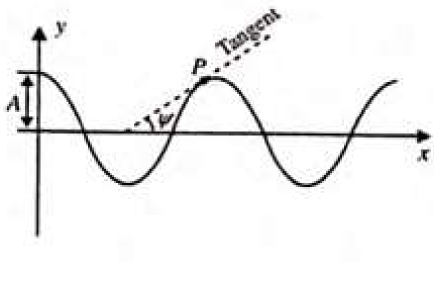
$$= a(dx + dy)$$

$\therefore$ Change in volume $= a\,dy$

$$\therefore \quad \text{Volume strain} = \frac{\text{Change in volume}}{\text{Original volume}} = \frac{a\,dy}{a\,dx} = \frac{dy}{dx}$$

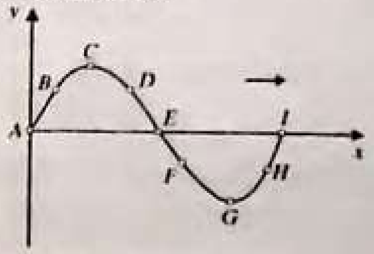
Hence, in case of longitudinal waves dy/dx represents the volume strain.

In case of transverse waves, the term dy/dx has its usual geometrical meaning. If a 'snapshot' be taken, of the particles of a medium at any instant, in which a simple harmonic wave is travelling, then the shape of the waveform will be a sine curve (as shown in figure) dy/dx, at the instant for any particle say P) represents the slope of the curve at that point. Thus, if ψ is be the angle made by the geometrical tangent drawn to the curve at that point, with the positive direction of the x-axis, then $dy/dx = \tan\psi$.



Concept Application Exercise 16.2

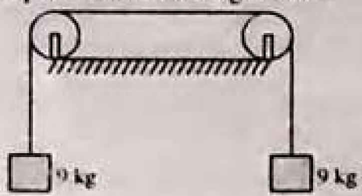
1. A transverse wave is travelling along a string in the positive x-axis. The figure shows the photograph of the wave at an instant. Find



(a) the points moving upward ______
(b) the points moving downwards ______
(c) the points which have zero velocity ______
(d) the points which have maximum velocity ____

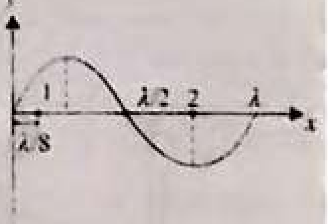
2. The equation of transverse wave travelling on a rope is given by
$y = 5 \sin (4.0t - 0.02x)$
where y and x are in centimetres and time t in seconds
(i) Calculate the amplitude, frequency, velocity, and wavelength.
(ii) Calculate the maximum transverse speed of a particle in the rope.

3. A uniform wire passes over two pulleys and 9 kg weight is suspended at each end. The length of wire between the pulleys is 1.5 m and its mass is 12.0 g. Find the frequency of vibration with which the wire vibrates in two loops, the middle point of wire being at rest.



4. The following equation gives the displacement y at time t for a particle at a distance x:
$y = 0.01 \sin 500\pi (t - x/30)$
where all are in SI units.
Find (i) the wavelength, (ii) the speed of the wave, (iii) the velocity amplitude of the particles of the medium and (iv) the acceleration amplitude of the particles of the medium.

5. What is the phase difference between the particles 1 and 2 located as shown in figure?



6. A circular loop of string rotates about its axis on a frictionless horizontal plane at a uniform rate so that the tangential speed of any particle of the string is v. If a small transverse disturbance is produced at a point of the loop, with what speed (relative to the string) will this disturbance travel on the string?

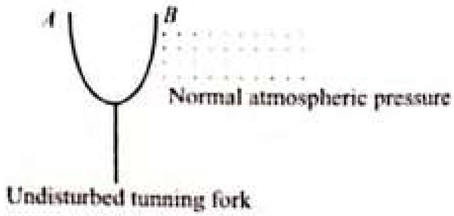
SOUND WAVES

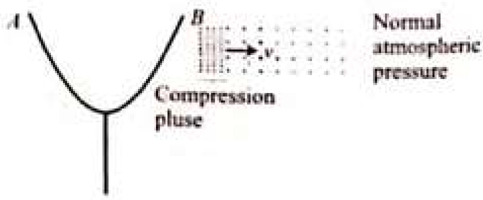
Sound waves travel through any material medium with a speed that depends on the properties of the medium. As sound waves travel through air, the elements of air vibrate to produce changes in density and pressure along the direction of motion of the wave. If the source of the sound waves vibrates sinusoidally, the pressure variations are also sinusoidal. The mathematical description of sinusoidal sound waves is very similar to that of sinusoidal waves on strings.

Propagation of Sound Waves

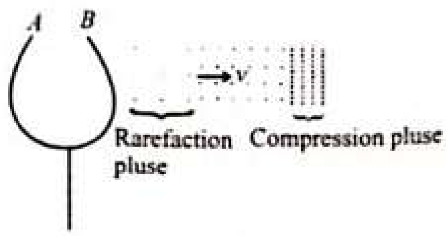
Consider a tuning fork producing sound waves. When prong B moves outward towards right it compresses the air in front of it, causing the pressure to rise slightly. The region of increased pressure is called a *compression pulse* and it travels away from the prong with the speed of sound.

After producing the compression pulse, prong B reverses its motion and moves inward. This drags away some air from the region in front of it, causing the pressure to dip slightly below the normal pressure. This region of decreased pressure is called a *rarefaction pulse*. Following immediately behind the compression pulse, the rarefaction pulse also travels away from the prong with the speed of sound.





If the prongs vibrate in SHM, the pressure variation in the layer close to the prong also varies simple harmonically and hence increase in pressure above normal value can be written as



$$\delta P = \delta P_0 \sin \omega t$$

where δP_0 is the maximum increase in pressure above normal value.

As this disturbance travels towards right with wave velocity v, the excess pressure at any position x at time t will be given

by
$$\delta P = \delta P_0 \sin[\omega(t - x/v)]$$
Using $\Delta p = \delta P$, $\Delta p_{max} = \delta P_0$, the above equation of sound wave can be written as
$$\Delta p = \Delta p_{max} \sin[\omega(t - x/v)]$$

Illustration 16.8 The equation of a sound wave in air is given by $\Delta p = (0.02) \sin[(3000)t - (9.0)x]$, where all variables are in SI units. (a) Find the frequency, wavelength and the speed of sound wave in air. (b) If the equilibrium pressure of air is 1.01×10^5 N/m^2, what are the maximum and minimum pressures at a point as the wave passes through that point?

Solution.

(a) Comparing with the standard form of a travelling wave,
$$\Delta p = \Delta p_{max} \sin[\omega(t - x/v)]$$
we see that $\omega = 3000$ s^{-1}. The frequency is
$$f = \frac{\omega}{2\pi} = \frac{3000}{2\pi} \text{ Hz}$$
Also from the same comparison,
$$\omega/v = 9.0 \text{ m}^{-1}$$
or $$v = \frac{\omega}{9.0 \text{ m}^{-1}} = \frac{3000 \text{ s}^{-1}}{9.0 \text{ m}^{-1}} = \frac{1000}{3} \text{ m/s}$$
The wavelength is
$$\lambda = \frac{v}{f} = \frac{1000/3 \text{ m/s}}{3000/2\pi \text{ Hz}} = \frac{2\pi}{9} \text{ m}$$

(b) The pressure amplitude is $\Delta p_{max} = 0.02$ N/m^2. Hence, the maximum and minimum pressures at a point in the wave motion will be $1.01 \times 10^5 \pm 0.02$ N/m^2.

Speed of Sound Waves

The speed of sound waves in a medium depends on the compressibility and density of the medium. If the medium is a liquid or a gas and has bulk modulus B and density ρ, the speed of sound waves in that medium is
$$v = \sqrt{\frac{B}{\rho}} \quad \text{(i)}$$
It is interesting to compare this expression with the equation for the speed of transverse waves on a string, $v = \sqrt{T/\mu}$. In both cases, the wave speed depends on an elastic property of the medium (bulk modulus B or string tension T) and on an inertial property of the medium (ρ or μ). In fact, the speed of all mechanical waves follows an expression of the general form
$$v = \sqrt{\frac{\text{Elastic property}}{\text{Inertial property}}}$$
For longitudinal sound waves in solid rod of material, for example, the speed of sound depends on Young's modulus Y and the density ρ.

Speed of Sound: Newton's Formula

On the basis of observations, Newton obtained a formula for speed of sound in air as
$$v = \sqrt{\frac{P}{\rho}} \quad \text{(i)}$$
where P is the isothermal elasticity of the air. He argued that when sound propagates through air, the temperature of air remains constant. By Newton's formula the speed of sound at one atmosphere is
$$V = \sqrt{\frac{1.013 \times 10^5}{1.29}} = 280 \text{ m/s}$$
This value is less than experimental value of 332 m/s. Hence Newton's formula requires some correction, which was made by Laplace in 1816.

Laplace's Correction

French scientist Laplace pointed out that when sound propagates in air the heat of the medium remains constant instead of its temperature. So he replaced isothermal elasticity by adiabatic elasticity B_{ad}. The corrected formula is
$$v = \sqrt{\frac{B_{ad}}{\rho}}$$
For adiabatic change, PV^{γ} = constant
Differentiating both sides, we get
$$P(\gamma V^{\gamma-1})\,dV + V^{\gamma}dP = 0$$
$$\Rightarrow \quad \gamma P dV + V dP = 0 \quad \text{or} \quad \frac{dP}{\left(\frac{-dV}{V}\right)} = \gamma P$$
We have $$\frac{dP}{\left(\frac{-dV}{V}\right)} = B_{ad} \quad \therefore \quad B_{ad} = \gamma P \quad \text{(i)}$$
where $\gamma = C_p/C_v$ is the ratio of specific heats. Hence Laplace's formula for the speed of sound in air (gas) is
$$v = \sqrt{\frac{\gamma P}{\rho}} \quad \text{(ii)}$$
For air γ= 7/4, so the speed of sound in air at STP will be
$$v = \sqrt{\gamma}\sqrt{\frac{P}{\rho}} = \sqrt{\frac{7}{5}} \times 280 = 332 \text{ m/s}$$
This value is in very close agreement with the experimental value.

Factors Affecting Speed of Sound in Gas

Effect of Pressure

The speed of sound in a gas is given by
$$v = \sqrt{\frac{\gamma P}{\rho}}$$

We know that $PV = nRT = \frac{m}{M}RT$

At constant temperature, $P\Delta V = \frac{\Delta m}{M}RT$

$$\therefore \quad P = \frac{\Delta m}{\Delta V}\frac{RT}{M} \quad \text{or} \quad P = \rho\frac{RT}{M}$$

or $\quad \frac{P}{\rho} = \text{constant}$

Therefore, with the change in pressure, the density also changes in such proportion, so that p/ρ remains constant. Hence pressure has no effect on the speed of sound in a gas.

Effect of Density

For two gases of densities ρ_1 and ρ_2 at same pressure with ratios of specific heats γ_1 and γ_2,

$$\frac{v_1}{v_2} = \sqrt{\frac{\gamma_1}{\gamma_2} \times \frac{\rho_2}{\rho_1}}$$

Effect of Temperature

We have, $\frac{P}{\rho} = \frac{RT}{M}$

$$\therefore \quad v = \sqrt{\frac{\gamma RT}{M}} \quad \text{Clearly,} \quad v \propto \sqrt{T}$$

Hence the speed of sound in a gas is proportional to the square root of its absolute temperature.

ILLUSTRATION 16.9 Calculate the velocity of sound in air at NTP. The density of air at NTP is 1.29 g/L. Assume air to be diatomic with $\gamma = 1.4$. Also calculate the velocity of sound in air at 27°C.

Solution. Velocity of sound in air is given by

$$v = \sqrt{\frac{\gamma P}{\rho}} = \sqrt{\frac{1.4 \times 1.013 \times 10^5 \text{ N/m}^2}{1.29 \text{ kg/m}^3}} = 331.6 \text{ m/s}$$

$$\left(\text{using } \frac{P}{\rho} = \frac{R}{M}T\right)$$

We can see that the velocity of sound is proportional to the square root of absolute temperature. Hence,

$$\frac{v_2}{v_1} = \sqrt{\frac{T_2}{T_1}} \quad \Rightarrow v_2 = v_1\sqrt{\frac{T_2}{T_1}} = 331.6\sqrt{\frac{273+27}{273}} = 347.6 \text{ m/s}$$

ILLUSTRATION 16.10 Taking the composition of air to be 75% of nitrogen and 25% of oxygen by weight, calculate the velocity of sound through air.

Solution. The molecular weight of a mixture is given by

$$\frac{m_1 + m_2 + m_3 + \cdots}{M} = \frac{m_1}{M_1} + \frac{m_2}{M_2} + \frac{m_3}{M_3} + \cdots$$

$$\therefore \quad \frac{75+25}{M} = \frac{75}{28} + \frac{25}{32}$$

or $\quad M = 28.9$ g

$$\therefore \quad c = \sqrt{\gamma\frac{RT}{M}} = \sqrt{\frac{1.4 \times 8.3 \times 1000 \times 273}{28.9}} = 331.3 \text{ m/s}$$

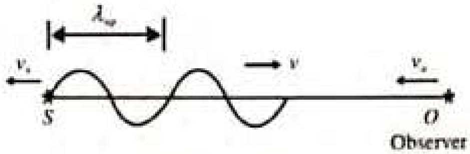
Here $\gamma = 1.4 \rightarrow$ as both the gases are diatomic.

DOPPLER EFFECT

When a car at rest on a road sounds its high frequency horn and you are also standing on the road nearby, you will hear the sound of same frequency it is sounding but when the car approaches you with its horn sounding, the pitch (frequency) of its sound seams to drop as the car passes. This phenomenon was first described by the Austrian scientist Christien Doppler and is called the Doppler effect.

Moving Source and Moving Observer

Let us consider the situation when both source and observer are moving in same direction as shown in figure at speeds v_s and v_0, respectively.



In this case, the apparent wavelength emitted by the source behind it is given as

$$\lambda_{ap} = \frac{v + v_S}{n_0} \quad \text{...(i)}$$

Now, this wavelength will approach the observer at relative speed $v + v_0$. Thus the apparent frequency of sound heard by the observer is given as

$$n_{ap} = \frac{v + v_o}{\lambda_{ap}} = n_0\left(\frac{v + v_o}{v + v_s}\right) \quad \text{...(ii)}$$

By looking at the expression of apparent frequency given by Eq. (ii), we can easily develop a general relation for finding the apparent frequency heard by a moving observer due to moving source as

$$n_{ap} = n_0\left[\frac{v \pm v_o}{v \pm v_s}\right] \quad \text{...(iii)}$$

Here + and – signs are chosen according to the direction of motion of source and observer. The sign convention related to the direction of motion can be stated as follows:

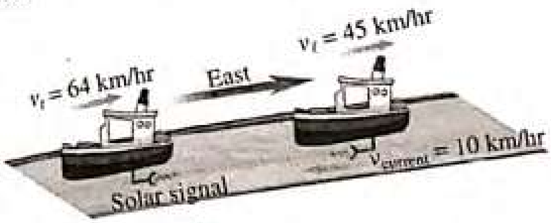
i. For both source and observer, v_0 and v_s are taken in Eq. (iii) with –ve sign if they are moving in the direction of v, i.e., the direction of propagation of sound from source to observer.

ii. For both source and observer, v_o and v_s are taken in Eq. (iii) with +ve sign if they are moving in the direction

opposite to v, i.e., opposite to the direction of propagation of sound from source to observer.

ILLUSTRATION 16.11 Two ships are moving along a line due east. The trailing ship has a speed relative to land-based observation point of 64.0 km/h, and the leading ship has a speed of 45.0 km/h relative to that point. The two ships are in a region of the ocean where the current is moving uniformly due west at 10.0 km/h. The trailing ship transmits a sonar signal at a frequency of 1200.0 Hz. What frequency is monitored by the leading ship? Use 1520 m/s as the speed of sound in ocean water.

Solution.



When the observer is moving in front of and in the same direction as the source, the Doppler equation becomes

$$f' = \left(\frac{v+(-v_l)}{v-v_t}\right)f$$

where v_l and v_t are the speeds of the leading and trailing ships measured relative to the medium in which the sound is propagated. In this case the ocean current is opposite to the direction of travel of the ships and

$$v_l = 45.0 \text{ km/h} - (-10.0 \text{ km/h}) = 55.0 \text{ km/h} = 15.3 \text{ m/s}$$
$$v_t = 64.0 \text{ km/h} - (-10.0 \text{ km/h}) = 74.0 \text{ km/h} = 20.6 \text{ m/s}$$

Therefore,

$$f' = (1200 \text{ Hz})\left(\frac{1520 \text{ m/s} - 15.3 \text{ m/s}}{1520 \text{ m/s} - 20.6 \text{ m/s}}\right) = 1204 \text{ Hz}$$

Doppler Effect in Reflected Sound

When a car is moving towards a stationary wall as shown in figure. If the car sounds a horn, wave travels towards the wall and is reflected form the wall. When the reflected wave is heard by the driver, it appears to be of relatively high pitch. If we wish to measure the frequency of reflected sound then the problem must be handled in two steps.

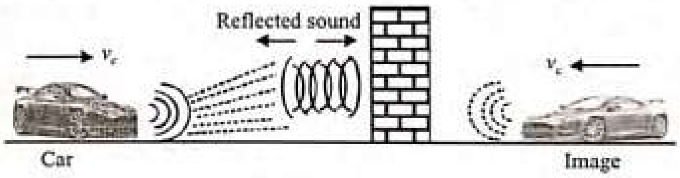
First, we treat the stationary wall as a stationary observer and car as a moving source of sound of frequency n_0. In this case, the frequency received by the wall is given as

$$n_1 = n_0\left(\frac{v}{v-v_c}\right)$$

Now, the wall reflects this frequency and behaves like a stationary source of sound of frequency n_1 and car (driver) behaves like a moving observer moving with velocity v_c. Here the apparent frequency heard by the car driver can be given as

$$n_{ap} = n_1\left(\frac{v+v_c}{v}\right)$$
$$= n_0\left(\frac{v}{v-v_c}\right)\times\left(\frac{v+v_c}{v}\right) = n_0\left(\frac{v+v_c}{v-v_c}\right)$$

Same problem can also be solved in a different manner by using method of sound images. In this procedure, we assume the image of the sound source behind the reflector. In previous example, we can explain this by a situation shown in figure.



Here we assume that the sound which is reflected by the stationary wall is coming from the image of car which is at

Some Important Cases of Doppler Effect

Situation	Apparent frequency	Apparent wavelength
$S \xrightarrow{v_s}$ $\quad O \xrightarrow{v_o}$ $\quad \xrightarrow{} v$	$f' = f\left(\frac{v-v_o}{v-v_s}\right)$	$\lambda' = \frac{(v-v_s)}{f} = \lambda\left(\frac{v-v_s}{v}\right)$
$\xrightarrow{} v$ $\quad \xrightarrow{v_s}$ $\quad \xleftarrow{v_o}$	$f' = f\left(\frac{v+v_o}{v-v_s}\right)$	$\lambda' = \lambda\left(\frac{v-v_s}{v}\right)$
$\xrightarrow{} v$ $\quad \xleftarrow{v_s}$ $\quad \xrightarrow{v_o}$	$f' = f\left(\frac{v-v_o}{v+v_s}\right)$	$\lambda' = \lambda\left(\frac{v+v_s}{v}\right)$
$\xrightarrow{} v$ $\quad \xleftarrow{v_s}$ $\quad \xleftarrow{v_o}$	$f' = f\left(\frac{v+v_o}{v+v_s}\right)$	$\lambda' = \lambda\left(\frac{v+v_s}{v}\right)$

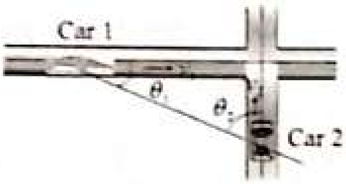
the back of it and coming towards it with velocity v_r. Now the frequency of sound heard by car driver can directly be given as

$$n_{ap} = n_0 \left[\frac{v + v_r}{v - v_r}\right]$$

This method of images for solving problem of Doppler effect is very convenient but is used only for velocities of source and observer which are very small compared to the speed of sound and it should not be used frequently when the reflector of sound is moving.

Doppler's Effect When Source and Observer are not in Same Line of Motion

Consider the situation shown in figure. Two cars 1 and 2 are moving along perpendicular roads at speeds v_1 and v_2. When car 1 sounds a horn of frequency n_0, it emits sound in all directions and say car 2 is at the position, shown in figure when it receives the sound. In such cases, we use velocity components of the cars along the line joining the source and observer. Thus, the apparent frequency of sound heard by car 2 can be given as



$$n_{ap} = n_0 \left[\frac{v + v_2 \cos\theta_2}{v - v_1 \cos\theta_1}\right] \qquad \text{(xiii)}$$

ILLUSTRATION 16.12 A train approaching a railway crossing at a speed of 120 km/h sounds a short whistle at frequency 640 Hz when it is 300 m away from the crossing. The speed of sound in air is 340 m/s. What will be the frequency heard by a person standing on a road perpendicular to the track through the crossing at a distance of 400 m from the crossing?

Solution. The observer A is at rest with respect to the air and the source is travelling at a velocity of 120 km/h, i.e., (100/3) m/s. As is clear from the figure, the person receives the sound of the whistle in a direction BA making an angle θ with the track where $\cos\theta = 300/500 = 3/5$. The component of the velocity of the source (i.e., of the train) along the direction AB is (100/3) × (3/5) m/s = 20 m/s. As the source is approaching the person with this component, the frequency heard by the observer is

$$n' = \frac{v}{v - u\cos\theta}\, n = \frac{340}{340 - 20} \times 640 \text{ Hz} = 680 \text{ Hz}$$

NOTE: Suppose a source of sound moves towards a stationary observer with a speed v'. Then the observed frequency is

$$f' = f\left(\frac{v}{v - v'}\right)$$

Now if the observer moves towards the stationary source with the same speed v', then the observed frequency is

$$f'' = f'\left(\frac{v + v'}{v}\right)$$

From the above equation, it is clear that the observed frequency in two cases is different, although the relative speed between them is same. For this season, the Doppler effect in sound is said to be asymmetric. However, the Doppler effect in light is symmetric. This is because the observed frequency or wavelength depends only on relative speed between source and observer.

CONCEPT APPLICATION EXERCISE 16.3

1. A source of sound with frequency 1000 Hz moves at right angles to a wall with a velocity u = 17 cm/s. Two stationary receivers R_1 and R_2 are located on a straight line coinciding with the path of the source in the following succession: R_1 → source → R_2 → wall. Which receiver registers beating and what is the beat frequency? The velocity of sound is c = 340 m/s.
2. A whistle of frequency 540 Hz rotates in a horizontal circle of radius 2 m at an angular speed of 15 rad/s. What is the lowest and the highest frequency heard by a listener a long distance away at rest with respect to the centre of the circle? (Velocity of sound in air is c = 330 m/s.)
3. A bat flies perpendicularly towards a wall with a speed of 6 m/s, emitting sound of frequency 450 kHz. What is the frequency of the wave reflected from the wall that it will hear? Given, c = 340 m/s.
4. The ratio of the apparent frequencies of a car when approaching and receding a stationary observer is 11:9. What is the speed of the car, if the velocity of sound in air is 330 m/s?
5. A whistle emitting a sound of frequency 440 Hz is tied to a string of 1.5 m length and rotated with an angular velocity of 20 rad/s in the horizontal plane. Calculate the range of frequencies heard by an observer stationed at a large distance from the whistle (speed of sound is 330 m/s).
6. A siren emitting a sound of frequency 2000 Hz moves away from you towards a cliff at a speed of 8 m/s.
   (a) What is the frequency of the sound you hear coming directly from the siren.
   (b) What is the frequency of sound you hear reflected off the cliff. Speed of sound in air is 330 m/s.

SUPERPOSITION AND INTERFERENCE

If two or more travelling waves are moving through a medium, the resultant value of the wave function at any point is the algebraic sum of the values of the wave function of the individual waves.

In other words, the wave function $y(x, t)$ that describes the resulting motion in this situation is obtained by adding the two wave functions for the two separate waves:

$y(x, t) = y_1(x, t) + y_2(x, t)$

Waves that obey this principle are called linear waves. In the case of mechanical wave, linear waves are generally characterized by having amplitudes much smaller than their wavelengths. Waves that violate the superposition principle are called non-linear waves and are often characterized by large amplitudes. In this book, we deal only with linear waves.

One consequence of the superposition principle is that two travelling waves can pass through each other without being destroyed or even altered. For instance, when two pebbles are thrown into a pond and hit the surface at different locations, the expanding circular surface waves from the two locations do not destroy each other but rather pass through each other. The resulting complex pattern can be viewed as two independent sets of expanding circles.

Superposition of Sinusoidal Waves

Let us now apply the principle of superposition to two sinusoidal waves travelling in the same direction in a linear medium. If the two waves are travelling to the right and have the same frequency, wavelength, and amplitude but differ in phase, we can express their individual wave functions as

$$y_1 = A\sin(kx - \omega t),\quad y_2 = A\sin(kx - \omega t + \phi)$$

where, as usual $k = 2\pi/\lambda$, $\omega = 2\pi f$, and ϕ is the phase constant. Hence, the resultant wave function y is

$$y = y_1 + y_2 = A[\sin(kx - \omega t) + \sin(kx - \omega t + \phi)]$$

To simplify this expression, we use the trigonometric identity

$$\sin a + \sin b = 2\cos\left(\frac{a-b}{2}\right)\sin\left(\frac{a+b}{2}\right)$$

Letting $a = kx - \omega t$ and $b = kx - \omega t + \phi$, we find that the resultant wave function y reduces to

$$y = 2A\cos\left(\frac{\phi}{2}\right)\sin\left(kx - \omega t + \frac{\phi}{2}\right)$$

The result has several important features.

The resultant wave function y is also sinusoidal and has the same frequency and wavelength as the individual waves because the sine function incorporates the same values of k and ω that appear in the original wave functions.

ILLUSTRATION 16.13 Two travelling sinusoidal waves described by the wave functions

$$y_1 = (5.00\text{ m})\sin[\pi(4.00x - 1200t)]$$

and

$$y_2 = (5.00\text{ m})\sin[\pi(4.00x - 1200t - 0.250)]$$

where x, y_1 and y_2 are in metres and t is in seconds. (a) what is the amplitude of the resultant wave? (b) What is the frequency of resultant wave?

Solution. Graphs for these wave functions are like continuous sine curves. Think of water waves produced by continuously vibrating pencils on the water surface and seen through the side wall of an aquarium.

The pair of waves travelling in the same direction, perhaps separately created, combine to give a single travelling wave.

We can represent the waves symbolically as

$$y_1 = A_0\sin(kx - \omega t)\quad\text{and}\quad y_2 = A_0\sin(kx - \omega t - \phi)$$

with $A_0 = 5.00$ m, $\omega = 1200\pi\ \text{s}^{-1}$ and $\phi = 0.250\pi$ rad

According to the principle of superposition, the resultant wave function has the form

$$y = y_1 + y_2 = 2A_0\cos\left(\frac{\phi}{2}\right)\sin\left(kx - \omega t - \frac{\phi}{2}\right)$$

(a) with amplitude $A = 2A_0\cos\left(\frac{\phi}{2}\right)$

$$= 2(5.00)\cos\left(\frac{\pi}{8.00}\right) = 9.24\text{ m}$$

(b) and frequency $\phi = \frac{\omega}{2\pi} = \frac{1200\pi}{2\pi} = 600$ Hz

Interference of Waves

Mathematical Analysis of Interference

Consider two harmonic waves of same frequency (coherent waves). Suppose A_1 and A_2 be the amplitudes of the waves and ϕ is the phase difference between them. It is assumed that the waves are plane and move almost along a line. Thus wave equations are

$$y_1 = A_1\sin(kx - \omega t) \quad \text{(i)}$$

or $$y_2 = A_2\sin(kx - \omega t + \phi) \quad \text{(ii)}$$

here $\phi = \left(\frac{2\pi}{\lambda}\right)\Delta x$

$$y = y_1 + y_2$$
$$= A_1\sin(kx - \omega t) + [A_2\sin(kx - \omega t)\cos\phi + A_2\cos(kx - \omega t)\sin\phi]$$
$$= (A_1 + A_2\cos\phi)\sin(kx - \omega t) + A_2\sin\phi\cos(kx - \omega t)$$

Let $A_1 + A_2\cos\phi = R\cos\theta$ (iii)

and $A_2\sin\phi = R\sin\theta$ (iv)

Squaring and adding Eqs. (iii) and (iv), we get

$$R^2 = A_1^2 + A_2^2 + 2A_1A_2\cos\phi \quad \text{(v)}$$

As $I \propto A^2$, $\therefore I = I_1 + I_2 + 2\sqrt{I_1I_2}\cos\phi$ (vi)

Also $$\tan\theta = \frac{A_2\sin\phi}{A_1 + A_2\cos\phi} \quad \text{(vii)}$$

The resultant wave becomes

$$y = R\sin[(kx - \omega t) + \theta] \quad \text{(viii)}$$

clearly the resultant wave has the same frequency and speed as the interfering waves

Types of Interferences

i. **Constructive interference:** For constructive interference the resultant intensity will be greater than the sum of the individual intensities of the waves. For maximum intensity using Eq. (vi), we get

$$\cos\phi = 1$$

or $\phi = 2\pi n$, when $n = 0, 1, 2, 3, \ldots$

As 2π phase difference is equal to a path difference λ, so

$\Delta x = n\lambda$

Thus from Eq. (v) $R_{max} = A_1 + A_2$

ii. Destructive interference: If two waves are moving to the medium such that they are out of phase. The resultant amplitude of the wave may be less than the sum of individual amplitudes of the waves. For minimum amplitude using Eq. (v)

$\cos\phi = -1$

or $\phi = (2n-1)\pi$, where $n = 1, 2, 3, \ldots$

and $\Delta x = (2n-1)\lambda/2$

Thus from Eq. (v)

$R_{min} = A_1 - A_2$

The ratio of maximum to minimum intensities

$$\frac{I_{max}}{I_{min}} = \frac{(A_1 + A_2)^2}{(A_1 - A_2)^2} = \frac{\left(\sqrt{I_1} + \sqrt{I_2}\right)^2}{\left(\sqrt{I_1} - \sqrt{I_2}\right)^2} \quad \text{(ix)}$$

NOTE: The distance between maximum and next minima = l/2.

Conditions of sustained interference: Mathematically, interference phenomenon can take place between two waves of same frequency and different amplitudes. But for observable interference, the amplitude of the waves should be equal. In this case,

$A_1 = A_2 = A$

$\therefore \quad R^2 = A^2 + A^2 + 2AA\cos\phi$

or $\quad R^2 = 2A^2(1 + \cos\phi) = 2A^2 \times 2\cos^2\dfrac{\phi}{2}$

$$R^2 = 4A^2\cos^2\frac{\phi}{2} \quad \text{(x)}$$

Write $R^2 = I$ and $4A^2 = I_0$

$$\therefore \quad I = I_0\cos^2\frac{\phi}{2} \quad \text{(xi)}$$

From Eq. (xi), the maximum intensity is $4A^2$ and minimum intensity is zero. In the phenomenon of interference, the energy is not destroyed but is only redistributed from the positions of minimum intensity to those of maximum intensity.

ILLUSTRATION 16.14 Two identical sources of sound S_1 and S_2 produce intensity I_0 at a point P equidistant from each source.

i. Determine the intensity of each source at the point P.
ii. If the power of S_1 is reduced to 64% and phase difference between the two sources is varied continuously, then determine the maximum and minimum intensities at the point P.
iii. If the power of S_1 is recued by 64%, then determine the maximum and minimum intensities at the point P.

Solution.

i. Both the sources produce maximum at the point P.

Thus, $I_{max} = I_0 = \left(\sqrt{I_1} + \sqrt{I_2}\right)^2$

Since the sources are identical, therefore, $I_1 = I_2 = I$.

$I_0 = 4I$ or $I = I_0/4$

ii. Now $I_1 = 0.64\,I = 0.16\,I_0$

And $I_2 = I = 0.25\,I_0$

$I_{max} = \left(\sqrt{I_1} + \sqrt{I_2}\right)^2 = 0.81 I_0$

$I_{min} = \left(\sqrt{I_1} - \sqrt{I_2}\right)^2 = 0.01 I_0$

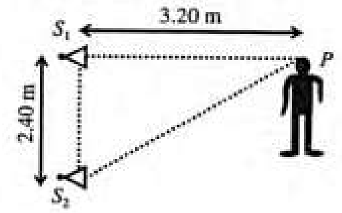
iii. Now $I_1 = (1 - 0.64)I_0 = 0.36\,I = 0.09 I_0$

And $I_2 = I = 0.25\,I_0$

$I_{max} = \left(\sqrt{I_1} + \sqrt{I_2}\right)^2 = 0.64 I_0$

$I_{min} = \left(\sqrt{I_1} - \sqrt{I_2}\right)^2 = 0.04 I_0$

ILLUSTRATION 16.15 Two stereo speakers S_1 and S_2 are separated by a distance of 2.40 m. A person (P) is at a distance of 3.20 m directly in front of one of the speakers as shown in figure. Find the frequencies in the audible range (20–20,000 Hz) for which the listener will hear a minimum sound intensity. Speed of sound in air = 320 m/s.



Solution. Waves from S_1 to S_2 reach at point P.

Therefore, the path difference between waves reaching from S_1 to S_2 will be $\Delta = S_2P - S_1P$

Given $S_1P = 3.20$ m

$S_2P = \sqrt{(2.40)^2 + (3.20)^2} = 4.0$ m

$\therefore \quad \Delta = 4.0 - 3.20 = 0.80$

For minima, path difference

$$\Delta = (2r-1)\frac{\lambda}{2};\ r = 1, 2, 3, \ldots$$

We have $\lambda = v/n$, where n is the frequency

$$\Delta = (2r-1)\frac{v}{2n}$$

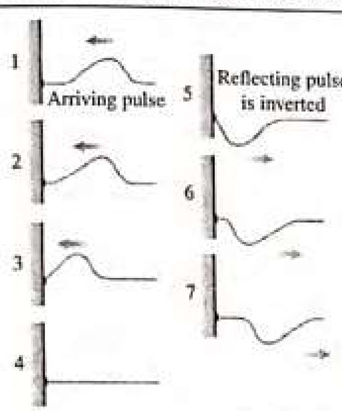
$$0.80 = (2r-1)\frac{v}{2n}$$

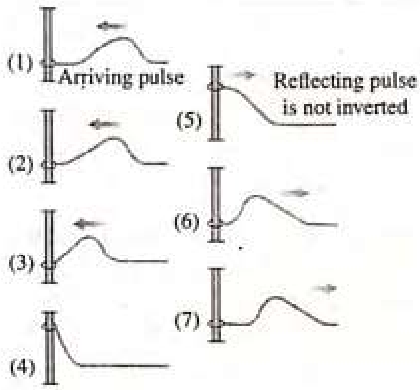
Frequency $n = \dfrac{(2r-1)v}{2 \times 0.80} = (2r-1)\dfrac{320}{1.6}$ Hz $= (2r-1)200$ Hz

Therefore, the required frequencies are $n = (2r - 1) \times 200$ with $r = 1, 2, \ldots 50$.

Putting the values of r in the above equation, we get
n = 200 Hz, 600 Hz, 1000 Hz, 1400 Hz, 1800 Hz, ..., 19800 Hz

REFLECTION OF WAVES AT FIXED AND FREE ENDS

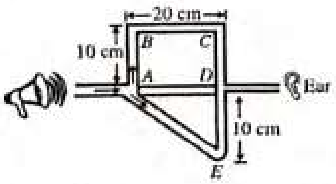
Reflection of Waves—Fixed End	Reflection of Waves—Free End
• When the wave reaches the fixed end it exerts an upward pull on the end. According to Newton's third law, the fixed point exerts an equal and opposite force downward on the string. Thus, there is phase change of π for the reflected wave, the wave is inverted as shown in the figure. • Whenever a travelling wave reaches a boundary, some or all of the wave is reflected. • When it is reflected from a fixed end, the wave is inverted.	• If the end of the string is free to move vertically, the free end overshoots twice the amplitude as shown in figure. • When a travelling wave reaches a boundary, all or part of it is reflected. • When reflected from a free end, the pulse is not inverted.
	




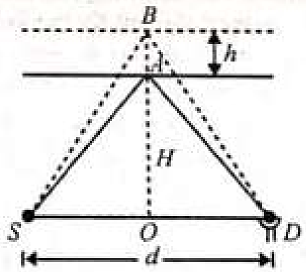
CONCEPT APPLICATION EXERCISE 16.4

1. Find the resultant amplitude and the phase difference between the resultant wave and the first wave, in the event the following waves interfere at a point;
$y_1 = (3\text{ cm})\sin\omega t$,
$$y_2 = (4\text{ cm})\sin\left(\omega t + \frac{\pi}{2}\right);\ y_3 = (5\text{cm})\sin(\omega t + \pi)$$

2. Figure shows a tube structure in which signal is sent from one end and is received at the other end. The frequency of the sound source can be varied electronically between 2000 and 5000 Hz. Find the frequencies at which maxima of intensity are detected. The speed of sound in air 340 m/s.



3. A source and a detector D of high frequency waves are a distance d apart on the ground. Maximum signal is received at D when the reflecting layer is at a height H. When the layer rises a distance h, no signal is detected at D. Neglecting absorption in the atmosphere, find the relation between d, h, H, and the wavelength λ of the waves.



4. Two waves have the same frequency. The first has intensity I_0. The second has intensity $4I_0$ and lags behind the first in phase by $\pi/2$. When they meet, find the resultant intensity, and the phase relationship of the resultant wave with the first wave.

5. Determine the amplitude of the resultant motion when two sinusoidal waves of same frequency, travelling in the same direction are combined. Their amplitudes are 3.0 cm and 4.0 cm and they differ in phase by $\pi/2$ radians.

6. In a large room, a person receives direct sound waves from a source 120 m away. He also receives waves from the same source which reach him after being reflected from the 5-m high ceiling at a point halfway between them. For which wavelengths will these two sound waves interfere constructively?

STATIONARY WAVES

In this situation, two identical waves travel in opposite directions in the same medium as shown in figure. These waves combine in accordance with the wave in interference model.

We can analyse such a situation by considering wave functions for two transverse sinusoidal waves having the same amplitude, frequency, and wavelength but travelling in opposite directions in the same medium. Consider two waves

$$y_1 = A\sin(kx - \omega t) \quad \text{and} \quad y_2 = A\sin(kx + \omega t)$$

where y_1 represents a wave travelling in the $+x$-direction and y_2 represents one travelling in the $-x$-direction. Adding these two functions gives the resultant wave function y.

$$y = y_1 + y_2 = A\sin(kx - \omega t) + A\sin(kx + \omega t)$$

When we use the trigonometric identity

$\sin(a \pm b) = \sin(a)\cos(b) \pm \cos(a)\sin(b)$,

this expression reduces to

$$y = (2A\sin kx)\cos\omega t \qquad \text{(i)}$$

Notice that Eq. (i) does not contain a function $kx - \omega t$. Therefore, it is not an expression for a single travelling wave. When you observe a standing wave, there is no sense of motion in the direction of propagation of either original wave. comparing Eq. (i) with equation $x(t) = A\cos(\omega t + \phi)$, we see that it describes a special kind of simple harmonic motion. Every element of the medium oscillates in simple harmonic motion with the same angular frequency ω (according to the $\cos\omega t$ factor in the equation). The amplitude of the simple harmonic motion of a given element (given by the factor $2A\sin kx$, the coefficient of the cosine function) depends on the location x of the element in the medium. However, the amplitude of the simple harmonic motion of an element of the medium has a minimum value of zero when x satisfies the condition $\sin kx = 0$, that is, when

$kx = 0, \pi, 2\pi, 3\pi$

because $k = 2\pi/\lambda$, these values for kx give

$$x = 0, \frac{\lambda}{2}, \lambda, \frac{3\lambda}{2}, \ldots = \frac{n\lambda}{2}$$

$$n = 0, 1, 2, 3, \ldots \qquad \text{(ii)}$$

These points of zero amplitude are called nodes.

The element of the medium with the greatest possible displacement from equilibrium has an amplitude of $2A$. The positions in the medium at which this maximum displacement occurs are called antinodes. The antinodes are located at positions for which the coordinate x satisfies the condition $\sin kx = \pm 1$, that is, when

$$kx = \frac{\pi}{2}, \frac{3\pi}{2}, \frac{5\pi}{2}, \ldots$$

Therefore, the positions of the antinodes are given by

$$x = \frac{\lambda}{4}, \frac{3\lambda}{4}, \frac{5\lambda}{4}, \ldots = \frac{n\lambda}{4}$$

$n = 1, 3, 5, \ldots$

Characteristics of Stationary Waves

i. In a stationary wave, the disturbance does not move in any direction. The conditions of crests and troughs merely appear and disappear in fixed positions to be followed by opposite conditions after every $T/2$.

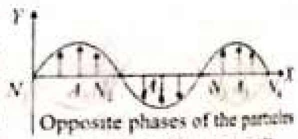
ii. All the particles of the medium, except those at nodes, execute simple harmonic motion with the particle of the wave about their mean position.

iii. During the formation of a stationary wave, the medium is broken into loops between equally spaced points called nodes which remain at rest and in between them are points of maximum displacement called antinodes.

iv. The amplitude of the particles are different at different points. The amplitude varies gradually from zero at the nodes to the maximum at the antinodes.

v. The maximum velocity is different at different points. Its value is zero at the nodes and gradually increases towards the antinodes. All the particles attain their maximum velocities simultaneously when they pass through their mean positions.

vi. All the particles in a particular segment between two nodes vibrate in the same phase but the particles in the neighbouring segments vibrate in opposite phases, as shown in figure.



Opposite phases of the particles in consecutive segments

vii. The energy becomes alternately wholly potential and wholly kinetic twice in each cycle. It is wholly potential when particles are at their positions of maximum displacement and wholly kinetic when the particle pass through the mean positions.

viii. A stationary wave has the same wavelength and time period as the component waves.

ix. The distance between two consecutive nodes and antinodes is $\lambda/2$. The distance between nodes and next antinode is $\lambda/4$.

ILLUSTRATION 16.16 Two travelling waves of equal amplitudes and equal frequencies move in opposite direction along a string. They interfere to produce a standing wave having the equation.

$$y = A\cos kx \sin\omega t$$

in which $A = 1.0$ mm, $k = 1.57\ \text{cm}^{-1}$ and $\omega = 78.5\ \text{s}^{-1}$. (a) Find the velocity and amplitude of the component travelling waves. (b) Find the node closest to the origin in the region $x > 0$. (c) Find the antinode closest to the origin in the region $x > 0$. (d) Find the amplitude of the particle at $x = 2.33$ cm.

Solution.

(a) The standing wave is formed by the superposition of the waves

$$y_1 = \frac{A}{2}\sin(\omega t - kx) \quad \text{and} \quad y_2 = \frac{A}{2}\sin(\omega t + kx)$$

The wave velocity (magnitude) of either of the waves is

$$v = \frac{\omega}{k} = \frac{78.5\ s^{-1}}{1.57\ cm^{-1}} = 50\ cm/s; \quad \text{Amplitude} = 0.5\ mm$$

(b) For a node, $\cos kx = 0$.
The smallest positive x satisfying this relation is given by

$$kx = \pi/2$$

or $$x = \frac{\pi}{2k} = \frac{3.14}{2 \times 1.57\ cm^{-1}} = 1\ cm$$

(c) For an antinode, $|\cos kx| = 1$.
The smallest positive x satisfying this relation is given by

$$kx = \pi$$

or, $$x = \frac{\pi}{k} = 2\ cm$$

(d) The amplitude of vibration of the particle at x is given by $|A \cos kx|$. For the given point,

$$kx = (1.57\ cm^{-1})\ (2.33\ cm)$$

$$= 1.57\left[2 + \frac{1}{3}\right] = \pi + \frac{\pi}{6} = \frac{7\pi}{6}$$

Thus, the amplitude will be

$$(1.0\ mm)\ |\cos(\pi + \pi/6)| = \frac{\sqrt{3}}{2}\ mm = 0.86\ mm$$

Standing Waves in a String Fixed at Both Ends

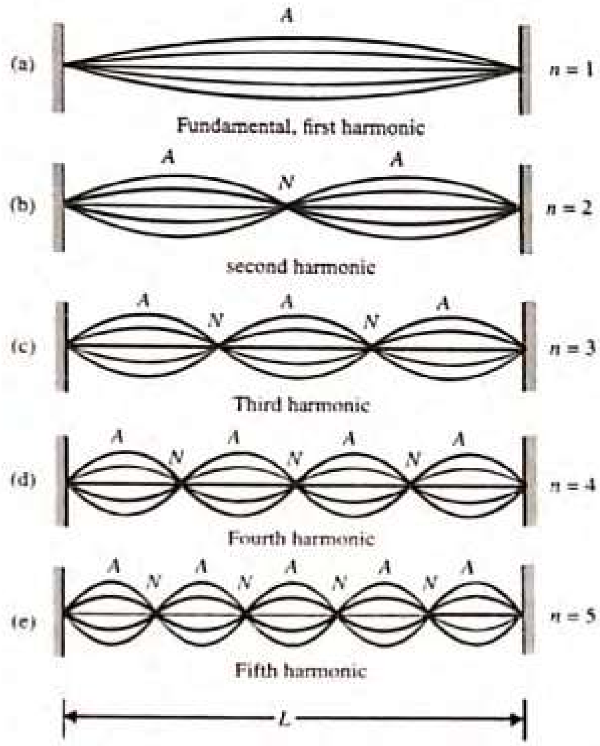
The first normal mode that is consistent with these requirements, shown in Figure (a), has nodes at its ends and one antinode in the middle. This normal mode is the longest wavelength mode that is consistent with our boundary conditions. The first normal mode occurs when the wavelength $\lambda_1 = 2L$. The section of a standing wave from one node to the next node is called a loop. In the first normal mode, the string is vibrating in one loop. In the second normal mode (Figure (b)) the string vibrates in two loops. In this case, the wavelength λ_2 is equal to the length of the string, as expressed by $\lambda_2 = L$. The third normal mode (Figure (c)) corresponds to the case in which $\lambda_3 = 2L/3$ and our string vibrates in three loops. In general, the wavelengths of the various normal modes for a string of length L fixed at both ends are

$$\lambda_n = \frac{2L}{n}; \quad n = 1, 2, 3, \ldots \tag{iv}$$

where the index n refers to the nth normal mode of oscillation. These modes are the possible modes of oscillation for the string. The actual modes that are excited on a string are discussed shortly.

The natural frequencies associated with the modes of oscillation are obtained from the relationship $f = v/\lambda$, where the wave speed v is same for all frequencies. Using Eq. (iv), we find that the natural frequencies f_n of the normal modes are

$$f_n = \frac{v}{\lambda_n} = n\frac{v}{2L}; \quad n = 1, 2, 3 \tag{v}$$



These natural frequencies are also called the quantized frequencies associated with the vibrating string fixed at both ends.

Because $v = \sqrt{T/\mu}$ for waves on a string, where T is the tension in the string and μ is its linear mass density, we can also express the natural frequencies of a taut string as

$$f_n = \frac{n}{2L}\sqrt{\frac{T}{\mu}}; \quad n = 1, 2, 3, \ldots \tag{vi}$$

The lowest frequency ϕ_1, which corresponds to $n = 1$, is called either the fundamental frequency or the first harmonic and is given by

$$f_1 = \frac{1}{2L}\sqrt{\frac{T}{\mu}}; \quad n = 1, 2, 3, \ldots \tag{vii}$$

The frequencies of the remaining normal modes are integer multiples of the fundamental frequencies of normal modes that exhibit an integer multiple relationship such as this form a harmonic series, and the normal modes are called harmonics. The fundamental frequency f_1 is the frequency of the first harmonic, the frequency $f_2 = 2f_1$ is the frequency of the second harmonic, and the frequency $f_n = nf_1$ is the frequency of the nth harmonic.

Sonometer

It is a device used to measure velocity of transverse mechanical wave in a stretched metal wire. The principle of sonometer is based on resonance of string vibrations. Working oscillations are induced in a clamped string by an external source like a tuning fork or an oscillator and the corresponding oscillations

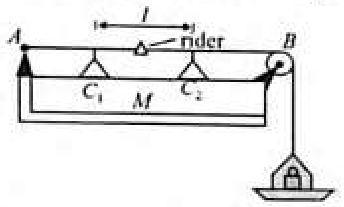
in string will become stronger when resonance takes place, i.e., the frequency of oscillation of source matches with any of the harmonic of the string vibration.

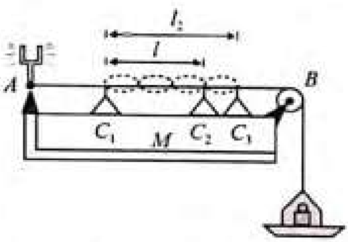
Figure shows basic structure and setup of a sonometer. It consists of a wooden box M on which a wire AB is stretched, by a hanging weight as shown in the figure. On sonometer box there are two clamps C_1 and C_2 placed which can slide under the wire to change the length of wire between the clamps.

When an oscillating turning fork is placed in contact with the sonometer wire as shown in figure some oscillations are transferred to the wire. If tension in wire is T and n_0 is the frequency of turning fork, the wavelength of wave in wire is

$$\lambda = \frac{v}{n_0} = \frac{1}{n_0}\sqrt{\frac{T}{\mu}} \qquad \text{(i)}$$

When the length between clamps is an integral multiple of $\lambda/2$ then stationary waves are established in the portion of wire between C_1 and C_2. To adjust this, clamp C_1 is fixed and C_2 is displaced so that a small rider (a piece of paper) on wire start jumping violently on wire and falls indicating that the oscillation amplitude of wire is increasing and stationary waves are established. Let in this situation the length between clamps be l_1. Now again C_2 is displaced away from C_1 so that again resonance is obtained. This will happen again when the clamp reaches the position C_3 and when next node of stationary waves is present as shown in figure. Let this length be l_2.





So we can say that if l_1 and l_2 are the two successive resonance lengths then we have

$$l_2 - l_1 = \frac{\lambda}{2}$$

So wavelength of wave is $\lambda = 2(l_2 - l_1)$.

As frequency n_0 of oscillating source is known, we can find the velocity of wave in wire as

$$v = n_0\lambda$$
$$= 2n_0(l_2 - l_1) \qquad \text{(ii)}$$

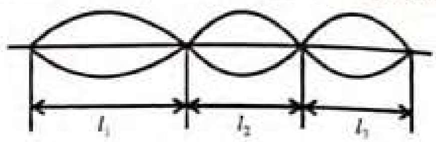
Equation (ii) gives the partially measured value of velocity of transverse waves in a stretched wire. This can be compared with the theoretical value of v given by $\sqrt{T/\mu}$.

ILLUSTRATION 16.17 The length of a sonometer wire between two fixed ends is 1.10 m. Where should the two bridges be placed to divide the wire into three segments whose fundamental frequencies are in the ratio of 1:2:3?

Solution. Let l_1, l_2, l_3 be the lengths of three segments. Given $l_1 + l_2 + l_3 = 1.10$

From relation $n = \dfrac{1}{2l}\sqrt{\left(\dfrac{T}{\mu}\right)}$

If tension T and mass per unit length μ are fixed, then $n \propto 1/l$



so nl = constant

$$n_1 l_1 = n_2 l_2 = n_3 l_3$$

$$\therefore \quad l_1 : l_2 : l_3 = \frac{1}{n_1} : \frac{1}{n_2} : \frac{1}{n_3} = \frac{1}{1} : \frac{1}{2} : \frac{1}{3} = \frac{6:3:2}{6} = 6:3:2$$

$\therefore \quad l_1 = 6k,\ l_2 = 3k,\ l_3 = 2k,\ k$ being a constant.

From Eq. (i)

$$6k + 3k + 2k = 1.10 \quad \text{or} \quad 11k = 1.10$$

$$\therefore \quad k = 1.10/11 = 0.1$$

$$\therefore \quad l_1 = 6 \times 0.1 = 0.6 \text{ m}$$
$$l_2 = 3 \times 0.1 = 0.3 \text{ m}$$
$$l_3 = 2 \times 0.1 = 0.2 \text{ m}$$

Therefore the bridges must be placed at distance 0.6 m and $(0.6 + 0.3) = 0.9$ m

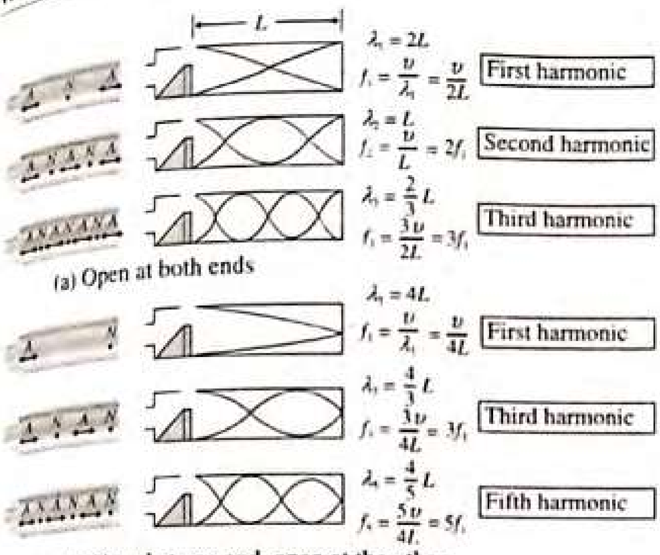
Standing Waves in Air Columns

The waves under boundary conditions model can also be applied to sound waves in a column of air such as that inside an organ pipe. Standing waves are the result of interference between longitudinal sound waves travelling in opposite directions.

In a pipe closed at one end, the closed end is a displacement node because the rigid barrier at this end does not allow longitudinal motion of the air. Because the pressure wave is 90° out of phase with the displacement wave, the closed end of an air column corresponds to a pressure antinode (that is, a point of maximum pressure variation).

The open end of an air column is approximately a displacement antinode and a pressure node. We can understand why no pressure variation occurs at an open end by noting that the end of the air column is open to the atmosphere; therefore, the pressure at this end must remain constant at atmospheric pressure.

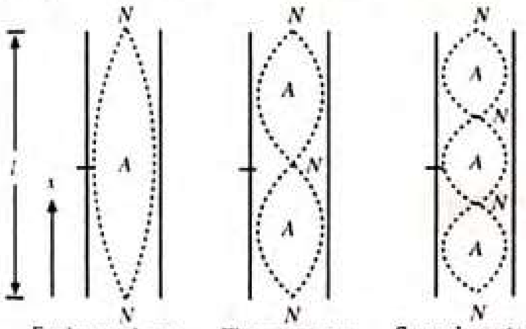
The first three normal modes of oscillation of a pipe open at both ends are shown in Figure (a). Notice that both ends are displacement antinodes (approximately). In the first normal mode, the standing wave extends between two adjacent antinodes, which is distance of half a wavelength. Therefore, the wavelength is twice the length of the pipe, and the fundamental frequency is $f_1 = v/2L$. As Figure (a) shows the frequencies of the higher harmonics are $2f_1, 3f_1, \ldots$



(b) Closed at one end, open at the other

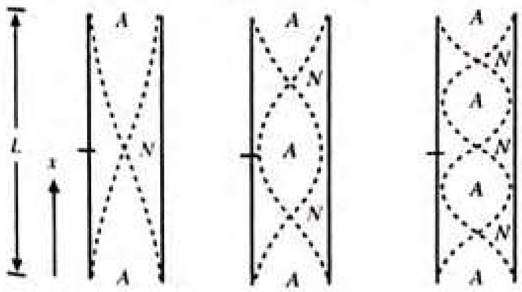
In a pipe open at both ends, the natural frequencies of oscillation form a harmonic series that includes all integral multiples of the fundamental frequency.

Because all harmonics are present and the fundamental frequency is given by the same expression as that for a string, we can express the natural frequencies of oscillation as



Fundamental note First overtone Second overtone

Various modes of vibration showing pressure nodes and antinodes.



Fundamental note First overtone Second overtone

Various modes of vibration showing displacement nodes and antinodes

$$f_n = n\frac{v}{2L} \quad \text{where } n = 1, 2, 3, \ldots \tag{i}$$

In a pipe closed at one end, the natural frequencies of oscillation form a harmonic series that includes only odd integral multiples of the fundamental frequency.

We express this result mathematically as

$$f_n = n\frac{v}{4L}; \quad n = 1, 3, 5, \ldots \tag{ii}$$

It is interesting to investigate what happens to the frequencies of instruments based on air columns and strings during a concert as the temperature rises. The sound emitted by a flute, for example, becomes sharp (increase in frequency) as the flute warms up because the speed of sound increases in the increasingly warmer air inside the flute (consider Eq. (i)). The sound produced by a violin becomes flat (decrease in frequency) as the string thermally expand and the expansion causes their tension to decrease.

ILLUSTRATION 16.18 Find the number of possible natural oscillations of air column in a pipe frequencies of which lie below $\nu_0 = 1250$ Hz. The length of the pipe is $l = 85$ cm. The velocity of sound is $v = 340$ m/s. Consider two cases

i. the pipe is closed from one end,
ii. the pipe is open from both ends.

Solution.

First Method

i. **Pipe is closed from one end:** An air column in a pipe closed from one end oscillates only odd harmonics [1st harmonic (fundamental mode), 3rd harmonic (1st overtone), 5th harmonic (2nd overtone), 7th harmonic (3rd overtone) etc.]

Fundamental frequency

$$= \frac{v}{4l} = \frac{340}{4 \times \frac{85}{100}} = 100 \text{ Hz}$$

Other modes of oscillation are:

3rd harmonic frequency $= 3 \times 100 = 300$ Hz

5th harmonic frequency = 5 × 100 = 500 Hz
7th harmonic frequency = 7 × 100 = 700 Hz
9th harmonic frequency = 9 × 100 = 900 Hz
11th harmonic frequency = 11 × 100 = 1100 Hz
13th harmonic frequency = 13 × 100 = 1300 Hz

Only those natural oscillations are to be counted frequencies of which lie below v_0 = 1250 Hz, the harmonics till 11th harmonic are to be counted.

Since number of possible natural oscillations
= 1 (1st harmonic) + 1 (3rd harmonic) + 1 (5th harmonic) + 1(7th harmonic) + 1(9th harmonic) + 1 (11th harmonic) = 6

Second Method

All the frequencies possible are integral multiples of fundamental frequency which is 100 Hz. Using the fact that integer which is multiplied by fundamental frequency is the number of harmonic itself you get, highest harmonic predicted = [12.50/100] where [x] represents greatest integer less than or equal to x = [12.5] = 12.

Now for closed pipe, only odd harmonics are possible and the highest harmonic possible = 11th. The possible harmonics are 1, 3, 5, 7, 9, 11 which are six in number.

ii. Pipe opened from both ends: Fundamental frequency

$$=\frac{V}{2l}=\frac{340}{2\times 85}\times 100=200 \text{ Hz}$$

Frequency of the other natural modes of oscillational are:
2nd harmonic frequency = 2 × 200 = 400 Hz
3rd harmonic frequency = 3 × 200 = 600 Hz
4th harmonic frequency = 4 × 200= 800 Hz
5th harmonic frequency = 5 × 200 = 1000 Hz
6th harmonic frequency = 6 × 200 = 1200 Hz
7th harmonic frequency = 7 × 200 = 1400 Hz

You have to count only those harmonics whose frequencies are below 1250 Hz. All the harmonics till 6th harmonic are possible, and obviously they are six in number.

Third Method

Fundamental frequency = 200 Hz
Frequencies possible = n × fundamental frequency
= n × 200 [n is 1, 2, ...]

Maximum value of n = [12.50/200] = 6 ([x] represents greater than or equal to x)

Now n is also equal to the number of harmonic for which frequency is being calculated, highest harmonic possible = 6th.

As all harmonics are possible in case of open tube, harmonics possible are 1st, 2nd, 3rd, 4th, 5th and 6th.

Number of harmonics possible in this case = 6.

BEATS: INTERFERENCE IN TIME

The interference phenomena we have studied so far involve the superposition of two or more waves having the same frequency.

Now let's consider another type of interference, one that results from the superposition of two waves having slightly different frequencies. In this case, when the two waves are observed at a point in space, they are periodically in and out of phase. That is, there is a temporal (time) alternation between constructive and destructive interference. As a consequence, we refer to this phenomenon as interference in time or temporal interference. For example, if two tuning forks of slightly different frequencies are struck, one hears a sound of periodically varying amplitude. This phenomenon is called beating.

Beating is the periodic variation in amplitude at a given point due to the superposition of two waves having slightly different frequencies.

The number of amplitude maxima one hears per second, or the beat frequency, equals the difference in frequency between the two sources as we shall show below.

$$f_{\text{beat}} = |f_1 - f_2| \quad \text{(iii)}$$

For instance, if one tuning fork vibrates at 438 Hz and a second one vibrates at 442 Hz, the resultant sound wave of the combination has a frequency of 440 Hz (the musical note A) and a beat frequency of 4 Hz. A listener would hear a 440 Hz sound wave go through an intensity maximum four times every second.

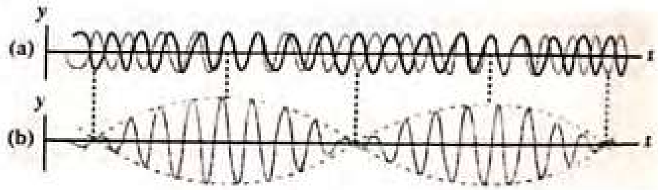

ILLUSTRATION 16.19 Two identical piano strings of length 0.750 m are each tuned exactly to 440 Hz. The tension in one of the strings is then increased by 1.0%. If they are now struck, what is the beat frequency between the fundamental of the two strings?

Solution. As the tension in one of the strings is changed, its fundamental frequency changes. Therefore, when both strings are played, they will have different frequencies and beats will be heard.

We must combine our understanding of the waves under boundary conditions model for strings with our new knowledge of beats.

Set up a ratio of the fundamental frequencies of the two strings using equation

$$\frac{f_2}{f_1}=\frac{(v_2/2L)}{(v_1/2L)}=\frac{v_2}{v_1}$$

Use equation $v=\sqrt{T/\propto}$ to substitute for the wave speeds on the strings.

$$\frac{f_2}{f_1}=\frac{\sqrt{T_2/\mu}}{\sqrt{T_1/\mu}}=\sqrt{\frac{T_2}{T_1}}$$

Incorporate that the tension in one string is 1.0% larger than the other; that is, $T_2 = 1.010\ T_1$.

$$\frac{f_2}{f_1}=\sqrt{\frac{1.010T_1}{T_1}}=1.005$$

Solve for the frequency of the tightened string:

$f_2 = 1.005 f_1 = 1.005$ (440 Hz) = 442 Hz

Find the beat frequency using Eq. (iii)

$f_{beat} = 442$ Hz − 440 Hz = 2 Hz

Notice that a 1.0% mistuning in tension leads to an easily audible beat frequency of 2 Hz. A piano tuner can use beats to tune a stringed instrument by 'beating' a note against a reference tone of known frequency. The tuner can then adjust the string tension until the frequency of the sound it emits equals the frequency of the reference tone. The tuner does so by tightening or loosening the string until the beats produced by it and the reference source become too infrequent to notice.

ILLUSTRATION 16.20 Wavelength of two notes in air is (90/175) m and (90/173) m, respectively. Each of these notes produces 4 beats/s with a third note of a fixed frequency. Calculate the velocity of sound in air.

Solution. Given: $\lambda_1 = 90/175$ m and $\lambda_2 = 90/173$ m

If f_1 and f_2 are the corresponding frequencies and v is the velocity of sound in air, we have

$$v = f_1\lambda_1 \quad \text{and} \quad v = f_2\lambda_2$$

$$f_1=\frac{v}{\lambda_1} \quad \text{and} \quad f_2=\frac{v}{\lambda_2}$$

Since, $\lambda_1 < \lambda_2$, we must have $f_1 > f_2$.

If f is the frequency of the third note, then

$$f_1 - f = 4 \quad \text{and} \quad f - f_2 = 4$$

$$\Rightarrow \quad f_1 - f_2 = 8$$

$$\frac{v}{\lambda_1}-\frac{v}{\lambda_2}=8$$

$$v\left[\frac{175}{90}-\frac{173}{90}\right]=8$$

which gives, $v = 360$ m/s

CONCEPT APPLICATION EXERCISE 16.5

1. Two tuning forks A and B produce 4 beats/s when sounded together. A resonates to 32.4 cm of stretched wire and B is in resonance with 32 cm of the same wire. Determine the frequencies of the two tuning forks.
2. A glass tube of length 1.5 m is filled completely with water; the water can be drained out slowly at the bottom of the tube. Find the total number of resonance obtained, when a tuning fork of frequency 606 Hz is put at the upper open end of the tube. $v_{sound} = 340$ m/s.
3. Calculate the speed of sound in a gas in which two waves of wavelengths 50 cm and 50.5 cm produce 6 beats/s.
4. A stationary wave is given by

   $$y = 5\sin\frac{\pi x}{3}\cos 40\pi t$$

   where x and y are in cm and t is in second.
   (a) What are the amplitude and velocity of the component wave whose superposition can give rise to this vibration?
   (b) What is the distance between the nodes?
   (c) What is the velocity of a particle of the string at the position $x = 1.5$ cm when $t = 9/8$ s?
5. An open organ pipe has a fundamental frequency of 300 Hz. The first overtone of a closed organ pipe has the same frequency as the first overtone of the open pipe. Find length of each pipe. The velocity of sound in air = 350 m/s.
6. A tuning fork A is in resonance with an air column 32 cm long and closed at one end. When the length of this column is increased by 1 cm, it is in resonance with another fork B. When A and B are sounded together, they produce 40 beats in 5 s. Find their frequencies.

SOLVED EXAMPLES

1. A wave travelling in positive X-direction with $A = 0.2$ m has a velocity of 360 m/sec. if $\lambda = 60$ m then correct expression for the wave

   (a) $y=0.2\sin\left[2\pi\left(6t+\frac{x}{60}\right)\right]$

   (b) $y=0.2\sin\left[\pi\left(6t+\frac{x}{60}\right)\right]$

   (c) $y=0.2\sin\left[2\pi\left(6t-\frac{x}{60}\right)\right]$

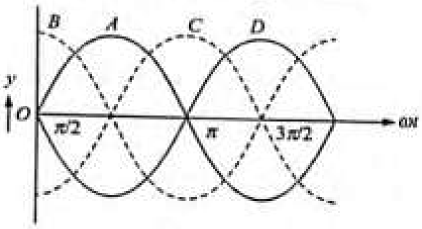
   (d) $y=0.2\sin\left[\pi\left(6t-\frac{x}{60}\right)\right]$

Sol. (c) A wave travelling in positive x-direction may be represented as $y = A\sin\frac{2\pi}{\lambda}(vt - x)$.

On putting values $y = 0.2\sin\frac{2\pi}{60}(360t - x)$

$$\Rightarrow \quad y=0.2\sin 2\pi\left(6t-\frac{x}{60}\right)$$

2. The figure shows four progressive waves A, B, C, and D with their phases expressed with respect to the wave A. It can be concluded from the figure that



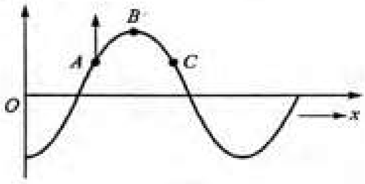
(a) The wave C is ahead by a phase angle of $\pi/2$ and the wave B lags behind by a phase angle of $\pi/2$
(b) The wave C lags behind by a phase angle of $\pi/2$ and the wave B is ahead by a phase angle of $\pi/2$
(c) The wave C is ahead by a phase angle of π and the wave B lags behind by a phase angle of π
(d) The wave C lags behind by a phase angle of π and the wave B ahead by a phase angle of π

Sol. (b) Equation of A, B, C and D are

$$y_A = A\sin\omega t,\ y_B = A\sin(\omega t + \pi/2)$$
$$y_C = A\sin(\omega t - \pi/2),\ y_D = A\sin(\omega t - \pi)$$

It is clear that wave C lags behind by a phase angle of $\pi/2$ and the wave B is ahead by a phase angle at $\pi/2$.

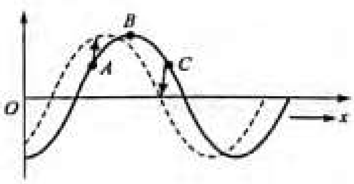
3. A wave is travelling along a string. At an instant, shape of the string is as shown in figure. At this instant, point A is moving upwards.



(i) The wave is travelling to the right
(ii) Displacement amplitude of the wave is equal to displacement of B at this instant
(iii) At this instant velocity of C is also directed upwards
(iv) Phase difference between A and C may be equal to $\dfrac{\pi}{2}$

Which of the following statements are correct?
(a) (i) and (iii) (b) (ii) and (iv)
(c) (i),(iii) and (iv) (d) (i) and (iv)

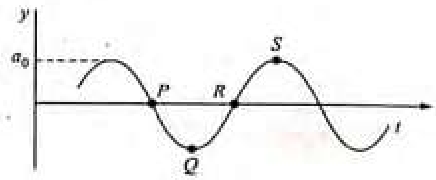
Sol. (b) Since A is moving upwards, therefore, after an elemental time interval the wave will be as shown dotted in following figure. It means, the wave is travelling leftward. Therefore, (a) is wrong.



Displacement amplitude of the wave means maximum possible displacement of medium particles due to propagation of the wave, which is equal to the displacement at B at the instant shown in figure. Hence (b) is correct.
From figure, it is clear that C is moving downwards at this instant. Hence (c) is wrong.

The phase difference between two points will be equal to $\dfrac{\pi}{2}$ if distance between them is equal to $\dfrac{\lambda}{4}$. Between A and C, the distance is less than $\dfrac{\lambda}{2}$ It may be equal to $\dfrac{\lambda}{4}$. Hence, phase difference between these two points may be equal to $\dfrac{\pi}{2}$.

4. A wave motion has the function $y = a_0\sin(\omega t - kx)$. The graph in figure shows how the displacement y at a fixed point varies with time t. Which one of the labelled points shows a displacement equal to that at the position $x = \dfrac{\pi}{2k}$ at time $t = 0$



(a) P (b) Q
(c) R (d) S

Sol. (b) At $t = 0$ and $x = \dfrac{\pi}{2k}$. The displacement

$$y = a_0\sin\left(\omega x_0 - k\times\frac{\pi}{2x}\right) = -a_0\sin\frac{\pi}{2} = -a_0$$

from graph. Point of maximum displacement (a_0) in negative direction is Q.

5. The diagram below shows an instantaneous position of a string as a transverse progressive wave travels along it from left to right

Which one of the following correctly shows the direction of the velocity of the points 1, 2 and 3 on the string

	1	2	3
(a)	→	→	→
(b)	→	←	→
(c)	↓	↓	↓
(d)	↓	↑	↓

Sol. (d) Particle velocity $(v_p) = -v\times$ Slope of the graph at that point
At point 1 : Slope of the curve is positive, hence particle velocity is negative or downward (↓)

At point 2 : Slope negative, hence particle velocity is positive or upwards (↑)

At point 3 : Again slope of the curve is positive, hence particle velocity is negative or downward (↓)

6. Two identical straight wires are stretched so as to produce 6 beats per second when vibrating simultaneously. On changing the tension in one of them, the beat frequency remains unchanged. Denoting by T_1, T_2, the higher and the lower initial tensions in the strings, then it could be said that while making the above change in tension
(a) T_2 was decreased (b) T_2 was increased
(c) T_1 was increased (d) T_1 was kept constant

Sol. (b) Using $n = \frac{1}{2l}\sqrt{\frac{T}{m}}$;

As $T_1 > T_2 \Rightarrow n_1 > n_2$ giving $n_1 - n_2 = 6$

The beat frequency of 6 will remain fixed when

(i) n_1 remains same but n_2 is increased to a new value $(n_2' - n_2 = 12)$ by increasing tension T_2.

(ii) n_2 remains same but n_1 is decreased to a new value $(n_1 - n_1' = 12)$ by decreasing tension T_1.

7. A wire of density 9×10^3 kg/m^3 is stretched between two clamps 1 m apart and is subjected to an extension of 4.9×10^{-4} m. The lowest frequency of transverse vibration in the wire is ($Y = 9 \times 10^{10}$ N/m^2)
(a) 40 Hz (b) 35 Hz
(c) 30 Hz (d) 25 Hz

Sol. (b) For wire if

M = mass, ρ = density, A = Area of cross section

V = volume, l = length, Δl = change in length

Then mass per unit length $m = \frac{M}{l} = \frac{Al\rho}{l} = A\rho$

And Young's modulus of elasticity $Y = \frac{T/A}{\Delta l/l}$

$$\Rightarrow \quad T = \frac{Y\Delta l A}{l}.$$

Hence lowest frequency of vibration

$$n = \frac{1}{2l}\sqrt{\frac{T}{m}} = \frac{1}{2l}\sqrt{\frac{Y\left(\frac{\Delta l}{l}\right)A}{A\rho}} = \frac{1}{2l}\sqrt{\frac{Y\Delta l}{l\rho}}$$

$$\Rightarrow \quad n = \frac{1}{2\times 1}\sqrt{\frac{9\times 10^{10} \times 4.9\times 10^{-4}}{1\times 9\times 10^3}} = 35 \text{ Hz}$$

8. An open pipe is in resonance in its 2nd harmonic with tuning fork of frequency f_1. Now it is closed at one end. If the frequency of the tuning fork is increased slowly from f_1 then again a resonance is obtained with a frequency f_2. If in this case the pipe vibrates n^{th} harmonics then
(a) $n = 3, f_2 = \frac{3}{4}f_1$ (b) $n = 3, f_2 = \frac{5}{4}f_1$
(c) $n = 5, f_2 = \frac{5}{4}f_1$ (d) $n = 5, f_2 = \frac{3}{4}f_1$

Sol. (c) Open pipe resonance frequency $f_1 = \frac{2v}{2L}$

Closed pipe resonance frequency $f_2 = \frac{nv}{4L}$

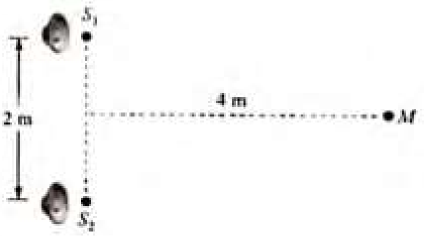
$$f_2 = \frac{n}{4}f_1 \qquad \text{(where } n \text{ is odd and } f_2 > f_1)$$

$\therefore \quad n = 5$

9. Two speakers connected to the same source of fixed frequency are placed 2.0 m apart in a box. A sensitive microphone placed at a distance of 4.0 m from their midpoint along the perpendicular bisector shows maximum response. The box is slowly rotated until the speakers are in line with the microphone. The distance between the midpoint of the speakers and the microphone remains unchanged. Exactly five maximum responses are observed in the microphone in doing this. The wavelength of the sound wave is
(a) 0.2 m (b) 0.4 m
(c) 0.6 m (d) 0.8 m

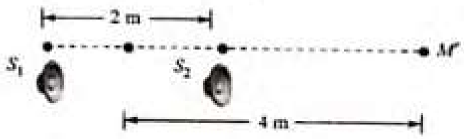
Sol. (b) Initially $S_1M = S_2M$

$\Rightarrow$ Path Difference $(\Delta x) = S_1M - S_2M = 0$.



Finally when the box is rotated

Path Difference $= S_1M' - S_2M' \Rightarrow \Delta x = 5 - 3 = 2$ m



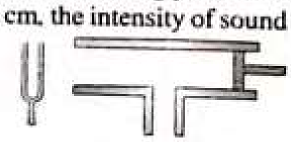
For maxima

Path Difference = (Even multiple) $\frac{\lambda}{2} \Rightarrow \Delta x = (2n)\frac{\lambda}{2}$

For 5 maximum responses

$$\Rightarrow \quad 2 = 2(5)\frac{\lambda}{2}\left\{\because \Delta x = (2n)\frac{\lambda}{2}\right\} \Rightarrow \lambda = \frac{2}{5} = 0.4m.$$

10. Vibrating tuning fork of frequency n is placed near the open end of a long cylindrical tube. The tube has a side opening and is fitted with a movable reflecting piston. As the piston is moved through 8.75 cm, the intensity of sound changes from a maximum to minimum. If the speed of sound is 350 m/s. Then n is



(a) 500 Hz (b) 1000 Hz
(c) 2000 Hz (d) 4000 Hz

Sol. (b) When the piston is moved through a distance of 8.75 cm, the path difference produced is 2×8.75 cm = 17.5 cm.

This must be equal to $\frac{\lambda}{2}$ for maximum to change to minimum.

$$\therefore \quad \frac{\lambda}{2} = 17.5 \text{ cm} \Rightarrow \lambda = 35 \text{ cm} = 0.35 \text{ m}$$

$$\text{So.} \quad v = n\lambda \Rightarrow n = \frac{v}{\lambda} = \frac{350}{0.35} = 1000 \text{Hz}$$

11. If $n_1, n_2, n_3 \ldots$ are the frequencies of segments of a stretched string, the frequency n of the string is given by

(a) $n = n_1 + n_2 + n_3 + \ldots$ (b) $n = \sqrt{n_1 \times n_2 \times n_3 \times \ldots\ldots}$

(c) $\frac{1}{n} = \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3} + \ldots$ (d) None of these

Sol. (c) For a vibrating string

$$n_1 l_1 = n_2 l_2 = n_3 l_3 = \text{constant} = k \text{ (say)} = nl$$

Also $l_1 + l_2 + l_3 + l_4 + \ldots = 1$

$$\frac{k}{n_1} + \frac{k}{n_2} + \frac{k}{n_3} + \frac{k}{n_4} + \ldots = \frac{k}{n} \Rightarrow \frac{1}{n} = \frac{1}{n_1} + \frac{1}{n_2} + \frac{1}{n_3} + \ldots$$

12. A stone is hung in air from a wire which is stretched over a sonometer. The bridges of the sonometer are L cm apart when the wire is in unison with a tuning fork of frequency N. When the stone is completely immersed in water, the length between the bridges is l cm for re-establishing unison, the specific gravity of the material of the stone is

(a) $\frac{L^2}{L^2 + l^2}$ (b) $\frac{L^2 - l^2}{L^2}$

(c) $\frac{L^2}{L^2 - l^2}$ (d) $\frac{L^2 - l^2}{L^2}$

Sol. (c) Frequency of vib. is stretched string $n = \frac{1}{2(\text{Length})}\sqrt{\frac{T}{m}}$

When the stone is completely immersed in water, length changes but frequency doesn't ($\because$ unison reestablished)

$$\text{Hence length} \propto \sqrt{T} \Rightarrow \frac{L}{l} = \sqrt{\frac{T_{air}}{T_{water}}} = \sqrt{\frac{V\rho g}{V(\rho - 1)g}}$$

(Density of stone = ρ and density of water = 1)

$$\Rightarrow \quad \frac{L}{l} = \sqrt{\frac{\rho}{\rho - 1}} \Rightarrow \rho = \frac{L^2}{L^2 - l^2}$$

13. A tuning fork of frequency 340 Hz is vibrated just above the tube of 120 cm height. Water is poured slowly in the tube. What is the minimum height of water necessary for the resonance (speed of sound in the air = 340 m/sec)

(a) 15 cm (b) 25 cm
(c) 30 cm (d) 45 cm

Sol. (d) Because the tuning fork is in resonance with air column in the pipe closed at one end, the frequency is $n = \frac{(2N-1)v}{4l}$

where $N = 1, 2, 3 \ldots$ corresponds to different mode of vibration putting $n = 340$Hz, $v = 340$ m/s, the length of air column in the pipe can be

$$l = \frac{(2N-1)340}{4 \times 340} = \frac{(2N-1)}{4} \text{m} = \frac{(2N-1) \times 100}{4} \text{cm}$$

For $N = 1, 2, 3, \ldots$ we get l = 25 cm, 75 cm, 125 cm ...

As the tube is only 120 cm long, length of air column after water is poured in it may be 25 cm or 75 cm only, 125 cm is not possible, the corresponding length of water column in the tube will be (120 – 25) cm = 95 cm or (120 – 75) cm = 45 cm. Thus minimum length of water column is 45 cm.

14. An organ pipe is closed at one end has fundamental frequency of 1500 Hz. The maximum number of overtones generated by this pipe which a normal person can hear is:

(a) 14 (b) 13
(c) 6 (d) 9

Sol. (c) Critical hearing frequency for a person is 20,000 Hz.

If a closed pipe vibration in N^{th} mode then frequency of vibration $n = \frac{(2N-1)v}{4l} = (2N-1)n_1$

(where n_1 fundamental frequency of vibration)

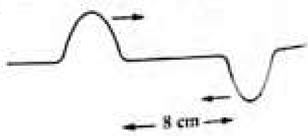
Hence $20{,}000 = (2N-1) \times 1500 \Rightarrow N = 7.1 = 7$

Also, in closed pipe

Number of over tones = (No. of mode of vibration) –1

= 7 – 1 = 6.

15. Two pulses in a stretched string whose centres are initially 8 cm apart are moving towards each other as shown in the figure. The speed of each pulse is 2 cm/s. After 2 seconds, the total energy of the pulses will be

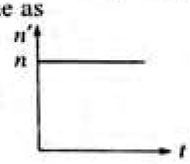


(a) Zero
(b) Purely kinetic
(c) Purely potential
(d) Partly kinetic and partly potential

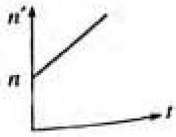
Sol. (b) After 2 sec the pulses will overlap completely. The string becomes straight and therefore does not have any potential energy and its entire energy must be kinetic.

16. An observer starts moving with uniform acceleration a toward a stationary sound source emitting a whistle of frequency n. As the observer approaches source, the apparent frequency, heard by the observer varies with time as

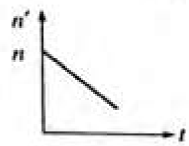
(a)



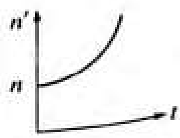
(b)



(c)



(d)



Sol. (b) For observer approaching a stationary source

$n' = \frac{v+v_0}{v}.n$ and given $v_0 = at \Rightarrow n' = \left(\frac{an}{v}\right)t + n$

this is the equation of straight line with positive intercept n and positive slope $\left(\frac{n}{v}\right)$.

17. The difference between the apparent frequency of a source of sound as perceived by an observer during its approach and recession is 2% of the natural frequency of the source. If the velocity of sound in air is 300 m/sec, the velocity of the source is (It is given that velocity of source << velocity of sound)

(a) 6 m/sec (b) 3 m/sec
(c) 1.5 m/sec (d) 12 m/sec

Sol. (b) When the source approaches the observer

Apparent frequency $n' = \frac{v}{v-v_s}\;n = n\left[\frac{1}{1-\frac{v_s}{v}}\right]$

$$= n\left[1-\frac{v_s}{v}\right]^{-1} = n\left[1+\frac{v_s}{v}\right]$$

(Neglecting higher powers because $v_s << v$)

When the source recedes the observed apparent frequency

$n'' = n\left[1-\frac{v_s}{v}\right]$

Given $n'-n'' = \frac{2}{100}n$, $v = 300\ m/sec$

$\therefore \quad \frac{2}{100}n = n\left[1+\frac{v_s}{v}\right] - n\left[1-\frac{v_s}{v}\right] = n\left[2\frac{v_s}{v}\right]$

$\Rightarrow \quad \frac{2}{100} = 2\frac{v_s}{v} \Rightarrow v_s = \frac{v}{100} = \frac{300}{100} = 3\ \text{m/sec}$

18. A sound wave of frequency f travels horizontally to the right. It is reflected from a large vertical plane surface moving to the left with a speed v. The speed of sound in the medium is c, then study following statements

(i) The frequency of the reflected wave is $\frac{f(c+v)}{c-v}$

(ii) The wavelength of the reflected wave is $\frac{c(c-v)}{f(c+v)}$

(iii) The number of waves striking the surface per second is $\frac{f(c+v)}{c}$

(iv) The number of beats heard by a stationary listener to the left of the reflecting surface is $\frac{f\,v}{c-v}$

Correct statements are

(a) (i),(ii) and (iii) (b) (i),(ii) and (iv)
(c) (ii),(iii) and (iv) (d) (i),(iii) and (iv)

Sol. (a) Number of waves striking the surface per second (or the frequency of the waves reaching surface of the moving target) $n' = \frac{(c+v)}{\lambda} = \frac{f(c+v)}{c}$

Now these waves are reflected by the moving target (Which now act as a source). Therefore apparent frequency of reflected second $n'' = \left(\frac{c}{c-v}\right)n' = f\left(\frac{c+v}{c-v}\right)$

The wavelength of reflected wave $= \frac{c}{n''} = \frac{c(c-v)}{f(c+v)}$

The number of beats heard by stationary listener

$$= n'' - f = f\left(\frac{c+v}{c-v}\right) - f = \frac{2fv}{(c-v)}$$

Hence option (a) is correct.

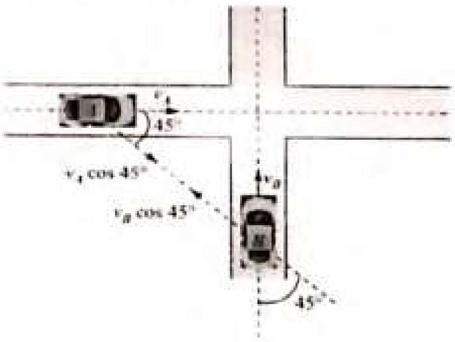
19. Two cars are moving on two perpendicular roads towards a crossing with uniform speeds of 72 km/hr and 36 km/hr. If first car blows horn of frequency 280 Hz, then the frequency of horn heard by the driver of second car when line joining the cars make 45° angle with the roads; will be

(a) 321 Hz (b) 298 Hz
(c) 289 Hz (d) 280 Hz

Sol. (b) Here $v_A = 72\text{km/hr} = 20\text{m/sec}$

$v_B = 36\text{km/hr} = 10\text{m/sec}$

$$n' = n\left(\frac{v + v_B\cos 45^\circ}{v - v_A\cos 45^\circ}\right)$$



$\Rightarrow \quad n' = 280\left(\frac{340+10/\sqrt{2}}{340-20/\sqrt{2}}\right) = 298\,\text{Hz}$

20. A police car moving at 22 m/s, chases a motorcyclist. The police man sounds his horn at 176 Hz, while both of them move towards a stationary siren of frequency 165 Hz. Calculate the speed of the motorcycle, if it is given that he does not observes any beats

(a) 33 m/s (b) 22 m/s
(c) Zero (d) 11 m/s

Sol. (b)

n_1 = Frequency of the police car horn observer heard by motorcyclist

n_2 = Frequency of the siren heard by motorcyclist
v_2 = Speed of motor cyclist

$$n_1 = \frac{330 - v}{330 - 22} \times 176 \,;\, n_2 = \frac{330 + v}{330} \times 165$$

$\because \quad n_1 - n_2 = 0 \Rightarrow v = 22$ m/s.

EXERCISES

Progressive Waves and Sound Waves

1. The equation of a wave travelling on a string is

$$y = 4 \sin \frac{\pi}{2}\left(8t - \frac{x}{8}\right)$$

if x and y are in centimetres, then velocity of wave is
(a) 64 cm/s in –ve x-direction
(b) 32 cm/s in –ve x-direction
(c) 32 cm/s in +ve x-direction
(d) 64 cm/s in +ve x-direction

2. A wave is represented by the equation

$$y = 7 \sin\left(7\pi t - 0.04\pi x + \frac{\pi}{3}\right)$$

x is in metres and t is in seconds. The speed of the wave is
(a) 175 m/s (b) 49 π m/s
(c) 49/π m/s (d) 0.28 π m/s

3. The path difference between the two waves

$$y_1 = a_1 \sin\left(\omega t \frac{2\pi x}{\lambda}\right) \text{and } y_2 = a_2 \cos\left(\omega t \frac{2\pi x}{\lambda} + \phi\right) \text{ is}$$

(a) $\frac{\lambda}{2\pi}\phi$ (b) $\frac{\lambda}{2\pi}\left(\phi + \frac{\pi}{2}\right)$
(c) $\frac{2\pi}{\lambda}\left(\phi - \frac{\pi}{2}\right)$ (d) $\frac{2\pi}{\lambda}(\phi)$

4. If $x = a \sin[\omega t + \pi/6]$ and x' cos ωt, then what is the phase difference between the two waves?
(a) $\frac{\pi}{3}$ (b) $\frac{\pi}{6}$
(c) $\frac{\pi}{2}$ (d) π

5. A transverse wave is described by the equation

$$y = y_0 \sin 2\pi\left(ft - \frac{x}{\lambda}\right)$$

The maximum particle velocity is four times the wave velocity if
(a) $\lambda = \frac{\pi y_0}{4}$ (b) $\lambda = \frac{\pi y_0}{2}$
(c) $\lambda = \pi y_0$ (d) $\lambda = 2\pi y_0$

6. A simple harmonic wave is represented by the relation

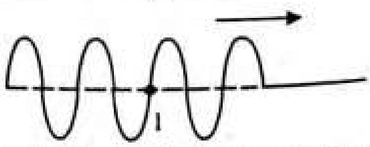
$$y(x,t) = a_0 \sin 2\pi\left(vt - \frac{x}{\lambda}\right)$$

If the maximum particle velocity is three times the wave velocity, the wavelength λ of the wave is
(a) $\pi a_0/3$ (b) $2\pi a_0/3$
(c) πa_0 (d) $\pi a_0/2$

7. Small amplitude progressive wave in a stretched string has a speed of 100 cm/s, and frequency 100 Hz. The phase difference between two points 2.75 cm apart on the string, in radians, is
(a) 0 (b) $11\pi/2$
(c) $\pi/4$ (d) $3\pi/8$

8. The mathematical form of three travelling waves are given by
y_1 = (2 cm) sin (3x – 6t)
y_2 = (3 cm) sin (4x – 12t)
and y_3 = (4 cm) sin (5x – 11t) of these waves.
(a) Wave 1 has greatest wave speed and greatest maximum transverse string speed
(b) Wave 2 has greatest wave speed and wave 1 has greatest maximum transverse string speed
(c) Wave 3 has greatest wave speed and wave 1 has greatest maximum transverse string speed
(d) Wave 2 has greatest wave speed and wave 3 has greatest maximum transverse string speed.

9. A transverse wave on a string travelling along +ve x-axis has been shown in the figure below:



The mathematical form of the shown wave is

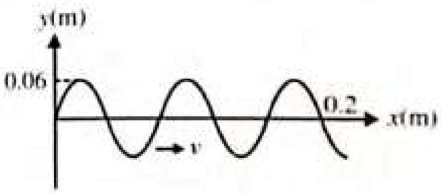
$$y = (3.0 \text{ cm}) \sin\left[2\pi \times 0.1\, t - \frac{2\pi}{100} x\right]$$

where t is in seconds and x is in centimetres. Find the total distance travelled by the particle at (1) in 10 min 15 s measured from the instant shown in the figure and direction of its motion at the end of this time.
(a) 6 cm, in upward direction

(b) 6 cm, in downward direction
(c) 738 cm, in upward direction
(d) 732 cm, in upward direction

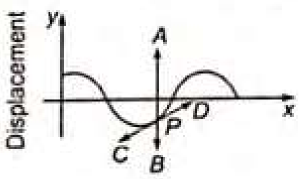
10. A sinusoidal wave travelling in the positive direction on stretched string has amplitude 20 cm, wavelength 1.0 m and wave velocity 5.0 m/s. At $x = 0$ and $t = 0$ it is given that $y = 0$ and $\partial y/\partial t < 0$. Find the wave function $y(x, t)$.
(a) $y(x,t) = (0.02\text{ m})\sin\left[\left(2\pi\text{ m}^{-1}\right)x + \left(10\pi\text{ s}^{-1}\right)t\right]\text{m}$
(b) $y(x,t) = (0.02\text{ m})\cos\left[\left(10\pi\text{s}^{-1}\right)t + \left(2\pi\text{m}^{-1}\right)x\right]\text{ m}$
(c) $y(x,t) = (0.02\text{ m})\sin\left[\left(2\pi\text{ m}^{-1}\right)x - \left(10\pi\text{ s}^{-1}\right)t\right]\text{m}$
(d) $y(x,t) = (0.02\text{ m})\sin\left[\left(\pi\text{ m}^{-1}\right)x + \left(5\pi\text{ s}^{-1}\right)t\right]\text{m}$

11. For the wave shown in figure, write the equation of this wave if its position is shown at $t = 0$. Speed of wave is $v = 300$ m/s.



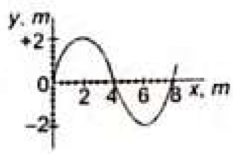
(a) $y = (0.06\text{ m})\cos[(78.5\text{ m}^{-1})x + (23562\text{ s}^{-1})t]$ m
(b) $y = (0.06\text{ m})\sin[(78.5\text{ m}^{-1})x - (23562\text{ s}^{-1})t]$ m
(c) $y = (0.06\text{ m})\sin[(78.5\text{ m}^{-1})x + (23562\text{ s}^{-1})t]$ m
(d) $y = (0.06\text{ m})\cos[(78.5\text{ m}^{-1})x - (28562\text{ s}^{-1})t]$ m

12. The figure below is a representation of a simple harmonic progressive wave, progressing in the negative X-axis, at a given instant. The direction of the velocity of the particle at stage P in the figure is best represented by the arrow.



(a) $\overrightarrow{PA}$ (b) $\overrightarrow{PB}$
(c) $\overrightarrow{PC}$ (d) $\overrightarrow{PD}$

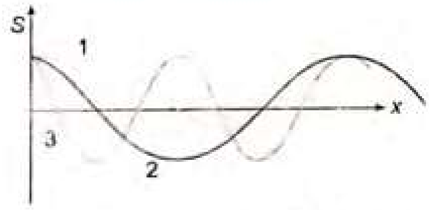
13. The graph shows a wave at $t = 0$ travelling to the right with a velocity of 4 m/s. The equation that best represents the wave is



(a) $y(x, t) = 2\sin(\pi x/4 - \pi t)$ metres
(b) $y(x, t) = 2\sin(16\pi x - 8\pi t)$ metres
(c) $y(x, t) = 2\sin(\pi x/4 + \pi t)$ metres
(d) $y(x, t) = 4\sin(\pi x/4 - \pi t)$ metres

14. The velocity of sound in a gas at temperature 27°C is v then in the same gas its velocity will be $2v$ at temperature:
(a) 54°C (b) 327°C
(c) 927°C (d) 108°C

15. Figure shown is a graph, at a certain time t, of the displacement function $S(x,t)$ of three sound waves 1, 2 and 3 as marked on the curves that travel along x-axis through air. If P_1, P_2 and P_3 represent their pressure amplitudes respectively, then correct relation between them is



(a) $P_1 > P_2 > P_3$ (b) $P_3 > P_2 > P_1$
(c) $P_1 = P_2 = P_3$ (d) $P_2 > P_3 > P_1$

16. The equation of displacement due to a sound wave is $s = s_0 \sin^2(\omega t - kx)$. If the bulk modulus of the medium is B, then the equation of pressure variation due to that sound is
(a) $Bks_0 \sin(2\omega t - 2kx)$
(b) $-Bks_0 \sin(2\omega t - 2kx)$
(c) $Bks_0 \cos^2(\omega t - kx)$
(d) $-Bks_0 \cos^2(\omega t - kx)$

17. The average density of Earth's crust 10 km beneath the surface is 2.7 gm/cm^3. The speed of longitudinal seismic waves at that depth is 5.4 km/s. The bulk modulus of Earth's crust considering its behaviour as fluid at that depth, is
(a) 7.9×10^{10} Pa (b) 5.6×10^{10} Pa
(c) 7.9×10^7 Pa (d) 1.46×10^7 Pa

18. Two identical sounds S_1 and S_2 reach at a point P in phase. The resultant loudness at point P is n dB higher than the loudness of S_1. The value of n is
(a) 2 (b) 4
(c) 5 (d) 6

19. In expressing sound intensity, we take 10^{-19} W m^{-2}, as the reference level. For ordinary conversation, the intensity level is about 10^{-6} W m^{-2}. Expressed in decibel, this is
(a) 10^6 (b) 6
(c) 60 (d) $\log_e(10^6)$

20. A two-fold increase in intensity of a wave implies an increase of (Given: $\log_{10} 2 = 0.3010$.)
(a) 2 dB (b) 10 dB
(c) 3.01 dB (d) 0.5 dB

Doppler Effect

21. When a source moves away from a stationary observer, the frequency is 6/7 times the original frequency. Given: speed of sound = 330 m/s. The speed of the source is
(a) 40 m/s (b) 55 m/s
(c) 330 m/s (d) 165 m/s

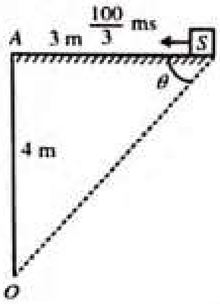
22. An engine running at speed $v/10$ sounds a whistle of frequency 600 Hz. A passenger in a train coming from the opposite side at speed $v/15$ experiences this whistle to be of frequency f. If v is speed of sound in air and there is no wind, f is nearest to

(a) 711 Hz (b) 630 Hz
(c) 580 Hz (d) 510 Hz

23. The apparent frequency of the whistle of an engine changes in the ratio of 6:5 as the engine passes a stationary observer. If the velocity of sound is 330 m/s, then the velocity of the engine is

(a) 3 m/s (b) 30 m/s
(c) 0.33 m/s (d) 660 m/s

24. A source of sound S is travelling at 100/3 m/s along a road, towards a point A. When the source is 3 m away from A, a person standing at a point O on a road perpendicular to AS hears a sound of frequency f'. The distance of O from A at that time is 4 m. If the original frequency is 640 Hz, then the value of f' is (velocity of sound is 340 m/s)

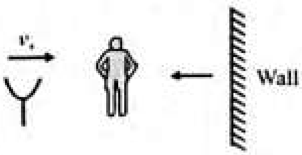


(a) 620 Hz
(b) 680 Hz
(c) 720 Hz
(d) 840 Hz

25. A source of sound is travelling with a velocity of 30 m/s towards a stationary observer. If actual frequency of source is 1000 Hz and the wind is blowing with velocity 20 m/s in a direction at 60° with the direction of motion of source, then the apparent frequency heard by observer is (speed of sound is 340 m/s)

(a) 1011 Hz (b) 1000 Hz
(c) 1094 Hz (d) 1086 Hz

26. A tuning fork of frequency 380 Hz is moving towards a wall with a velocity of 4 m/s. Then the number of beats heard by a stationary listener between direct and reflected sounds will be (velocity of sound in air is 340 m/s)



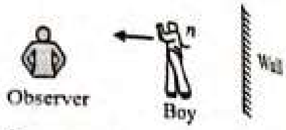
(a) 0 (b) 5
(c) 7 (d) 10

27. A sound wave of frequency n travels horizontally to the right with speed c. It is reflected from a broad wall moving to the left with speed v. The number of beats heard by a stationary observer to the left of the wall is

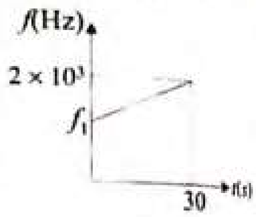
(a) zero (b) $\dfrac{n(c+v)}{c-v}$
(c) $\dfrac{nv}{c-v}$ (d) $\dfrac{2nv}{c-v}$

28. A boy is walking away from a wall at a speed of 1.0 m/s in a direction at right angles to the wall. The boy blows a whistle steadily. An observer towards whom the boy is moving hears 4 beats/s. If the speed of sound is 340 m/s, the frequency of whistle is

(a) 480 Hz
(b) 680 Hz
(c) 840 Hz
(d) 1000 Hz

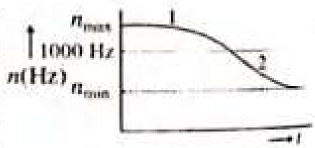


29. A source of sound of frequency f_1 is placed on the ground. A detector placed at a height is released from rest on this source. The observed frequency f(Hz) is plotted against time t(sec). The speed of sound in air is 300 m/s. Find f_1 (g = 10 m/s^2).



(a) 0.5×10^3 Hz (b) 1×10^3 Hz
(c) 0.25×10^3 (d) 0.2×10^3 Hz

30. A stationary observer receives a sound from a sound of frequency f_0 moving with a constant velocity v_s = 30 m/s. The apparent frequency varies with time as shown in figure. Velocity of sound v = 300 m/s. Then which of the following is incorrect?



(a) The minimum value of apparent frequency is 889 Hz.
(b) The natural frequency of source is 1000 Hz.
(c) The frequency–time curve corresponds to a source moving at an angle to the stationary observer.
(d) The maximum value of apparent frequency is 1111 Hz.

31. Two passenger trains moving with a speed of 108 km/hour cross each other. One of them blows a whistle whose frequency is 750 Hz. If sound speed is 330 m/s, then passengers sitting in the other train, after trains cross each other will hear sound whose frequency will be

(a) 900 Hz (b) 625 Hz
(c) 750 Hz (d) 800 Hz

32. A table is revolving on its axis at 5 revolutions per second. A sound source of frequency 1000 Hz is fixed on the table at 70 cm from the axis. The minimum frequency heard by a listener standing at a distance from the table will be (speed of sound = 352 m/s)

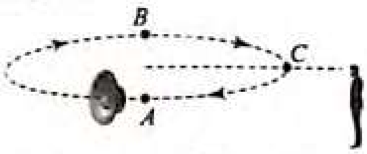
(a) 1000 Hz (b) 1066 Hz
(c) 941 Hz (d) 352 Hz

33. Two sirens situated one kilometer apart are producing sound of frequency 330 Hz. An observer starts moving

from one siren to the other with a speed of 2 m/s. If the speed of sound be 330 m/s, what will be the beat frequency heard by the observer?

(a) 8 (b) 4
(c) 6 (d) 1

34. A small source of sound moves on a circle as shown in the figure and an observer is standing on O. Let n_1, n_2 and n_3 be the frequencies heard when the source is at A, B and C respectively. Then



(a) $n_1 > n_2 > n_3$ (b) $n_2 > n_3 > n_1$
(c) $n_1 = n_2 > n_3$ (d) $n_2 > n_1 > n_3$

Superposition of Waves

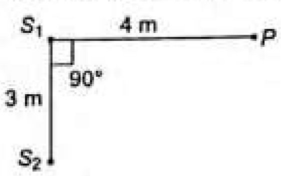
35. Equation of motion in the same direction is given by $y_1 = A\sin(\omega t - kx)$, $y_2 = A\sin(\omega t - kx - \theta)$. The amplitude of the medium particle will be

(a) $2A\cos\frac{\theta}{2}$ (b) $2A\cos\theta$
(c) $\sqrt{2}A\cos\frac{\theta}{2}$ (d) $1.2f, 1.2\lambda$

36. Two pulses travel in mutually opposite directions in a string with a speed of 2.5 cm/s as shown in the figure. Initially the pulses are 10 cm apart. What will be the state of the string after two seconds?

(a) 

(b) 
(c)
(d) 
37. S_1 and S_2 are two coherent sources of sound of frequency 110 Hz each. They have no initial phase difference. The intensity at a point P due to S_1 is I_0 and due to S_2 is $4I_0$. If the velocity of sound is 330 m/s then the resultant intensity at P is



(a) I_0 (b) $9I_0$
(c) $3I_0$ (d) $8I_0$

38. The wavelength of the waves arriving at P from two coherent sources S_1 and S_2 is 4 m, while intensity of each wave is I_0. The resultant intensity at P is $2\,I_0$. Find the minimum value of S_2P.

(a) $\frac{x\sqrt{5}}{2}$ (b) $2x$
(c) $(x + 1)$ (d) $(x + \sqrt{2})$

39. At a point, beats frequency of n Hz is observed. It means:
(a) medium particles, at that point, are vibrating with frequency n Hz
(b) amplitude of vibrations changes simple harmonically with frequency n Hz at that point only
(c) at that, zero intensity is observed $2n$ times per second
(d) none of the above

40. When beats are produced by two progressive waves of nearly the same frequency, which one of the following is correct?
(a) The particles vibrate simple harmonically, with the frequency equal to the difference in the component frequencies.
(b) The amplitude of vibration at any point changes simple harmonically with a frequency equal to the difference in the frequencies of the two waves.
(c) The frequency of beats depends upon the position, where the observer is.
(d) The frequency of beats changes as the time progresses.

41. Wavelengths of two notes in air are 1 m and $\frac{1}{164}$ m. Each note produces 1 beat/s with a third note of a fixed frequency. The speed of sound in air is
(a) 330 m/s (b) 340 m/s
(c) 350 m/s (d) 328 m/s

42. The equation of a stationary wave is given by
$y = 6\sin(\pi x/3)\cos 40\pi t$
where y and x are given in cm and time t in second, then the amplitude of progressive wave is
(a) 6 cm (b) 3 cm
(c) 12 cm (d) 2 cm

43. In question 42, the wavelength of the component progressive wave is
(a) 6 cm (b) 3 cm
(c) 12 cm (d) 2 cm

44. In question 42, the time period of the component progressive wave is
(a) 20 sec (b) 40 sec
(c) (1/20) sec (d) (1/10) sec

45. In question 42, the frequency of the component progressive wave is
(a) 20 Hz (b) 40 Hz
(c) (1/20) Hz (d) (1/10) Hz

46. In question 42, the speed of the component progressive wave is
(a) 20 cm/sec (b) 6 cm/sec
(c) 120 cm/sec (d) 40 cm/sec

47. In question 46, the separation between two consecutive antinodes is:
(a) 3 cm (b) 6 cm
(c) 12 cm (d) 20 cm

48. In question 42, the phase difference between two points on opposite sides of an antinode with a separation of 1 cm between them is
(a) zero radian (b) $(\pi/3)$ radian
(c) $(\pi/2)$ radian (d) π radian

49. The equation of displacement of two waves are given as

$$y_1 = 10\sin\left(3\pi t + \frac{\pi}{3}\right); \quad y_2 = 5[\sin 3\pi t + \sqrt{3}\cos 3\pi t]$$

Then what is the ratio of their amplitudes
(a) 1 : 2 (b) 2 : 1
(c) 1 : 1 (d) None of these

50. On sounding tuning fork A with another tuning fork B of frequency 384 Hz, 6 beats are produced per second. After loading the prongs of A with wax and then sounding it again with B, 4 beats are produced per second. What is the frequency of the tuning fork A.
(a) 388 Hz (b) 80 Hz
(c) 378 Hz (d) 390 Hz

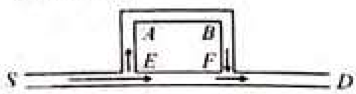
51. The equation of a stationary wave is $y = 0.8\cos\left(\frac{\pi x}{20}\right)$ $\sin 200\,\pi t$ where x is in cm and t is in s. The separation between consecutive nodes will be
(a) 20 cm (b) 10 cm
(c) 40 cm (d) 30 cm

52. Which of the following statements is correct for stationary waves?
(a) Nodes and antinodes are formed in case of stationary transverse wave only
(b) In case of longitudinal stationary wave, compressions and rarefactions are obtained in place of nodes and antinodes respectively
(c) Suppose two plane waves, one longitudinal and the other transverse having same frequency and amplitude are travelling in a medium in opposite directions with the same speed, by superposition of these waves, stationary waves cannot be obtained
(d) None of the above

53. A sound wave of wavelength 0.40 m enters the tube at S. The smallest radius r of the circular segment to hear minimum at detector D must be

(a) 1.75 m (b) 0.175 m
(c) 0.93 m (d) 9.3 m

54. A sound wave starting from source S, follows two paths $SEFD$ and $SEABFD$. If $AB = l$, $AE = BF = 0.6\ l$ and wavelength of wave is $\lambda = 11$ m. If maximum sound is heard at D, then minimum value of length l is



(a) 11 m (b) 6 m
(c) 2.5 m (d) 5 m

55. The displacement y of a particle executing periodic motion is given by

$$y = 4\cos^2\frac{t}{2}\sin 1000t$$

How many independent harmonic motions may be considered to superpose to result this expression:
(a) two (b) three
(c) four (d) five

Vibration of String and Organ Pipes

56. A sonometer wire of length l vibrates in fundamental mode when excited by a tuning fork of frequency 416 Hz. If the length is doubled keeping other things same, the string will
(a) vibrate with a frequency of 416 Hz
(b) vibrate with a frequency of 208 Hz
(c) vibrate with a frequency of 832 Hz
(d) stop vibrating

57. A sonometer wire, 100 cm in length has fundamental frequency of 330 Hz. The velocity of propagation of transverse waves along the wire is
(a) 330 m/s (b) 660 m/s
(c) 115 m/s (d) 990 m/s

58. A wire of length 'l' having tension T and radius 'r' vibrates with fundamental frequency 'f'. Another wire of the same metal with length '$2l$' having tension $2T$ and radius $2r$ will vibrate with fundamental frequency:
(a) f (b) $2f$
(c) $\frac{f}{2\sqrt{2}}$ (d) $\frac{f}{2}\sqrt{2}$

59. When the string of a sonometer of length L between the bridges vibrates in the first overtone, the amplitude of vibration is maximum at
(a) $L/2$
(b) $(L/4)$ and $(3L/4)$
(c) $(L/6)$, $(3L/6)$ and $(5L/6)$
(d) $\frac{L}{8}, \frac{3L}{8}, \frac{5L}{8}, \frac{7L}{8}$

60. A string is under tension so that its length is increased by $1/n$ times its original length. The ratio of fundamental frequency of longitudinal vibrations and transverse vibrations will be
(a) $1:n$ (b) $n^2:1$
(c) $\sqrt{n}:1$ (d) $n:1$

61. A stretched string of length 1 m fixed at both ends, having a mass of 5×10^{-4} kg is under a tension of 20 N. It is plucked at a point situated at 25 cm from one end. The stretched string would vibrate with a frequency of

(a) 400 Hz (b) 100 Hz
(c) 200 Hz (d) 256 Hz

62. A closed organ pipe and an open organ pipe have their first overtones identical in frequency. Their lengths are in the ratio
(a) 1:2 (b) 2:3
(c) 3:4 (d) 4:5

63. Two organ pipes, both closed at one end, have lengths l and $l+\Delta l$. Neglect end correction. If the velocity of sound in air is v, then the number of beats / s is
(a) $\frac{v}{4l}$ (b) $\frac{v}{2l}$
(c) $\frac{v}{4l^2}\Delta l$ (d) $\frac{v}{2l^2}\Delta l$

64. A closed organ pipe has a frequency 'n'. If its length is doubled and radius is halved, its frequency nearly becomes.
(a) halved (b) doubled
(c) trebled (d) quadrupled

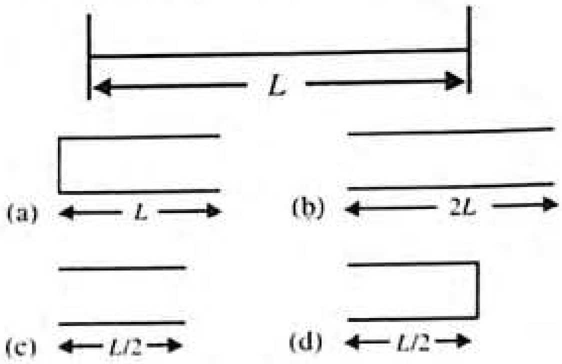
65. An organ pipe A closed at one end vibrating in its fundamental frequency and another pipe B open at both ends is vibrating in its second overtone are in resonance with a given tuning fork. The ratio of length of pipe A to that of B is
(a) 1:2 (b) 3:8
(c) 2:3 (d) 1:6

66. An open and a closed pipe have same length. The ratio of frequency of their nth overtone is
(a) $\frac{n+1}{2n+1}$ (b) $\frac{2(n+1)}{2n+1}$
(c) $\frac{n}{2n+1}$ (d) $\frac{n+1}{2n}$

67. A closed organ pipe and an open organ pipe of same length produce 2 beats when they are set into vibration simultaneously in their fundamental mode. The length of the open organ pipe is now halved and of the closed organ pipe is doubled; the number of beats produced will be
(a) 8 (b) 7
(c) 4 (d) 2

68. An open organ pipe of length l is sounded together with another open organ pipe of length $l+x$ in their fundamental tones. Speed of sound in air is v. The beat frequency heard will be ($x \ll l$)
(a) $\frac{vx}{4l^2}$ (b) $\frac{vl^2}{2x}$
(c) $\frac{vx}{2l^2}$ (d) $\frac{vx^2}{2l}$

69. Figure shows a stretched string of length L and pipes of length L, $2L$, $L/2$ and $L/2$ in options (a), (b), (c) and (d) respectively. The string's tension is adjusted until the speed of waves on the string equals the speed of sound waves in the air. The fundamental mode of oscillation is then set up on the string. In which pipe will the sound produced by the string cause resonance?



70. An ideal organ pipe resonates at successive frequencies of 50 Hz, 150 Hz, 250 Hz, etc.(speed of sound = 340 m/s) The pipe is
(a) open at both ends and of length 3.4 m
(b) open at both ends and of length 6.8 m
(c) closed at one end, open at the other, and of length 1.7 m
(d) closed at one end, open at the other, and of length 3.4 m

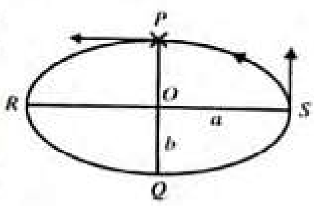
Problems Based on Mixed Concepts

71. The linear density of a vibrating string is 10^{-4} kg/m. A transverse wave is propagating on the string, which is described by the equation $y = 0.02 \sin(x + 30t)$, where x and y are in metres and time t in seconds. Then tension in the string is
(a) 0.09 N (b) 0.36 N
(c) 0.9 N (d) 3.6 N

72. Two blocks of masses 40 kg and 20 kg are connected by a wire that has a linear mass density of 1 g/m. These blocks are being pulled across horizontal frictionless floor by horizontal force F that is applied to 20 kg block. A transverse wave travels on the wave between the blocks with a speed of 400 m/s (relative to the wire). The mass of the wire is negligible compared to the mass of the blocks. The magnitude of F is
(a) 160 N (b) 240 N
(c) 320 N (d) 400 N

73. A source of sound produces waves of wavelength 60 cm when it is stationary. If the speed of sound in air is 320 m/s and source moves with speed 20 m/s, the wavelength of sound in the forward direction will be nearest to
(a) 56 cm (b) 60 cm
(c) 64 cm (d) 68 cm

74. A train is moving in an elliptical orbit in anticlockwise sense with a speed of 110 m/s. Guard is also moving in the given direction with same speed as that of train. The



ratio of the length of major and minor axes is 4/3. Driver blows a whistle of 1900 Hz at P, which is received by guard at S. The frequency received by guard is (velocity of sound $v = 330$ m/s)

(a) 1900 Hz (b) 1800 Hz
(c) 2000 Hz (d) 1500 Hz

75. In sports meet the timing of a 200 m straight dash is recorded at the finish point by starting an accurate stop watch on hearing the sound of starting gun fired at the starting point. The time recorded will be more accurate

(a) in winter (b) in summer
(c) in all seasons (d) none of these

76. Length of a string of density ρ and Young's modulus Y under tension is increased by $1/n$ times of its original length. If the velocity of transverse and longitudinal vibrations of the string is same, find the value of such velocity.

(a) $\sqrt{\dfrac{Y}{\rho n}}$ (b) $\sqrt{\dfrac{Y}{\rho n^{1/2}}}$
(c) $\sqrt{\dfrac{Y}{\rho}}$ (d) $\sqrt{\dfrac{Y}{\rho n^{3/2}}}$

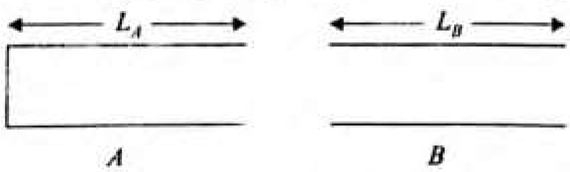
77. Source and observer start moving simultaneously along x and y-axis, respectively. The speed of source is twice the speed of observer, v_0. If the ratio of observed frequency to the frequency of the source is 0.75, find the velocity of sound.

(a) $\dfrac{11}{\sqrt{5}}v_0$ (b) $\dfrac{17}{\sqrt{5}}v_0$
(c) $\dfrac{16}{\sqrt{5}}v_0$ (d) $\dfrac{19}{\sqrt{5}}v_0$

78. A string under a tension of 100 N, emitting its fundamental mode, gives 5 beats/s with a tuning fork. When the tension is increased to 121 N, again 5 beats/s are heard. The frequency of the fork is

(a) 105 Hz (b) 95 Hz
(c) 210 Hz (d) 190 Hz

79. Two pipes are submerged in sea water, arranged as shown in figure. Pipe A with length $L_A = 1.5$ m and one open end, contains a small sound source that sets up the standing wave with the second lowest resonant frequency of that pipe. Sound from pipe A sets up resonance in pipe B, which has both ends open. The resonance is at the second lowest resonant frequency of pipe B. The length of the pipe B is



(a) 1 m (b) 1.5 m
(c) 2 m (d) 3 m

80. Equations of stationary and a traveling waves are as follows:

$y_1 = a \sin kx \cos \omega t$ and $y_2 = a \sin (\omega t - kx)$

The phase difference between two points $x_1 = \dfrac{\pi}{3k}$ and $x_2 = \dfrac{3\pi}{2k}$ are ϕ_1 and ϕ_2 respectively for the two waves. The ratio (ϕ_1/ϕ_2) is

(a) 1 (b) $\dfrac{5}{6}$
(c) $\dfrac{3}{4}$ (d) $\dfrac{6}{7}$

81. Two waves of wavelengths λ and $(\lambda + \Delta\lambda)$ produce 6 beats per second. If $\dfrac{\Delta\lambda}{\lambda} = \dfrac{\lambda + \Delta\lambda}{51}$, find the speed of sound wave in a gas in which these waves produce beats.

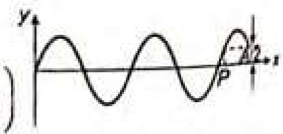
(a) 316 m/s (b) 310 m/s
(c) 306 m/s (d) 326 m/s

82. The equations of a travelling and stationary waves are $y_1 = a \sin (\omega t - kx)$ and $y_2 = a \sin kx \cos \omega t$. The phase differences between two points $x_1 = \dfrac{\pi}{4k}$ and $x_2 = \dfrac{4\pi}{3k}$ are ϕ_1 and ϕ_2 respectively for two waves, where k is the wave number. The ratio of ϕ_1/ϕ_2 is

(a) 6/7 (b) 16/3
(c) 12/13 (d) 13/12

83. The position of a wave (of wavelength λ)

$y(x,t) = A \sin 2\pi\left(\dfrac{x}{\lambda} - 3750\,t\right)$



is shown at $t = 0$, find x-coordinate of point P in metres if the wave speed is 300 m/sec:

(a) $\dfrac{27\lambda}{12}$ (b) $\dfrac{29\lambda}{12}$
(c) $\dfrac{25\lambda}{12}$ (d) $\dfrac{31\lambda}{12}$

84. A simple harmonic wave of amplitude 2 units is travelling along positive x-axis. At a given instant, displacement for two different particle on the wave is 1 unit and $\sqrt{2}$ unit. If the wavelength is λ, find the distance between them.

(a) $\dfrac{\lambda}{12}$ (b) $\dfrac{\lambda}{8}$
(c) $\dfrac{\lambda}{24}$ (d) $\dfrac{\lambda}{16}$

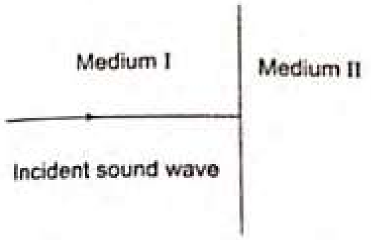
85. A rightward moving wave $y(x, t) = A \sin (kx - \omega t + \phi)$ has initial condition $y = 0$ at $x = 0$ and $t = 0$. Find the value of x and t at $\phi = (1/2)\,n\pi$ for which particle acceleration will have the same value as for initial condition and $\phi = 2n\pi$.

$n = 0, 2,...$ if λ and f are wave length and frequency respectively.

(a) $\lambda, \frac{1}{f}$ (b) $\frac{\lambda}{4}, \frac{2}{f}$

(c) $2\lambda, \frac{1}{f}$ (d) Both (a) and (c)

86. A sound wave propagating along x-axis, in medium I of density $\rho_1 = 1.5$ kg/m^3 is transmitted to a medium II of density $\rho_2 = 3$ kg/m^3 as shown.



The equation of excess pressure developed by wave in medium I and that in medium II respectively are

$$p_1 = 4\times10^{-2}\cos\omega\left(t - \frac{x}{400}\right) \quad \text{(in SI units)}$$

$$p_2 = 3\times10^{-2}\cos\omega\left(t - \frac{x}{1200}\right) \quad \text{(in SI units)}$$

Then the ratio of intensity of transmitted wave I_2 (wave in medium II) to the intensity of incident wave I_1 (wave in medium I), that is, $\frac{I_2}{I_1}$ is

(a) $\frac{3}{4}$ (b) $\frac{9}{16}$

(c) $\frac{3}{32}$ (d) None of these

ARCHIVES

1. A wave $y = a\sin(\omega t - kx)$ on a string meets with another wave producing a node at $x = 0$. Then the equation of the unknown wave is

(a) $y = a\sin(\omega t + kx)$ (b) $y = a\sin(\omega t - kx)$

(c) $y = -a\sin(\omega t + kx)$ (d) $y = -a\sin(\omega t - kx)$

(AIEEE 2002)

2. A tuning fork produces 4 beats per second with another fork of frequency 288 cps. A little wax is placed on the unknown fork and it then produces 2 beats per second. The unknown frequency is

(a) 286 cps (b) 284 cps

(c) 292 cps (d) 290 cps **(AIEEE 2002)**

3. Tube A has both ends open, while tube B has one end closed; otherwise, they are identical. The ratio of the fundamental frequencies of tubes A and B is

(a) 1 : 2 (b) 2 : 1

(c) 1 : 4 (d) 4 : 1 **(AIEEE 2002)**

4. The length of a string tied to two rigid supports is 40 cm. The maximum length (wavelength in cm) of a stationary wave produced on it is

(a) 20 (b) 80

(c) 40 (d) 120 **(AIEEE 2002)**

5. A metal wire of linear mass density of 9.8 g/m is stretched with a tension of 10 kg weight between two rigid supports 1 metre apart. The wire passes at its middle point between the poles of a permanent magnet, and it vibrates in resonance when carrying an alternating current of frequency n. The frequency n of the alternating source is

(a) 25 Hz (b) 50 Hz

(c) 100 Hz (d) 200 Hz **(AIEEE 2003)**

6. A tuning fork of known frequency 256 Hz makes 5 beats per second with the vibrating string of a piano. The beat frequency decreases to 2 beats per second when the tension in the piano string is slightly increased. The frequency of the piano string before increasing the tension was

(a) 256 + 5 Hz (b) 256 + 2 Hz

(c) 256 – 2 Hz (d) 256 – 5 Hz

(AIEEE 2003)

7. The displacement y of a particle in a medium can be expressed as

$$y = -6\sin\left(100t + 20x + \frac{\pi}{4}\right)m$$

where t is in seconds and x in metres. The speed of the wave is

(a) 2000 m/s (b) 50 m/s

(c) 20 m/s (d) 5 m/s **(AIEEE 2004)**

8. The displacement y of a particle in a medium can be expressed as: $y = 10^{-6}\sin(100t + 20x + \pi/4)m$, where t is in second and x in meter. The speed of wave is

(a) 2000 m/s (b) 5 m/s

(c) 20 m/s (d) 5 π m/s **(AIEEE 2004)**

9. An observer moves towards a stationary source of sound with a velocity one-fifth of the velocity of sound. What is the percentage increase in the apparent frequency?

(a) 20% (b) 5%

(c) 0.5% (d) zero **(AIEEE 2005)**

10. When two tuning forks (fork 1 and fork 2) are sounded simultaneously, 4 beats per second are heard. Now some tape is attached to the prong of fork 2. When the tuning forks are sounded again, 6 beats per second are heard.

If the frequency of fork 1 is 200 Hz, then what was the original frequency of fork 2?

(a) 204 Hz (b) 196 Hz
(c) 202 Hz (d) 200 Hz **(AIEEE 2005)**

11. Two simple harmonic motions are represented by the equations

$y_1 = 0.1\,[\sin 100\pi t + (\pi/3)]$ and $y_2 = 0.1\cos \pi t$.

The phase difference of the velocity of particle 1 with respect to the velocity of particle 2 is

(a) $\dfrac{\pi}{6}$ (b) $\dfrac{-\pi}{3}$
(c) $\dfrac{\pi}{3}$ (d) $\dfrac{-\pi}{6}$ **(AIEEE 2005)**

12. A string is stretched between fixed points departed by 75 cm. It is observed to have resonant frequencies of 420 Hz and 315 Hz. There are no other resonant frequencies between these two. Then the lowest resonant frequency for this string is

(a) 105 Hz (b) 1.05 Hz
(c) 1050 Hz (d) 10.5 Hz **(AIEEE 2006)**

13. A whistle producing sound waves of frequencies 9500 Hz and above is approaching a stationary person with velocity v metres per second. The velocity of sound in air is 300 m/s. If a person can hear frequencies up to 10000 Hz, the maximum value of v up to which he can hear the whistle is

(a) $15\sqrt{2}$ m/s (b) $\dfrac{15}{\sqrt{2}}$ m/s
(c) 15 m/s (d) 30 m/s **(AIEEE 2006)**

14. A sound absorber attenuates the sound level by 20 dB. The intensity decreases by a factor of

(a) 10000 (b) 10
(c) 100 (d) 1000 **(AIEEE 2007)**

15. While measuring the speed of sound by performing a resonance column experiment, a student gets the first resonance condition at a column length of 18 cm during winter. Repeating the same experiment during summer, he measures the column length to be x centimetre for the second resonance. Then

(a) $18 > x$ (b) $x > 54$
(c) $54 > x > 36$ (d) $36 > x > 18$

(AIEEE 2008)

16. The speed of sound in oxygen at a certain temperature is 460 m/s. The speed in helium at the same temperature will be (assume both gases to be ideal)

(a) 460 m/s (b) 500 m/s
(c) 650 m/s (d) 330 m/s **(AIEEE 2008)**

17. A wave travelling along the x-axis is described by the equation $y(x, t) = 0.005 \cos (\alpha x - \beta t)$. If the wavelength and time period of the wave are 0.08 m and 2.0 s, respectively, then α and β in appropriate units are

(a) $\alpha = 25.00\pi,\ \beta = \pi$ (b) $\alpha = \dfrac{0.08}{\pi},\ \beta = \dfrac{2.0}{\pi}$
(c) $\alpha = \dfrac{0.04}{\pi},\ \beta = \dfrac{1.0}{\pi}$ (d) $\alpha = 12.50\pi,\ \beta = \dfrac{\pi}{2.0}$

(AIEEE 2008)

18. A motor cycle starts from rest and accelerates along a straight path at 2 m/s^2. At the starting point of the motor cycle, there is a stationary electric siren. How far has the motor cycle gone when the driver hears the frequency of the siren at 94% of its value when the motor cycle was at rest? (Speed of sound is 330 m/s.)

(a) 49 m (b) 98 m
(c) 147 m (d) 196 m **(AIEEE 2009)**

19. Three sound waves of equal amplitudes have frequencies $(f - 1)$, f, and $(f + 1)$. They superpose to give beats. The number of beats produced per second will be

(a) 4 (b) 3
(c) 2 (d) 1 **(AIEEE 2009)**

20. The equation of a wave on a string of linear mass density 0.04 kg/m is given by

$$y = 0.02(m)\sin\left[2\pi\left(\frac{t}{0.04(s)} - \frac{x}{0.50(m)}\right)\right]$$

The tension in the string is

(a) 4.0 N (b) 12.5 N
(c) 0.5 N (d) 6.25 N **(AIEEE 2010)**

21. The transverse displacement $y(x, t)$ of a wave on a string is given by $y(x,t) = e^{-(ax^2+bt^2+2\sqrt{ab}\,xt)}$

This represents a

(a) wave moving in $+x$ direction with speed $\sqrt{\dfrac{a}{b}}$

(b) wave moving in $-x$ direction with speed $\sqrt{\dfrac{b}{a}}$

(c) standing wave of frequency $\sqrt{b}$

(d) standing wave of frequency $\dfrac{1}{\sqrt{b}}$ **(AIEEE 2011)**

22. A cylindrical tube, open at both ends, has a fundamental frequency, f, in air. The tube is dipped vertically in water so that half of it is in water. The fundamental frequency of the air-column is now

(a) f (b) $f/2$
(c) $3f/4$ (d) $2f$ **(AIEEE 2012)**

23. A sonometer wire of length 1.5 m is made of steel. The tension in it produces an elastic strain of 1%. What is the fundamental frequency of steel if density and elasticity of steel are 7.7×10^3 and 2.2×10^{11} N/m^2 respectively?

(a) 178.2 Hz (b) 200.5 Hz
(c) 770 Hz (d) 188.5 Hz **(JEE Main 2013)**

24. A pipe of length 85 cm is closed from one end. Find the number of possible natural oscillations of air column in the pipe whose frequencies lie below 1250 Hz. The velocity of sound in air is 340 m/s.
(a) 6 (b) 4
(c) 12 (d) 8 **(JEE Main 2014)**

25. A train is moving on a straight track with speed 20 ms^{-1}. It is blowing its whistle at the frequency of 1000 Hz. The percentage change in the frequency heard by a person standing near the track as the train passes him is (speed of sound = 320 ms^{-1}) close to:
(a) 6% (b) 12%
(c) 18% (d) 24% **(JEE Main 2015)**

26. A uniform string of length 20 m is suspended from a rigid support. A short wave pulse is introduced at its lowest end. It starts moving up the string. The time taken to reach the support is: (take $g = 10\ ms^{-2}$)
(a) $2\pi\sqrt{2}$ s (b) 2 s
(c) $2\sqrt{2}$ s (d) $\sqrt{2}$ s **(JEE Main 2016)**

27. A pipe open at both ends has a fundamental frequency f in air. The pipe is dipped vertically in water so that half of it is in water. The fundamental frequency of the air column is now:
(a) $\frac{f}{2}$ (b) $\frac{3f}{4}$
(c) $2f$ (d) f **(JEE Main 2016)**

28. A granite rod of 60 cm length is clamped at its middle point and is set into longitudinal vibrations. The density of granite is $2.7 \times 10^3\ kg/m^3$ and its Young's modulus is 9.27×10^{10} Pa. What will be the fundamental frequency of the longitudinal vibrations?
(a) 7.5 kHz (b) 5 kHz
(c) 2.5 kHz (d) 10 kHz **(JEE Main 2018)**

Chapter 17

Electric Charge and Field

ELECTRIC CHARGE

Charge is the property associated with matter due to which it produces and experiences electrical and magnetic effects. It is known that every atom is electrically neutral, containing as many electrons as the number of protons in the nucleus. Charged particles can be created by disturbing the neutrality of an atom. Loss of electrons gives positive charge (as $n_p > n_e$) and gain of electrons gives negative charge (as $n_e > n_p$) to a particle. When an object is negatively charged, it gains electrons and therefore its mass increases negligibly. Similarly, on charging a body with positive electricity its mass decreases. Change in the mass of the object is equal to $n \times m_e$, where n is the number of electrons transferred and m_e is the mass of electron.

The rate of flow of electric charge is called electric current, i.e., $i = dQ/dt$ or $dQ = idt$.

Hence, SI unit of charge is ampere × second = coulomb (C). Smaller SI units are mC, μC, and nC (1 mC = 10^{-3} C, 1 μC = 10^{-6} C, 1 nC = 10^{-9} C). CGS unit of charge is stat coulomb or esu. Dimensional formula of charge is $[Q] = [AT]$.

Properties of Charge

Charge is transferable: If a charged body is put in contact with an uncharged body, the uncharged body becomes charged due to the transfer of electrons from one body to the other.

Charge is always associated with mass: Charge cannot exist without mass though mass can exist without charge.

Charge is conserved: Charge can neither be created nor be destroyed. Some important observations regarding this law are as follows:

- The net charge remains constant even though it may not be zero.
- If the universe is considered as a whole, conservation of charge means that the net charge of the universe is constant.
- This principle does not prohibit the creation and destruction of charged particles. However, because of charge conservation, charged particles are created and destroyed only in pairs with equal and opposite charges.
- The law is also true for relativistic motion which means that the total electric charge of an isolated system is relativistically invariant.
- On the basis of the evidence on the macroscopic scale, the principle is largely speculative, but there is ample justification for it on the microscopic scale.

CHARGING OF A BODY

It is possible to give a net charge to an object by different methods, all of which are said to involve electrostatic charging.

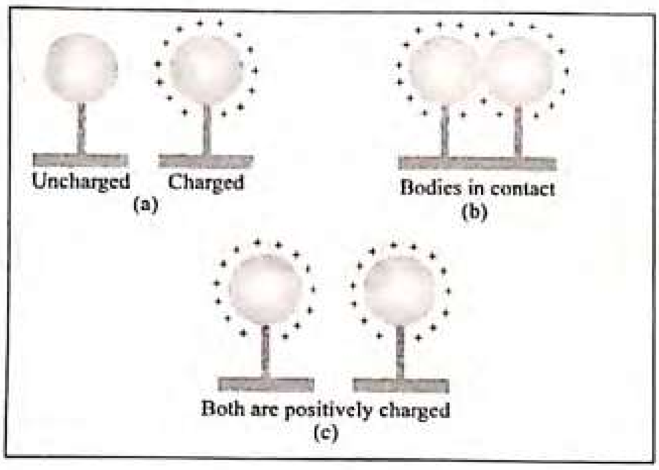
Charging by Friction

When certain insulators are rubbed with cloth or fur, they become electrically charged by a transfer of charge (i.e., electrons). As the two objects are rubbed together, one object loses electrons while the other gains electrons; that is, there is transfer of electrons from one object to the other. The object that gains electrons becomes negatively charged, while the object that loses electrons has an excess of positive charge. Hence it is positively charged. The transfer of charge is due to the contact between the materials, and the amount of charge transferred depends, as we might expect, on the nature of these materials.

Because of conservation of charge, each electron adds negative charge to the silk and an equal positive charge is left on the glass rod.

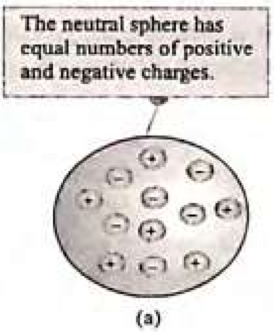
Charging by Conduction

Charging by conduction requires contact between two objects (see figure). Take two conductors, one charged and the other uncharged. Bring the conductors in contact with each other. The charge (whether positive/negative) under its own repulsion will spread over both the conductors. Thus, the conductors will be charged with the same sign. This is called charging by conduction (through contact).



Charging by Induction

Induction is a process by which a charged body can be used to create other charged bodies without touching them or losing its own charge. If a charged body is brought near a neutral body, the charged body attracts opposite charge and repels similar charge present on the neutral body. If the neutral body is now earthed, the like charge is neutralized by the flow of charge from earth, leaving unlike charge on the body. Now the earthing and the charging body are removed leaving the initially neutral body charged. The whole process is shown step by step in figure.



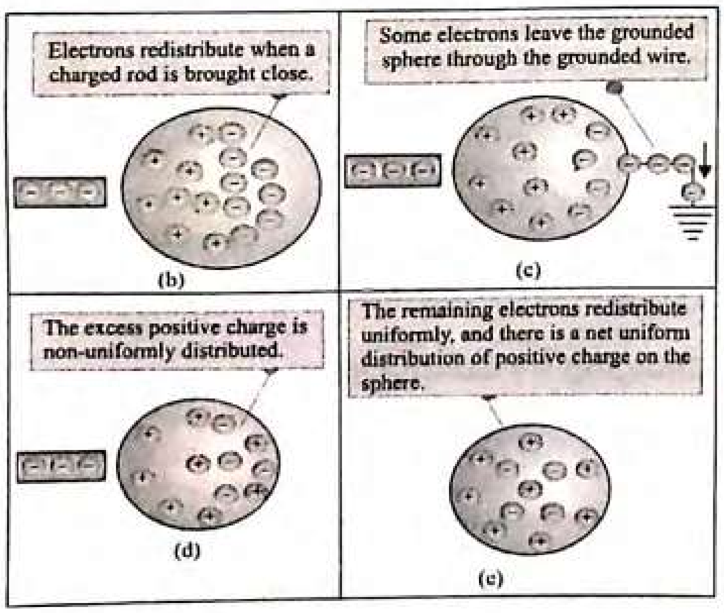


ILLUSTRATION 17.1 Calculate the total positive (or negative) charge on a 3.11 g copper penny. Given Avogadro's number = $6.023 \times 10^{23}\ g^{-1}\ mol^{-1}$; for copper, atomic number = 29 and atomic mass = 63.5.

Solution. The number of atoms in the penny is

$$\left[\frac{6.02 \times 10^{23}}{63.5}\right]3.11 = 0.295 \times 10^{23}$$

Since each copper atom contains 29 protons (and 29 electrons), the total number of positive (or negative) charges in the penny is $n = 29(0.295 \times 10^{23}) = 8.56 \times 10^{23}$.

Total charge (positive or negative) on the penny is

$$q = ne = (8.56 \times 10^{23})(1.6 \times 10^{-19}\ C)$$
$$= 1.37 \times 10^5\ C$$

CONCEPT APPLICATION EXERCISE 17.1

1. How many megacoulombs of positive (or negative) charge are present in 2.0 mol of neutral hydrogen gas.
2. A polythene piece rubbed with wool is found to have a negative charge of 3×10^{-7} C.
   (a) Estimate the number of electrons transferred (from which to which)?
   (b) Is there a transfer of mass from wool to polythene?
3. Two identical conducting spheres, one having an initial charge $+Q$ and the other initially uncharged, are brought into contact.
   (a) What is the new charge on each sphere?
   (b) While the spheres are in contact, a positively charged rod is moved close to one sphere, causing a redistribution of the charges on the two spheres, so the charge on the sphere closest to the rod has a charge $-Q$. What is the charge on the other sphere?
4. Two identical conducting spheres are charged by induction and then separated by a large distance; sphere-1 has charge $+Q$ and sphere-2 has charge $-Q$. A third sphere is initially uncharged. If sphere-3 is touched to sphere-1 and separated and then touched to sphere-2 and separated, what is the final charge on each of the three spheres?
5. In 1 g of a solid, there are 5×10^{21} atoms. If one electron is removed from each of 0.01% atoms of the solid, find the charge gained by the solid (given that electronic charge is 1.6×10^{-19} C).

COULOMB'S LAW

Charles Coulomb measured the magnitude of electric forces between charged objects using the torsion balance. From Coulomb's experiments, we can generalize the properties

of the electric force (sometimes called electrostatic force) between two stationary charged particles.

We use the term point charge to refer to a charged particle of zero size. The electrical behavior of electrons and protons is very well described by modeling them as point charges. From experimental observations, Coulomb showed that the electric force between two stationary charged particles

- is inversely proportional to the square of the separation r between the particles and directed along the line joining them;
- is proportional to the product of the charges q_1 and q_2 on the two particles;
- is attractive if the charges are of opposite sign and repulsive if the charges have the same sign. Thus,

$$F_e = k_e \frac{q_1 q_2}{r^2}$$

where k_e is a constant called the Coulomb constant. The value of the Coulomb constant depends on the choice of units. The SI unit of charge is coulomb (C). The Coulomb constant k_e in SI units has the value $k_e = 9 \times 10^9$ Nm^2 C^{-2}. This constant is also written in the form $k_e = 1/4\pi\varepsilon_0$, where the constant ε_0 (Greek letter epsilon) is known as the permittivity of free space and has the value $\varepsilon_0 = 8.85 \times 10^{-12}$ C^2 N^{-1} m^{-2}. Now we can write

$$F_e = \frac{1}{4\pi\varepsilon_0} \frac{q_1 q_2}{r^2}$$

Important Points

- The permittivity of a given medium is the measure of the fact how strongly a medium is influenced by external electric field. If an externally applied field has stronger polarizing effect on the medium, it has high permittivity.
- If two charges are placed in any medium other than vacuum or air, the force between two charges decreases due to the polarization of the medium. Thus, the resultant force on a charge gets reduced by a factor k known as the dielectric constant of the medium or relative permittivity of the medium. Thus $\varepsilon/\varepsilon_0 = k = \varepsilon_r$, where ε is the permittivity of the medium, ε_0 is the permittivity of vacuum, and ε_r is relative permittivity. Thus,

$$|\vec{F}| = \frac{1}{4\pi\varepsilon_0\varepsilon_r} \frac{q_1 q_2}{r^2}$$

For vacuum, $\varepsilon_r = 1$, and for conductivity medium, $\varepsilon_r = \infty$.

- Coulomb force between two charges is an action-reaction pair, which is conservative in nature and is a central force. It acts along the line joining two point charges.
- Coulomb's law is valid only for point charges. If the size of an object is very small as compared to the separation, then they are considered point charges.
- The force between two point charges is independent of the presence or absence of any other charges. Due to the presence of the surrounding medium the resultant force changes because of polarization of the molecules of the medium.
- Coulomb's law is not valid for distances less than 10^{-15} m.
- Electrostatic forces are comparatively stronger than gravitational forces.
- Coulomb's law is similar to Newton's gravitational law and both obey inverse square law.
- Coulomb's law obeys Newton's third law, i.e., the forces exerted by the two charges on each other are equal and opposite.
- Electrostatic force is a conservative force.

COULOMB'S LAW IN VECTOR FORM

Let q_1 and q_2 be two like charges placed at points A and B, respectively, in vacuum. $\vec{r}_1$ is the position vector of point A, and $\vec{r}_2$ is the position vector of point B. Let $\vec{r}_{21}$ be vector from A to B, then

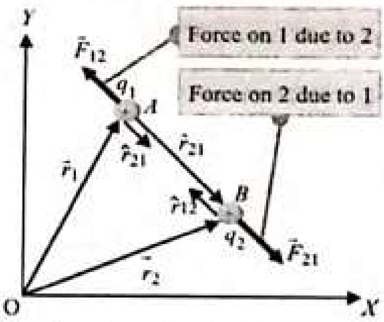
$$\vec{r}_{21} = \vec{r}_2 - \vec{r}_1$$

and $\quad |\vec{r}_{21}| = r = |\vec{r}_2 - \vec{r}_1|$

$$\hat{r}_{21} = \frac{\vec{r}_{21}}{r} = \frac{\vec{r}_2 - \vec{r}_1}{|\vec{r}_2 - \vec{r}_1|}$$

From figure it is clear that $\vec{F}_{21}$ and $\hat{r}_{12}$ are in the same direction, so

$$\vec{F}_{21} = \frac{1}{4\pi\varepsilon_0} \frac{q_1 q_2}{r^2} \hat{r} = \frac{1}{4\pi\varepsilon_0} \frac{q_1 q_2}{r^2} \frac{\vec{r}}{r} = \frac{q_1 q_2}{4\pi\varepsilon_0} \frac{\vec{r}}{r^3} = \frac{q_1 q_2}{4\pi\varepsilon_0} \frac{\vec{r}_2 - \vec{r}_1}{|\vec{r}_2 - \vec{r}_1|^3}$$



The above equations give the Coulomb's law in vector form. As we know that charges apply equal and opposite forces on each other, we have $\vec{F}_{12} = -\vec{F}_{21}$

or $$\vec{F}_{12} = \frac{q_1 q_2}{4\pi\varepsilon_0} \frac{\vec{r}_1 - \vec{r}_2}{|\vec{r}_1 - \vec{r}_2|^3}$$

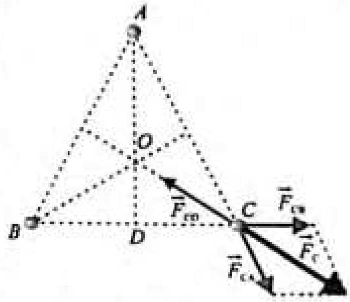
We can also write in terms of unit vector notation:

$$\vec{F}_{12} = \frac{1}{4\pi\varepsilon_0} \frac{q_1 q_2}{r^2} \hat{r}_{12}$$

where $\hat{r}_{12}$ is a unit vector directed toward q_1 from q_2. This force of Coulomb's law is illustrated in figure. For three different point charge distributions, we have $\hat{r}_{12} = -\hat{r}_{21}$. So

$$\vec{F}_{12} = \frac{1}{4\pi\varepsilon_0}\frac{q_1 q_2}{r^2}\hat{r}_{12} = \frac{1}{4\pi\varepsilon_0}\frac{q_2 q_1}{r^2}(-\hat{r}_{21}) = -\frac{1}{4\pi\varepsilon_0}\frac{q_2 q_1}{r^2}\hat{r}_{21} = -\vec{F}_{21}$$

ILLUSTRATION 17.2 Three charges of equal magnitude q are placed at the vertices of an equilateral triangle of side l. How can the system of charges be placed in equilibrium?



Solution. To keep the system in equilibrium, the net force experienced by charges at A, B, and C should be zero. For this, another charge of opposite sign should be placed at the centroid of the triangle. Let this charge be $-Q$.

$$AD = l\cos 30° = \frac{l\sqrt{3}}{2}$$

$$AO = \frac{2}{3}AD = \frac{l}{\sqrt{3}} = CO$$

$$2|\vec{F}_{CA}|\cos 30° = |\vec{F}_{CO}|$$

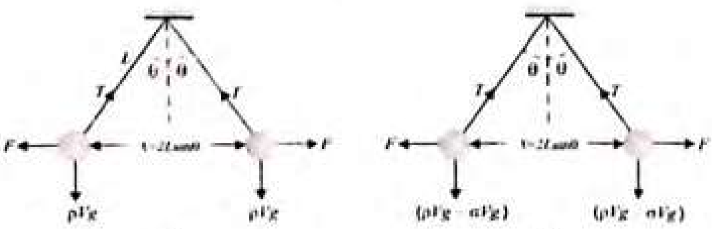
$$|\vec{F}_{CB}| = |\vec{F}_{CA}|$$

$$2\frac{1}{4\pi\varepsilon}\frac{q^2}{l^2}\frac{\sqrt{3}}{2} = \frac{1}{4\pi\varepsilon}\frac{Qq}{(l/\sqrt{3})^2} \text{ or } Q = \frac{q}{\sqrt{3}}$$

ILLUSTRATION 17.3 Two identical balls, each having a density ρ, are suspended from a common point by two insulating strings of equal length. Both the balls have equal mass and charge. In equilibrium, each string makes an angle θ with the vertical. Now, both the balls are immersed in a liquid. As a result, the angle θ does not change. The density of the liquid is σ. Find the dielectric constant of the liquid.

Solution. Let V be the volume of each ball, then the mass of each ball is $m = \rho V$. When the balls are in air, from the previous problem,

$$F = mg\tan\theta = \rho Vg\tan\theta \qquad \text{(i)}$$



(a) (b)

When the balls are suspended in liquid, the Coulombic force is reduced to $F' = F/K$ and apparent weight = weight − upthrust, i.e.,

$$W' = \rho Vg - \sigma Vg$$

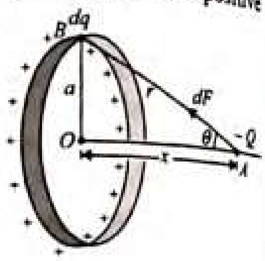
According to the problem, angle θ is unchanged. Therefore,

$$F' = W'\tan\theta = (\rho Vg - \sigma Vg)\tan\theta \qquad \text{(ii)}$$

From Eqs. (i) and (ii), we get

$$\frac{F}{F'} = K = \frac{\rho Vg}{\rho Vg - \sigma Vg} = \frac{\rho}{\rho - \sigma}$$

ILLUSTRATION 17.4 A thin fixed ring of radius a has a positive charge q uniformly distributed over it. A particle of mass m, having a negative charge Q, is placed on the axis at a distance of x ($x << a$) from the center of the ring. Show that the motion of the negatively charged particle is approximately simple harmonic. Calculate the time period of oscillation.



Solution. The force on the point charge Q due to the element dq of the ring is

$$dF = \frac{1}{4\pi\varepsilon_0}\frac{dqQ}{r^2} \text{ along } AB$$

For every element of the ring, there is a diametrically opposite element. The components of forces along the axis will add up, while those perpendicular to it will cancel each other. Hence, the net force on the charge is $-Q$; negative sign shows that this force will be toward the center of ring.

$$F = \int dF\cos\theta = \cos\theta\int dF = \frac{x}{r}\int\frac{1}{4\pi\varepsilon_0}\left[-\frac{Qdq}{r^2}\right]$$

So
$$F = -\frac{1}{4\pi\varepsilon_0}\frac{Qx}{r^3}\int dq = -\frac{1}{4\pi\varepsilon_0}\frac{Qqx}{(a^2+x^2)^{3/2}} \qquad \text{(i)}$$

$$\left[\text{as } r = (a^2+x^2)^{1/2} \text{ and } \int dq = q\right]$$

As the restoring force is not linear, the motion will be oscillatory. However, if $x \ll a$ so that $x^2 \ll a^2$, then

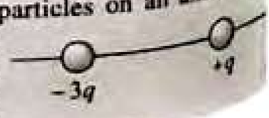
$$F = -\frac{1}{4\pi\varepsilon_0}\frac{Qq}{a^3}x = -kx \text{ with } k = \frac{Qq}{4\pi\varepsilon_0 a^3}$$

Thus, the restoring force will become linear and so the motion is simple harmonic with time period

$$T = \frac{2\pi}{\omega}2\pi\sqrt{\frac{m}{k}} = 2\pi\sqrt{\frac{4\pi\varepsilon_0 ma^3}{qQ}}$$

CONCEPT APPLICATION EXERCISE 17.2

1. Figure shows two charge particles on an axis. The charges are free to move. At one point, however, a third charged particle can be



placed such that all three particles are in equilibrium.
(a) Is that point to the left of the first two particles, to their right, or between them?
(b) Should the third particle be positively or negatively charged?
(c) Is the equilibrium stable or unstable?

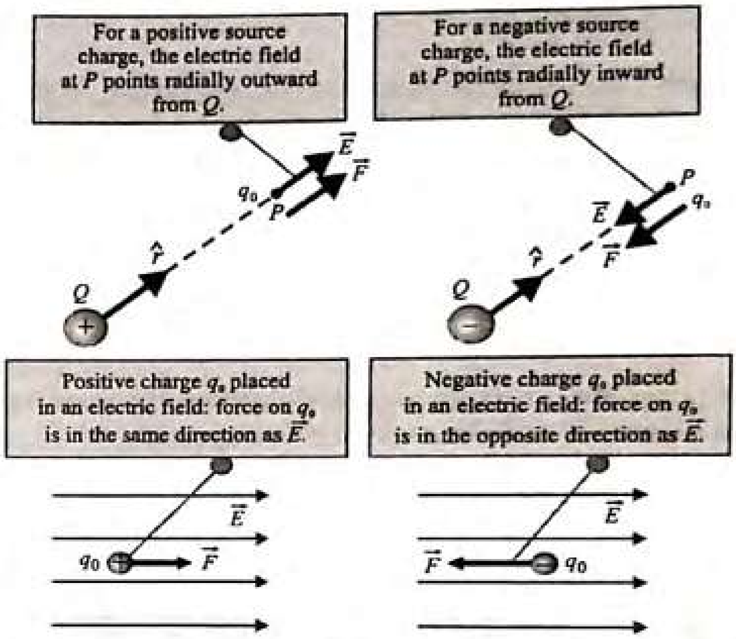
2. The force between two point electric charges kept at a distance d apart in air is F. If these charges are kept at the same distance in water, the force between the charges is F'. The ratio F'/F is equal to ________
3. Two small balls, each having charge q, are suspended by two insulating threads of equal length L from a hook in an elevator. The elevator is freely falling. Calculate the angle between the two threads and tension in each thread.
4. Suppose we have a large number of identical particles, very small in size. Any two of them at 10 cm separation repel with a force of 3×10^{-10} N.
   (a) If one of them is at 10 cm from a group (of very small size) of n others, how strongly do you expect it to be repelled?
   (b) Suppose you measure the repulsion and find it 6×10^{6} N How many particles were there in the group?
5. The electrostatic force of repulsion between two positively charged ions carrying equal charge is 3.7×10^{-9} N when these are separated by a distance of 5 Å. How many electrons are missing from each ion?
6. Two fixed point charges $+4e$ and $+e$ units are separated by a distance a. Where should a third point charge be placed for it to be in equilibrium?
7. Two insulated identically sized charged copper spheres A and B have their centers separated by a distance of 50 cm. A third sphere of the same size but uncharged is brought in contact with the first, then in contact with the second, and finally removed from both. What is the new force of repulsion between A and B?
8. Two small balls having equal positive charge Q (coulomb) on each are suspended by two insulating strings of equal length L (meter) from a hook fixed to a stand. The whole set-up is taken in a satellite into space where there is no gravity (state of weightlessness).
   (i) What is the angle between the two strings?
   (ii) What is the tension in each string?

ELECTRIC FIELD

We define electric field as the space around a charge in which its influence can be felt by any other charged particle. An electric field is said to exist in the region of space around a charged object, the source charge. When another charged object—the test charge—enters this electric field, an electric force acts on it.

As an example, consider figure, which shows a small positive test charge q_0 placed near a second object carrying a much greater positive charge Q. We define the electric field due to the source charge at the location of the test charge to be the electric force on the test charge per unit charge. To be more specific, the electric field vector $\vec{E}$ at a point in space is defined as the electric force $\vec{F}_e$ acting on a positive test charge q_0 placed at that point divided by the test charge:

$$\vec{E} = \lim_{q_0 \to 0} \frac{\vec{F}}{q_0}$$



The direction of $\vec{E}$ will be same as that of $\vec{F}$. The magnitude of the test charge is kept small because otherwise it may disturb the original charge distribution and then we will get electric field due to disturbed configuration and not original.

The unit of electric field is NC^{-1} (newton per coulomb). The dimensional formula of electric field is

$$\frac{\text{Force}}{\text{Charge}} = \frac{MLT^{-2}}{\text{ampere} \times \text{time}} = \frac{MLT^{-2}}{AT} = [MLT^{-3}A^{-1}]$$

A Point Charge in an Electric Field

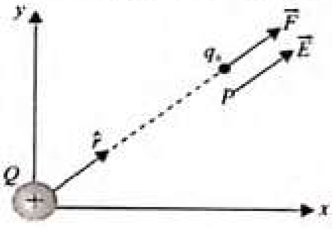
What happens if a point charge q_0 is placed at any point in an electric field produced by some other stationary charges? Let this electric field be $\vec{E}$. Charge q_0 will experience a force; let this force be $\vec{F}$. Then the value of electric field at that point must be

$$\vec{E} = \frac{\vec{F}}{q_0} \quad \text{or} \quad \vec{F} = q_0\vec{E}$$

This is the force on q_0 by E. q_0 has no contribution in $\vec{E}$. A charged particle is not affected due to its own field. It means a charge particle can experience force due to the field produced by other charge particles, but not due to the field produced by itself.

ELECTRIC FIELD DUE TO AN ISOLATED POINT CHARGE

Consider a point charge Q placed at the origin O. To find the electric intensity at a point P, distant r from O, place a test charge q_0 at P. According to Coulomb's law, the force exerted on q_0 by Q is



$$\vec{F} = k_e \frac{Qq_0}{r^2}\hat{r}$$

where $\hat{r}$ is a unit vector from O to P, i.e., from Q to q_0. If $\vec{E}$ is the electric field created by Q at P, then by definition

$$\vec{E} = \lim_{q_0 \to 0} \frac{\vec{F}}{q_0} = \lim_{q_0 \to 0} \frac{k_e \frac{Qq_0}{r^2}\hat{r}}{q_0}$$

$$= k_e \frac{Q}{r^2}\hat{r} = \frac{1}{4\pi\varepsilon_0}\frac{Q}{r^2}\hat{r} = \frac{1}{4\pi\varepsilon_0}\frac{Q}{r^3}\vec{r}$$

If Q is positive, $\vec{E}$ is directed radially outward from it and if Q is negative, $\vec{E}$ is directed toward it. In magnitude,

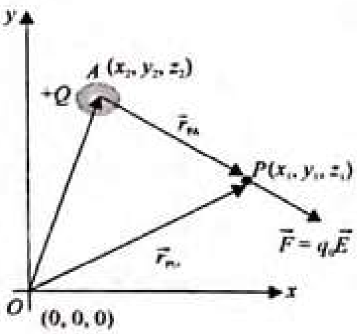
$$E = k_e \frac{Q}{r^2} = \frac{1}{4\pi\varepsilon_0}\frac{Q}{r^2}$$

ELECTRIC FIELD DUE TO A POINT CHARGE IN VECTOR NOTATION

Electric force on test charge $+q_0$ in the direction of position vector $\vec{r}_{PA}$ is given by $\vec{r}_{PA} = \vec{r}_{PO} - \vec{r}_{AO}$

$$\vec{F}_E = \frac{1}{4\pi\varepsilon_0}\frac{Qq_0}{r^3}(\vec{r}_{PA})$$

$$\vec{E} = \frac{\vec{F}_E}{q_0} = \frac{1}{4\pi\varepsilon_0}\frac{Q}{r^3}(\vec{r}_{PA})$$



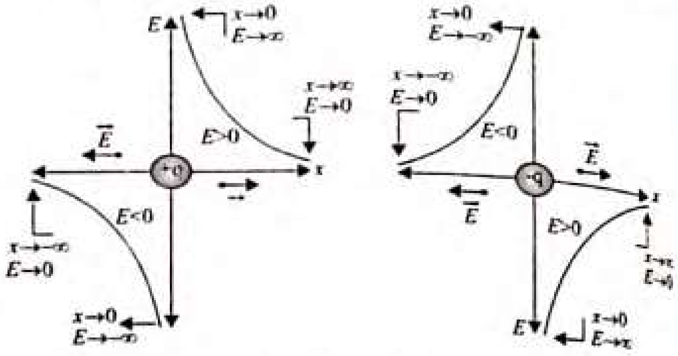
$\vec{E}$ is the electric field intensity vector at position P due to a point charge placed at the position A.

$$\vec{r}_{PA} = \vec{r}_{PO} - \vec{r}_{AO}$$

If $\quad \vec{r}_{PO} = x_1\hat{i} + y_1\hat{j} + z_1\hat{k}$ and $\vec{r}_{AO} = x_2\hat{i} + y_2\hat{j} + z_2\hat{k}$, then

$$\frac{Q\{(x_1 - x_2)\hat{i} + (y_1 - y_2)\hat{j} + (z_1 - z_2)\hat{k}\}}{\pi\varepsilon\ \{(x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2\}^{3/2}}$$

Graphical Variation of $\vec{E}$ on x-axis Due to a Point Charge



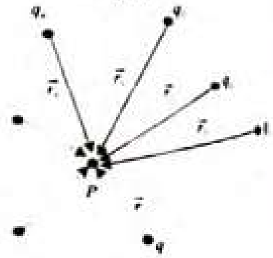
Electric Field Intensity Due to a Group of Charges

Using the principle of superposition, the net field at point P is given by

$$\vec{E} = \vec{E}_1 + \vec{E}_2 + \cdots + \vec{E}_n$$

$$= \frac{1}{4\pi\varepsilon_0}\frac{q_1}{r_1^2}\hat{r}_1 + \frac{1}{4\pi\varepsilon_0}\frac{q_2}{r_2^2}\hat{r}_2 + \cdots + \frac{1}{4\pi\varepsilon_0}\frac{q_n}{r_n^2}\hat{r}_n$$

$$= \frac{1}{4\pi\varepsilon_0}\sum_{i=1}^{n}\frac{q_i}{r_i^2}\hat{r}_i$$



In terms of position vectors,

$$\vec{E} = \frac{1}{4\pi\varepsilon_0}\sum_{i=1}^{n}\frac{q_i(\vec{r} - \vec{r}_i)}{|\vec{r} - \vec{r}_i|^3}$$

ILLUSTRATION 17.5 Two point charges of $+5 \times 10^{-19}$ C and $+20 \times 10^{-19}$ C are separated by a distance of 2 m. Find the point on the line joining them at which electric field intensity is zero.

Solution. Here, $q_1 = +5 \times 10^{-19}$ C, $q_2 = +20 \times 10^{-19}$ C. If P is the point (distant x from q_1), where electric field intensity is zero, then

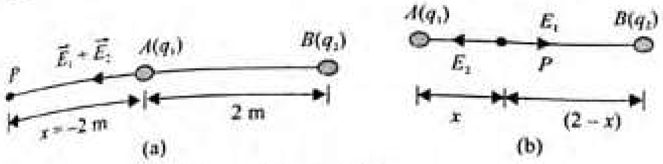
$$|E_1| = |E_2|$$

or $\quad k_e \dfrac{q_1}{x^2} = k_e \dfrac{q_2}{(2-x)^2}$

or $\quad \dfrac{(2-x)^2}{x^2} = \dfrac{q_2}{q_1} = \dfrac{20 \times 10^{-19}\,\text{C}}{5 \times 10^{-19}\,\text{C}} = 4$

or $\quad \dfrac{(2-x)}{x} = \pm 2$

Hence, $x = -2$ m or $x = 2/3$ m. If $x = -2$ m, the point P lies to the left of A. In this case, since $\vec{E}_1$ and $\vec{E}_2$ are in the same direction, the two positive charges produce a resultant electric field $\vec{E}$, where $\vec{E} = \vec{E}_1 + \vec{E}_2$ as shown in Figure (a). Hence, this is not a feasible situation.



Thus, as shown in Figure (b), $x = 2/3$ m.

ILLUSTRATION 17.6 The positions of two point charges q_1 and q_2 are $\vec{r}_1$ and $\vec{r}_2$, respectively. Find the position of the point where the net field is zero due to these charges.

Solution. At P, let the net field be zero.

$$\vec{E}_P = \vec{E}_1 + \vec{E}_2 = 0 \tag{i}$$

As we know,

$$\vec{E}_1 = \frac{q_1(\vec{r}-\vec{r}_1)}{4\pi\varepsilon_0\,|\vec{r}-\vec{r}_1|^3} \tag{ii}$$

and $$\vec{E}_2 = \frac{q_2(\vec{r}-\vec{r}_2)}{4\pi\varepsilon_0\,|\vec{r}-\vec{r}_2|^3} \tag{iii}$$

Substituting $\vec{E}_1$ and $\vec{E}_2$ from Eqs. (ii) and (iii) in Eq. (i), we have

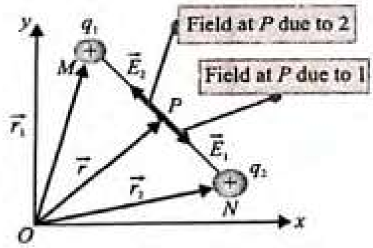
$$\frac{q_1(\vec{r}-\vec{r}_1)}{4\pi\varepsilon_0|\vec{r}-\vec{r}_1|^3} + \frac{q_2(\vec{r}-\vec{r}_2)}{4\pi\varepsilon_0|\vec{r}-\vec{r}_2|^3} = 0$$

or $$q_1(\vec{r}-\vec{r}_1) + q_2(\vec{r}-\vec{r}_2)\cdot\frac{|\vec{r}-\vec{r}_1|^3}{|\vec{r}-\vec{r}_2|^3} = 0 \tag{iv}$$

Since $E = 0$ at P,

$$|\vec{E}_1| = |\vec{E}_2|$$

$$\Rightarrow \quad \frac{q_1}{4\pi\varepsilon_0 r_{P_1}^2} = \frac{q_2}{4\pi\varepsilon_0 r_{P_2}^2}$$



where $\vec{r}_{P_1} = \vec{r} - \vec{r}_1$

and $\vec{r}_{P_2} = \vec{r} - \vec{r}_2$. Therefore,

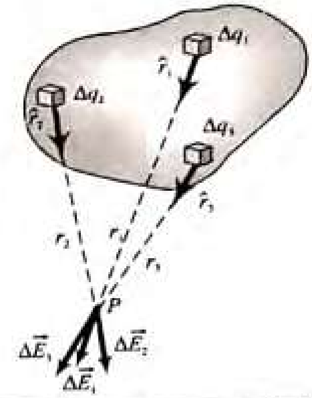
$$\frac{q_1}{|\vec{r}-\vec{r}_1|^2} = \frac{q_2}{|\vec{r}-\vec{r}_2|^2} \quad \text{or} \quad \frac{|\vec{r}-\vec{r}_1|}{|\vec{r}-\vec{r}_2|} = \frac{\sqrt{q_1}}{\sqrt{q_2}} \tag{v}$$

Substituting the value of $|\vec{r}-\vec{r}_1|/|\vec{r}-\vec{r}_2|$ from Eq. (v) in Eq. (iv), we get

$$q_1(\vec{r}-\vec{r}_1) + q_2(\vec{r}-\vec{r}_2)\left(\frac{q_1}{q_2}\right) = 0 \quad \text{or} \quad \vec{r} = \frac{\vec{r}_1\sqrt{q_2}+\vec{r}_2\sqrt{q_1}}{\sqrt{q_1}+\sqrt{q_2}}$$

ELECTRIC FIELD DUE TO CONTINUOUS DISTRIBUTION OF CHARGE

A system of closely spaced electric charges forms a continuous charge distribution. To find the field of a continuous charge distribution, we divide the charge into infinitesimal charge elements. Each infinitesimal charge element is then considered a point charge, and the electric field $d\vec{E}$ is determined due to this charge at a given point. The net field at the given point is the summation of fields of all the elements, i.e., $\vec{E} = \int d\vec{E}$.

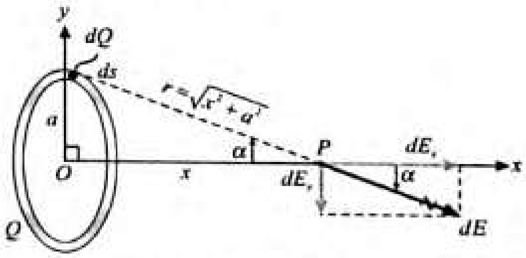


Linear charge distribution	Surface charge distribution	Volume charge distribution
In this distribution, charge is distributed on a line, *for example* charge on a wire, charge on a ring, etc. The linear charge density is given by $\lambda = \frac{\text{Charge}}{\text{Length}} = \frac{Q}{2\pi R}$	In this distribution, charge is distributed on the surface, *for example* charge on a conducting sphere, charge on a sheet, etc. The surface charge density is given by $\sigma = \frac{\text{Charge}}{\text{Area}} = \frac{Q}{4\pi R^2}$	In this distribution, charge is distributed in the whole volume of the body, *for example* a solid uniformly charged object, say a solid charged sphere. The volume charge density is given by $\rho = \frac{\text{Charge}}{\text{Volume}} = \frac{Q}{\frac{4}{3}\pi R^3}$

FIELD OF RING CHARGE

A ring-shaped conductor with radius a carries a total charge Q uniformly distributed around it. Let us calculate the electric field at a point P that lies on the axis of the ring at a distance x from its center.

$$\vec{E} = E_x\hat{i} = \frac{1}{4\pi\varepsilon_0}\frac{xQ}{(x^2+a^2)^{3/2}}\hat{i} \tag{i}$$



Electric field is directed away from positively charged ring. For $x = 0$, $E = 0$, this conclusion may be arrived at by the symmetry consideration. At a large distance from the ring, the electric field will be zero. Hence, it should have certain maximum value between $x = 0$ and $x = \infty$ (or $x = -\infty$). If we maximize Eq. (i), we can get the value of x_m as well as E_{max}. For the maximum value of E_x, we get

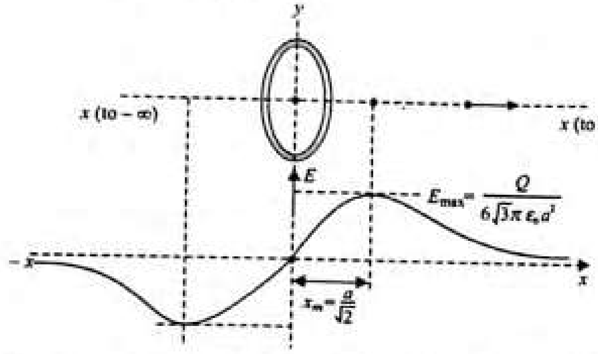
$$\frac{d}{dx}\left\{\frac{1}{4\pi\varepsilon_0}Q\frac{x}{(x^2+a^2)^{3/2}}\right\} = 0$$

or $$\frac{(x^2+a^2)^{3/2}(1)-x\frac{3}{2}(x^2+a^2)^{1/2}(2x)}{(x^2+a^2)^3}=0$$

or $$(x^2+a^2)-3x^2=0 \text{ or } x=\pm\frac{a}{\sqrt{2}}$$

The maximum value of the electric field is

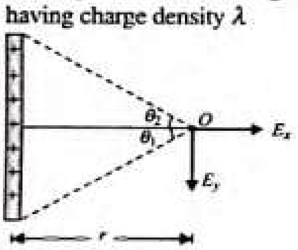
$$E_{a(\max)}=\frac{1}{4\pi\varepsilon_0}\left(\frac{2Q}{3\sqrt{3}\,a^2}\right)$$



Electric field is in the direction along the line that divides the charge distribution symmetrically. Some cases of summetry are as follows:

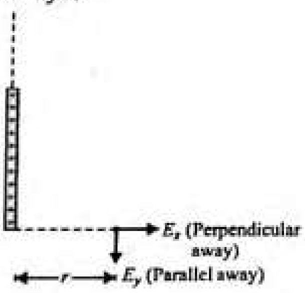
Some Useful Results

A charged rod of fixed length having charge density λ



$$E_x=\frac{\lambda}{4\pi\varepsilon_0 r}(\sin\theta_1+\sin\theta_2)$$
$$E_y=\frac{\lambda}{4\pi\varepsilon_0 r}(\cos\theta_1-\cos\theta_2)$$

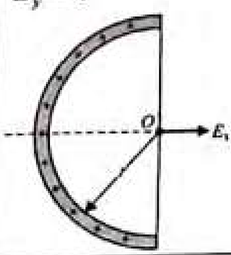
Semi-infinite rod having charge density λ



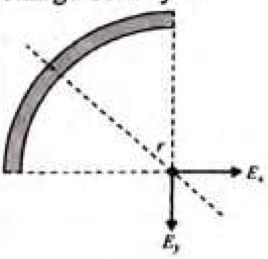
$$E_x=\frac{\lambda}{4\pi\varepsilon_0 r},\quad E_y=\frac{\lambda}{4\pi\varepsilon_0 r}$$

Semicircular ring having charge density λ

$$E_x=\frac{\lambda}{2\pi\varepsilon_0 r}$$
$$E_y=0$$

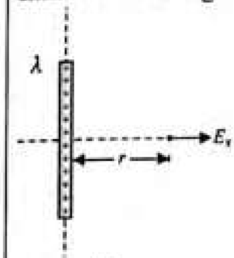


Quarter circular ring having charge density λ



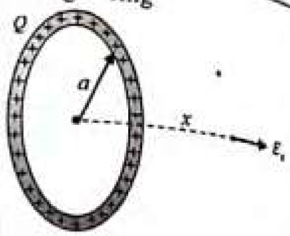
$$E_x=\frac{\lambda}{4\pi\varepsilon_0 r},\quad E_y=\frac{\lambda}{4\pi\varepsilon_0 r}$$

Infinite line charge



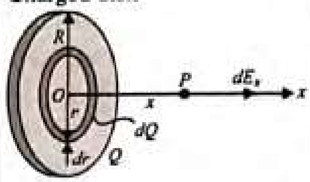
$$E_x=\frac{\lambda}{2\pi\varepsilon_0 r}$$
$$E_y=0$$

Charged ring



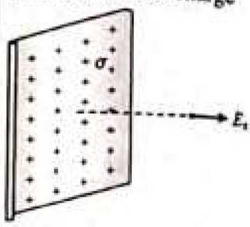
$$E_x=\frac{kQx}{(x^2+a^2)^{3/2}}$$
$$E_y=0$$

Charged disk



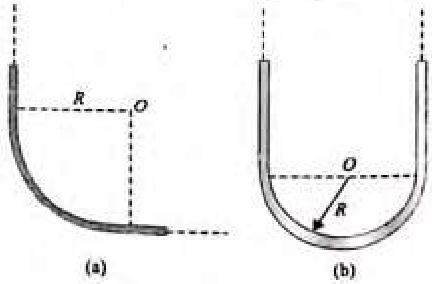
$$E_x=\frac{\sigma}{2\varepsilon_0}\left[1-\frac{x}{\sqrt{x^2+R^2}}\right]$$
$$E_y=0$$

Infinite sheet of charge



$$E_x=\frac{\sigma}{2\varepsilon_0},\quad E_y=0$$

ILLUSTRATION 17.7 A long wire with a uniform charge density λ is bent in two configurations shown in Figure (a) and (b). Determine the electric field intensity at point O.



Solution.

(a) For Figure (a), field due to segment 1 is

$$\vec{E}_1=\left[\frac{\lambda}{4\pi\varepsilon_0 R}\right]\hat{i}+\left[-\frac{\lambda}{4\pi\varepsilon_0 R}\right]\hat{j}$$

Field due to segment 2 is

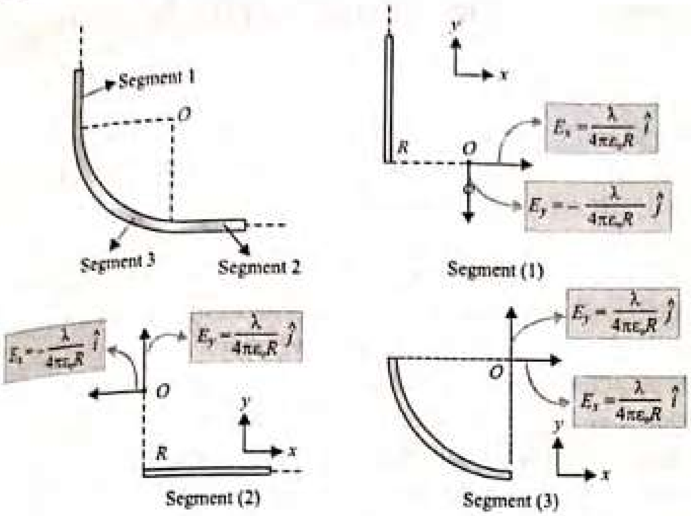
$$\vec{E}_2=\left[-\frac{\lambda}{4\pi\varepsilon_0 R}\right]\hat{i}+\left[\frac{\lambda}{4\pi\varepsilon_0 R}\right]\hat{j}$$

Field due to quarter shape wire segment 3 is

$$\vec{E}_3=\left[\frac{\lambda}{4\pi\varepsilon_0 R}\right]\hat{i}+\left[\frac{\lambda}{4\pi\varepsilon_0 R}\right]\hat{j}\ (\because \theta_1=90^\circ, \theta_2=0^\circ)$$

The resultant field is the superposition of the fields due to each part, i.e.,

$$\vec{E}=\vec{E}_1+\vec{E}_2+\vec{E}_3 \qquad \text{(i)}$$



Substituting the values of $\vec{E}_1$, $\vec{E}_2$, and $\vec{E}_3$ in Eq. (i), we get

$$\vec{E} = \left[\frac{\lambda}{4\pi\varepsilon_0 R}\right]\hat{i} + \left[\frac{\lambda}{4\pi\varepsilon_0 R}\right]\hat{j}$$

$$|\vec{E}| = \left[\left(\frac{\lambda}{4\pi\varepsilon_0 R}\right)^2 + \left(\frac{\lambda}{4\pi\varepsilon_0 R}\right)^2\right]^{1/2} = \frac{\sqrt{2}\lambda}{4\pi\varepsilon_0 R}$$

Here, $E_x = E_y = \dfrac{\lambda}{4\pi\varepsilon_0 R}$

Hence, the resultant field will make an angle of 45° with the axis.

(b) For Figure (b), field due to segment 1 is

$$\vec{E}_1 = \frac{\lambda}{4\pi\varepsilon_0 R}[\hat{i} - \hat{j}]$$

Field due to segment 2 is

$$\vec{E}_{x_2} = -\frac{\lambda}{4\pi\varepsilon_0 R}\hat{i}$$

$$\vec{E}_{y_2} = -\frac{\lambda}{4\pi\varepsilon_0 R}\hat{j}$$

$$\vec{E}_2 = -\frac{\lambda}{4\pi\varepsilon_0 R}[\hat{i} + \hat{j}]$$

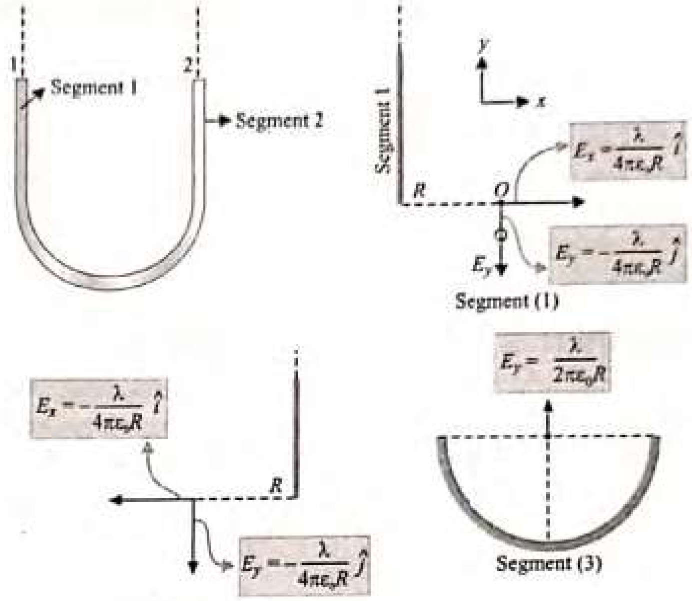
Field due to segment 3 is

$$\vec{E}_3 = \frac{\lambda}{2\pi\varepsilon_0 R}\hat{j}$$

From the principle of superposition of electric fields,

$$\vec{E} = \vec{E}_1 + \vec{E}_2 + \vec{E}_3$$

$$= \frac{\lambda}{4\pi\varepsilon_0 R}[\hat{i} - \hat{j}] - \frac{\lambda}{4\pi\varepsilon_0 R}[\hat{i} + \hat{j}] + \frac{\lambda}{2\pi\varepsilon_0 R}\hat{j} = 0$$



Segment (2)

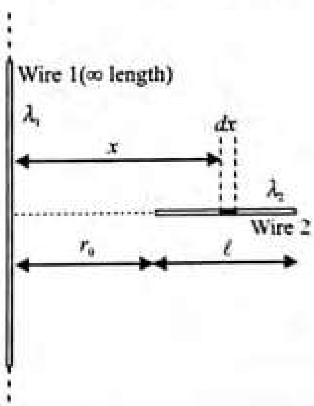
Hence, the net field is zero.

ILLUSTRATION 17.8 A segment of a charged wire of length l, charge density λ_2, and an infinitely long charged wire, charge density λ_1, lie in a plate at right angles to each other. The separation between the wires is r_0. Determine the force of interaction between the wires.

Solution. Electric field near a long wire is given by the expression

$$E = \frac{\lambda}{2\pi\varepsilon_0 r}$$

The second wire lies in the nonuniform field of the first wire. Each element of the second wire experiences different magnitude of field. Therefore, we consider differential element dx, and charge $dQ = \lambda_2 dx$, at a distance x from the long wire. The force acting on this element dF is



$$dF = EdQ = \left[\frac{\lambda_1}{2\pi\varepsilon_0 x}\right]\lambda_2 dx$$

The force acting on each element depends on x, the separation between wire 1 and 2. Integrating the expression for dF in the limits $x = r_0$ to $x = r_0 + l$, we obtain

$$F = \int_{r_0}^{r_0+\ell} \frac{\lambda_1\lambda_2}{2\pi\varepsilon_0}\frac{dx}{x} = \frac{\lambda_1\lambda_2}{2\pi\varepsilon_0}\ln\left[1 + \frac{\ell}{r_0}\right]$$

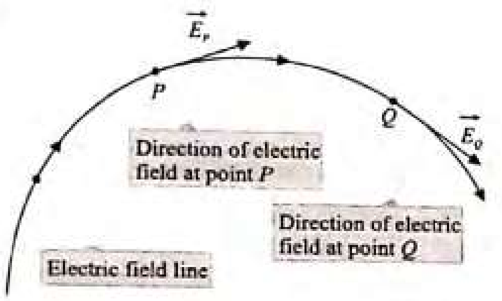
LINES OF FORCE

We have defined the electric field mathematically. Let us now explore a means of visualizing the electric field in a pictorial

representation. A convenient way of visualizing electric field patterns is to draw lines, called electric field lines. The lines of force provide a nice idea to visualize the pattern of electric field in a given space. We assume that the space around a charged body is filled with some lines known as electric lines of force. *These lines of force are drawn in space in such a way that the tangent to the line at any point gives the direction of the electric field at that point.* It has been found quite convenient to visualize the electric field in terms of lines of force.

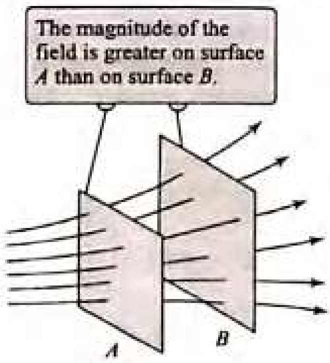
Properties of Electric Lines of Force

The electric field vector $\vec{E}$ is tangent to the electric field line at each point. The line has a direction, indicated by an arrowhead, that is the same as that of the electric field vector. The direction of the line is that of the force on a positive test charge placed in the field.



The number of lines per unit area through a surface perpendicular to the lines is proportional to the magnitude of the electric field in that region. Therefore, the field lines are close together where the electric field is strong and far apart where the field is weak.

No field line originates or terminates in the space surrounding a charge. Every field line is a continuous and smooth curve originating from a positive charge and ending on a negative charge. If one type of charge is in excess, some lines will begin or end infinitely far away.



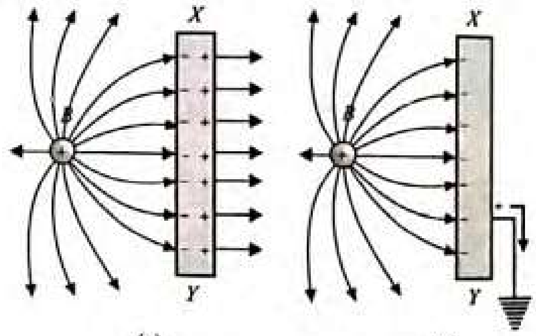
Two electric lines of force never cross each other, because if they do, intensity will have two directions at the point of intersection, which is absurd.

Field lines do not pass through the conductor. This indicates that the *electric field within the conductor is zero.* The field lines are perpendicular to the surface of the conductor. Had it been not so, there would have been a component of the field along the surface of the conductor and a current would flow through it. But no current flows in such an *electrostatic situation. Thus, the electric field just outside the surface of the conductor is perpendicular to its surface.*

ELECTROSTATIC SHIELDING (OR SCREENING)

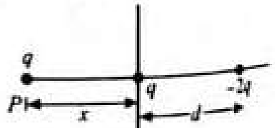
Electrostatic screening is the process of limiting the electric field to a certain region of space.

An earthed conductor acts as a screen (or a shield) against the electric field. If we place a metal screen XY near a charged body B, the resultant electrostatic field due to electrostatic induction is as shown in Figure (a). But when the conductor XY is earthed, the free induced positive charge on it flows to the earth and with it the lines of force emanating from it disappear as shown in Figure (b). Thus, the region to the right of XY is shielded from the field due to B. It is to be noted that the shielding surface may or may not be continuous. Continuous shielding surfaces, called Faraday cages, are hollow conductors and are based on the fact that electric field inside a hollow conductor is zero. To protect people and dielectric instruments from external electric field, we enclose them in such cages and leave them unearthed. An apparatus generating high voltage is also enclosed in such a cage to prevent its field from spreading out. But such a cage is earthed.



(a) (b)

ILLUSTRATION 17.9 Charges $+q$ and $-2q$ are fixed at distance d apart as shown in figure.



i. Sketch roughly the pattern of electric field lines, showing the position of neutral point.

ii. Where should a charge particle q be placed so that it experiences no force?

Solution. Let the net force on q at P be zero. Then,

$$\frac{kq^2}{x^2} = \frac{kq\,2q}{(d+x)^2} \text{ or } x = \frac{d}{\sqrt{2}-1}$$

P is the neutral point where electric field will be zero.

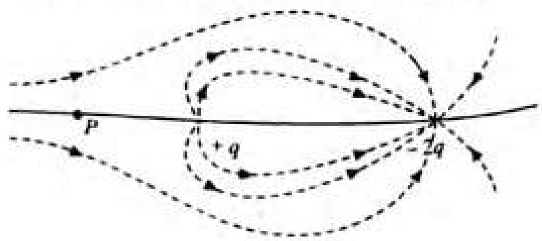


ILLUSTRATION 17.10 The field lines for two point charges are shown in figure.

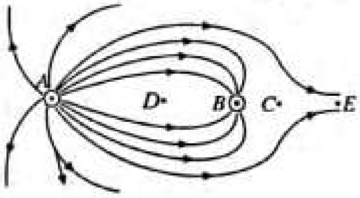


i. Is the field uniform?
ii. Determine the ratio q_A/q_B.
iii. What are the sign of q_A and q_B?
iv. Apart from infinity, where is the neutral point?
v. If q_A and q_B are separated by a distance $10(\sqrt{2}-1)$ cm, find the position of neutral point.
vi. Where will the lines meet which are coming from A and are not meeting at q_B?
vii. Will a positive charge follow the line of force if free to move?

Solution.

i. No
ii. The number of lines coming from or coming to a charge is proportional to the magnitude of the charge, so

$$\frac{q_A}{q_B}=\frac{12}{6}=2$$

iii. q_A is positive and q_B is negative.
iv. C is the other neutral point.
v. For neutral point

$$E_A=E_B \Rightarrow \frac{1}{4\pi\varepsilon_0}\frac{q_A}{(l+x)^2}=\frac{1}{4\pi\varepsilon_0}\frac{q_B}{x^2}$$

or $$\left(\frac{l+x}{x}\right)^2=\frac{q_A}{q_B}=2 \text{ or } x=10\text{ cm}$$

vi. At infinity.
vii. No. As lines of force are curved, the direction of velocity and acceleration will be different. Hence, a charge cannot follow strictly the lines of force. Also to move on some curved path, centripetal force is required, whereas the lines of force will provide only tangential force.

MOTION OF CHARGED PARTICLE IN UNIFORM ELECTRIC FIELD

When a charged particle is placed in an electric field, it experiences an electrical force. If this is the only force on the particle, it must be the net force. The net force will cause the particle to accelerate according to Newton's second law. So

$$\vec{F}_e=q\vec{E}=m\vec{a}$$

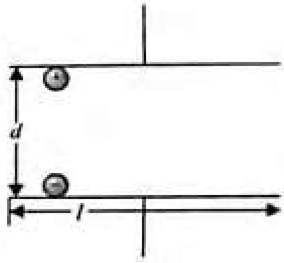
If $\vec{E}$ is uniform, then $\vec{a}$ is constant and $\vec{a}=q\vec{E}/m$. If the particle has a positive charge, its acceleration is in the direction of the field. If the particle has a negative charge, its acceleration is in the direction opposite to the electric field. Since the acceleration is constant, the kinematic equations can be used.

ILLUSTRATION 17.11 A uniform electric field E exists between two metal plates one negative and other positive. The plate length is l and the separation of the plates is d.

i. An electron and a proton start from the negative plate and positive plate, respectively, and go to opposite plates. Which one of them wins this race?
ii. An electron and a proton start moving parallel to the plates toward the other end from the midpoint of the separation of plates at one end of the plates. Which of the two will have greater deviation when they come out of the plates if they start with the
 (a) same initial velocity,
 (b) same initial kinetic energy, and
 (c) same initial momentum.

Solution.

i. $a_e=\frac{eE}{m_e}, a_p=\frac{eE}{m_p}; d=\frac{1}{2}at^2$



$$t=\sqrt{\frac{2d}{a}} \text{ or } t=\sqrt{\frac{2md}{eE}}$$

Therefore, we have

$$\frac{t_e}{t_p}=\sqrt{\frac{m_e}{m_p}}$$

As $m_e<m_p$, so $t_e<t_p$. Hence, electron will take less time, i.e., the electron wins the race.

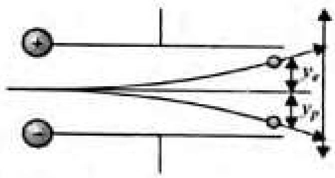
ii. Time to cross the plates is $t=l/u$. Deviation is

$$y=\frac{1}{2}at^2=\frac{1}{2}\frac{eE}{m}\left(\frac{l}{u}\right)^2$$

or $$\frac{y_e}{y_p}=\frac{m_p}{m_e}\left(\frac{u_p}{u_e}\right)^2 \qquad \text{(i)}$$

(a) If $u_p=u_e$, then

$$\frac{y_e}{y_p}=\frac{m_p}{m_e}$$



As $m_p>m_e$, so $y_e>y_p$. Hence, the deviation of the electron will be more.

(b) From Eq. (i),

$$\frac{y_e}{y_p}=\left(\frac{m_pu_p^2}{m_eu_e^2}\right)=1 \qquad \text{(as given)}$$

Hence, the deviation of both the electron and the proton will be the same.

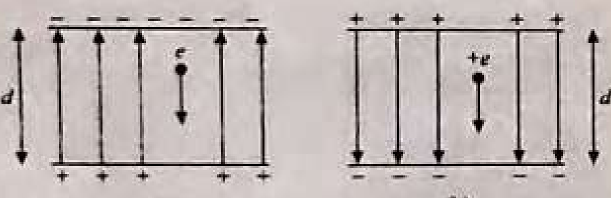
(c) From Eq. (i),

$$\frac{y_e}{y_p}=\left(\frac{m_pu_p}{m_eu_e}\right)^2\frac{m_e}{m_p}=\frac{m_e}{m_p}$$

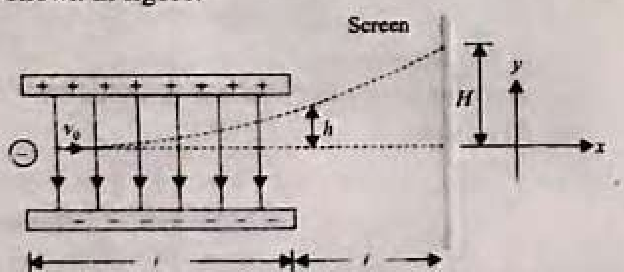
As $m_e<m_p$, so $y_e<y_p$. Hence, the deviation of proton will be more.

Concept Application Exercise 17.3

1. Two identical positive charges are fixed on the y-axis, at equal distances from the origin O. A particle with a negative charge starts on the x-axis at a large distance from O, moves along the x-axis, passes through O, and moves far away from O on the other side. Its acceleration a is taken as positive along its direction of motion. Plot acceleration a of the particle against its x-coordinate.
2. Three identical positive charges Q are arranged at the vertices of an equilateral triangle. The side of the triangle is a. Find the intensity of the field at the vertex of a regular tetrahedron of which the triangle is the base.
3. Two point charges $+5 \times 10^{-19}$ C and $+20 \times 10^{-19}$ C are separated by a distance of 2 m. The electric field intensity will be zero at a distance d = ______ from the charge of 5×10^{-19} C.
4. An electron (mass m_e) falls through a distance d in a uniform electric field of magnitude E. The direction of the field is reversed keeping its magnitude unchanged, and a proton (mass m_p) falls through the same distance. If the times taken by the electron and the proton to fall the distance d is t_{electron} and t_{proton}, respectively, then the ratio $t_{\text{electron}}/t_{\text{proton}}$ = ______



5. An electron moving in a gravitational free space enters a uniform electric field E with an initial velocity v_0 as shown in figure.



(a) Find the deflection distance h in the field.
(b) Find an expression for the velocity of electron when it just emerges from the field.
(c) Find an expression for the total deflection distance H at a vertical screen placed at a distance l from the region of uniform field. (Assume that the field abruptly ends outside the field.)

ELECTRIC DIPOLE

An electric dipole is a system of two equal and opposite point charges separated by a very small and finite distance. Figure shows an electric dipole consisting of two equal and opposite point charges $-q$ and $+q$ separated by a small distance $2l$. The strength of an electric dipole is measured by a vector quantity known as electric dipole moment. Its magnitude is equal to the product of the magnitude of either charge and the distance between the two charges, i.e., $p = 2ql$. The direction of p is from the negative charge to the positive charge. In the SI system of units, p is measured in coulomb-meter.

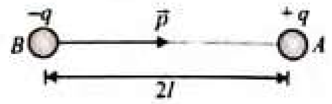


ILLUSTRATION 17.12 Three charges $+q$, $+q$, and $-2q$ are placed at the vertices of an equilateral triangle. What is the dipole moment of the system?

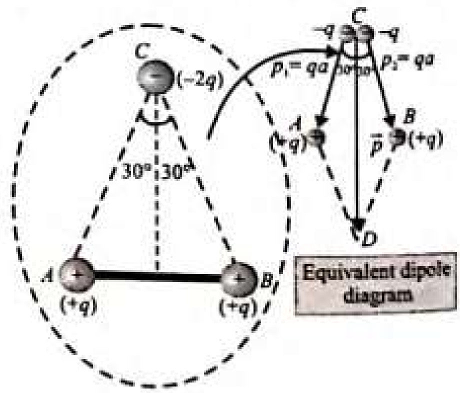
Solution. Charge $-q$ at C and $+q$ at A form one dipole, and the remaining charge $-q$ at C and $+q$ at B form another dipole (figure).

Dipole moment along CA is qa, and dipole moment along CB is qa. So the net dipole moment is

$$p = \sqrt{(qa)^2 + (qa)^2 + 2(qa)(qa)\cos 60^\circ} = \sqrt{3}qa$$

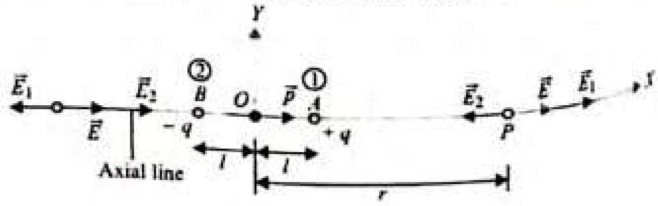
$\vec{p}$ acts along CD, which bisects the angle (60°) at C.



ELECTRIC FIELD DUE TO A DIPOLE

Electric Field Intensity Due to an Electric Dipole at a Point on the Axial Line

A line passing through the negative and positive charges of the electric dipole is called the axial line of the electric dipole.



$$\vec{E} = -\frac{1}{4\pi\varepsilon_0} \times \frac{\vec{p}}{r^3}$$

NOTE: The direction of the electric field E is opposite to the direction of $\vec{p}$, i.e., antiparallel to the axis of dipole from the positive charge toward the negative charge.

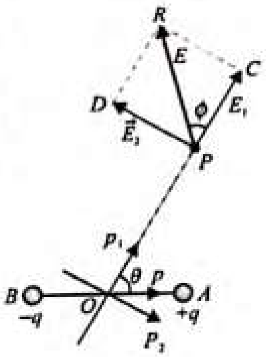
ELECTRIC FIELD INTENSITY DUE TO A SHORT DIPOLE AT SOME GENERAL POINT

Let AB be a short electric dipole of dipole moment $\vec{p}$ (directed from B to A). We are interested to find the electric field at some general point P. The distance of the observation point P with respect to midpoint O of the dipole is r, and the angle made by the line OP with the axis of the dipole is θ.

We know that the dipole moment of a dipole is a vector quantity. It can be resolved into two rectangular components $\vec{p}_1$ and $\vec{p}_2$ as shown in figure, so that $\vec{p} = \vec{p}_1 + \vec{p}_2$. The magnitudes of $\vec{p}_1$ and $\vec{p}_2$ are $p_1 = p\cos\theta$ and $p_2 = p\sin\theta$.

It is clear from the figure that point P lies on the axial line of the dipole with moment $\vec{p}_1$. Hence, the magnitude of the electric field intensity $\vec{E}_1$ at P due to $\vec{p}_1$ is

$$E_1 = \frac{1}{4\pi\varepsilon_0} \times \frac{2p\cos\theta}{r^3} \text{ (along the direction } OC) \quad \text{(i)}$$



Similarly, P lies on the equatorial line of dipole with moment $\vec{p}_2$. Hence, the magnitude of electric field intensity $\vec{E}_2$ at P due to $\vec{p}_2$ is

$$E_2 = \frac{1}{4\pi\varepsilon_0} \frac{p\sin\theta}{r^3} \text{ (opposite to } p_2) \quad \text{(ii)}$$

Hence, the resultant intensity at P is $\vec{E} = \vec{E}_1 + \vec{E}_2$.

The magnitude of $\vec{E}$ is $E = \sqrt{E_1^2 + E_2^2}$ (as $\vec{E}_1$ and $\vec{E}_2$ are mutually perpendicular).

$$E = \sqrt{\left(\frac{2p\cos\theta}{4\pi\varepsilon_0 r^3}\right)^2 + \left(\frac{p\sin\theta}{4\pi\varepsilon_0 r^3}\right)^2}$$

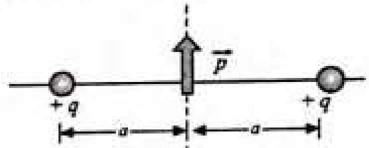
$$= \frac{p}{4\pi\varepsilon_0 r^3}\sqrt{4\cos^2\theta + \sin^2\theta}$$

$$= \frac{p}{4\pi\varepsilon_0 r^3}\sqrt{1 + 3\cos^2\theta}$$

If the resultant field intensity vector $\vec{E}$ makes an angle ϕ with the direction of $\vec{E}_1$, then

$$\tan\phi = \frac{E_2}{E_1} = \frac{p\sin\theta / 4\pi\varepsilon_0 r^3}{2p\cos\theta / 4\pi\varepsilon_0 r^3} = \frac{1}{2}\tan\theta$$

ILLUSTRATION 17.13 What is the force on a dipole of dipole moment p placed as shown in figure.



Solution. Force on any q by dipole is

$$F = qE_{\text{dipole}} = \frac{q}{4\pi\varepsilon_0}\frac{p}{a^3} \text{ downward}$$

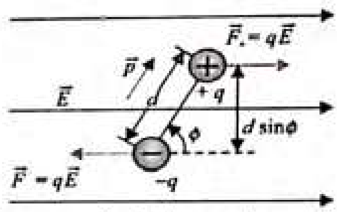
So from Newton's third law, force on the dipole due to both charges is

$$2F = \frac{qp}{2\pi\varepsilon_0 a^3} \text{ upward}$$

DIPOLE IN A UNIFORM ELECTRIC FIELD

Torque

When a dipole is placed in a uniform field as shown in figure, the net force on it is $F_R = q\vec{E} + (-q)\vec{E} = 0$.



Hence, the net force on a dipole is zero in a uniform electric field. While the torque is

$$\tau = qE \times d\sin\phi = pE \times \sin\phi \text{ (as } p = qd)$$

$$\therefore \quad \vec{\tau} = \vec{p} \times \vec{E} \text{ (by electric field)}$$

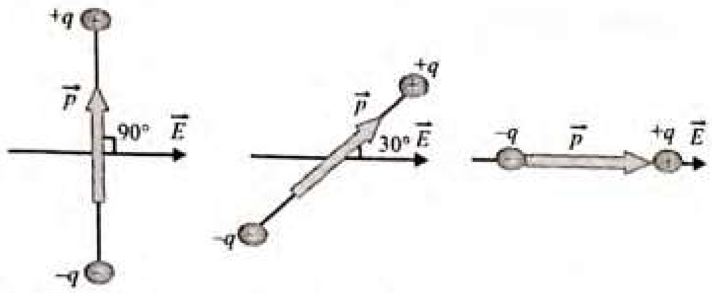
and $\quad \vec{\tau} = \vec{E} \times \vec{p}$ (if the dipole is in equilibrium)

From the expression, it is clear that the couple acting on a dipole is maximum $(= pE)$ when the dipole is perpendicular $(\phi = 90°)$ to the field and minimum $(= 0)$ when the dipole is parallel $(\phi = 0°)$ or antiparallel $(\phi = 180°)$ to the field.

By applying a torque, the electric field tends to align a dipole in its own direction.

ILLUSTRATION 17.14 An electric dipole of dipole moment $\vec{p}$ is placed in a uniform electric field $\vec{E}$. Write the expression for the torque $\vec{\tau}$ experienced by the dipole. Identify two pairs of perpendicular vectors in the expression. Show diagrammatically the orientation of the dipole in the field for which the torque is (i) maximum, (ii) half the maximum value, and (iii) zero.

Solution. As $\vec{\tau} = \vec{p} \times \vec{E}$, the pair of perpendicular vectors are (i) $\vec{\tau}$ and $\vec{p}$ and (ii) $\vec{\tau}$ and $\vec{E}$. The required orientations of the dipole in the electric field are shown in figure.



$\tau = pE \sin 90°$
$= pE$ = maximum (τ_{max})

$\tau = pE \sin 30°$
$= (1/2)pE = 1/2\,(\tau_{max})$

$\tau = pE \sin 0°$
$= 0$

ELECTRIC DIPOLE IN A NONUNIFORM ELECTRIC FIELD

If an electric dipole is placed in a nonuniform electric field, there is a net force on the dipole in addition to the torque tending to align the dipole with the field. The net force depends on

- the orientation of the dipole with respect to the electric field,
- the dipole moment of the dipole, and
- how rapidly the field varies in space.

Qualitative Discussion

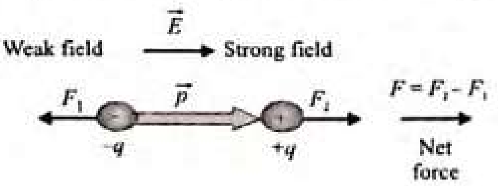
To clarify the basic ideas, let us consider only the simplest situation where

- the electric field has a constant direction and
- its magnitude increases steadily as we move in the direction of the electric field.

Further, consider the following two cases:

When $\vec{p}$ is parallel to $\vec{E}$, i.e., $\vec{p}\uparrow\uparrow\vec{E}$

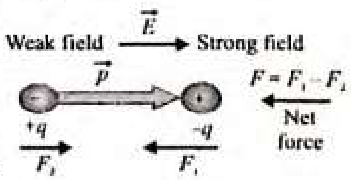
Since the force F_2 acting on $+q$ (lying in the strong field) is greater than the force F_1 acting on $-q$ (lying in the weak field), the net force $F = F_2 - F_1$ is in the direction of increasing $\vec{E}$, i.e., toward the region of the strong field as shown in figure.



(a)

When $\vec{p}$ is antiparallel to $\vec{E}$, i.e., $\vec{p}\uparrow\downarrow\vec{E}$

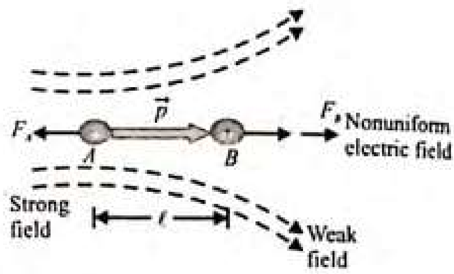
Since the force F_1 acting on $-q$ (placed in the strong field) is greater than the force F_2 acting on $+q$ (placed in the weak field), the net force $F = F_1 - F_2$ is in the direction of decreasing field, i.e., toward the region of the weak field as shown in figure.



Thus, when $\vec{p}\uparrow\uparrow\vec{E}$, the dipole moves toward the region of strong electric field (i.e., in the direction of increasing $\vec{E}$) and when $\vec{p}\uparrow\downarrow\vec{E}$, the dipole moves toward the region of weak field (i.e., in the direction of decreasing $\vec{E}$).

Quantitative Discussion

An electric dipole in a nonuniform electric field is subject to the action of a resultant force because the negative and the positive charges ($-q$ and $+q$) of the dipole are located at different points in the field, having different field strengths as shown in figure.



The resultant force is

$$F = F_A - F_B = qE_A - qE_B = q\ell\left[\frac{E_A - E_B}{\ell}\right] \quad \text{(i)}$$

But $q\ell = p$ is the dipole moment (l being the length of the dipole) and $(E_A - E_B)/\ell = \Delta E/\Delta\ell$ is field strength gradient (i.e., the quantity showing the change in field strength per unit length). Thus, from Eq. (i),

$$F = p\frac{\Delta E}{\Delta\ell} \quad \text{(ii)}$$

In differential form

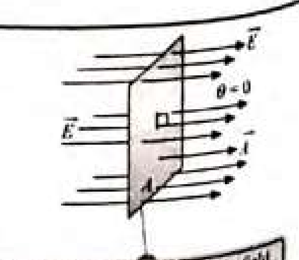
$$|\vec{F}| = \left|p\frac{d\vec{E}}{dx}\right|$$

where $d\vec{E}/dx$ is the gradient of the field in the x-direction.

This force pulls the dipole into the region with a stronger field. It is due to this reason that a charged body attracts light objects such as pieces of paper, dust, pieces of foil, etc. By the action of the field, these objects first acquire a dipole moment and then pulled to a region where the field strength is greater, i.e., closer to the electrified body.

ELECTRIC FLUX

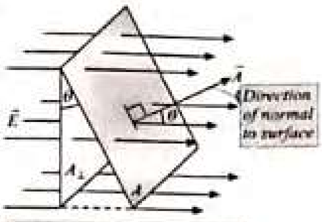
The field lines penetrate a rectangular surface of area A, whose plane is oriented perpendicular to the field. As we know that the number of lines per unit area (in other words, the *line density*) is proportional to the magnitude of the electric field, the total number of



Surface face on to electric field $\vec{E}$ and $\vec{A}$. Parallel angle between $\vec{E}$ and $\vec{A}$ is $\theta = 0$; flux $\Phi_E = \vec{E}\cdot\vec{A} = EA$

lines penetrating the surface is proportional to the product EA. This product of the magnitude of the electric field E and surface area A perpendicular to the field is called the **electric flux** Φ_E (uppercase Greek letter phi) given by

$$\Phi_E = EA \quad \text{(i)}$$



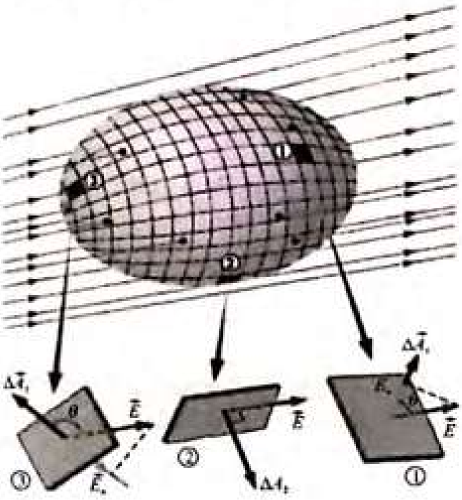
The number of field lines that go through area A is the same as the number of lines that go through area $A_\perp$

From the SI units of E and A, we see that Φ_E has the units of Nm^2C^{-1}. Electric flux is proportional to the number of electric field lines penetrating some surface.

If the area of each element approaches zero, the number of elements approaches infinity and the sum is replaced by an integral. Therefore, the general definition of electric flux is

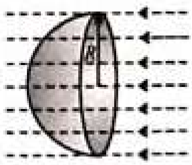
$$\Phi_E \equiv \int_{\text{Surface}} \vec{E}\cdot d\vec{A} \quad \text{(ii)}$$

Equation (ii) is a surface integral, which means it must be evaluated over the surface in question. In general, the value of Φ_E depends both on the field pattern and on the surface.



We are often interested in evaluating the flux through a closed surface, defined as a surface that divides space into an inside and an outside region so that one cannot move from one region to the other without crossing the surface. The surface of a sphere, for example, is a closed surface.

ILLUSTRATION 17.15 Find out the flux through the curved surface of a hemisphere of radius R if it is placed in a uniform electric field E as shown in figure.



Solution. The number of electric lines passing through the base of the hemisphere is the same as that of the lines passing through the hemisphere.

The flux associated with the base of the hemisphere is $\phi = -E\pi R^2$ (negative as it is the incoming flux). Hence, the same amount of flux will be associated with the curved surface, but the sign of the flux will be positive as it is as outgoing flux. Hence,

$$\phi_{\text{curve}} = E\pi R^2$$

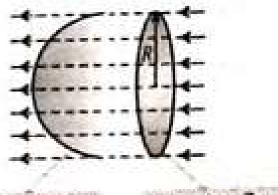


ILLUSTRATION 17.16 Consider a cylindrical surface of radius R and length l in a uniform electric field E. Compute the electric flux if the axis of the cylinder is parallel to the field direction.

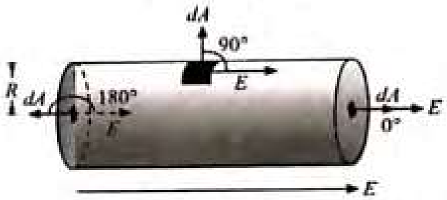
Solution. We can divide the entire surface into three parts, right and left plane faces and curved portion of its surface. Hence, the surface integral consists of the sum of the three terms:

$$\phi_E = \oint \vec{E}\cdot\overrightarrow{dA} = \int_{\text{left end}} \vec{E}\cdot\overrightarrow{dA} + \int_{\text{right end}} \vec{E}\cdot\overrightarrow{dA} + \int_{\text{curved}} \vec{E}\cdot\overrightarrow{dA}$$



All the area elements on the left end and electric field E are at an angle of 180°.

$$(\phi_E)_{\text{left end}} = \oint_{\text{left end}} \vec{E}\cdot\overrightarrow{dA} = \oint_{\text{left end}} E\,dA\cos 180°$$

$$= -E\oint_{\text{left end}} dA = -E\pi R^2$$

Note that E is constant over the entire plane surface of left end; therefore, we take it out from the integral.

Similarly, all the area elements on the right end are parallel to electric field E, i.e., angle is 0°.

$$(\phi_E)_{\text{right end}} = \oint_{\text{right end}} \vec{E}\cdot\overrightarrow{dA} = \oint_{\text{right end}} E\,dA\cos 0°$$

$$= +E\oint_{\text{right end}} dA = E\pi R^2$$

Finally, at every point on the curved surface the area vectors are perpendicular to the direction of the electric field. Thus,

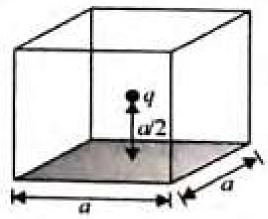
$$(\phi_E)_{\text{curved}} = \oint_{\text{curved surface}} \vec{E}\cdot\overrightarrow{dA} = \oint_{\text{curved surface}} E\,dA(\cos 90°) = 0$$

$$\text{Total flux} = (\phi_E)_{\text{right end}} + (\phi_E)_{\text{left end}} + (\phi_E)_{\text{curved surface}}$$

$$= (+E\pi R^2) + (-E\pi R^2) + 0 = 0$$

Hence, we see that in a uniform field the flux through a closed surface is zero. This is true for any shape of closed surface.

ILLUSTRATION 17.17 A point charge q is placed at a distance $a/2$ from the center of a square of side a as shown in figure. Calculate the electric flux passing through the square.

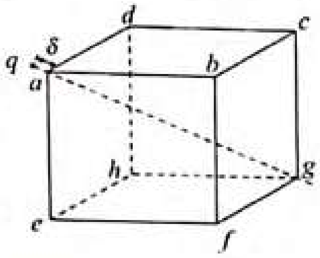


Solution.

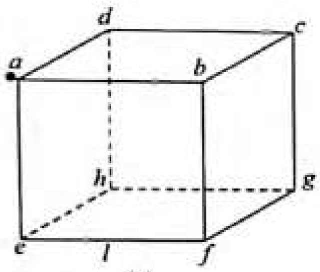
- This problem can be solved by symmetry consideration and Gauss's law.
- We can enclose the charged particle by a cube of side '*a*' and keep the particle at the center of the cube.
- The total flux passing through the close cube is $\phi = q/\varepsilon_0$.
- All the six surfaces are symmetrical with respect to charge, hence they will have equal contribution of the flux. So, flux through any one face is $\phi' = \phi/6 = q/6\varepsilon_0$.

ILLUSTRATION 17.18 In figure, a charge q is placed at a distance $\delta \to 0$ near one of the corners of a cube of edge l on a line of symmetry along diagonal.

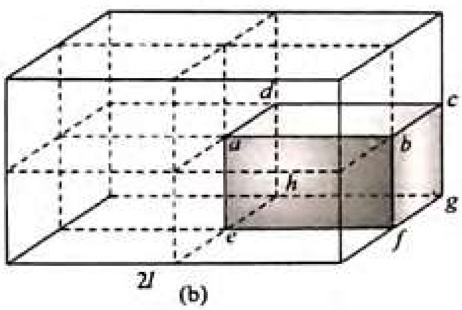
1. What is the flux through each of the faces containing the point a?
2. What is the flux through the other three faces?



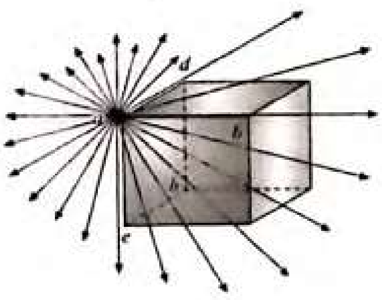
Solution. Use of symmetry consideration may be useful in problems of flux calculation.



(a)



(b)



(c)

- We can imagine a charged particle placed at the center of a cube of side $2l$.
- The flux enclosed with the cube is $\phi = q/\varepsilon_0$.
- The flux passing through one of the faces of the cube is $\phi' = \phi/6 = q/6\varepsilon_0$.
- Hence, the flux passing through the face *bcgf* is $\phi'/4 = q/24\varepsilon_0$.
- Each of the faces (*efgh*), (*bcgf*), and (*dcgh*) is symmetrical with respect to charge. Hence, the flux passing through each of the face is $q/24\varepsilon_0$.
- The electric field lines for the faces (*efgh*), (*bcgf*) and (*dcgh*) are away from the faces. Hence, the flux associated with each of the faces will be positive (i.e., $+ q / 24\varepsilon_0$). Hence, the total flux through these sides is

$$\frac{3 \times q}{24\varepsilon_0} = \frac{q}{8\varepsilon_0}.$$

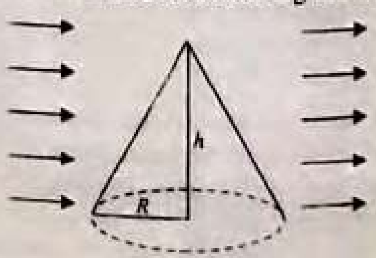
- As $\delta \to 0$, we can say the faces (*abcd*), (*abfe*) and (*adhe*) are also symmetrical about charge. Charge is slightly outside the cube.
- The number of electric field lines passing through the faces, which do not contain the point a, is same as the number of electric field lines passing through the faces containing the point a.
- Hence, the same amount of flux will pass through the faces containing the point a, i.e., $q/8\varepsilon_0$.
- The electric field lines are toward the faces containing the point a. Hence, the flux will be negative, i.e., $\phi'' = -q/8\varepsilon_0$.
- Hence, the flux through each of the faces containing the point '*a*' will be $\phi''/3 = q/24\varepsilon_0$.

Your Task: Repeat Illustration 17.18 if the charge is exactly at the corner of the cube given.

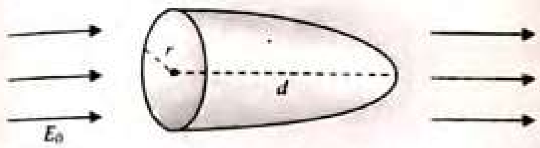
CONCEPT APPLICATION EXERCISE 17.4

1. A point charge Q is located just above the center of the flat face of a hemisphere of radius R as in figure. What is the flux
   (a) through the curved surface, and
   (b) through the flat face?
   (c) Repeat parts (a) and (b) if the charge is exactly at the center.

2. In figure, a cone lies in a uniform electric field E. Determine the electric flux entering the cone.



3. A uniform electric field $a\hat{i} + b\hat{j}$ intersects a surface of area A. What is the flux through this area if the surface lies (a) in the yz plane, (b) in the xz plane, (c) in the xy plane?
4. (a) A point charge q is located at distance d from an infinite plane. Determine the electric flux through the plane due to the point charge.
   (b) A point charge q is located at a very small distance from the center of a very large square on the line perpendicular to the square passing through its center. Determine the approximate electric flux through the square due to the point charge.
5. Calculate the total electric flux through the paraboloidal surface due to a uniform electric field of magnitude E_0 in the direction shown in figure.



6. Consider a closed surface of arbitatry shape as shown in figure. Suppose a single charge Q_1 is located at some point within the surface and second charge Q_2 is located outside the surface.

   (a) What is the total flux passing through the surface due to charge Q_1?
   (b) What is the total flux passing through the surface due to charge Q_2?

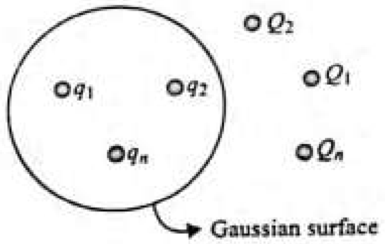
GAUSS'S LAW

Gauss's law is an alternative to Coulomb's law. Although completely equivalent to Coulomb's law, Gauss' law provides a different way to express the relationship between electric charge and electric field.

Gauss's law states that the total electric flux through a closed surface is proportional to the total electric charge enclosed within the surface. This law is useful in calculating field caused by charge distributions that have various symmetry properties. Mathematically, Gauss's law can be written as

$$\phi = \oint \vec{E} \cdot d\vec{A} = \frac{q_{in}}{\varepsilon_0}$$

One thing is to note that the electric field appearing in Gauss's law is the resultant electric field due to all the charges present inside as well as outside the given closed surface. On the other hand, the charges q_{in} appearing in the law are only the charges contained within the closed surface. The contribution of the charges outside the closed surface in producing the flux is zero. A surface on which Gauss's law is applied is sometimes called the Gaussian surface (figure).



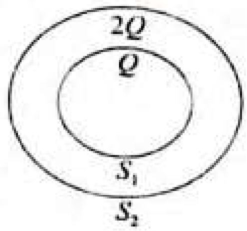
Caution: Remember that the closed surface in Gauss's law is imaginary; there need not be any material object at the position of the surface.

Important Points

Some important points on Gauss's law are as follows:

- The net flux through the surface is proportional to the net number of lines leaving the surface, where the net number means the number of lines leaving the surface minus the number of lines entering the surface. If more lines are leaving than entering, the net flux is positive. If more lines are entering than leaving, the net flux is negative.
- If no net flux passes through any closed surface, E may not be zero, but the flux of $\vec{E}$ must be zero and the net charge enclosed must be zero.
- In Gauss's law, $\vec{E}$ is the net field due to all charges present inside and outside the Gaussian surface.
- No net flux is contributed by the charges present outside the Gaussian surface because the number of E-lines (flux) coming into is equal to the number of E-lines going out of the surface.
- The net flux is contributed only by the charges inside (or enclosed by) the Gaussian surface.
- If we change the configuration by displacing the charges inside the Gaussian surface, the electric field at any point may change leaving the net flux passing through the Gaussian surface unchanged.
- However, any change in configuration of the charges outside a Gaussian surface may change E at a point, but the net flux remains the same as external charges contribute nothing to the total flux.

ILLUSTRATION 17.19 S_1 and S_2 are two hollow concentric spheres enclosing charges Q and $2Q$, respectively, as shown in figure.



i. What is the ratio of the electric flux through S_1 and S_2?
ii. How will the electric flux through sphere S_1 change if a medium of dielectric constant 5 is introduced in the space inside S_1 in place of air.

Solution.

i. Flux through S_1 is

$$\phi_1 = \frac{Q}{\varepsilon_0}$$

Flux through S_2 is

$$\phi_2 = \frac{Q+2Q}{\varepsilon_0} = \frac{3Q}{\varepsilon_0}$$

Thus,

$$\frac{\phi_1}{\phi_2} = \frac{Q/\varepsilon_0}{3Q/\varepsilon_0} = \frac{1}{3} = 1:3$$

ii. As $E_m = \dfrac{E}{\varepsilon_r}$ and $\varepsilon_r = 5$, so $E_m = \dfrac{E}{5}$

ϕ_1' (changed flux through S_1)

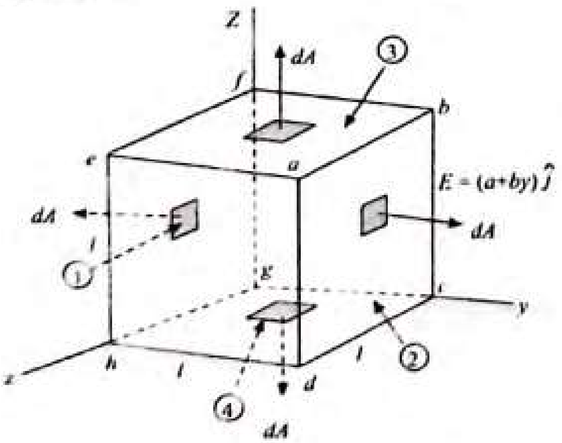
$$= \oint \vec{E}_m \cdot d\vec{S} = \oint \vec{E} \cdot d\vec{S}$$

$$= \frac{1}{5}\phi_1 \quad \left(\text{as} \oint \vec{E} \cdot d\vec{S} = \phi_1\right)$$

$$= \frac{Q}{5\varepsilon_0} \quad \left(\text{as } \phi_1 = \frac{Q}{\varepsilon_0}\right)$$

ILLUSTRATION 17.20 A cube of side l has one corner at the origin of coordinates and extends along the positive x-, y- and z-axes. Suppose that the electric field in this region is given by $\vec{E} = (a + by)\hat{j}$. Determine the charge inside the cube (a and b are some constants).

Solution. The faces *adhe*, *bcgf*, *cdhg*, and *abfe* will contribute zero flux because the area vector is normal to the electric field for these faces.



Flux through face *efgh* is

$$\phi_1 = \int \vec{E} \cdot d\vec{A} = a(\hat{j}) \cdot l^2(-\hat{j}) = -al^2$$

The field at the face *efgh* (that lies in the yz-plane, $y = 0$) is $\vec{E} = a\hat{j}$ and the area vector is $l^2(-\hat{j})$ (direction outward normal). Flux through face *abcd* is

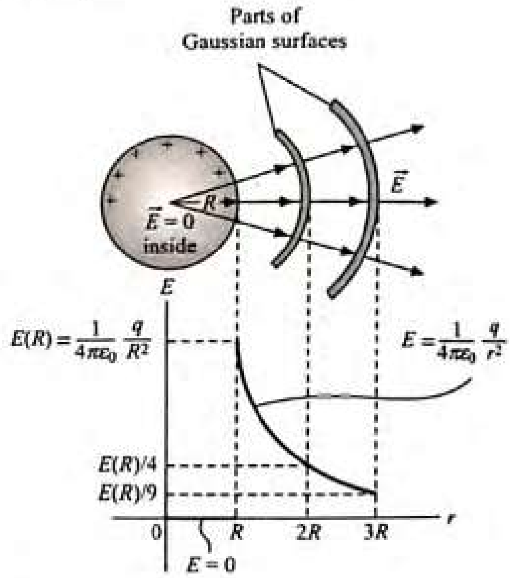
$$\phi_2 = (a + bl)\hat{j} \cdot l^2\hat{j} = (al^2 + bl^3) \quad (\text{for this } y = l)$$

Net flux through the cube is $\phi_1 + \phi_2 = bl_3$. From Gauss's law

$$\phi = \frac{Q_{\text{enclosed}}}{\varepsilon_0} \text{ or } Q_{\text{enclosed}} = \varepsilon_0\phi_E = \varepsilon_0 bl^3$$

FIELD OF A CHARGED CONDUCTING SPHERE

We place positive charge q on a solid conducting sphere with radius R (as shown in figure). All the charges must be on the surface of the sphere.



Electric Field Outside the Sphere

We first consider the field outside the conductor, so we choose $r > R$. The entire conductor is within the Gaussian surface, so the enclosed charge is q. The area of the Gaussian surface is $4\pi r^2$; $\vec{E}$ is uniform over the surface and perpendicular to it at each point. The flux integral $\oint E_\perp dA$ in Gauss's law is therefore $E(4\pi r^2)$ which gives

$$E(4\pi r^2) = \frac{q}{\varepsilon_0}$$

or $$E = \frac{1}{4\pi\varepsilon_0}\frac{q}{r^2} \quad \text{(outside a charged conducting sphere)}$$

This expression for the field at any point outside the sphere ($r > R$) is the same as for a point charge; the field due to the charged sphere is the same as if the entire charge were concentrated at its centre. Just outside the surface of the sphere, where $r = R$, we get

$$E = \frac{1}{4\pi\varepsilon_0}\frac{q}{R^2}$$

(at the surface of a charged conducting sphere)

Electric Field Inside the Sphere

We know that extra charge on a conductor lies on its outer surface. So there is no charge inside the Gaussian surface, i.e., $q_{in} = 0$ (figure). Therefore,

$$\oint \vec{E} \cdot d\vec{A} = \frac{q_{in}}{\varepsilon_0} = 0$$

$\Rightarrow \quad E 4\pi r^2 = 0$

$\Rightarrow \quad E = 0$

Hence, at a point inside the sphere, electric field is zero.

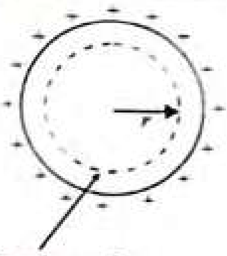


ILLUSTRATION 17.21 A point charge $+Q$ is placed at the center of an uncharged spherical conducting shell of inner radius a and outer radius b.

i. Find the electric field for $r < a$.

ii. What is the magnitude and sign of the induced charge q' on the inner shell surface?

iii. What is the electric field at points $r > b$?

iv. What is the surface charge on the outer surface of the conductor?

Solution.

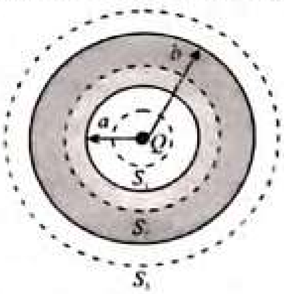
i. Consider a Gaussian surface S_1 of radius $r < R$ inside the cavity, centered on charge Q. From Gauss's law,

$$\phi_E = \oint E \cdot dA = E(4\pi r^2) = \frac{+Q}{\varepsilon_0}$$

From this we find the electric field to be

$$E = \frac{1}{4\pi\varepsilon_0}\frac{Q}{r^2}$$

ii. Consider a Gaussian surface S_2 inside the conducting material. We do not know if there is a charge on the inside surface of the conductor or not. We assume that the charge is q'; if q' is zero, the result of Gauss's law will show it. Because the Gaussian surface is inside the conductor, the electric field is zero. From Gauss's law,



$$\oint \vec{E} \cdot d\vec{A} = E(4\pi r^2) = \frac{Q_{enclosed}}{\varepsilon_0} = 0$$

or $\quad \dfrac{Q_{enclosed}}{\varepsilon_0} = \dfrac{Q + q'}{\varepsilon_0} = 0 \quad$ or $q' = -Q$

There is a charge on the inside surface of the conductor. The total charge induced on the inside surface of the cavity is the negative of the charge placed at its center.

iii. For E $(r > b)$, consider a Gaussian surface S_3. From Gauss's law,

$$\phi_E = \oint \vec{E} \cdot d\vec{A} = \frac{Q_{enclosed}}{\varepsilon_0}$$

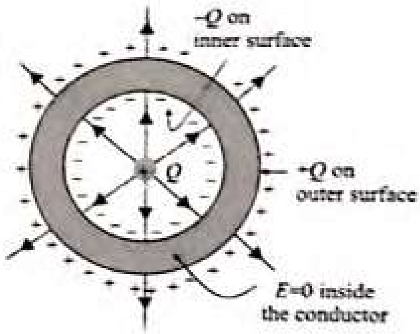
or $\quad E(4\pi r^2) = \dfrac{+Q}{\varepsilon_0}$

or $\quad E = \dfrac{Q}{4\pi\varepsilon_0 r^2}$

It was stated in the problem that the conducting sphere has no net charge. Consequently, the total charge inside our Gaussian surface S_3 is the sum of charge $+Q$ and induced charges $-Q$ on the inner surface of the conductor and $+Q$ on the surface. Once more we can see that the field outside the sphere is the same as for a point charge. The conducting sphere has no shielding effect at all.

However, such a conducting shield prevents electrostatic fields from charges outside the shell from entering it.

iv. The conducting shell has no net charge, yet there is a surface charge $-Q$ on its surface. Because the net charge on the shell is zero and no charge can reside inside a conductor, there must be $+Q$ on the outer surface of the conductor.



FIELD OF A LINE CHARGE

There is no flux through the ends because $\vec{E}$ lies in the plane of the surface. To find the flux through the side walls, note that $\vec{E}$ is perpendicular to the surface at each point; by symmetry, E has the same value everywhere on the walls (curved surface). The area of the side wall is $2\pi rl$. Hence, the total flux Φ_E through the entire cylinder is the sum of the flux through the side wall, which is $(E)(2\pi rl)$, and the zero flux through the two ends. Finally, we need the total enclosed charge, which is the charge per unit length multiplied by the length of wire inside the Gaussian surface, or $Q_{encl} = \lambda l$. From Gauss's law, we get

$$\Phi_E = (E)(2\pi rl) = \frac{\lambda l}{\varepsilon_0} \text{ and } E = \frac{1}{2\pi\varepsilon_0}\frac{\lambda}{r}$$

(field of an infinite line of charge)

We have assumed that λ is positive. If it is negative, $\vec{E}$ is directed radially inward toward the line of charge, and in the above expression for the field magnitude E, we must interpret λ as the magnitude (absolute value) of the charge per unit length.

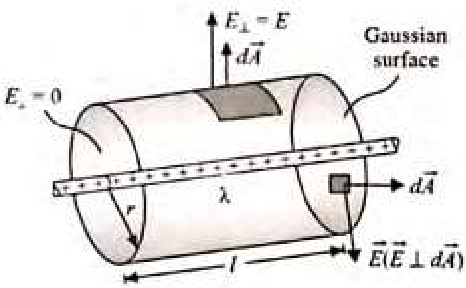


ILLUSTRATION 17.22 A long, straight wire is surrounded by a hollow metal cylinder whose axis coincides with that of the wire. The wire has a charge per unit length of λ, and the cylinder has a net charge per unit length of 2λ. From this information, use Gauss's law to find (i) the charge per unit length on the inner and outer surfaces of the cylinder and (ii) the electric field outside the cylinder, a distance r from the axis.

Solution.

i. **Inside surface:** Consider a cylindrical surface within the metal. Since E inside the conducting shell is zero, the total charge inside the Gaussian surface must be zero; so the charge/length on the inner surface of the cylinder is $-\lambda$.

Outside surface: The total charge on the metal/cylinder is

$$2\lambda l = q_{in} + q_{out} \quad \text{or} \quad q_{out} = 2\lambda l - q_{in},$$

where $q_{in} = -\lambda l$

$$q_{out} = 2\lambda l + \lambda l = 3\lambda l$$

So the outside charge/length is $q_{out}/l = 3\lambda$

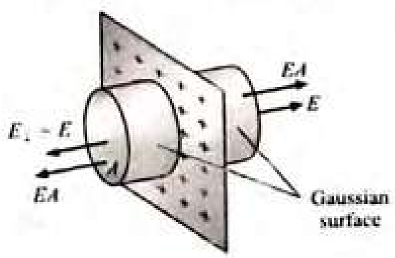
ii. Electric field out side the cylinder $E = \dfrac{\lambda_{net}}{2\pi\varepsilon_0 r} = \dfrac{3\lambda}{2\pi\varepsilon_0 r}$

radially outward

FIELD OF AN INFINITE PLANE SHEET OF CHARGE

To take advantage of these symmetry properties, we use a cylinder as our Gaussian surface with its axis perpendicular to the sheet of charge, with ends of area A (figure).

The charged sheet passes through the middle of the cylinder's length, so the cylinder is perpendicular to the surface; hence, the flux through each end is EA. Because $\vec{E}$ is perpendicular to the charged sheet, it is parallel to the curved side wall of the cylinder, and there is no flux through these wall.



The total flux integral in Gauss's law is then $2EA$ (EA from each end and zero from the side wall). The net charge within the Gaussian surface is the charge per unit area multiplied by the sheet area enclosed by the surface, or $Q_{encl} = \sigma A$. Hence, according to the Gauss's law

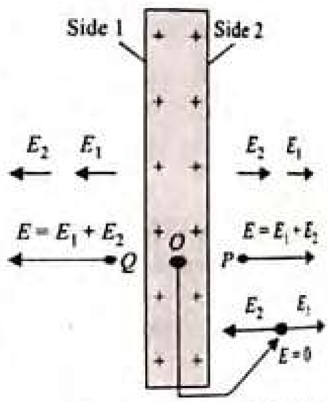
$$2EA = \frac{\sigma A}{\varepsilon_0}$$

or $$E = \frac{\sigma}{2\varepsilon_0} \quad \text{(field of an infinite sheet of charge)}$$

Electric Field Due to a Charged Isolated Conducting Plate

The electric field due to a charged isolated conducting plate is twice the field due to a plane sheet of charge. This is due to the reason that in the case of the sheet, the same charge is present on both its sides.

The above result can be obtained very easily from the principle of superposition of fields. The electric field at P is due to two sheets of charge, one on each surface of the plate.



Further, the fields due to both the sheets are perpendicular to the plate and are in the same direction.

Thus, E is the electric field (E_1) at P due to the sheet of charge on side 1 plus the electric field (E_2) at P due to the sheet of charge on side 2 of the plate, i.e.,

$$E = E_1 + E_2 = \frac{\sigma}{2\varepsilon_0} + \frac{\sigma}{2\varepsilon_0} = \frac{\sigma}{\varepsilon_0}$$

Same is true for a point Q on the left side of the plate.

For a point inside the plate,

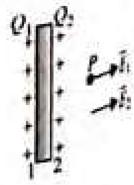
$$\vec{E} = \vec{E}_1 + \vec{E}_2$$

or $$E = E_1 - E_2 = 0 \quad (\text{as } \vec{E}_1 \text{ and } \vec{E}_2 \text{ are equal and opposite})$$

ILLUSTRATION 17.23 If an isolated infinite plate contains a charge Q_1 on one of its surfaces and a charge Q_2 on its other surface, then prove that electric field intensity at a point in front of the plate will be $Q/2A\varepsilon_0$, where $Q = Q_1 + Q_2$.

Solution. Let us take a point P right of the plate.

The electric field at P is the vector sum of the field due to both the surfaces. Hence,



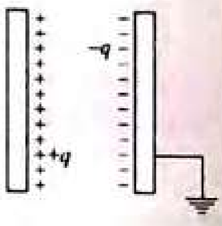
$$\vec{E} = \vec{E}_1 + \vec{E}_2$$

$$= \frac{Q_1}{2A\varepsilon_0}\hat{n} + \frac{Q_2}{2A\varepsilon_0}\hat{n}$$

$$= \frac{Q_1 + Q_2}{2A\varepsilon_0}\hat{n} = \frac{Q}{2A\varepsilon_0}\hat{n}$$

Important Point

- The illustration shows that the resultant field due to a sheet depends only on the total charge of the sheet and not on the distribution of charge on individual surfaces.
- Facing surfaces have equal but opposite nature of charges with magnitude half the difference of the charges on different plates, i.e., $(q_1 - q_2)/2$ in surface (2) and $(q_2 - q_1)/2$ or $-(q_1 - q_2)/2$ in surface (3).
- Outer surfaces always have equal charges of magnitude half the summation of charges, i.e., $(q_1 + q_2)/2$ in each surfaces (1) and (4).
- If we have this type of charge distribution, then the electric field inside any metal plate will be zero.



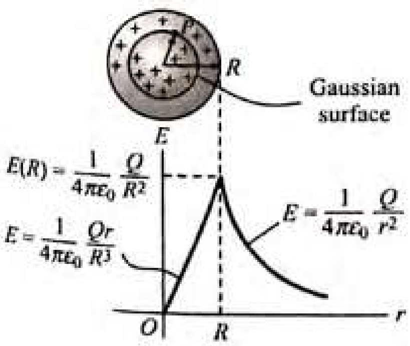
- The charge appearing on surfaces (2) and (3) is called bounded charge, and the charge appearing on surfaces (1) and (4) is called free charge.
- If we join the second plate (right plate) with ground, the charge appearing on surface (4) will go to the earth.
- Any metal plate or object connected to the earth need not have zero charge. If the conducting body is isolated and connected to earth, then it will have no charge. If the conducting body connected to earth has any charged object near it, then the body will not have zero charge.

FIELD OF A UNIFORMLY CHARGED SPHERE

Positive electric charge Q is distributed uniformly throughout the volume of an insulating sphere with radius R.

Electric Field Inside the Sphere

From symmetry, the magnitude E of the electric field has the same value at every point on the Gaussian surface, and the direction of $\vec{E}$ is radial at every point on the surface. Hence, the total electric flux through the Gaussian surface is the product of E and the total area of the surface $A = 4\pi r^2$, that is, $\Phi_E = 4\pi r^2 E$.



The amount of charge enclosed within the Gaussian surface depends on the radius r. Let us first find the field magnitude inside the charged sphere of radius R; so we choose $r < R$.

The volume charge density ρ is the charge Q divided by volume of the entire charged sphere of radius R, i.e.,

$$\rho = \frac{Q}{4\pi R^3/3}$$

$$Q_{encl} = \rho V_{encl} = \left(\frac{Q}{4\pi R^3/3}\right)\left(\frac{4}{3}\pi r^3\right) = Q\frac{r^3}{R^3}$$

Then using Gauss's law, we get

$$\phi = \int E dA = \frac{Q_{encl}}{\varepsilon_0}$$

$$E\int dA = E4\pi r^2 = \frac{Q}{\varepsilon_0}\frac{r^3}{R^3}$$

or $$E = \frac{1}{4\pi\varepsilon_0}\frac{Qr}{R^3} \text{ (field inside a uniformly charged sphere)}$$

The field magnitude is proportional to the distance r of the field point from the center of the sphere (figure).

At the center ($r = 0$), $E = 0$.

Electric field in terms of charge density (at inside point) is

$$E = \frac{1}{4\pi\varepsilon_0}\frac{\left(\rho\frac{4}{3}\pi R^3\right)r}{R^3} = \frac{\rho r}{3\varepsilon_0}$$

$\Rightarrow$ $$E = \frac{\rho r}{3\varepsilon_0} \text{ (field inside a uniformly charged sphere)}$$

Electric Field Outside the Charged Sphere

We use a spherical Gaussian surface of radius $r > R$. This surface encloses the entire charged sphere, so $Q_{encl} = Q$ and Gauss's law gives

$$E4\pi r^2 = \frac{Q}{\varepsilon_0}$$

$$E = \frac{1}{4\pi\varepsilon_0}\frac{Q}{r^2} \text{ (field outside a uniformly charged sphere)}$$

For any spherically symmetric charged body, the electric field outside the body is the same; however, the entire charge is concentrated at the center.

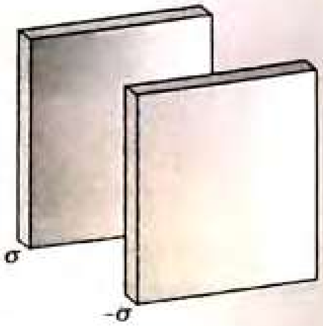
CONCEPT APPLICATION EXERCISE 17.5

1. A small conducting spherical shell with inner radius a and outer radius b is concentric with a larger conducting sphereical shell with inner radius c and outer radius d. The inner shell has total charge $+2q$ and the outer shell has charge $+4q$.
   (a) Make a plot of the magnitude of the electric field versus r.
   (b) Calculate the electric field (magnitude and direction in terms of q) and the distance r from the common

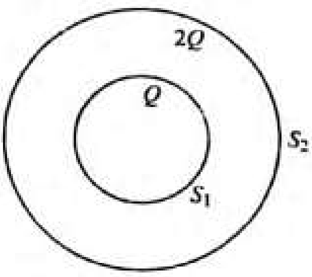
centre of the two shell for (i) $r < a$; (ii) $a < r < b$; (iii) $b < r < c$; (iv) $c < r < d$; (v) $r > d$. Show your result in a graph with radial component of $\vec{E}$ as function of r.

(c) What is the total charge on the
  i. inner surface of the small shell;
  ii. outer surface of the small shell;
  iii. inner surface of the large shell;
  iv. outer surface of the large shell?

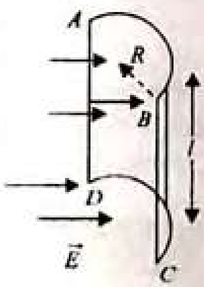
2. Two infinite, non-conducting sheets of charge are parallel to each other, as shown in figure. The sheet on the left has a uniform surface charge density σ, and the one on the right has a uniform charge density $-\sigma$. Calculate the electric field at points (a) to the left of, (b) in between, and (c) to the right of the two sheets.



3. S_1 and S_2 are two hollow concentric spheres enclosing charge Q and $2Q$, respectively, as shown in figure. What is the ratio of the electric flux leaving through the surface of S_1 and S_2?



4. A hollow half cylinder surface of radius R and length l is placed in a uniform electric field $\vec{E}$. Electric field is acting perpendicular on the plane $ABCD$. Find the flux through the curved surface of the hollow cylindrical surface.



5. Consider two concentric conducting spheres. The outer sphere is hollow and initially has a charge $-7Q$ on it. The inner sphere is solid and has a charge $+2Q$ on it.
  (a) How much charge is on the outer surface and inner surface of the outer sphere.
  (b) If a wire is connected between the inner and outer sphere, after electrostatic equilibrium is established how much total charge is on the outer sphere? How much charge is on the outer surface and inner surface of the outer sphere? Does the electric field at the surface of the inside sphere change when the wire is connected?
  (c) We return to original condition in (a). We now connect the outer sphere to ground with a wire and then disconnect it. How much total charge will be on the outer sphere? How much charge will be on the inner surface and outer surface of the outer sphere?

SOLVED EXAMPLES

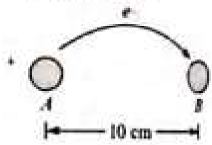
1. Two copper balls, each weighing 10 g are kept in air 10 cm apart. If one electron from every 10^6 atoms is transferred from one ball to the other, the coulomb force between them is (atomic weight of copper is 63.5)

(a) 2.0×10^{10} N (b) 2.0×10^4 N
(c) 2.0×10^8 N (d) 2.0×10^6 N

Sol. (c) Number of atoms in given mass $= \dfrac{10}{63.5} \times 6.02 \times 10^{23}$

$= 9.48 \times 10^{22}$

Transfer of electron between balls



$$= \frac{9.48 \times 10^{22}}{10^6}$$

$= 9.48 \times 10^{16}$

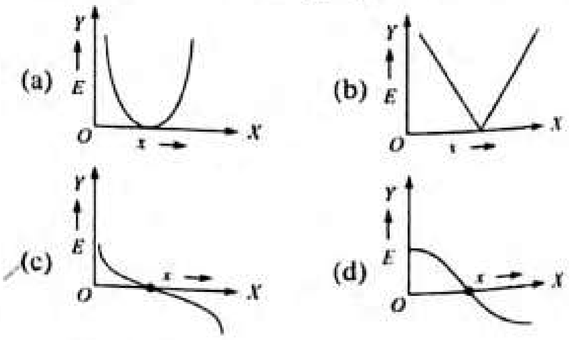
Hence magnitude of charge gained by each ball.

$$Q = 9.48 \times 10^{16} \times 1.6 \times 10^{-19} = 0.015 \text{ C}$$

Force of attraction between the balls

$$F = 9 \times 10^9 \times \frac{(0.015)^2}{(0.1)^2} = 2 \times 10^8 \text{ N}.$$

2. Two identical point charges are placed at a separation of d. P is a point on the line joining the charges, at a distance x from any one charge. The field at P is E, E is plotted against x for values of x from close to zero to slightly less than d. Which of the following represents the resulting curve



Sol. (c) At mid point, $E = 0$

Before mid point, E is positive. This is maximum near the charge and decreases towards mid point.

After mid point, E is negative, The curve crosses x-axis at $x = d/2$. From centre to end, E decreases.

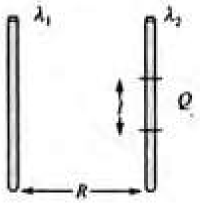
The variation is shown by curve (c).

3. Two infinitely long parallel wires having linear charge densities λ_1 and λ_2 respectively are placed at a distance of R metres. The force per unit length on either wire will be $\left(k = \dfrac{1}{4\pi\varepsilon_0}\right)$

(a) $k\dfrac{2\lambda_1\lambda_2}{R^2}$ (b) $k\dfrac{2\lambda_1\lambda_2}{R}$

(c) $k\dfrac{\lambda_1\lambda_2}{R^2}$ (d) $k\dfrac{\lambda_1\lambda_2}{R}$

Sol. (b) Force on l length of the wire 2 is



$$F_2 = QE_1 = (\lambda_2 l)\frac{2k\lambda_1}{R}$$

$$\Rightarrow \quad \frac{F_2}{l} = \frac{2k\lambda_1\lambda_2}{R}$$

Also $\dfrac{F_1}{l} = \dfrac{F_2}{l} = \dfrac{F}{l} = \dfrac{2k\lambda_1\lambda_2}{R}$

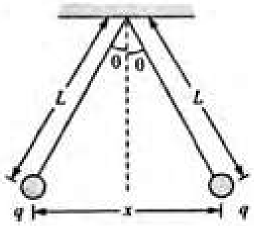
4. In the given figure two tiny conducting balls of identical mass m and identical charge q hang from non-conducting threads of equal length L. Assume that θ is so small that $\tan\theta \approx \sin\theta$, then for equilibrium x is equal to

(a) $\left(\dfrac{q^2L}{2\pi\varepsilon_0 mg}\right)^{\frac{1}{3}}$

(b) $\left(\dfrac{qL^2}{2\pi\varepsilon_0 mg}\right)^{\frac{1}{3}}$

(c) $\left(\dfrac{q^2L^2}{4\pi\varepsilon_0 mg}\right)^{\frac{1}{3}}$

(d) $\left(\dfrac{q^2L}{4\pi\varepsilon_0 mg}\right)^{\frac{1}{3}}$



Sol. (a) In equilibrium

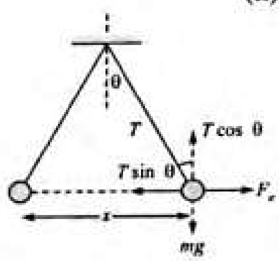
$F_e = T\sin\theta$ (i)

$mg = T\cos\theta$ (ii)

$$\tan\theta = \frac{F_e}{mg} = \frac{q^2}{4\pi\varepsilon_o x^2 \times mg}$$

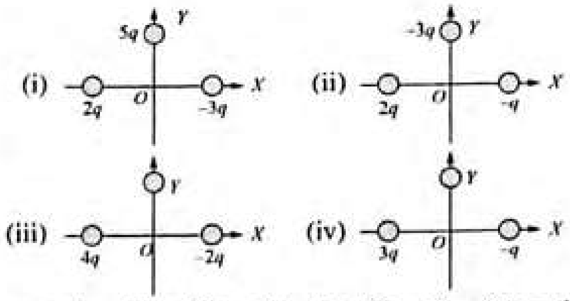
also $\tan\theta \approx \sin\theta = \dfrac{x/2}{L}$

Hence $\dfrac{x}{2L} = \dfrac{q^2}{4\pi\varepsilon_o x^2 \times mg}$



$$\Rightarrow \quad x^3 = \frac{2q^2L}{4\pi\varepsilon_o mg} \Rightarrow x = \left(\frac{q^2L}{2\pi\varepsilon_o mg}\right)^{1/3}$$

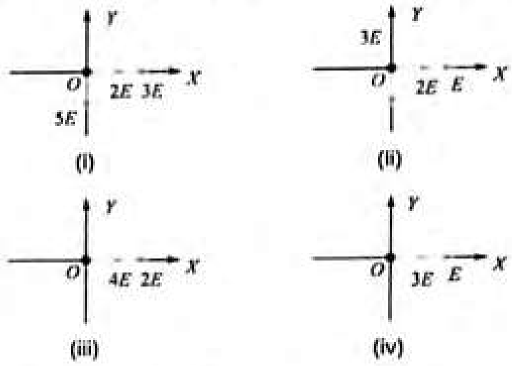
5. In the following four situations charged particles are at equal distance from the origin. Arrange them as per the magnitude of the net electric field at origin greatest first



(a) (i) > (ii) > (iii) > (iv) (b) (ii) > (i) > (iii) > (iv)

(c) (i) > (iii) > (ii) > (iv) (d) (iv) > (iii) > (ii) > (i)

Sol. (c) If electric field due to charge $|q|$ at origin is E then electric field due to charges $|2q|$, $|3q|$, $|4q|$ and $|5q|$ are respectively $2E$, $3E$, $4E$ and $5E$



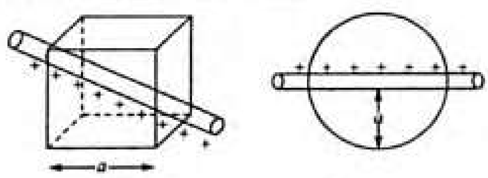
$$E_{(i)} = \sqrt{(5E)^2 + (5E)^2} = 5\sqrt{2}E$$

$$E_{(ii)} = \sqrt{(3E)^2 + (3E)^2} = 3\sqrt{2}E$$

$$E_{(iii)} = 4E + 2E = 6E \text{ and } E_{(iv)} = 3E + E = 4E$$

$$\Rightarrow \quad E_{(i)} > E_{(iii)} > E_{(ii)} > E_{(iv)}$$

6. A linear charge having linear charge density λ penetrates a cube diagonally and then it penetrates a sphere diametrically as shown. What will be the ratio of flux coming out of cube and sphere



(a) $\dfrac{1}{2}$ (b) $\dfrac{2}{\sqrt{3}}$

(c) $\dfrac{\sqrt{3}}{2}$ (d) $\dfrac{1}{1}$

Sol. (c) Flux coming out of the cube

$$\phi_1 = \frac{\lambda . a\sqrt{3}}{\varepsilon_0} \qquad \text{(i)}$$

and from sphere

$$\phi_2 = \frac{\lambda \cdot 2a}{\varepsilon_0} \qquad \text{(ii)}$$

$\therefore \quad \frac{\phi_1}{\phi_2} = \frac{\sqrt{3}}{2}$

7. Two charges each equal to $\eta q (\eta^{-1} < \sqrt{3})$ are placed at the corners of an equilateral triangle of side a. The electric field at the third corner is E_3
(a) $E_3 = E_0$ (b) $E_3 < E_0$ (c) $E_3 > E_0$ (d) $E_3 < E_0$
where $(E_0 = q/4\pi\varepsilon_0 a^2)$

Sol. *(c)* $E_1 = \frac{\eta q}{4\pi\varepsilon_0 a^2}, E_2 = \frac{\eta q}{4\pi\varepsilon_0 a^2}$

Therefore $\vec{E} = \vec{E}_1 + \vec{E}_2$

$$= \sqrt{E_1^2 + E_2^2 + 2E_1E_2\cos 60^o} = \frac{\sqrt{3}\eta q}{4\pi\varepsilon_0 a^2}$$

Since $\eta^{-1} < \sqrt{3}$, $1 < \sqrt{3}\eta$, $\sqrt{3}\eta > 1$.

$$\Rightarrow \quad \frac{\sqrt{3}\eta q}{4\pi\varepsilon_0 a^2} > \frac{q}{4\pi\varepsilon_0 a^2} \Rightarrow E_3 > E_0 \left(E_0 = \frac{q}{4\pi\varepsilon_0 a^2} \right)$$

8. Three positive charges of equal value q are placed at the vertices of an equilateral triangle. The resulting lines of force should be sketched as in

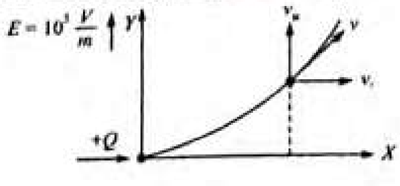
(a) 
(b) 
(c) 
(d) 
Sol. *(c)* Option (a) shows lines of force starting from one positive charge and terminating at another. Option (b) has one line of force making closed loop. Option (d) shows all lines making closed loops. All these are not correct. Only option (c) is correct.

9. There is a uniform electric field of strength 10^3 V/m along y-axis. A body of mass 1g and charge 10^{-6}C is projected into the field from origin along the positive x-axis with a velocity 10 m/s. Its speed in m/s after 10 s is (Neglect gravitation)

(a) 10 (b) $5\sqrt{2}$

(c) $10\sqrt{2}$ (d) 20

Sol. *(c)* Body moves along the parabolic path.



For vertical motion: By using $v = u + at$

$$\Rightarrow \quad v_y = 0 + \frac{QE}{m} \cdot t = \frac{10^{-6} \times 10^3}{10^{-3}} \times 10 = 10 \text{ m/sec}$$

For horizontal motion. Its horizontal velocity remains the same i.e. after 10 sec, horizontal velocity of body $v_x = 10$ m/sec.

Velocity after 10 sec $v = \sqrt{v_x^2 + v_y^2} = 10\sqrt{2}$ m/sec

10. An electric dipole is situated in an electric field of uniform intensity E whose dipole moment is p and moment of inertia is I. If the dipole is displaced slightly from the equilibrium position, then the angular frequency of its oscillations is

(a) $\left(\frac{pE}{I}\right)^{1/2}$ (b) $\left(\frac{pE}{I}\right)^{3/2}$

(c) $\left(\frac{I}{pE}\right)^{1/2}$ (d) $\left(\frac{p}{IE}\right)^{1/2}$

Sol. *(a)* When dipole is given a small angular displacement θ about its equilibrium position, the restoring torque will be

$$\tau = -pE\sin\theta = -pE\theta \text{ (as } \sin\theta = \theta)$$

or $\quad I\frac{d^2\theta}{dt^2} = -pE\theta$ (as $\tau = I\alpha = I\frac{d^2\theta}{dt^2}$)

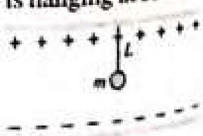
or $\quad \frac{d^2\theta}{dt^2} = -\omega^2\theta$ with $\omega^2 = \frac{pE}{I} \Rightarrow \omega = \sqrt{\frac{pE}{I}}$

11. A metallic shell has a point charge 'q' kept inside its cavity. Which one of the following diagrams correctly represents the electric lines of forces?

(a) 

(b) 
(c) 
(d) 
Sol. *(c)* Electric field is perpendicular to the equipotential surface and is zero everywhere inside the metal.

12. A small sphere carrying a charge 'q' is hanging in between two parallel plates by a string of length L. Time period of pendulum is T_0. When parallel plates are charged, the time period changes to T. The ratio T/T_0 is equal to

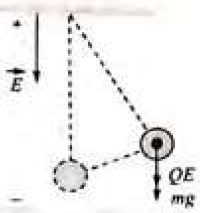


(a) $\left(\frac{g + \frac{qE}{m}}{g}\right)^{1/2}$ (b) $\left(\frac{g}{g + \frac{qE}{m}}\right)^{3/2}$

(c) $\left(\frac{g}{g + \frac{qE}{m}}\right)^{1/2}$ (d) None of these

Sol. (c)
Net downward force $mg' = mg + qE$

$\Rightarrow$ Effect acceleration $g' = \left(g + \frac{qE}{m}\right)$



Hence time period

$$T = 2\pi\sqrt{\frac{l}{g'}} = 2\pi\sqrt{\frac{l}{\left(g + \frac{qE}{m}\right)}}$$

$$T_0 = 2\pi\sqrt{\frac{l}{g}}$$

So, $$\frac{T}{T_0} = \sqrt{\frac{g}{g + \frac{qE}{m}}}$$

13. Two concentric conducting thin spherical shells A, and B having radii r_A and r_B ($r_B > r_A$) are charged to Q_A and $-Q_B$ ($|Q_B| > |Q_A|$). The electrical field along a line, (passing through the centre) is

(a) (b) (c) (d) 
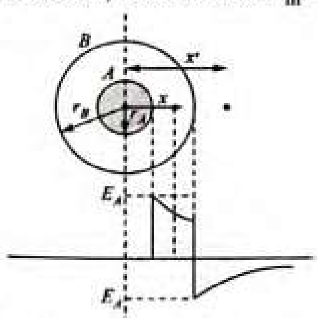
Sol. (a) Inside the shell A, electric field $E_{in} = 0$



At the surface of shell A,

$$E_A = \frac{kQ_A}{r_A^2} \longrightarrow \text{(a fixed positive value)}$$

Between the shells A and B, at a distance x from the common centre

$$E = \frac{k.Q_A}{x^2} \longrightarrow \text{(as } x \text{ increases } E \text{ decreases)}$$

At the surface of shell B,

$$E_B = \frac{k.(Q_A - Q_B)}{r_B^2} \longrightarrow$$

(a fixed negative value because $|Q_A| < |Q_B|$).

Outside the both shells, at a distance x from the common centre

$E_{out} = \frac{k(Q_A - Q_B)}{x'^2} \longrightarrow$ (as x' increases negative value of E_{out} decreases and it becomes zero at $x = x$)

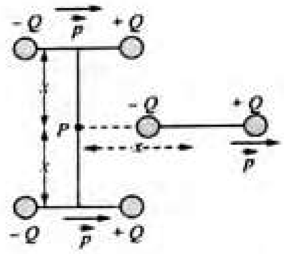
14. Three identical dipoles are arranged as shown below. What will be the net electric field at P $\left(k = \frac{1}{4\pi\varepsilon_0}\right)$?

(a) $\frac{k.p}{x^3}$

(b) $\frac{2kp}{x^3}$

(c) Zero

(d) $\frac{\sqrt{2}\,kp}{x^3}$

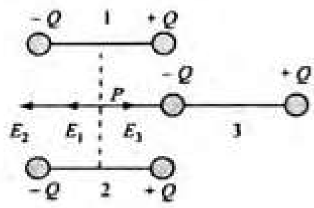


Sol. (c) Point P lies at equatorial positions of dipole 1 and 2 and axial position of dipole 3.

Hence field at P

due to dipoles 1

$$E_1 = \frac{k.p}{x^3} \text{ (towards left)}$$



due to dipole 2

$$E_2 = \frac{k.p}{x^2} \text{ (towards left)}$$

due to dipole 3

$$E_3 = \frac{k.(2p)}{x^3} \text{ (towards right)}$$

So net field at P will be zero.

15. A charge Q is fixed at a distance d in front of an infinite metal plate. The lines of force are represented by

(a) (b) (c) 
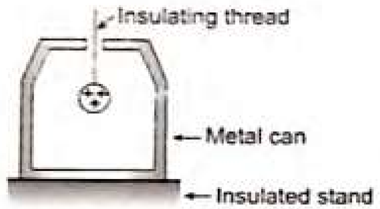
(d) 
Sol. (a) Metal plate acts as an equipotential surface, therefore the field lines should enter normal to the surface of the metal plate.

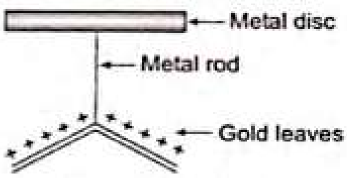
EXERCISES

Electric Charge and Coulomb's Law

1. A charged metallic ball is lowered into an insulated metal can.

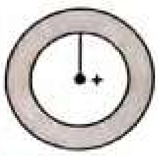


The ball is made to touch bottom of the can, then it is placed on the disc of electroscope shown below. Final observation must be



(a) leaves of electroscope diverges
(b) leaves of electroscope converges
(c) leaves of electroscope remains unaffected
(d) leaves of electroscope oscillates

2. An electrically isolated hollow (initially uncharged), conducting sphere has a small positively charged ball suspended by an insulating rod from its inside surface, see diagram.



This causes the inner surface of the sphere to become negatively charged. When the ball is centered in the sphere the electric field outside the conducting sphere is
(a) zero
(b) the same as if the sphere wasn't there
(c) twice what it would be if the sphere wasn't there
(d) equal in magnitude but opposite in direction to what it would be if the sphere wasn't there

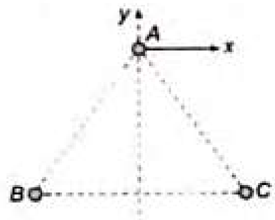
3. A copper sphere of mass 2.0 g contains about 2×10^{22} atoms. The charge on the nucleus of each atom is 29 e (e = electronic charge). The mass of an electron is 9.11×10^{-31} kg. How much mass will the sphere lose or gain if it is a given a charge of +2 μC?
(a) Loss a mass of 1.13×10^{-14} g
(b) Gain a mass of 1.13×10^{-14} g
(c) Neither gain nor loss any mass
(d) Change in mass will depend upon the kinetic energy of the electrons

4. Two identical balls having like charges and placed at a certain distance apart repel each other with a certain force. They are brought in contact and then moved apart to a distance equal to half their initial separation. The force of repulsion between them increases 4.5 times in comparison with the initial value. The ratio of the initial charges of the balls is
(a) 2 (b) 3
(c) 4 (d) 6

5. Two identical simple pendulums, A and B, are suspended from the same point. The bobs are given positive charges, with A having more charge than B. They diverge and reach equilibrium, with A and B making angles θ_1 and θ_2 with the vertical respectively. Which of the following is correct?
(a) $\theta_1 > \theta_2$
(b) $\theta_1 < \theta_2$
(c) $\theta_1 = \theta_2$
(d) The tension in A is greater than that in B

6. Two copper balls, each weighing 10 g are kept in air 10 cm apart. If one electron from every 10^6 atoms is transferred from one ball to the other, the coulomb force between them is (atomic weight of copper is 63.5)
(a) 2.0×10^{10} N (b) 2.0×10^4 N
(c) 2.0×10^8 N (d) 2.0×10^6 N

7. Three similar charges $+q$ are placed on 3 corners of an equilateral triangle ABC of side a. How many minimum charges should be placed on a circle of radius a with the centre at A so that resultant force on the charge placed at the centre is $\dfrac{q^2}{4\pi\varepsilon_0 a^2}$ along x-axis?



(a) 4 (b) 6
(c) 3 (d) Any number

8. Two identical conducting spheres having unequal positive charges q_1 and q_2 separated by distance r. If they are made to touch each other and then separated again to the same distance. The electrostatic force between the spheres in this case will be (neglect induction of charges)
(a) less than before (b) same as before
(c) more than before (d) zero

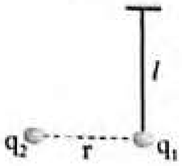
9. Which of the following four figures correctly show the forces that three charged particles exert on each other?

(i) 
(ii) 
(iii) 

(iv) 

(a) all of the above (b) none of the above
(c) ii, iii (d) ii, iii and iv

10. An isolated charge q_1 of mass m is suspended freely by a thread of length l. Another charge q_2 is brought near it ($r >> l$). When q_1 is in equilibrium, tension in thread will be



(a) mg
(b) $>mg$
(c) $<mg$
(d) none of these

11. Three charges $+Q_1$, $+Q_2$, and q are placed on a straight line such that q is somewhere in between $+Q_1$ and $+Q_2$. If this system of charges is in equilibrium, what should be the magnitude and sign of charge q?

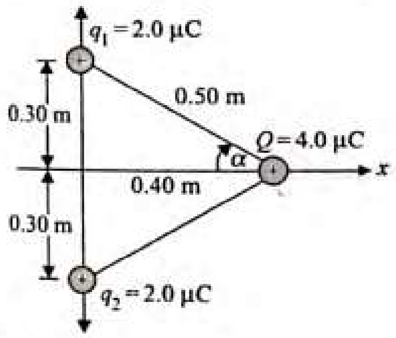
(a) $\dfrac{Q_1Q_2}{\left(\sqrt{Q_1}+\sqrt{Q_2}\right)^2}$, positive

(b) $\dfrac{Q_1+Q_2}{2}$, positive

(c) $\dfrac{Q_1Q_2}{\left(\sqrt{Q_1}+\sqrt{Q_2}\right)^2}$, negative

(d) $\dfrac{Q_1+Q_2}{2}$, negative

12. In figure, two equal positive point charges $q_1 = q_2 = 2.0$ μC interact with a third point charge $Q = 4.0$ μC. The magnitude, as well as direction, of the net force on Q is



(a) 0.23 N in the $+x$-direction
(b) 0.46 N in the $+x$-direction
(c) 0.23 N in the $-x$-direction
(d) 0.46 N in the $-x$-direction

13. Three positive charges of equal magnitude q are placed at the vertices of an equilateral triangle of side l. How can the system of charges be placed in equilibrium?
(a) by placing a charge $Q = -q/\sqrt{3}$ at the centroid of the triangle
(b) by placing a charge $Q = q/\sqrt{3}$ at the centroid of the triangle
(c) by placing a charge $Q = q$ at a distance l from all the three charges
(d) by placing a charge $Q = -q$ above the plane of the triangle at a distance l from all the three charges

14. Three identical spheres, each having a charge q and radius R, are kept in such a way that each touches the other two. The magnitude of the electric force on any sphere due to the other two is

(a) $\dfrac{1}{4\pi\varepsilon_0}\left(\dfrac{q}{R}\right)^2$ (b) $\dfrac{\sqrt{3}}{4\pi\varepsilon_0}\left(\dfrac{q}{R}\right)^2$

(c) $\dfrac{\sqrt{3}}{16\pi\varepsilon_0}\left(\dfrac{q}{R}\right)^2$ (d) $\dfrac{\sqrt{5}}{16\pi\varepsilon_0}\left(\dfrac{q}{R}\right)^2$

15. Five point charges, each of value $+q$, are placed on five vertices of a regular hexagon of side L. The magnitude of the force on a point charge of value $-q$ coulomb placed at the center of the hexagon is

(a) $\dfrac{1}{\pi\varepsilon_0}\left(\dfrac{q}{L}\right)^2$ (b) $\dfrac{2}{\pi\varepsilon_0}\left(\dfrac{q}{L}\right)^2$

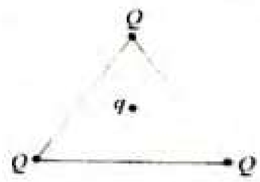
(c) $\dfrac{1}{2\pi\varepsilon_0}\left(\dfrac{q}{L}\right)^2$ (d) $\dfrac{1}{4\pi\varepsilon_0}\left(\dfrac{q}{L}\right)^2$

16. It is required to hold equal charges q in equilibrium at the corners of a square. What charge when placed at the center of the square will do this?

(a) $-\dfrac{q}{2}(1+2\sqrt{2})$ (b) $\dfrac{q}{2}(1+2\sqrt{2})$

(c) $\dfrac{q}{4}(1+2\sqrt{2})$ (d) $-\dfrac{q}{4}(1+2\sqrt{2})$

17. Three charges (each Q) are placed at the three corners of an equilateral triangle. A fourth charge q is placed at the center of the triangle. The ratio $|q/Q|$ so as to make the system in equilibrium is



(a) 1:3
(b) 1:$\sqrt{3}$
(c) $\sqrt{3}$:1
(d) 2:$\sqrt{3}$

18. An electric charge q exerts a force F on a similar electric charge q separated by a distance r. A third charge $q/4$ is placed midway between the two charges. Now, the force F will
(a) become $F/3$ (b) become $F/9$
(c) become $F/27$ (d) remain F

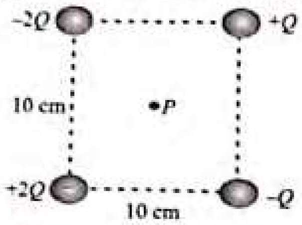
Electric Field

19. A positively charged ball hangs from a long silk thread. Electric field at a certain point (at the same horizontal level of ball) due to this charge is E. Let us put a positive test charge q_0 at this point and measure F/q_0 on this charge. Then, E
(a) $> F/q_0$ (b) $< F/q_0$
(c) $= F/q_0$ (d) none of these

20. A point charge of 100 μC is placed at $3\hat{i}+4\hat{j}$ m. Find the electric field intensity due to this charge at a point located at $9\hat{i}+12\hat{j}$ m.

(a) 8000 Vm^{-1} (b) 9000 Vm^{-1}
(c) 2250 Vm^{-1} (d) 4500 $V m^{-1}$

21. Four electrical charges are arranged on the corners of a 10 cm square as shown. What would be the direction of the resulting electric field at the center point *P*?

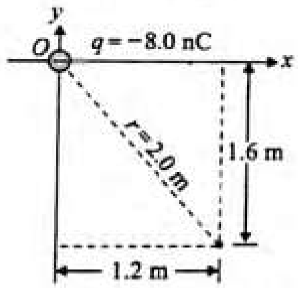


(a) → (b) ↑
(c) ← (d) ↓

22. Two charges $Q_1 = 18$ μC and $Q_2 = -2$ μC are separated by a distance *R*, and Q_1 is on the left of Q_2. The distance of the point where the net electric field is zero is

(a) between Q_1 and Q_2 (b) left of Q_1 at *R*/2
(c) right of Q_2 at *R* (d) right of Q_2 at *R*/2

23. A point charge $q = -8.0$ nC is located at the origin. The electric field (in NC^{-1}) vector at the point $x = 1.2$ m, $y = -1.6$ m, as shown in figure, is



(a) $-14.4\hat{i}+10.8\hat{j}$ (b) $-14.4\hat{i}-10.8\hat{j}$
(c) $-10.8\hat{i}+14.4\hat{j}$ (d) $-10.8\hat{i}-14.4\hat{j}$

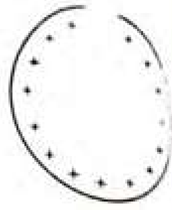
24. A positive point charge 50 μC is located in the plane *xy* at a point with radius vector $\vec{r}_0 = 2\hat{i}+3\hat{j}$. The electric field vector $\vec{E}$ at a point with radius vector $\vec{r} = 8\hat{i}-5\hat{j}$, where r_0 and *r* are expressed in meter, is

(a) $(1.4\hat{i}-2.6\hat{j})$ kNC^{-1} (b) $(1.4\hat{i}+2.6\hat{j})$ kNC^{-1}
(c) $(2.7\hat{i}-3.6\hat{j})$ kNC^{-1} (d) $(2.7\hat{i}+3.6\hat{j})$ kNC^{-1}

25. Five point charges, $+q$ each, are placed at the five vertices of a regular hexagon. The distance of the center of the hexagon from any of the vertices is *a*. The electric field at the center of the hexagon is

(a) $\dfrac{q}{4\pi\varepsilon_0 a^2}$ (b) $\dfrac{q}{8\pi\varepsilon_0 a^2}$
(c) $\dfrac{q}{16\pi\varepsilon_0 a^2}$ (d) zero

26. A ring of charge with radius 0.5 m has 0.002 m gap. If the ring carries a charge of +1 C, the electric field at the center is

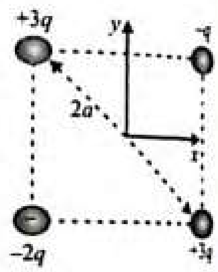


(a) 7.5×10^7 NC^{-1}
(b) 7.2×10^7 NC^{-1}
(c) 6.2×10^7 NC^{-1}
(d) 6.5×10^7 NC^{-1}

27. Three equal charges, each $+q$, are placed on the corners of an equilateral triangle. The electric field intensity at the centroid of the triangle is

(a) kq/r^2 (b) $3kq/r^2$
(c) $\sqrt{3}kq/r^2$ (d) zero

28. Four point charges are placed at the corners of a square with diagonal 2*a* as shown. What is the total electric field at the center of the square?



(a) kq/a^2 at an angle 45° above the +*x*-axis
(b) kq/a^2 at an angle 45° below the −*x*-axis
(c) $3kq/a^2$ at an angle 45° above the −*x*-axis
(d) $3kq/a^2$ at an angle 45° below the +*x*-axis

29. The maximum electric field at a point on the axis of a uniformly charged ring is E_0. At how many points on the axis will the magnitude of the electric field be $E_0/2$.

(a) 1 (b) 2
(c) 3 (d) 4

30. *A* and *B* are two points on the axis and the perpendicular bisector, respectively, of an electric dipole. *A* and *B* are far away from the dipole and at equal distances from it. The fields at *A* and *B* are $\vec{E}_A$ and $\vec{E}_B$. Then

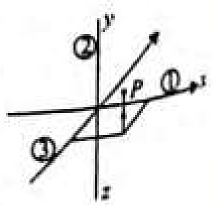
(a) $\vec{E}_A = \vec{E}_B$

(b) $\vec{E}_A = 2\vec{E}_B$

(c) $\vec{E}_A = -2\vec{E}_B$

(d) $|\vec{E}_B| = \frac{1}{2}|\vec{E}_A|$, and $\vec{E}_A$ is perpendicular to $\vec{E}_B$

31. Find the electric field vector at *P* (*a*, *a*, *a*) due to three infinitely long lines of charges along the *x*-, *y*- and *z*-axes, respectively. The charge density, i.e., charge per unit length of each wire is λ.



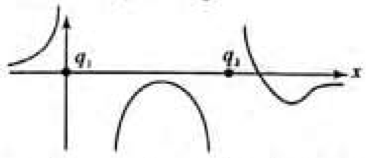
(a) $\frac{\lambda}{3\pi\varepsilon_0 a}(\hat{i}+\hat{j}+\hat{k})$

(b) $\frac{\lambda}{2\pi\varepsilon_0 a}(\hat{i}+\hat{j}+\hat{k})$

(c) $\frac{\lambda}{2\sqrt{2}\pi\varepsilon_0 a}(\hat{i}+\hat{j}+\hat{k})$

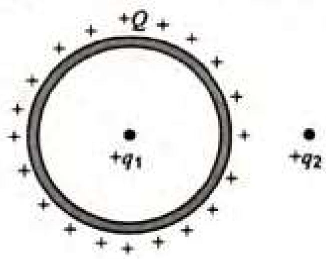
(d) $\frac{\sqrt{2}\lambda}{\pi\varepsilon_0 a}(\hat{i}+\hat{j}+\hat{k})$

32. Two charges q_1 and q_2 are kept on the x-axis, and the electric field at different points on the x-axis is plotted against x. Choose the correct statement about the nature and magnitude of q_1 and q_2.



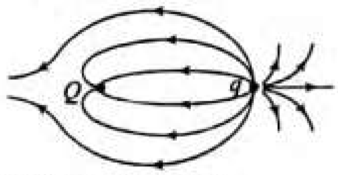
(a) q_1 is positive, q_2 is negative; $|q_1| > |q_2|$
(b) q_1 is positive, q_2 is negative; $|q_1| < |q_2|$
(c) q_1 is negative, q_2 is positive; $|q_1| > |q_2|$
(d) q_1 is negative, q_2 is positive; $|q_1| < |q_2|$

33. A thin metallic spherical shell contains a charge Q on its surface. A point charge q_1 is placed at the center of the shell, and another charge q_2 is placed outside the shell. All the three charges are positive. Then the force on charge q_1 is



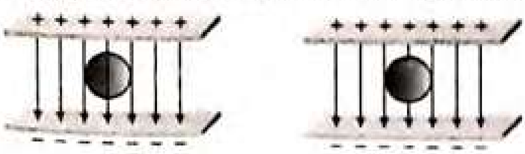
(a) toward right
(b) toward left
(c) zero
(d) none of these

34. The lines of force of the electric field due to two charges q and Q are sketched in the figure. State if



(a) Q is positive and $|Q| > |q|$
(b) Q is negative and $|Q| > |q|$
(c) q is positive and $|Q| < |q|$
(d) q is negative and $|Q| < |q|$

35. An uncharged sphere of metal is placed in between two charged plates as shown. The lines of force look like

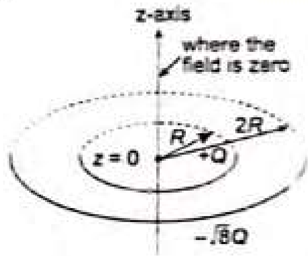


A B

C D

(a) A (b) B
(c) C (d) D

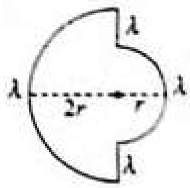
36. Two concentric rings, one of radius R and total charge $+Q$ and the second of radius $2R$ and total charge $-\sqrt{8}\,Q$, lie in x-y plane (i.e., $z = 0$ plane). The common centre of rings lies at origin and the common axis coincides with z-axis. The charge is uniformly distributed on both rings. At what distance from origin is the net electric field on z-axis zero?



(a) $\frac{R}{2}$ (b) $\frac{R}{\sqrt{2}}$

(c) $\frac{R}{2\sqrt{2}}$ (d) $\sqrt{2}\,R$

37. Two semicircular rings lying in the same plane of uniform linear charge density λ have radii r and $2r$. They are joined using two straight uniformly charged wires of linear charge density λ and length r as shown in the figure. The magnitude of electric field at common centre of semi-circular rings is



(a) $\frac{1}{4\pi\varepsilon_o}\frac{3\lambda}{2r}$

(b) $\frac{1}{4\pi\varepsilon_o}\frac{\lambda}{2r}$

(c) $\frac{1}{4\pi\varepsilon_o}\frac{2\lambda}{r}$

(d) $\frac{1}{4\pi\varepsilon_o}\frac{\lambda}{r}$

38. A positively charged particle moving along x-axis with a certain velocity enters a uniform electric field directed along positive y-axis. Its

(a) vertical velocity changes but horizontal velocity remains constant
(b) horizontal velocity changes but vertical velocity remains constant
(c) both vertical and horizontal velocities change
(d) neither vertical nor horizontal velocity changes

39. An electron of mass m_e initially at rest moves through a certain distance in a uniform electric field in time t_1. A proton of mass m_p also initially at rest takes time t_2 to move through an equal distance in this uniform electric field. Neglecting the effect of gravity, the ratio of t_2/t_1 is nearly equal to

(a) 1 (b) $(m_p/m_e)^{1/2}$
(c) $(m_e/m_p)^{1/2}$ (d) 1836

40. An electron falls through a small distance in a uniform electric field of magnitude 2×10^4 NC^{-1}. The direction of the field is reversed keeping the magnitude unchanged and a proton falls through the same distance. The time of fall will be

(a) same in both cases
(b) more in the case of an electron
(c) more in the case of proton
(d) independent of charge

Electric Flux and Gauss Law

41. Under what conditions can the electric flux ϕ_E be found through a closed surface?

(a) If the magnitude of the electric field is known everywhere on the surface.
